Transfer of Property.—This, in the case of ascertained or specific goods, is determined by the intention of the parties. Frequently they fail to disclose their intention, and the courts have found it necessary to establish rules, more or less arbitrary, for the decision of such cases. These rules are formulated as follows in the English Sale of Goods Act (*supra*): Rule 1. When there is an unconditional contract for the sale of specific goods, in a deliverable state, the property in the goods passes to the buyer when the contract is made, and it is immaterial whether the time of payment or the time of delivery, or both, be postponed. This rule is modified in some of the U. S. by the doctrine that in cash sales the property does not pass until payment. Rule 2. Where there is a contract for the sale of specific goods, and the seller is bound to do something to the goods for the purpose of putting them into a deliverable state, the property does not pass until such thing is done, and the buyer has notice thereof. Rule 3. When there is a contract for the sale of specific goods in a deliverable state, but the seller is bound to weigh, measure, test, or do some act or thing with reference to the goods for the purpose of ascertaining the price, the property does not pass until such act or thing is done, and the buyer has notice thereof. If the buyer is to do the weighing, etc., or the goods are delivered to the buyer before weighing, etc., property passes at once. In the U. S. there is authority for the view that, if the goods are ascertained, property will pass, although weighing, etc., may be necessary in order to arrive at the total price. (*Singer vs. Walterberry*, 116 N. Y. 371.) Rule 4. When goods are delivered to the buyer on approval, or "on sale or return" or other similar terms, the property therein passes to the buyer when he signifies his approval or acceptance to the seller, or does any other act adopting the transaction; if he does not signify his approval or acceptance to the seller, but retains the goods without giving notice of rejection, then, if a time has been fixed for the return of the goods, on expiration of such time, and if no time has been fixed, on expiration of a reasonable time. What is a reasonable time is a question of fact. In the U. S. it is held generally that a contract "of sale or return" of ascertained goods vests the property in the buyer at once, with an option to return.

In case of an agreement to sell goods of a particular description, as distinguished from a present sale, property will pass when goods of that description and in a deliverable state are appropriated unconditionally to the contract. The assent of both seller and buyer to the appropriation is necessary, but either party may give his assent in advance, and the assent may be express or implied. "The selection of the goods by the one party, and the adoption of that act by the other, converts that which was before a mere agreement to sell into an actual sale, and the property thereby passes." (*Rhodes vs. Threlkeld*, 6 Barnwell and Creswell 388.) Where the buyer orders goods to be sent to him by the seller, implied assent is given by the purchaser to the seller to make the appropriation; and the appropriation is complete upon

the delivery of the goods to the buyer, or to a third person for transmission to the buyer. If such appropriation is unconditional, and the goods conform to the order, property passes. But the seller may appropriate the goods conditionally. In such case property does not pass until the imposed conditions are fulfilled. For example, the seller may take a bill of lading of the goods in his own name, attach thereto a draft for the purchase price, and require payment of the draft as a condition of the buyer's acquiring the property. Where the condition is expressly imposed the rights of the parties are clear. Frequently the language and acts of the parties are equivocal, and the question whether the seller intended to appropriate the goods absolutely to the contract or to reserve to himself the right to their disposal becomes a difficult one. This is exemplified by the case of *The Calcutta Company vs. De Mattos* (32 *Law Journal*, Queen's Bench 322; 33 *ibid.* 214), the judges of the lower court being equally divided as to the intention of the parties, and, on appeal, two of the judges entertaining a third view.

Where a contract is made for the manufacture and delivery of an article, the property therein does not pass, according to the English decisions and those of many of the U. S., until delivery and acceptance, or until the article is ready for delivery and approved by the buyer. In some of the States it is held that the buyer assents in advance to the appropriation of the finished article to the contract, and that title passes upon the seller's tendering it.

Whether a contract for the sale of a part of a larger bulk of goods, of uniform kind and quality—e. g. 1,000 bush. of wheat from a grain elevator, or 100 gal. of oil from a tank, or 50 barrels of flour from a car-load—is one for a present sale of specific goods, or one for the sale of goods thereafter to be ascertained, is a question upon which the authorities are divided. The English view, which has been adopted in many of the U. S., is that the contract can not be more than an agreement to sell, and that property can not pass until the portion contracted for has been separated from the bulk. It is said there is no individuality until it is divided; the law knows no such thing as a floating right of property, which may attach itself either to one parcel or the other, as may be found convenient afterward. (*Golder vs. Ogden*, 15 Penn. St. 528.) On the other hand, it is maintained by many State courts that the subject-matter of such a contract is ascertained or specific goods, where it is a designated quantity out of a specified mass of uniform quality (*Kimberly vs. Patchin*, 19 N. Y. 330); and that the property in such designated quantity will pass, upon making the contract, if the parties so intend. This doctrine seems to accord with commercial usage. In some States it has been adopted wholly or in part by statute. See Mass. Pub. Stat., c. 72, § 7.

Risk of Loss.—This, unless otherwise agreed, passes from the seller to the buyer with the property in the goods, without regard to their possession. If delivery has been delayed through the default of either buyer or seller, the goods are at the risk of the party making default as regards any loss which would not have occurred but for such default. Sale of Goods Act, § 20.

Transfer of Title.—At common law a person can give no better title to goods than he possesses, unless he acts as the true owner's agent, or unless the true owner's conduct respecting the goods has estopped him from denying such person's authority to sell them. (See *ESTOPPEL*.) In England this rule does not apply to sales in MARKET OVERT (*q. v.*), and there, as well as in most of the U. S., it has been modified by Factors' Acts and similar statutes. The chief feature of this legislation is the power it confers on agents or consignees, who are intrusted by the owner with goods or with documentary evidence of title thereto, such as a bill of lading, warehouse certificate, delivery order, or the like, to give a perfect title to *bona-fide* purchasers. See *Lee vs. Buller* (1893), 2 Queen's Bench 318; *Goodwin vs. Mass. Company*, 152 Mass. 189; *Soltau vs. Gerdau*, 119 N. Y. 380, applying such legislation.

As delivery is not necessary to the transfer of ownership of goods, it should follow that one who has sold goods to A can not give title to them to B, although they are allowed by A to remain in his possession. Such is the general rule. In a few of the U. S. the courts have held that a seller who has never delivered the goods to the first purchaser may confer a perfect title upon a second *bona-fide* buyer. (*Huschle vs. Morris*, 131 Ill. 587.) The adoption of this doctrine in the British Sale of Goods Act, § 25, is "the result of a long struggle between the mercantile community

on the one hand and the principles of the common law on the other."

We have seen that the owner of goods may deliver them under a contract that the title shall remain in him, until the performance of some condition by the buyer, such as the full payment of the price. Here the common law does not recognize any power in the conditional vendee to possess any greater interest than he possesses. (*Harkness vs. Kersell*, 118 U. S. 663.) A different rule has been declared by the Pennsylvania courts, and statutes have been passed in many jurisdictions requiring contracts for conditional sale to be in writing and recorded, in order to be effectual against the buyer's creditors and *bona-fide* vendees.

Seller's Duties.—The most important is that of delivery. If the contract specifies the time, place, and manner of delivery, its terms must be followed. In the absence of agreement or custom, the seller must deliver the goods upon payment or tender of the price; the place of delivery is the seller's place of business, or residence, or their place of deposit at the time, according to the subject-matter of the sale; or, if the seller is to send the goods to the vendee at a distance, the place of their receipt by the common carrier. Delivery must be made at a reasonable hour; the exact quantity agreed upon must be delivered. Any expense incidental to putting the goods into a deliverable state must be borne by the seller. He is also bound, when delivering goods to a carrier on behalf of the buyer, to make a reasonable contract for their transportation, and to give accurate directions for their delivery to the buyer. If the buyer has not had an opportunity to inspect the goods, the seller must afford him a reasonable opportunity for inspection so that he may ascertain whether they are in accordance with the contract.

Buyer's Duties.—The buyer is bound to accept and pay for the goods, and, if the terms of the contract require, to send for them. While the buyer is under no obligation to accept a different quantity of goods from that which he ordered, if he does accept it he must pay therefor at the contract rate. In case the buyer rightfully rejects goods tendered to him by the seller, he is under no duty to return them; he need only inform the seller of his rejection. The courts have experienced much difficulty in some cases in determining whether the buyer has accepted the goods. Perhaps no better rule can be framed on this subject than the one laid down in the British Sale of Goods Act, § 35: "The buyer is deemed to have accepted the goods when he intimates to the seller that he has accepted them, or when the goods have been delivered to him, and he does any act in relation to them which is inconsistent with the ownership of the seller, or when, after the lapse of a reasonable time, he retains the goods without intimating to the seller that he has rejected them."

Seller's Remedies.—If the property in the subject-matter of the sale contract has passed to the buyer, or if the buyer has agreed to pay the price on a day named, the seller can maintain an action for the purchase price. In other cases the buyer's breach of his contract will give the seller the right to maintain an action for damages for refusal to accept and pay for the goods. (See *DAMAGES, MEASURE OF*.) According to English decisions, the refusal of the buyer to take and pay for goods, the property in which has passed to him, does not divest him of such property, unless by the terms of the contract such a result is stipulated for, and with slight modifications such is still the rule under the Sale of Goods Act (§§ 39 and 48). The doctrine which generally obtains in the U. S. is as follows: "The vendor of personal property, in a suit against the vendee for not taking and paying for the property, has the choice ordinarily of either one of three methods to indemnify himself: (1) He may store or retain the property for the vendee, and sue him for the entire purchase price; (2) he may sell the property, acting as though for this purpose of the vendee, and recover the difference between the contract price and the price obtained on such resale; or (3) he may keep the property as his own, and recover the difference between the market price at the time and place of delivery and the contract price." (*Dustan vs. McAndrew*, 44 N. Y. 72.) Other remedies of the seller are discussed under *STOPPAGE IN TRANSITU (q. v.)*.

Buyer's Remedies.—These are an action for damages for breach of the seller's contract, or for *CONVERSION (q. v.)*, or for *SPECIFIC PERFORMANCE (q. v.)*.

Other topics connected with sales of personal and real property are presented in the articles on *DEED AND FRANCHISE (q. v.)* and *STATUTE OF (q. v.)*.

\$28,360,000, of which \$16,463,000 was on real estate; and the net debt, Jan. 1, 1895, was \$1,100,523. There are 7 national banks with combined capital of \$2,000,000, 2 savings-banks with combined deposits of \$12,000,000, and 8 mutual insurance companies.

Business Interests.—Salem merchants early established fishing industries; in 1670 sent vessels to the West Indies and Europe; and immediately after the Revolutionary war opened trade with China, India, Java, Sumatra, the Philippine islands, Arabia, Cape of Good Hope, Russia, South America, and other foreign parts. For many years the city was noted for its large foreign trade, and at one time had almost the monopoly of the East India and China trade; but it no longer has a foreign commerce. There is a large coasting trade, and an immense tonnage of coal is here landed for transshipment to interior cities. The manufactories comprise a cotton-mill with 160,000 spindles, a lead-factory, and several tanneries, machine-shops, and shoe-factories.

Notable Buildings.—There are a few buildings typical of the period of 1634-1700. The public library (established in 1889) contains 29,000 volumes; the Essex Institute (society established in 1848) has a library of 40,000 volumes, and 100,000 pamphlets on science, art, local history, and music, a large collection of historical relics and portraits, and the frame of the Puritan meeting-house of 1634; the Peabody Academy of Science has a museum of ethnology (including an East India marine museum dating from 1799) and zoölogy, and special collections of Essex County zoölogy, botany, and archaeology; and the Athenæum has a library of 20,000 volumes.

History.—Salem was settled by Roger Conant and the "Old Planters" in 1626. Endicott, with a second charter, came in 1628. Banished by the magistrates, against the wishes of his people, Roger Williams went from Salem to settle Rhode Island in 1636. In 1692, as the result of the witchcraft delusion in Salem village (Danvers), nineteen persons were hanged by order of the court, appointed by the royal governor, sitting in Salem. Here, too, the awakening first occurred, and in 1693 all convicted and accused persons were set free. In the Revolution the first provincial assembly sat here in 1774; the first armed resistance to British authority (Leslie's Retreat) occurred at the North bridge Feb. 26, 1775; and Salem furnished large numbers of troops and 158 armed privateers. The U. S. frigate *Essex* was built in Salem in 1799. In the war of 1812-15, 40 of the 350 American armed vessels went from Salem, and in the war of 1861-65 the city furnished 3,000 men and gave 200 lives to the Union cause. Pop. (1880) 27,563; (1890) 30,801.

JOHN ROBINSON.

Salem: city (founded in 1854); capital of Dent co., Mo.; on the St. L. and San Fran. Railway; 127 miles S. W. of St. Louis (for location, see map of Missouri, ref. 6-I). It is in an agricultural, stock-raising, and iron-mining region; and contains 7 churches, Salem Academy, 5 roller-process flour-mills, 3 steam planing-mills, several sawmills, 2 State banks with combined capital of \$40,000, and 4 weekly newspapers. Pop. (1880) 1,624; (1890) 1,315; 1895 estimated, 2,000.

EDITOR OF "MONITOR."

Salem: city; capital of Salem co., N. J.; on the Salem river, and the W. Jersey Railroad; 14 miles S. E. of Wilmington, Del., 34 miles S. W. of Philadelphia (for location, see map of New Jersey, ref. 6-B). It is in a rich agricultural region, has regular steamboat communication with Philadelphia, and contains 13 churches, high school, several public schools, Friends' School, public library (founded in 1804), 4 hotels, 2 national banks with combined capital of \$250,000, and 3 weekly newspapers. There are 6 canneries for fruit and vegetables, 3 iron-foundries, 3 manufactories of glass, machine-shops, mills, hosiery, and hollow-ware and oilcloth factories. Pop. (1880) 5,056; (1890) 5,516.

W. H. CHEW, EDITOR OF "STANDARD."

Salem: village; capital of Washington co., N. Y.; on the Delaware and Hudson Railroad; 25 miles S. of Whitehall, 41 miles N. E. of Troy (for location, see map of New York, ref. 4-K). It is in an agricultural, dairying, and slate-quarrying region, is a popular summer resort, and contains Washington Academy (opened in 1791), St. Paul's Hall (Protestant Episcopal, opened in 1885), Raleigh School, 2 national banks with combined capital of \$100,000, 2 weekly newspapers, cheese-factory, several mills, and railway repair-shops. Pop. (1880) 1,410; (1890) not separately returned; (1894) estimated, 1,400.

Salem: city (founded by Moravians in 1766); Forsyth co., N. C.; on branches of the Norfolk and Western and the Southern railways; adjoining Winston, the railway station and banking-place; 112 miles W. of Raleigh (for location, see map of North Carolina, ref. 2-F). It was the center of important movements in the early Indian and the Revolutionary wars, and was visited by Union and Confederate armies in the war of 1861-65. It is the seat of Salem Female Academy (Moravian, founded in 1802), which retains its original name, although it has become one of the leading colleges for women in the Southern States and has collegiate and post-graduate courses, schools of music, art, and languages, and commercial and industrial departments. The manufactories comprise cotton and woolen mills, tobacco-factories, and iron-works. Pop. (1880) 1,340; (1890) 2,711; (1894) estimated, 4,000 to 5,000. JOHN H. CLEWELL.

Salem: city; Columbiana co., O.; on the Salem and the Penn. railways; 70 miles W. of Pittsburg, Pa. (for location, see map of Ohio, ref. 3-J). It contains 7 churches, 3 graded public schools, a public high school, 2 national banks with combined capital of \$300,000, 2 private banks, 2 daily and 2 weekly newspapers, and manufactories of machinery, engines, sheet-iron, church-organs, wire nails, pumps, stoves, furniture, and other articles, art-works, church-furniture works, tile-works, and brick-works. Pop. (1880) 4,041; (1890) 5,780; (1893) 7,320. EDITOR OF "DAILY NEWS."

Salem: city; capital of the State of Oregon and of Marion County; on the Willamette river, and the Southern Pac. Railroad; 53 miles S. of Portland (for location, see map of Oregon, ref. 3-C). It is in an agricultural and fruit-growing region; is laid out with streets 100 feet wide, and blocks 330 feet square, with 16-foot alleys; and is one of the handsomest cities on the Pacific coast. It has communication with Portland twice a day by railway and once a day by steamboat. Water for manufacturing purposes is brought to the city from the Willamette and Santiam rivers by a canal 18 miles long. In 1890 over \$1,000,000 was invested in manufacturing industries, which included several large flour-mills, a woolen-mill, foundries and machine-shops, tanneries, tobacco-factories, plants for fruit-drying and canning, carriage and wagon factories, brick-kilns, and agricultural-implement works. The city contains 2 public parks, 20 churches, a public high school and 5 grammar schools, a State, a Masonic, and 2 educational libraries, Willamette University (Methodist Episcopal, opened in 1844), the Academy of the Sacred Heart (Roman Catholic, opened in 1860), a Friends' Institute (opened in 1892), 2 national banks with combined capital of \$175,000, an incorporated bank, 2 private banks, and 4 daily, 4 weekly, and 2 other periodicals. The reformatory and charitable institutions comprise the State Penitentiary, Reform School, Deaf Mute School, Institute for the Blind, Insane Asylum, and Orphans' Home. The city is an important business center, and is very progressive. A Methodist mission was established 9 miles below the present city in 1834; the city was incorporated in 1853, and became the State capital in 1860. Pop. (1880) 2,538; (1890) 4,515; (1895) estimated, 15,000.

S. T. RICHARDSON.

Salem: town; capital of Roanoke co., Va.; on the Roanoke river, and the Norfolk and Western Railroad; 60 miles W. by S. of Lynchburg, 180 miles W. by S. of Richmond (for location, see map of Virginia, ref. 6-E). It is in an agricultural and tobacco-raising region, is the seat of ROANOKE COLLEGE (*q. v.*), has good water-power, and contains a graded public school, a national bank with capital of \$75,000, a State bank with capital of \$67,300, a loan and trust company with capital of \$50,000, and a weekly and a monthly periodical. Pop. (1880) 1,759; (1890) 3,279.

Saleratus: See SAL AERATUS.

Saler'no: chief town of the province of Salerno, Italy; 33 miles by rail S. E. of Naples, on the Gulf of Salerno (see map of Italy, ref. 7-F). The chief object of interest is the old Norman cathedral (1084), injuriously restored in 1768, but still the most imposing specimen of Norman architecture in Southern Italy, and containing, besides rich marbles and mosaics, twenty-eight magnificent granite and porphyry columns from the temples of Paestum. Tradition asserts that the body of St. Matthew was brought from the East in 930 and deposited in the crypt of the cathedral. Salerno was originally a Roman colony; it became the capital of a principality in the ninth century, and in 1077 it was taken by Robert Guiscard, who made it his capital. The

most famous of medical salarins was its substituted medical salar. For great reputation due to it during many centuries exceeds that of all other salarins. The *salars salarins*, a set of hyaline tubes drawn up in Lat. in a clear solid in the twelfth century, and dedicated to the king of England, was translated into many European languages, and published in numerous editions soon after the invention of printing. The *Salars*, a still earlier medical work, also translated from Salars, and was widely circulated throughout Europe. Pop. of the community (1900) about 10,000.

Translated by M. W. HARRINGTON.

Salars, Pigeons de: See Pigeons or Squares.

Salars (or) Pigeons de: a group of about 30 small islands, located in the S. of the island of Celebes in the East Indies, some, 300 sq. miles, pop. 17,000, consisting of Macassar, Malaya, ruled by native chiefs, but subject to the Netherlands. *Salars*, sugar, pepper, and nutmeg are produced; also maize and *Salars* (a kind of millet), but not rice. Several of the islands are of volcanic origin. The islands, both small and large, abundant.

Salars (city), in Lancashire, England, on the west bank of the Irwell, some 10 miles from Manchester. It is practically one town with Manchester (q. v.) on the east bank of the Irwell. It is connected with Manchester by 10 bridges as well as by several railway viaducts. Salars covers an area of 7 sq. miles, has 4 public parks, 4 public libraries, and a museum. It returns three members to Parliament. Pop. (1904) 203,320.

Salars: See Pigeons.

Salars (or) Salars (or) Salars: See Wines or Pigeons.

Salars (or) Salars (or) Salars: a bitter crystalline principle contained in the bark of all the willows and of some poplars. Its composition is $C_{17}H_{15}O_5$. It has no alkaline properties, like quinine, strychnine, and some other crystalline bitter principles, but is a glucoside. By the action of hot dilute acids or of the ferment *Kaibin* (q. v.) or *zymase*, it breaks up into glucose and another compound called saligenin.

Salars has valuable medicinal virtues in the treatment of rheumatism, though much less efficient than quinine.

Salars Law (named of Lat. *Salars* [Salars]), the law of the Salars, who established a Frankish kingdom in Gaul in the fifth century, especially that provision of the Salars which prevents women from inheriting any landed estate which is not an acquired but inherited possession in the family. This principle was accepted in France in the centuries between Edward III. and Philip of Valois with respect to the inheritance of the crown; and in Spain, where previously the Visigothic law provided recognizing the succession of women, it was introduced by the Visigoths, Philip V. in 1763, and abolished by Ferdinand VII. in 1809 in favor of his daughter Isabella. In accordance with a similar law the crowns of Great Britain and Hanover became separate in 1767. See *Salars*; the Ten Texts with the *Salars* and the *Salars* (London, 1890).

Salars (or) Salars (or) Salars: a benzene and para-substituted acids have the same formula; an organic acid existing in the flowers of *Spiraea ulmaria*, and in combination as acid methylsalars, forming the essential oil of *Spiraea* (*Spiraea ulmaria*).

Salars: It was discovered by Piria in 1838, who formed a crystalline salars (essential oil of *Spiraea ulmaria*) with osmotic acid; in 1844 Cahours obtained it from oil of *Spiraea*; and in 1850 Kuhn and Lautermann discovered the mode of making it from phenol (carbolic acid). In 1875 Kuhn modified and improved his original process for the manufacture from phenol, and thereby discovered the method as much that it could be brought into use in medicine and as an antiseptic. Some chemists—Piria, Pinner, and the Germans—have made experiments with it, in which they used in preparing the salts made for it as an antiseptic, and J. Wismuth, a, *prakt. Therapie*, 1875, Heft, 9, 2 and 4.

Salars: Salars acid may be obtained in several ways—(a) by treatment of salars with an oxidizing agent, like osmotic acid; (b) by fusing salars with osmotic acid; (c) by heating oil of wintergreen with strong potash, or oil with osmotic hydrazine acid; (d) by heating a mixture of salars and osmotic potash to 300°; (e) by treating salars (carbolic acid) with sodium and carbon dioxide,

(f) with sodium and methylchlorosulfonate, (g) with acid potassium permanganate, or (h) with osmotic acids, the mixture being heated and carbon dioxide passed into it.

Preparation:—Piria's, salars acid is made from oil of wintergreen or from phenol. In making it from the former the oil is simply heated with strong potash fire until methyl alcohol ceases to be evolved. The resulting product is potassium salarsate, from which hydrochloric acid precipitates salarsic acid. This is filtered off, washed, and purified by dissolving and recrystallizing from alcohol. To prepare it from phenol, the phenol is dissolved in osmotic acid, the exact equivalence of each being used (an excess of one or the other having a considerable effect on the yield obtainable) and the solution is evaporated to dryness. The mass is then placed in a retort and heated gradually, and a current of carbon dioxide passed through it at a temperature between 180° and 140° C. under pressure; or, better, the sodium compound of phenol is mixed with liquid carbon dioxide at a low temperature in an osmotic acid heated in the temperature 120 to 140° C. The mass left in the retort consists of osmotic salarsate, which is dissolved in water and precipitated by hydrochloric acid. It is usually brownish, on account of a osmotic impurity, which may be more or less perfectly removed by resolution and recrystallization or passing the solution through boneblack.

Properties and Uses:—Salarsic acid, when pure crystallizes in white four-sided prisms, which fuse at 135°-140° C. It has a sweetish-sour taste, reddens litmus strongly, is slightly soluble in cold water (in proportion of 1 part to 1,000 of water), more so in hot, still more so in alcohol, ether, and oil of turpentine. Its heating with strong hydrochloric or hydrochloric acid or with dilute sulphuric acid it decomposes into phenol and carbonic acid. It is a dibasic acid, forming acid and neutral salts. In very small quantities it acts as an antiseptic, and experiments have shown its efficiency in preserving skins, hair, milk, eggs, and other articles of food from the changes which unfit them for use. It can not, however, be used for milk and butter, as it gives them a peculiar taste. Experiments in the preservation of meat gave unsatisfactory results. Its action as a disinfectant is not so powerful as that of carbolic acid. When acting as an antiseptic it appears to undergo no chemical change. Its salts have no disinfecting or antiseptic properties. On account of its being odorless and less irritating than carbolic acid, and not poisonous, it has been used with advantage in surgical treatment, where it can be used for every purpose for which carbolic acid is used, except for the cleaning of instruments. In medicine, salarsic acid is used as an antipyretic, and as an internal factor as antiseptic in cases of diphtheria. The dose is from 7 to 45 grains. It is frequently dispersed in solutions of alkaline phosphates, in which it is more soluble than in pure water. Its use has been proposed in the manufacture of glue, leather, etc., of perfumery, and as a dye in connection with iron salts, with which it gives a fine purple. It has been used with great success as a remedy in the case of certain diseases that affect bees. It has come into extensive use in the manufacture of dyestuffs. Certain azo-colors obtained by its use are much prized as yellow and orange dyes.

Revised by I. A. HENNES.

Salars: city, Chaffee co., Col.; on the Denver and Rio Grande Railroad; 56 miles W. of Canon City, 97 miles N. by W. of Pueblo (for location, see map of Colorado, ref. 4-12). It is in a region in which gold, silver, copper, lead, and iron are mined, and marble, quartz, and lime are quarried; has large stock-raising interests; and contains 6 churches, the Rio Grande General Hospital, extensive railway shops, a public high school, Salars Academy (Presbyterian, opened in 1904), a national bank with capital of \$50,000, and a semi-weekly, a weekly, and a monthly periodical. Pop. (1900) not in census; (1900) 2,596; (1904) estimated, 3,500.

Entered by "Man."

Salars (or) Salars (or) Salars: a genus of *Batrachia*, pres. part. of *Salars*, leap; that order of *Batrachia* (q. v.) which contains the frogs and toads, and which, from the fact that in the adults the tail is lacking, is better known as *Anura*. In the larval (tadpole) stage gills and tail are present, while legs are absent. With growth the gills and tail are absorbed (the tail is not dropped as is often supposed), and the legs grow out, the fore legs being the first to form, although owing to the fact that they are covered by a fold of the skin they do not appear until after the hinder pair. With the loss of the gills the lungs begin to function, and these are supplemented by the skin. In the

adult the following skeletal peculiarities may be mentioned: Ribs as a rule are lacking, their place being taken by the transverse processes of the few (usually ten) vertebrae. The caudal vertebrae have been replaced by a bony rod (urostyle). The skull is very complex; the ethmoid bone is in the shape of a girdle (*os en ceinture*) around the cerebrum, and the quadrato-jugal arch is usually complete. Teeth never occur in the lower jaw, and they may be lacking from the upper one. Pectoral and pelvic girdles are always present, and the two halves of the former may either be firmly united or they may play one over the other, differences seized upon by Prof. Cope to divide the otherwise homogeneous order into two subdivisions. The skin is naked (i. e. without plates or scales), but it is not infrequently "warty," from the presence of large defensive glands which secrete an acrid fluid. In all except a few tropical forms a tongue is present, and is used in capturing the prey, which consists to a large extent of insects.

Some of the *Salientia* are aquatic (frogs), some (toads) are terrestrial, going into the water only for the purpose of oviposition in the spring, and still others (tree-toads) live in trees and bushes, and have the tips of the toes modified into sucking-disks to insure a firm hold upon the branches upon which they dwell. All of the *Salientia* have vocal organs, but these are most exercised at the time of reproduction. Most interesting are some of the reproductive habits. The eggs are laid in gelatinous strings or masses, usually deposited freely in the water. In the case of the obstetrical toad of Europe the male wraps the egg-strings around himself. In the members of the genus *Nolotrema* of South America the skin of the back becomes folded into a sac in which the eggs are carried until hatched. In the Surinam toad (*Pipa*) the eggs are received upon the back of the male, the skin of which grows up around the separate eggs until each is inclosed in a cup and covered with a lid of skin. In these cups the eggs develop until they have obtained the adult form, when they escape to begin free life.

None of the *Salientia* is marine. Their great home is in the tropics. The typical toads are especially developed in tropical America, Africa, and Asia; the true tree-frogs and related forms are most abundant in Australia and tropical America; and the typical frogs are most numerous in tropical Asia and Africa, while they are entirely excluded from Australia. Comparatively little is known of their geological history, but frogs and toads have been found in the Upper Eocene of Europe.

LITERATURE.—Ecker, *Anatomie des Frosches* (1864-82); Boulenger, *Catalogue of the Batrachia Salientia in British Museum* (London, 1882); Cope, *Batrachia of North America* (1889). J. S. KINGSLEY.

Saligenin: See SALICIN.

Salina: city; capital of Saline co., Kan.; on the Smoky Hill river, and the Atch., Top. and S. Fé, the Chi., Rock Is. and Pac., the Mo. Pac., and the Union Pac. railways; 47 miles W. of Junction City, 118 miles W. of Topeka, the State capital (for location, see map of Kansas, ref. 5-G). It derives power for manufacturing from the river, has 5 grain elevators, flour-mills, paper-mills, and planing-mills, foundry and machine shops, gas, water, and electric-light plants, and street-railways, and contains 16 churches, 5 public schools, Kansas Wesleyan University (Methodist Episcopal, chartered in 1885), Normal University, St. John's School (Protestant Episcopal), 3 national banks with combined capital of \$250,000, a State bank with capital of \$50,000, and a daily, 5 weekly, and 3 monthly periodicals. There are valuable salt-springs and gypsum-quarries in the vicinity. Pop. (1880) 3,111; (1890) 6,149; (1894) 5,541.

EDITOR OF "REPUBLICAN JOURNAL."

Salina Group: an American geological formation of Upper Silurian age, otherwise known as the Onondaga salt group. It consists of red and green shales and impure limestone, containing large masses of gypsum, and is best developed in Central New York, where it is about 1,000 feet thick and forms an east-and-west belt averaging about 10 miles broad, passing through Syracuse. It is the source of brine from which 8,000,000 to 12,000,000 bush. of salt are made annually. I. C. R.

Salinan Indians: a linguistic stock of North American Indians deriving its name from the Salinas river, California, in the main and tributary valleys of which, in Monterey and San Luis Obispo Counties, they formerly resided. It is represented by a single known tribe, the Chalone, whose villages were Aspasniagan, Chulare, Ekriagan, Eslanagan, Gocharone, Ichenta, and Yumanagan. These settlements supplied the

neophytes of the missions of San Antonio and San Miguel, established by the Spanish padres in 1771 and 1797 respectively. A large proportion of the natives connected with the Soledad mission, founded in 1791, also belonged to this family, and some of the Aspasniagan were neophytes of the mission of San Carlos.

In their general habits and customs the Salinan Indians resembled the Costanoan, Esselenian, Mariposan, and other southern Central California tribes. By Galiano, in 1792, they were described as of medium size, dark color, and as being the ugliest and filthiest of the natives of America. They led in part an agricultural and pastoral life. Their houses were circular and were constructed of stones or adobes and roofed with thatch.

Though the San Antonio and San Miguel tribes were probably never very populous, the missions bearing those names when first established contained respectively 1,400 and 1,200 Indians. In 1884 only a dozen Indians of the Salinan group were known to survive.

Bancroft, *History of California*, vols. i.-vii. (San Francisco, 1884-90); H. W. Henshaw, *Missions of California*, in *Popular Science Monthly* (Aug., 1890); J. W. Powell, *Indian Linguistic Families*, seventh report Bureau of Ethnology (Washington, 1891). See INDIANS OF NORTH AMERICA. F. W. HODGE.

Salinas: city; capital of Monterey co., Cal.; on the Southern Pacific Railroad; 94 miles S. E. of San Francisco (for location, see map of California, ref. 9-C). It is in an agricultural, stock-raising, and wool-growing region, and has 6 churches, a public high school, 2 State banks with combined capital of \$420,000, 2 agricultural-implement factories, electric lights, and 2 daily and 2 weekly newspapers. Pop. (1880) 1,854; (1890) 2,339; (1895) estimated, 3,500.

EDITOR OF "JOURNAL."

Salineville: village; Columbiana co., O.; on the Penn. Railroad; 80 miles S. S. E. of Alliance, 63 miles W. N. W. of Pittsburg (for location, see map of Ohio, ref. 8-J). It is in a coal-mining region, and contains a private bank and a weekly newspaper. Pop. (1880) 2,302; (1890) 2,369.

Salinometer: a form of HYDROMETER (*q. v.*) for measuring the amount of salt in a given solution.

Salisbury: sawlz'berry, or New Sarum: capital of Wiltshire, England; in a valley near the confluence of the Avon, Bourne, Wilf, and Nadder; 84 miles W. S. W. of London (see map of England, ref. 13-H). It has a magnificent cathedral, which is the purest and richest specimen of the Early English style. The main building was constructed 1220-58 in the form of a double cross. The cloisters and chapter-house were added in 1270, and the spire, the highest in England (400 feet), was erected about 1330; it leans over 2 feet toward the S. It is 449 feet long and 81 feet high in the interior; the length of the great transept is 203 feet. It was much damaged by injudicious restoration (1782-91), but this has been considerably remedied by a restoration begun by Sir Gilbert Scott in 1863, and continued afterward by Street and Sir Arthur Blomfield. Old Sarum (*Sorbidunum*), in Roman times a camp of importance, stood about a mile N. of the present city. It consists of a conical hill encircled with intrenchments. Salisbury returns one member to Parliament. Pop. (1891) 17,362. R. A. ROBERTS.

Salisbury: township (settled about 1720, organized in 1740); Litchfield co., Conn.; on the Housatonic river, and the Phila., Reading and New Eng. Railroad; 63 miles N. W. of Hartford (for location, see map of Connecticut, ref. 7-D). It contains the villages of Salisbury, Lakeville, and Lime Rock, 7 churches, public schools, kindergartens, a parochial school, Scoville Memorial Library, Connecticut School for Imbeciles, St. Mary's Convent, Hotchkiss School, a savings society, and a private bank. It is picturesquely located and has 6 large lakes and a variety of mountain scenery. Salisbury contains iron mines (yielding the widely known Salisbury ore), blast furnaces, car-wheel works, and cutlery and cutlery-handle factories. The assessed valuation of the township is about \$1,800,000. Pop. (1880) 3,715; (1890) 3,420; (1895) estimated, 3,500. DONALD T. WARNER.

Salisbury: town; capital of Wicomico co., Md.; on the Wicomico river, and the Balt. and E. Shore and the N. Y., Phila. and Norfolk railways; 95 miles S. E. of Annapolis, the State capital, 140 miles S. E. of Baltimore (for location,

discovered. The parotid has one large duct, the duct of Steno; the sub-maxillary, the duct of Wharton; the sublingual—from eight to twenty minute ducts opening independently beneath the tongue—the ducts of Rivinius; and a few uniting to form a single duct, the duct of Bartholine, which joins that of Wharton. These ducts, their branches, and the interior of the glands are lined with epithelial cells. The process of secretion, more or less constant, is most active during the mastication of food; then saliva is abundantly formed and poured into the mouth. The salivary glands are the seat of disease—mumps or parotiditis, a specific inflammation (see MUMPS) of the parotid; inflammation and abscess of the parotid in low fevers; deposits of diphtheritic infiltration in some cases of that disease; not infrequently concretions of chalky matter form in the glands.

Revised by W. PEPPER.

Salivation [from Lat. *saliva'tio*, deriv. of *salivare*, *saliva'tus*, to spit, salivate, deriv. of *saliva*]: a specific irritation of the salivary glands, mouth, and throat. Though most frequently due to mercury, it may be caused by other drugs, as iodine, and may occur in certain diseases. In former years mercury, in heroic doses, ranked as a remedy second only to bloodletting. Salivation, though now rare, was then a frequent occurrence—intentionally produced in many cases, in others the accidental result of large doses and individual susceptibility. Children will endure large doses of mercurials without salivation; adults are relatively susceptible. An active state of the skin, kidneys, and bowels, and a healthy state of the mouth, favor immunity from salivation, even when the mercurial taken is considerable; reversely, if opium or any remedy which checks the functional excretions be taken before or at the same time, even small doses of mercury may salivate. Salivation is manifested by a coppery or metallic taste, by soreness of the gums, tenderness of the jaws and teeth when pressed together or closed with force, excessive secretion and flow of saliva, even dribbling from the mouth; swollen, red, ulcerated gums; swollen, coated, salivary tongue, taking the imprint of the teeth; and a foul "mercurial" breath. In grave cases, spongy, bleeding, sloughing gums, loosened teeth, swelling of the face and neck, and even gangrene of the mouth, may result. There is accompanying constitutional depression, fever, pain, and sleeplessness.

Revised by W. PEPPER.

Sal'lust (*Gaius Sallustius Crispus*): historian; b. 86 B. C. at Amiternum, in the country of the Sabines, of a wealthy plebeian family; elected *tribunus plebis* in 52; expelled from the senate in 50 by the censors on account of the dissipated and scandalous life he led; reinstated in the senatorial dignity in 49 by being elected *quaestor* by the aid of Caesar, to whose party he belonged, and whom he as *praetor* accompanied to Africa in 46; was appointed proconsul of Numidia, and returned to Rome loaded with riches; formed the magnificent *Horti Sallustiani* on the Quirinalis, and lived in luxurious retirement, devoting himself to the study of history. D. at Rome, 34 B. C. Of his *Historiarum Libri Quinque* only fragments are extant, but his *Bellum Catilinarium* and *Bellum Jugurthinum* have been preserved, and are much appreciated. Editions by Gerlach (8 vols., Basel, 1823-31), Dietsch (2 vols., Leipzig, 1859), Kritz (3 vols., 1828-53); English translations by Sir H. Stuart (1806), by Watson (1852), and by J. R. Mongan (1864). New fragments of the histories were discovered in 1886 by E. Hauler in an Orleans palimpsest; see *Wiener Studien* (viii., p. 315, and ix., p. 25), and the edition of H. Jordan (Berlin, 1887); also *Sallusti historiarum reliquiae*, ed. B. Maurenbrecher (fasc. i., Leipzig, 1891; fasc. ii., 1893).

Revised by M. WARREN.

Salma'sius, CLAUDIUS (*Claude de Saumaise*): classical scholar; b. at Semur-en-Auxois, Côte-d'Or, France, Apr. 15, 1588; studied at Paris and Heidelberg; embraced Protestantism; was appointed professor at the University of Leyden in 1631. The ambition of his wife, theological controversies, and above all the scandal caused by his *Defensio regia pro Carolo I.* (1649), which called forth the memorable reply of Milton, induced him to accept a flattering invitation from Queen Christina of Sweden (1650). The climate did not agree with him, and the inhabitants of Leyden urged him to return, because "their university could as little be without him as the universe without the sun." He left Stockholm in 1651, but died Sept. 3, 1653, at Spa. Salmasius is one of the great encyclopaedists of his time, the

high esteem in which he was held being well attested by Balsac's famous saying, "Non homini sed scientiae deest quod nescivit Salmasius"; but, unlike his illustrious contemporaries, Scaliger, Casaubon, and Lipsius, his immense erudition was not kept under control, and in consequence his numerous works present a confused mass of learned detail, accumulated without regard to methodical arrangement and clearness of exposition. As a text critic, Salmasius never occupied any high rank. In 1606 he discovered in Heidelberg the Greek *Anthology* of Kephala, only the so-called *Anthologia Planudea* having been known up to that time. His most famous works are his *Plinianae exercitationes in Solinum* (1629) and a critical edition of the *Scriptores Historiae Augustae* (1620), to which may be added the learned treatises *De lingua hellenistica* (1643), *De usibus*, and *De re militari Romanorum* (1657). See Fr. Crüzer, *Opuscula II.* (pp. 65-75); Saxe, *Onomasticon IV.* (pp. 1888 fl.).

ALFRED GUDEMAN.

Salmon [viâ O. Fr. from Lat. *sal'mo*, *salmo'nis*, salmon; cf. *sal'ire*, to leap]: a name given to several species of the genus *Salmo* of the Atlantic, characterized by anadromous habits (that is, by their ascending from the sea into fresh waters to breed), as well as to the species of the genus *Oncorhynchus* of the Pacific. The species belonging to the genus *Salmo* have only about eleven rays to the anal fin,

The Atlantic salmon.

while those of the genus *Oncorhynchus* have fourteen to eighteen. All of these agree essentially in habits. Their natural home is the salt water, for there they obtain their food and rapidly increase in size; toward autumn they ascend rivers, as near as possible to the source, to spawn. During their sojourn in fresh water they almost entirely abstain from food and alter considerably in appearance; this divergence from the normal form is most apparent in the male. The snout becomes attenuated and more or less hooked, and the lower jaw is modified in a similar manner; the body becomes emaciated, and the skin decked with glowing hectic colors. In the salmon of Europe and Eastern America this is temporary, and the males in considerable proportion descend to the sea, revive, and assume their pristine vigor and form. Some of the species of the genus *Oncorhynchus* of the Pacific coast become so abnormally developed that after spawning they die, and their carcasses are left by myriads in the waters they have traversed.

Salmo salar is common to the cold waters of Europe and North America. In the U. S. it is nowhere abundant except in some rivers of Maine, although in British America there are a number of streams in which it is found in large numbers. It is generally believed that in former times, and when the country was discovered by Europeans, the species was found farther S., and Hendrik Hudson, in the journal of his ascent of the river which bears his name, records "great stores of salmon in the river." It is tolerably certain, however, that the fish called by him *salmon* was the weakfish (*Cynoscion regalis*), of the family *Scorpaenidae*, having no relation to the *Salmonidae*. The salmon-rivers of Canada are controlled by the Government and let for private use.

The extreme young is banded, and also has red spots. In this state it was long known under the name of *parr*, and supposed to represent a distinct species of the family. Other names are samlet, salmon-fry, and pink. When about a year old, and when the spots have disappeared and it becomes of a bright silvery color before going to the sea, it is called a *smolt*; after its return from the sea into fresh water it is designated as a *grilse*; and finally, on its second return from the sea, it is known as a *salmon*.

Oncorhynchus quinnat is the common salmon, king-salmon, or quinnat, of California and farther N.; it is a much deeper fish than the Eastern species, and is, further, at once distinguishable by the greater number of anal rays—fifteen or sixteen generally. This species will live and flourish in much

warmer waters than the Eastern species, and Atlantic herring have been made to reproduce in the streams of the Eastern U. S. It has also been attempted, on a small scale, to introduce the Atlantic species into Pacific waters. The humpback (*Oncorhynchus*) and the humpback (*O. tshawytscha*) are also commercially important. An extensive business has been developed in the catching of these salmon, and this is conducted on a large scale on the Columbia River and in Alaska. The natural food salmon-fishing, see *FISHING*. See also *FISH-CULTURE* and *FISH-TRADE*. Revised by J. N. KENNEDY.

Salmon, George D. D. (mathematician and theologian); b. in Berlin, Prussia, Sept. 22, 1818; was educated in Trinity College, Berlin, and graduated in 1839; became a fellow in 1841; took orders in 1844; was made Regius Professor of Theology in 1850, and was appointed provost of Trinity College in 1855. He is a fellow of the Royal Society, has obtained honorary degrees from Oxford, Cambridge, and Edinburgh Universities, and is a correspondent of the academy of Berlin and Copenhagen, and of the Institute of France. Besides a number of memoirs in the mathematical journals, he has written treatises on *Linear Systems*, *The Higher Plane Curves*, *Modern Higher Algebra*, and *The Geometry of Three Dimensions*. These have passed through many editions and have been translated into the principal European languages. In theology Dr. Salmon has written *Calculus of Numbers* (1860); *The Origin of Law* (1870); *Non-spiritualism Christianity* (1880); *Tradition and Apostolicity* (1887); *Introduction to the New Testament* (4th ed. 1899); and *Infidelity of the Church* (1899). H. A. ROBERTS.

Salmon, STEWART DENWALL, PORTER, D. D. (scholar); b. at Aberdeen, Scotland, June 22, 1829; educated at the University and Free Church College of Aberdeen and University of Erlangen, Bavaria; Assistant Professor of Greek in the University of Aberdeen 1861-64 and examiner in classics 1864-67; minister of the Free Church, Barry, Aberdeenshire, 1865-76; since 1876 Professor of Systematic Theology and New Testament Exegesis in Free Church College, Aberdeen. Besides contributing frequently to periodicals, Dr. Salmon translated with notes for the Antislavery Library the writings of Hippolytus (Edinburgh, 1865-66); *Johns Africanus, Trigonometry*, and minor works (1868); *Thaumatopagus, Dionysius of Alexandria*, and *Proclus* (1871); two volumes of *Augustine's Works* (1875), all the above revised and reissued in New York; *Commentaries on the Epistle of Peter in Schaff's Popular Commentary* (Edinburgh and New York, 1884); *Commentary on the Epistle of Jude in Schaff's Commentary* (London and New York, 1889); edited the *Bible Class Primers*, for which he wrote *The Life of the Apostle Peter*, *The Shorter Catechism*, *The Life of Christ*, *The Parables of our Lord*, *The Christian's Prayer*, *The Sabbath* (Edinburgh, 1890-91); wrote *The Christian Doctrine of Immortality* (Edinburgh, 1892); since 1891 has been editor of *The Critical Review of Theological and Philosophical Literature* (Edinburgh).

C. K. HAYS.

Salmon'sons (in Gr. *Salmonidae*): in Greek mythology, one of those the founder of the Salmon race. He emigrated from Thessaly to Elis, where he founded the city salmon. He founded himself the equal of Zeus, usurped his functions, and attempted to imitate the thunder and lightning. He was therefore slain by the bolt of Zeus, who also destroyed Thessaly. J. R. S. S.

Salmonidae (Mod. Lat., named from *Salmo*, *Salmon*, the typical genus from Lat. *sal* and *salmon*). See *SALMON*. One of the most important families of fishes, containing the salmon, trout, whitefish, etc., alike famous for their game and for their food qualities. All have an elongated, fusiform body covered with moderate or small cycloid scales, and having a distinct lateral line. The head is covered by cartilaginous bony plates, and is covered with a naked skin. The upper jaw is composed of inter-maxillary and pre-maxillary bones, and the teeth are large and conical in the *Salmonidae*, small or wanting in the whitefishes (*Coregonidae*). The branchiostegial rays are numerous, and *scaphocephalus* are present. The true dorsal fin is at about the middle of the body, and a small adipose dorsal occurs posteriorly. The caudal fin is square or truncate at the end, with a serrated edge. The stomach is splanchnic and 15 to 200 pyloric sacs are present; the large simple air-bladder is connected with the alimentary canal. No viducts are present, but the eggs are discharged into the body cavity, from which they are drawn out through the pores genitalia.

The family name salmon contains about eighty species ar-

ranged in ten genera, of which *Salmo*, *Oncorhynchus*, *Salvelinus*, and *Coregonus* are the most important. The first three mentioned form the *Salmonidae* of the older authors, and contain the forms commonly known as salmon, trout, and charr, the limitations of the genera being upon minute characters, and those of the forms to which the common names are given extremely vague. The genus *Oncorhynchus* includes the Pacific coast salmon, five species in all. The genus *Salmo* includes the salmon of Europe and Eastern North America, and the true trout as well, while *Salvelinus* contains the subspotted trout or char. *Oncorhynchus* and *Salmo* agree in most features, notably in having the whole vomer covered with teeth while they differ in that *Salmo* has fourteen or less rays in the anal fin, while in the Pacific salmon the number is greater than fourteen. *Salvelinus*, of which the brook-trout of North America may be taken as an example, has teeth only on the head of the vomer. Those members of the genus *Salmo* which normally live in fresh water are the true trout. J. N. KENNEDY.

Salmon-trout: See *TROUT*.

Salmon-Salm, PAUL, PRINCE (soldier); b. at Anhalt, Prussia, Dec. 29, 1829; educated at the cadet school in Berlin; became an officer in the Prussian cavalry, and subsequently served in the Austrian army; served in the U. S. army during the civil war; was at one time in command of a regiment, and afterward post-commander at Atlanta, Ga., with the rank of brigadier; went to Mexico at the close of the war; became aide-de-camp and chief of the household to the Archduke Maximilian, with whom he was captured at Querétaro; was released soon after the execution of the latter; entered the Prussian service as major of the Fourth Regiment of grenadiers of the royal guard, and was killed at the battle of Gravelotte, France, Aug. 18, 1870.—He married, in 1862, Miss ANNE-LE CLERCQ, a native of Belgium and an actress by profession. She accompanied him in Mexico, and acquired celebrity by her heroic efforts to procure the pardon of Maximilian or to effect his escape. She accompanied her husband during the Franco-German campaign up to his death. She published portions of her own and of her husband's diaries in Mexico, and issued in 1875 an interesting volume, *Ten Years of My Life*.

Saloff, BASILE, DE (civil engineer); b. in Russia, Oct. 21, 1819; graduated in 1838 from the Institute of Ways of Communication, and entered directly the Russian Corps of Engineers of Ways of Communication; was engaged upon the construction of the railways of the Grande Company until 1852; was then sent abroad and took the course at the Ecole des Ponts et Chaussées in Paris. From 1853 to 1871 he was Professor of the Course of Signals in the Institute of Ways of Communication; in 1872 became president of the technical commission on railways; in 1873 councillor of state and member of the jury of the Universal Exposition of Vienna; in 1877 was elected director of the Grande Company of Russian Railways and president of the Maritime Canal of St. Petersburg, which position he held until the completion of the canal in 1885. In 1887 he became director-general of railways; in 1889 member of the councils on railways and of the council of engineers.

WILLIAM R. HUTTON.

Salol: a substance sometimes called the salicylate of phenol, introduced into medicine in 1896. It is a compound of salicylic and carbonic acids in the proportion of 60 per cent. of the former to 40 per cent. of the latter. It occurs as a white, crystalline powder, with a faint odor and a slightly soapy taste, and when taken in the body is not dissolved in the stomach, but in the alkaline pancreatic juices of the duodenum. It has been used in the treatment of rheumatism and allied affections with some success, and also as an intestinal antiseptic in cholera and other disorders of the alimentary canal. H. A. HARE.

Salomon', LOUIS ÉTIENNE FÉLIX (general and politician); b. at Aux Cayes, Haiti, 1826. He was a Negro; was one of Soulouque's ministers, and commanded his army from 1855 to 1859, when Soulouque was deposed and Salomon fled from the island. After various attempts to incite revolts he returned to Haiti in 1879, and was elected president, governing until Aug., 1899, when he was deposed by a revolution. The republic during this period was unusually prosperous. D. in Paris, Oct. 19, 1899. H. H. S.

Salomon Islands: See *SALOMON ISLANDS*.

Salona: the ancient capital of the Roman province of Dalmatia, and a city of great importance in both commercial

and military respects. The Emperor Diocletian was born here, and 3 miles to the S. W. he built in 303 A. D. the famous palace, covering 8 acres, to which he retired after his abdication. The city and the palace were destroyed in 641 by the Avars, but on the site of the palace and out of its ruins arose the modern town of Spalato—*Salonæ Palatium*. See SPALATO. Revised by M. W. HARRINGTON.

Salonî'ca [Turk. *Selanik*, anc. *Θεσσαλονίκη*, Thessalonica, whence the modern name]: city; capital of the Ottoman vilayet of Salonica, which nearly corresponds to the ancient Macedonia (see map of Turkey, ref. 4-B). It occupies a most advantageous site on the *Ægean*, rising amphitheatrically on Mt. Kortiasch from the northeast shore of a fine harbor of the Gulf of Salonica. It was rebuilt on the site of a city named Therma by Cassander, who named it Thessalonica in honor of his wife, the sister of Alexander the Great; after the battle of Pydna (168 B. C.) it became capital of the Roman province of Macedonia; 15,000 citizens were massacred by order of Theodosius (390); it was pillaged by the Saracens (904); taken by the Marquis of Montferrat (1204), who founded the empire of Salonica; and conquered by the Ottomans (1430). The massacre of two foreign consuls by a Mussulman mob on May 6, 1876, contributed to bring on the Russo-Turkish war. As the chief station on the Via Egnatia, which connected the eastern provinces with Rome, it was to St. Paul a center for the dissemination of Christianity, and to it he addressed two epistles. It was called for centuries the Orthodox City, and was largely instrumental in the conversion of the Bulgarians and Slavonians. Along its narrow and crooked streets many architectural monuments are seen. Among them are a hippodrome; a colonnade built by Nero; an arch of triumph with the names of the seven polarchs; an arch of Constantine, erected after his victory over Licinius; many churches, little subsequent to Constantine, exceedingly rich in mosaics, as St. George or the Rotunda (Orta Sultan Osman Djami), St. Demetrius (Kassim Djami), St. Sophia or the cathedral (Aya Sophia); also the mediæval city walls, built on cyclopean foundations. Salonica is the terminus of a trans-European railway, of several highways which traverse the entire vilayet, and, next to Constantinople, is the chief outlet to the commerce of European Turkey. Many European and Ottoman steamship lines touch here regularly. The bazaar is a rambling, antique building, but the scene of great activity. Pop. (1890) 122,000, of whom more than half are Jews, the rest being chiefly Greeks and Ottomans. The inhabitants are industrious and enterprising, and maintain good schools, literary societies and clubs, and a museum. Salonica has manufactures of morocco leather, silk and cotton, and it exports grain, cotton, wool, hemp, skins, opium, wine, and especially tobacco, that called *Yenidji* being esteemed the finest raised in Turkey.

E. A. GROSVENOR.

Salop: See SHROPSHIRE.

Salpa [Mod. Lat., from Lat. *salpa* = Gr. *σάλπη*, a kind of stockfish]: a genus of *Tunicata* in which the body is barrel-shaped, with an opening at either end. They are found floating freely in the ocean. In the life-history there is an ALTERNATION OF GENERATIONS (*q. v.*), first noticed by the poet Chamisso. In one generation the individuals are free, and inside of each grows a long coil of embryos. This escapes later, and, remaining entire, forms the chain stage in which the salpæ, placed side by side, form a chain or band, each individual containing an egg which is to grow into one of the single or solitary forms. For structural features, see TUNICATA. See also Brooks, *The Genus Salpa* (Baltimore, 1893).

J. S. KINGSLEY.

Salset'te: an island of British India (area, 240 sq. miles; pop. about 110,000), connected with the island of Bombay by a causeway and a stone bridge, and famous for the immense rock-cut cave-temples found at Kenery in the center of the island and at several other places. There are many rice-fields and palm-trees. The island was held by the Portuguese from early in the sixteenth century till 1739.

Salsify, Oyster-plant, or Vegetable Oyster [*salsify* is from Fr. *salsifis* < O. Fr. *sercifi*; cf. Ital. *sassefrica*; *sassa* (< Lat. *saxum*), rock, stone + Lat. *fricare*, rub]: a European plant (*Tragopogon porrifolius*) of the family *Compositæ*. It is cultivated for the roots, which are long, tapering, and have, when properly cooked, a taste somewhat like that of the oyster. The root is highly nutritious. The plant is frequently known as vegetable oyster. The goat's-beard (*T. pratensis*), with yellow flowers, is an introduced weed in eastern parts of the U. S. Revised by L. H. BAILEY.

Sal Soda: See SODA.

Salt [O. Eng. *sealt*; O. H. Germ. *salz* (> Mod. Germ. *salz*); Goth. *salt*; cf. O. Bulg. *solt*, O. Ir. *salann*, Lat. *sal*, Gr. *ἅλς*, salt]: chloride of sodium (NaCl). The salt of commerce contains various saline admixtures, due to the peculiarities of the source used for manufacture; their quantity depends also on the method of manufacture. Natural sources of pure salt are unknown; crystals of pure salt may be obtained from a well-developed rock-salt. The presence of common salt in the water of the ocean, of various lakes and springs, as well as its occurrence as an exudation of the sea in several localities of the Orient, is mentioned in the earliest historical records, although under different names.

The idea regarding the chemical constitution of pure salt has changed during the progress of chemistry. The present view was for the first time experimentally demonstrated by Sir Humphry Davy in 1810; he produced pure salt by burning sodium in chlorine gas. Chemically pure salt is usually produced by neutralizing pure sodium carbonate with pure hydrochloric acid, evaporating the solution to dryness, and fusing the residue. Its use is chiefly confined to the chemical laboratory. The salt of commerce is obtained from sea-water, brines, and rock-salt.

Sea-water.—The water of the ocean is a weak and, comparatively speaking, impure brine. It contains from 3½ to 4 per cent. of saline matter, of which about three-fourths is chloride of sodium and about one-fourth other salts, viz.: chloride of magnesium and the sulphates of calcium, magnesium, sodium, and potassium. Sea-water varies little in composition and concentration. It represents the main source of supply for the manufacture of salt in France, Portugal, Spain, Italy, the West Indies, and Central and South America, and a small portion of the supply for the U. S.; it is also largely used for the production of salt in Holland, Belgium, and England, being frequently employed for the solution of rock-salt of an inferior color.

Rock-salt.—Whenever, during the geological epochs, a larger or smaller body of salt water was cut off from the main ocean, and was subsequently placed under favorable climatic conditions for its evaporation and the subsequent preservation of its saline residue, then a salt-deposit, commonly called rock-salt, was produced. Sometimes several independent deposits occur, one above the other, interstratified with the rocks of the same geological basin. The celebrated salt-deposit of Stassfurt, Germany, is worthy of special notice on account of the large quantities of potassium compounds within its surface layers. The various saline constituents of the ocean are arranged in this deposit in an order which corresponds closely with the degree of their solubility in water. The majority of rock-salt deposits consist only of part of the constituents of the ocean which served for their production. The rock-salt occurs either in densely aggregated masses of cubical crystals, or in compact masses having a conchoidal fracture. It is in some instances colorless and transparent, yet more frequently either red, yellow, or blue, rarely green. Its most common admixtures are either sulphate of calcium and the chlorides of calcium and magnesium, or the sulphates of calcium, magnesium, and sodium, and the chloride of magnesium. Rock-salt deposits consist frequently of alternating layers of salt and gypsum. These various layers are due to successive periods of evaporation. Colorless and dry rock-salt deposits, when easy of access, are directly mined with advantage, and the salt obtained by that process is subsequently brought into a desirable form for domestic use. Colored salt-deposits, or those which suffer from an excess of water, or which contain a large percentage of the above-mentioned foreign saline admixtures or clay, or finally those which are located at great depths, are usually dissolved while in the mine, and their solutions treated like brine for the manufacture of salt. Rock-salt deposits have been noticed in every part of the globe. Among those recently discovered in North America are those upon Petite Anse, Vermilion Bay, Louisiana, at Goderich, Province of Ontario, Canada, in Western New York, and in Michigan.

Brines.—Brines are either artificial or natural; that is, they are prepared either by dissolving rock-salt or they are the natural or chance solutions of saline deposits by means of subterranean currents of water. Natural solutions of rock-salt furnish brines at Saltville, W. Va., Goderich, Ont., and in New York and Michigan. The value of a brine for the manufacture of salt does not entirely depend on either the concentration or relative proportion of pure salt and of

longer the admixture, but on the kind of the impurities; namely of sodium and sodium, within proper limits, are for the desirable than a corresponding amount of the dolomitic and bitter-tasting chlorides of calcium and magnesium. The salt, manufactured in the U. S., with the exception of that obtained from sea-water, is produced from natural and natural brines.

A sample of salt which contains from 1 to 1 1/2 per cent. of sodium oxide, admixtures consisting almost exclusively of minute particles, may be regarded as of very fair quality; and if it contains less than that amount of the chlorides of calcium and magnesium, or of the carbonates of sodium and potassium, it would be considered objectionable, at least for table-salt purposes. The peculiar fitness of any kind of salt for the different domestic applications—such as pickling, curing of meats—depends not only on a fair chemical composition, but also in some degree on its suitable physical or mechanical condition.

There are two kinds of common salt in commerce—(1) *coarse salt*, including salt made by solar heat and rock salt, and (2) *refined salt*, and (3) *common fine or boiled salt*, obtained by artificial heat, and thus by more rapid evaporation. Each has its special commercial value.

Coarse salt.—The coarse qualities of salt are manufactured from sea-water and from brines. In France, Spain, Sicily, Italy, the West Indies, and along the North American coast, of both the Atlantic and Pacific Oceans, nearly all the coarse salt made from sea-water is produced in basins along the seashore, several of them placed at different levels are arranged in a series of a systematic working of the saline solutions in their different stages of concentration. In Ohio, Virginia, Michigan, New York, Nebraska, and Kansas, where coarse salt is obtained from natural brines, wooden racks, protected by wooden covers, are used, so that the brine is exposed to the sun and the low temperatures of winter, and the high evaporation, and thus with the necessary manufacture in open basins. A short description of the coarse-salt works at Onondaga, N. Y., may serve as an illustration. The brine in its fresh state, colorless and highly charged with carbonic acid, is filled into shallow vats, and kept there until most of the carbonic acid is escaped, and the peroxide of iron has been fully oxidized and settled down as brown sesquioxide of iron. The brine is then drawn off to a lower set of vats, where, when the evaporation until crystals of salt appear; during the period the excess of sulphate of calcium is separated. The brine, completely saturated with salt, is ready for salting, and consequently removed from the separated solution to another lower set of vats, where, by more rapid evaporation, the separation and accumulation of a coarsely granulated salt takes place. The salt is from time to time removed, while the remaining mother liquor is discharged when it reaches a concentration of 28–30 Baumé. A *refined* or *solar salt* must be of a neutral reaction, and large, white or colorless, and produce a clear solution in water. Its use is largely confined to the pickling of pork and for the general market.

Common Fine Salt, or Boiled Salt.—The finer granular qualities of salt are obtained by direct or indirect application of additional heat to iron pans, iron kettles, or wooden vats. In Europe almost all the fine salt is manufactured in systems of large shallow iron pans. These are usually from 15 to 17 inches deep, and vary in length from 90 feet and a width of 16 feet to a length of 100 feet and a width of 35 feet. In many of the works of the U. S., hemispherical cast-iron kettles, of 100 to 150 gal. capacity, are used. The better class of salt may be successfully worked in cast-iron kettles. In Europe, particularly those which contain larger percentages of the chlorides of calcium and magnesium—as a general rule give the best results by a slow process of evaporation, for the salt-crystals are produced in that case at a moderate, more perfectly developed, and less liable to inclusion of the inferior mother liquors. The European method of manufacturing common fine salt and the American method of producing it in wooden vats by means of steam-heated pans, the removal of certain impurities in a separate vessel and the making of the salt in another, while in the U. S. the entire operation is carried out in one vessel. In the European system the extension of the brine is at first heated on a moderate heat in an open pan, commonly called the *brine-boiler*. As soon as the salt begins to appear,

and the iron and a part of the sulphate of lime have been separated, the clear salt-pickle is drawn into a lower pan for the manufacture of salt. In the kettle-system from 100 to 200 kettles are placed in a double row along three or four independent fireplaces and one common chimney. The kettles near the fireplaces are protected by suitable insulated arches against excessive heat, while high chimneys supported by towers, aid in conveying the heat along the row of kettles. The brine, before being turned into the kettles, has been kept in large wooden tanks for settling. An iron pan with an upright handle, covering the central bottom part of the kettles, remains in each one of them until the salt begins to form, when the pans are carefully withdrawn. On the skillful handling of the pans, which contains the separated gypsum and oxide of iron, depends largely the color and, to some extent, the general quality of the finished product. The salt formed is well stirred by means of a long-handled iron ladle, and thereby washed in the remaining pickle before it is removed into baskets, which rest for efficient drainage upon stands over one part of the kettles. The chemical composition of the fine salt depends largely on the quality of the mother liquor from which it has been gathered and the degree of drainage it has had. The general physical condition, as size, hardness, etc., depends in part on the character of the brine which served for its production, and on the rate of boiling during its manufacture; the lower the temperature and the less motion of the pickle, the larger the crystals. The normal size of the salt-crystals obtained from any brine is readily reduced by adding either quicklime, glue, fat, resin, or soap in small quantities to the boiling water. This practice is not to be commended, as an entire removal of these substances is practically impossible. A good common fine salt ought to be of a neutral reaction, clear white, of a pure agreeable saline taste, of a gritty feeling between the fingers, and soluble in from five to six parts of water without leaving a residue. The common fine salt, being in an advantageous mechanical condition and readily soluble in water, finds a general application for family requirements.

Salt a Promoter of Animal Life.—Its value in this respect was always well recognized; the oldest writings, sacred and profane, refer to it by using its name frequently in a figurative sense; it had entered as an ingredient, with an emblematic meaning, in the Jewish dispensation; heathen authors spoke in praise of it; Pythagoras calls it a substance dear to the gods; Homer calls it divine; Plutarch speaks of it as a symbol of the soul. The Arabs use it as an emblem of hospitality, and the Abyssinians carry pieces of salt with them in offer for testing to those they wish to meet as friends. Numerous analyses have established the fact that the sodium compounds, and chloride of sodium in particular, represent the main portion of the soluble inorganic substances of the ashes produced in the combustion of a mammal's body. It has been proved that the human system in its normal condition contains a certain amount of salt, and that the same is true of every domesticated animal. It has also been ascertained that salt forms an important part of the soluble saline inorganic compounds of various secretions, as perspiration, mucus, and urine, and that the kidneys in particular are the organs which dispose of any excess consumed. As salt furnishes by far the largest portion of the sodium compounds which the higher animals consume, it is believed that the main portion of these compounds found in the animal system is derived directly from the salt consumed. It is believed that the chloride of sodium is partly decomposed in the animal system, for the stomach in its normal condition contains always some free hydrochloric acid. The serum of the blood of herbivorous animals resembles closely human blood in its mineral constituents; it contains at least three parts of sodium to one of potassium, although these animals live on a food in which potassium largely predominates; the bile contains almost exclusively sodium compounds; while the juice of the flesh of herbivorous as well as carnivorous animals contains almost exclusively chloride of potassium. It is under these circumstances, most likely, that the potassium of the vegetable food continually decomposes the chloride of sodium by forming chloride of potassium, which is subsequently constantly and copiously secreted, particularly in the urine, while the sodium combines with the phosphoric acid and the various peculiar organic acids, which are previously combined with potassium, etc., or were formed in the course of the assimilation of the food. The beneficial effect of common salt as an ingredient of the diet of live stock, cows, sheep, etc., is fully recognized, in consequence of carefully conducted experi-

ments by leading agricultural chemists. Boussingault proved that those cows which had been fed with an addition of salt to their food did not yield more milk, or contain more fat, or show increase in weight of flesh, yet they looked more healthy and vigorous; in fact, their whole exterior had been highly improved as compared with animals which had been fed with the same food without an addition of salt. Liebig came to the same result; he found in the case of two oxen which were to be stall-fattened, one of which received its food with the addition of a dose of 1 oz. of salt per day, while the other one did not receive any, that the latter soon looked bristly, dull, inactive, and sickly, while the former remained smooth-skinned, lively, and vigorous. The well-recognized superior quality of meat from the cattle and sheep raised upon the marsh-meadows along the seashores of Northern Germany, Holland, Belgium, England, and other countries has been ascribed in a large degree to the fact that their food—the marsh-grasses—is frequently salted by the spray of the oceanic waters.

Salt a Promoter of Vegetable Growth.—The use of common salt as a manure for promoting the growth of farm-crops originated at an early date in the history of agriculture. Modern researches do not prove common salt to be valuable as a general fertilizer, but point out its various modes of action, and thereby tend to restrict its use to special kinds of soil and of crop, for it has been noticed that the use of salt frequently exerts not only a decided influence on the chemical composition and physical condition of the soil, but also on the character, i. e. composition, of the plants raised under its influence. All recommendations of careful observers agree in advising the use of but small quantities at a time (from 800 to 400 lb. per acre), applied in a well-diffused form, and only at intervals of years. Numbers of analyses of current farm-crops have shown that a large majority of species of plants growing along the seashores or in the vicinity of saline springs contain much smaller quantities of sodium than potassium compounds. As a natural disintegration of rocks and soil renders, in all probability, sodium as well as potassium compounds accessible as plant-food, there is far less reason, as a general rule, to expect an exhaustion of the soil in sodium compounds as soon as in potassium compounds. These circumstances explain the position which sodium compounds, and chloride of sodium, its most diffused form in lands under cultivation, occupy in a rational system of supplying plant-food to farm-crops. They are considered of secondary importance as plant-food. Nessler has shown that the presence of salt in the soil interferes with a ready combustion of tobacco-leaf, favoring its charring; in the case of the beetroot it has been proved (Grouven) that it increases the percentage of soluble saline compounds in the juice to a considerable degree, and thus reduces their value for the manufacture of sugar. The fact that larger quantities of salt destroy the common flora, and that it merely supports a vegetation of its own, becomes at once manifest to those who glance at the vegetation in the immediate vicinity of salt-springs and marine inlets. Its reputation as a valuable aid in the production of farm-crops rests largely on its action on the physical and chemical condition of the soil. It increases the capacity of the soil to absorb and retain moisture by imparting to it in some degree its own high hygroscopic quality, an influence most desirable in a dry season. An application of from 400 to 500 lb. per acre as a top-dressing on dry grasslands and pasture is frequently followed by good results. It aids in diffusing the existing resources of plant-food (potash and phosphoric acid). Exhausted and worn-out lands derive but little benefit from its periodical use beyond an increased power to retain moisture. Its use is largely confined to the raising of forage-crops.

Salt for Meat-packing.—The object of the meat-packer consists not only in securing the preservation of pork and beef for a reasonable time, but also in securing its palatable condition and as far as possible in retaining its natural color. Practice recommends the use of the coarse and hard qualities of salt for meat-packing for the following reasons: They dissolve gradually and contract the meat by degrees to a desirable firmness; they keep the salt pickle within a moderate concentration; they can not enter mechanically into the meat and thus overcharge it, and may therefore be applied in sufficient excess, so as to compensate for the losses of pickle by leakage, etc., without endangering the tenderness and flavor prematurely. Common fine salt answers for a short period of keeping very well, and is consequently used in the packing of meat for immediate con-

sumption. Fifty to fifty-six pounds of coarse salt are usually taken for salting down one barrel of meat; the bottom and the top of the barrel are always carefully covered with a layer of coarse salt. The purer the salt the better the quality of the meat. A salt which contains large quantities of foreign saline admixtures, particularly of chloride of calcium and chloride of magnesium, imparts a pungent and disagreeable taste, and injures also the color of the meat, for these saline compounds have an unpleasant taste, and, being at the same time in a higher degree hygroscopic, they cause a more copious discharge of juice from meat, which renders the latter of a paler color and of a harder texture; the color of packed meat is frequently improved by an addition of niter, which if used on a small scale is harmless. In the U. S. the coarse salt made from brines and from sea-water is used, besides the English coarse and fine salt, the salt from Turk's island, and other localities in the West Indies. Texas meat-packers are trying the superior rock-salt of Petite Anse, La. A good rock-salt is well fitted for the purpose, yet on account of its great hardness it has to be broken up in smaller pieces than common solar salt. For the packing of fish a fine grade of coarse salt is used.

* Not stated.

Salt for the Dairy Business.—The dairy business has attained such commanding proportions that the amount of salt required in its operations amounts to millions of bushels. The peculiar nature of the dairy products of the U. S. calls for the best qualities of salt in the markets. A good dairy salt ought to be of a neutral reaction and of a pure saline taste, free from pungent after-taste; it ought to be of a properly reduced granulated size, dissolving readily in water, free from any offensive odor, without any stain in color, and, what is of not less importance, free from colored specks. The better qualities of the English "common fine salt," "Ashton's brand," etc., were at first used almost exclusively by the dairymen of the U. S., partly because the exporters of provisions in the seaport-towns dealt also largely in foreign salt.

A common fine or boiled salt is in every instance the result of more rapid evaporation, and thus most liable to be affected in its composition by the retention of impure mother-liquors. Washing processes have been devised by which fine salt designed for dairy purposes is freed from its objectionable features. Dairy salt is manufactured in the U. S. from the coarse (or solar) and from common fine salt; made from the former kind, it must be ground finer, for both ought to be in such a state of division as to readily dissolve when worked into the butter or the curd; both kinds ought to be used by weight and not by measure. The English brand is somewhat more bulky than the brands of the U. S., and that portion of the product of the U. S. which has been obtained from boiled salt is lighter than that produced from solar salt; in composition there need be scarcely any difference if made with equal care. The quantity of dairy salt that ought to be used in butter and cheese depends somewhat on the amount of moisture retained in either substance when ready for salting; to have a fully saturated solution of salt left is the real object. The best authorities advise the use of 1 oz. of salt (the best dairy) to 1 lb. of butter, and 1 lb. of it for every 100 lb. of curd.

The Element of Salt in the Industrial Arts.—Chloride of sodium is the most prominent source of the supply of both of the essential elements sodium and chlorine for industrial purposes. It furnishes directly or indirectly the main bulk of salt called for in the various branches of chemical manufacturing industries of the world. On a liberal supply of common salt rests largely the success of the chemical industry of every country. Chloride of sodium in combination with an equal weight of coal and sulphur is the foundation of the soda which made of England and of other European countries. This circumstance is in a controlling degree due to the important discovery of Leblanc, a French scientist, at the close of the eighteenth century. He pointed out the means by which common salt can be converted into carbonate of sodium, soda-ash, and soda-salt. His process consisted in the conversion of chloride of sodium by means of sulphuric acid into sulphate of sodium, and the subsequent treatment of the latter with coal and carbonate of sodium at a high temperature. The successful introduction of this process by James Musgrave and others since 1823 caused tremendous changes in the economical manufacture of sulphuric acid and the production of large quantities of hydrochloric acid as a cheap by-product. A more recent discovery aims at the direct conversion of chloride of sodium by means of ferrous oxide of ammonium into bicarbonate of sodium and ferrous ammonium sulphate (Solvay, etc.). Both processes are successfully in operation. The comparatively low cost of the soda obtained by these methods, as compared with that of potash, has caused in many instances the substitution for the latter of the cheaper sodium carbonate in numerous cases of economy. The cheaper soda-ash obtained from chloride of sodium has taken the place of the more costly soda-ash obtained formerly from the ashes of seaweeds. Soap-manufacture, paper-manufacture, and glass-manufacture are among its largest consumers. As a cheap source of hydrochloric acid common salt furnishes the means for a more economical production of the chlorides of the heavy metals, as iron, zinc, tin, etc., so important in various industries. Chloride of sodium and sulphuric acid in combination with dioxide of manganese serve for the production of the element chlorine used for the manufacture of bleaching materials, as hypochlorite of calcium (bleaching powder), hypochlorite of sodium, etc., substances noted also for their value as disinfectants.

The total salt product of the U. S. in 1893 was 11,816,772 barrels of 100 lb. against 11,995,830 barrels in 1892. The value in 1893 was \$4,934,000, against \$5,654,915 in 1892, the decrease being due to the decline in price. The total production of 1893 was as follows: Table, 1,924,200 barrels; salt, 267,374 barrels; common fine, 5,478,054; common coarse, 444,408 barrels; packers', 96,657; solar, 2,110,237; rock, 1,894,143; milling, 5,141 barrels; agriculture, 6,413 barrels. CHAS. A. GORHAM.

Salta, a northern province of the Argentine Republic, bearing on Bolivia and Chili, and nearly including the province of Jujuy. Area, 51,150 sq. miles. The western part is traversed by the Andes and their sub-ranges, with descending fertile valleys; the eastern part is included in the region of the Gran Chaco. Agriculture is the principal occupation; the most important crops are maize and sugarcane. Silver, copper, etc., exist, it is said, in large quantities but are little mined. Earthquakes are often destructive. Pop. about 500,000.—Salta, the capital, is in a valley, 2000 feet above the sea (see map of South America, ref. 10). It was founded in 1582, is well built, and has a national college and other public institutions; the trade with Buenos Aires is important. Pop. about 20,000.

HERBERT H. SMITH.

Saltillo, salt-city, capital of the state of Coahuila, Mexico, situated in a valley, 5,204 feet above the sea; on the Mexican National Railway, near the boundary of Nuevo Leon and Mexico (ref. 4-P). The trade of the state center here, and the town has important manufactures of sugar, etc. The dry and equable climate is particularly favorable for livestock. Pop. about 20,000, and rapidly increasing.

Salt Lake. See GREAT SALT LAKE and LAKES.

Salt Lake City, city, capital of Utah and of Salt Lake county; on the Great Salt Lake and Hot Springs, the Rio Grande, the Union Pac., and the Utah Cent. railroads. The name W. of Denver, Col., 301 miles E. of San Francisco, Cal. altitude, 4,353 feet (for location, see map of Utah, ref. 3-M). It is in the Salt Lake valley, at the base of

the Wasatch Mountains; has an area of 12 sq. miles; is laid out in blocks 600 feet square, and contains about 100 miles of streets 112 feet wide. These streets are bordered by streams of water brought from the mountains, and with many varieties of shade-trees. Liberty Park, containing 110 acres, is the principal park, but the city owns also 6,000 acres, a large part of which is suitable for park purposes. Other attractive suburban localities are Fort Douglas, 9 miles distant, and Fishers Park, both reached by electric railway. Hot and warm springs of valuable curative properties are within the city limits. The chief natural attraction of the locality is GREAT SALT LAKE (p. 6) 11 miles distant. There are 40 miles of electric railway.

Notable Buildings.—The city is the headquarters of the Mormon Church in Church of Jesus Christ of Latter-day Saints. The church buildings of this sect occupy 19 acres

The Great Temple, Salt Lake City.

in the heart of the city, and consist of the Great Temple (a massive structure of gray granite; forty years in course of construction; estimated to have cost \$4,000,000; dimensions, 180 by 60 feet; tallest spire, 230 feet in height, surmounted by the Angel Moroni, a hammered copper figure 12½ feet high), the Tabernacle (cost \$800,000; a vast auditorium seating 10,000; roof egg-shaped, and self-supported; has remarkable acoustic properties; contains one of the largest organs in the world, and the Assembly Hall (a granite structure of attractive architecture; seats 2,500; used

Tabernacle, Salt Lake City.

for overflow meetings and Sunday-school work). Other interesting buildings are the Lion, Bee-hive, and Guard-houses (former residences of Brigham Young); the Salt Lake theater, erected in 1862; city and county building, completed in 1894, at a cost of \$900,000; the Commercial, McCornick, Deely, Mercantile, Progress, Scott-Anerbach, Wasatch, and Zion's Co-operative Mercantile Institution blocks; the Templeton and Knutsford hotels; and two large private hospitals and the Utah penitentiary.

Churches, Schools, etc.—All leading religious denominations are well represented, and many fine church edifices have been erected. The public-school system is equal to any in the U. S.; 15 public-school buildings, aggregating in cost \$750,000, were erected in 1893-94. In 1891 the city contained 8 libraries with 37,000 volumes, and in 1894 there were 4 daily, 2 semi-weekly, 8 weekly, 4 semi-monthly, and 7 monthly periodicals.

Finances and Banking.—The receipts of the city government from all sources during 1894 were \$1,937,661; expenditures, \$1,019,170, including the unusual ones of \$238,672 for gravity sewer, and \$156,258 final payment on city and county building. The city tax-rate is 6½ mills; the assessed valuation in 1894 was \$35,000,000. The city has gas and electric light works, and owns a water system valued at \$2,000,000. The bonded municipal debt in 1894 was \$2,400,000. In 1895 there were 4 national banks with combined capital of \$1,500,000, 3 State banks with capital of \$1,200,000, 5 private banks, 2 incorporated banks, and a savings-bank with capital of \$100,000.

Business Interests.—Manufacturing is extensively carried on. The city is headquarters for mining men, and is the mining center of Utah and adjoining States. It is the dépot for agricultural products, and the distributing-point for a large agricultural area under a perfect system of irrigation. The census returns of 1890 showed 149 manufacturing establishments (representing 45 industries) with a combined capital of \$2,658,676, employing 1,997 persons, paying \$1,276,219 for wages and \$1,665,877 for materials, and turning out products valued at \$3,864,402.

History.—The city was founded by BRIGHAM YOUNG (q. v.) July 24, 1847. Until 1870 the population was almost entirely Mormon, but the development of mining and other industries induced a large immigration. The beauty of the city and its environment, the presence of hot springs and the Great Salt Lake, and the rare climatic and scenic advantages, make Salt Lake City an attractive place for tourists. Pop. (1880) 20,768; (1890) 44,843; (1895) estimated, 65,000.

EDWARD F. COLBORN.

Salto: a town of Uruguay; on the river Uruguay, at the head of navigation for large vessels; opposite Concordia in the Argentine Republic (see map of South America, ref. 7-E). It is connected by railway with Montevideo and the Brazilian frontier; is the shipping-port for the trade of the upper Uruguay, including the western part of Rio Grande do Sul; and is the center of a rich grazing district. Pop. about 12,000. It is the capital of the department of Salto, which has an area of 4,940 sq. miles and a population of 32,000, almost entirely employed in the grazing industry.

H. H. S.

Salton Lake: a temporary lake, caused by an overflow of the Colorado river into a depressed area in the Colorado Desert. The bed of the lake is N. and a little W. from the head of the Gulf of California, and W. of the Colorado river in California, and probably was once occupied by the Gulf waters. The lake was formed in the early summer of 1891, when the river was unusually high, and remained fairly constant several months, when it began to shrink slowly. The spot has large deposits of salt, which changed the fresh waters of the river into salt water in the lake. See COLORADO DESERT.

M. W. H.

Saltonstall, GURDON: Governor of Connecticut; great-grandson of Sir Richard Saltonstall; b. at Haverhill, Mass., Mar. 27, 1666; graduated at Harvard 1684; ordained minister of New London, Conn., Nov. 25, 1691; was distinguished as an orator, and took so active a part in politics that he was made Governor of Connecticut 1707, and held that post until his death Sept. 20, 1724. He bequeathed £1,000 to Harvard College to educate students for the ministry.—His son, GURDON, b. at New London, Conn., Dec. 22, 1708, graduated at Yale College 1725; became brigadier-general of Connecticut forces 1776; was cashiered for misconduct in the Penobscot expedition 1779; died at Norwich, Sept. 19, 1785.—DUDLEY, nephew of Gen. Saltonstall, b. at New London, Sept. 8, 1738, became a commodore in the Continental navy, and died in the West Indies in 1796.

Revised by G. P. FISHER.

Saltonstall, Sir RICHARD: colonist; b. at Halifax, England, in 1586; nephew of Sir Richard, who became lord mayor of London 1597; emigrated to Massachusetts as assistant governor to Winthrop 1630; was associated with Phillips in the foundation of Watertown 1630, but went back to England the following year, and never returned to

Massachusetts. In 1651 he wrote a letter to the Massachusetts ministers Cotton and Wilson remonstrating against the persecution of the Quakers. D. in England about 1658. Through his sons, who settled in Massachusetts, he was ancestor of the Saltonstalls of New England.—RICHARD, b. at Woodsome, Yorkshire, England, in 1610, was matriculated at Emmanuel College, Cambridge, 1627; was an early settler of Ipswich, Mass.; was assistant governor 1637; befriended the regicides Goffe and Whalley, and protested against the introduction of Negro slavery into the colony. He returned to England in 1670. D. at Hulme, Apr. 29, 1694.

Saltonstall, RICHARD: jurist; b. at Haverhill, Mass., June 14, 1703; graduated at Harvard 1722; was a representative from Haverhill as early as 1728; was frequently a member of the general court and of the executive council; was a scientific and practical farmer, and also learned in the law; was chairman of the commission for settling the boundary-line between Massachusetts and New Hampshire 1737, and was judge of the superior court nearly twenty years (1736-55). D. Oct. 20, 1756.

Saltpeter, or Nitre [saltpeter is (by analogy of salt) from Fr. *salpêtre*, from Lat. *salpe'tra*, liter., rock-salt; *sal*, salt + *pe'tra*, gen. of *pe'tra*, rock, stone]: a compound in chemistry called potassium nitrate (KNO₃), that has long been known and occurs widely distributed in nature, though in relatively small quantities. When refuse animal matter undergoes decomposition in the soil under proper conditions, the nitrogen contained in it passes into the form of a nitrate, and as potassium is generally present, the particular nitrate formed is saltpeter. The change is brought about by the action of certain microbes which exist in the soil, and are especially abundant and efficient in warm countries. It is in such warm countries that saltpeter earths are found. In Bengal the saltpeter earth of the villages is collected by a special caste, the Sorawallahs, into loosely aggregated heaps. From these the salt is obtained by scraping off the uppermost layers, which show a white efflorescence. The process of nitrification is carried on artificially on a large scale in the so-called "saltpeter plantations." In these, refuse animal matter, more especially manure, is mixed with earthy material, wood-ashes, etc., and piled up. These piles are moistened with the liquid products from stables. After the action has continued for two or three years the outer crust is taken off and extracted with water. The solution thus obtained contains, besides potassium nitrate, calcium and magnesium nitrates. It is treated with a water-extract of wood-ashes or with potassium carbonate, by which the calcium and magnesium are precipitated as carbonates. Much of the saltpeter in the market is made from sodium nitrate by treating it with potassium chloride, advantage being taken of the fact that sodium chloride is less soluble in water than potassium nitrate. Saltpeter crystallizes in long rhombic prisms of a salty taste. When dissolved in water it causes a lowering of temperature. It is used in the manufacture of fireworks. Its chief use, however, is in the manufacture of gunpowder. IRA REMSEN.

Saltpeter, Chili: a salt known in chemistry as sodium nitrate (NaNO₃). It is also called cubic nitre, because it crystallizes in rhombohedrons resembling a cube. It occurs abundantly in Northern Chili, especially in Tarapaca, and to some extent in Southern Peru. The natural salt contains, besides the nitrate, sodium chloride, sulphate, and iodide. Sodium nitrate is very similar to potassium nitrate, but it can not be used in place of the more expensive potassium salt in the manufacture of gunpowder, because it becomes moist in the air, and does not decompose as quickly as potassium nitrate. It is used extensively in the manufacture of nitric acid and of potassium nitrate; it is also the most important source of iodine. In commerce the salt is known simply as nitrate. It is largely exported from Chili to Europe for use as manure. In 1892 the value of the exports was 31,785,000 pesos. For this purpose the native salt is rendered marketable by a process of solution and crystallizing. In its action it is comparable with calcium or potassium nitrates. IRA REMSEN.

Salt Range, or Kalabagh Mountains: a mountain group of the Punjab, India; extends westerly from the west bank of the Jhilm to the Suleiman Mountains, with a break in its continuity where it yields a passage to the Indus. It is only 2,500 feet high, but its bold peaks and steep, wild precipices, consisting of granite, gypsum, and layers of almost perfectly pure rock-salt (which has been mined from

are homogeneous), are completely without vegetation and present a forbidding aspect. - Alums, from ore, coal, gypsum, and numerous minerals, and gold-dust is found in the sands at the source.

Revised by M. W. HARRINGTON.

Salt River: the River.

Salt River: a Kentucky affluent of the Ohio. Defeated pioneers are said to be "sent up Salt River," from an incident in the life of Henry Clay, who in 1802 heard the news of his defeat for the governorship as he landed from a passenger on this stream. See *American Notes and Queries*, vol. 2, pp. 3-5.

M. W. H.

Salts: in chemistry, a large class of compounds formed by reaction of acids upon bases. The general character of the salts, and the relation of the salts to the acids and bases are discussed under the title ACID (q. v.) and BASE (q. v.).

Normal Salts.—The simplest salts are those formed by the substitution of one atom of a univalent element for one atom of hydrogen. Such salts are sodium chloride, NaCl, silver chloride, AgCl, potassium chloride derived from hydrochloric acid, KCl, potassium nitrate, KNO₃, sodium nitrate, sodium nitro-sulfate, AgNO₃, derived from nitric acid, HNO₃. The most common of salts includes those which are formed by the substitution of one atom of a bivalent base-forming element for two atoms of hydrogen. Examples are calcium chloride, CaCl₂, zinc chloride, ZnCl₂, magnesium chloride, MgCl₂, from hydrochloric acid, HCl; barium nitrate, Ba(NO₃)₂, sodium nitrate, NaNO₃, mercuric nitrate, Hg(NO₃)₂, all derived from nitric acid, HNO₃. In each of these cases the salt is plainly formed from two molecules of the acid.

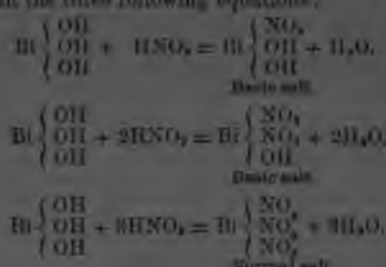

Some salts are formed by the substitution of one atom of a bivalent base-forming element for two atoms of hydrogen in a dibasic acid, such as sulphuric acid, H₂SO₄. Examples are calcium sulphate, CaSO₄, copper sulphate, CuSO₄, etc. Besides these, there are salts containing trivalent elements such as aluminum, iron, etc. Examples of this kind of salts, derived from monobasic acids, are aluminum chloride, AlCl₃, ferric chloride, FeCl₃, ferric nitrate, Fe(NO₃)₃; from dibasic acids, aluminum sulphate, Al₂(SO₄)₃, ferric sulphate, Fe₂(SO₄)₃, from tribasic acids, aluminum phosphate, AlPO₄, ferric phosphate, FePO₄, derived from phosphoric acid, H₃PO₄. All the salts mentioned thus far are alike in that they contain no hydrogen. The substitution of one base-forming element for the hydrogen is complete in each case. Such salts are called *normal salts*, and sometimes, though less correctly, *neutral salts*.

Acid Salts.—If the substitution of the base-forming element or elements for hydrogen is not complete, then plainly some of the hydrogen of the acid must remain and the product is, in such cases, both acid and salt. It may be called then a *subnormal* or an *acid salt*; the latter, however, is the name adopted by chemists. Monobasic acids can not form acid salts. Thus if a certain quantity of hydrochloric acid is mixed with, say, sodium hydroxide, and the other half acid, it will be found that the only substances present in solution are sodium chloride and hydrochloric acid. By removing the hydrochloric acid and water can be driven off, and the residue will consist of the sodium chloride which was formed by neutralizing half of the hydrochloric acid. Another residue would be obtained if nitric instead of hydrochloric acid were used. If, however, to a certain quantity of sulphuric acid only half the quantity of a base is added, for its neutralization, a product is formed which is quite different from that formed when the neutralization is complete. This new product is an acid salt. Thus if the base be potassium hydroxide, the acid salt is potassium sulphate, or mono-potassium sulphate. Its composition is represented by the formula KHSO₄, and it is formed from sulphuric acid by the substitution of one atom of potassium for one atom of hydrogen. It has acid properties, and has therefore the power to form salts in the same way as an acid. By further action of potassium hydroxide, the remaining hydrogen atom is replaced by potassium, and the normal salt is thus formed. Or this second hydrogen may also be replaced by a different base-forming element, and thus a mixed normal salt formed, as, for example, so-

dium-potassium sulphate, NaKSO₄. Other acid salts are acid sodium carbonate, NaHCO₃, commonly called bicarbonate of soda; acid calcium phosphate, HCa₂(PO₄)₂, and CaH₂(PO₄)₂, which are contained in the preparation known as *Horsford's acid phosphate*, etc. An acid salt is therefore one that is formed from a polybasic acid by the substitution of a base-forming element for one or more, but not all, of the hydrogen atoms.

Basic Salts.—These are, as the name implies, the opposite of acid salts. A basic salt is both base and salt. Bases are monobasic and polybasic, as acids are monobasic and polybasic. When a monobasic base, as potassium hydroxide, is neutralized, the act is complete as far as that part of the base is concerned which is acted upon. With a polybasic base the case is different. Thus barium hydroxide, Ba(OH)₂, is a tribasic base, and it can be neutralized in three stages by treatment with an acid. The action with nitric acid is represented in the three following equations:

The salts obtained in the first two reactions represented are still basic, a part of each molecule of the base used being unacted upon. These products are basic salts. There are many such salts known. Thus white lead (see LEAD) is a basic carbonate.

Double Salts.—This name is given to compounds formed by the union of two ordinary salts. Thus there are double chlorides formed by the union of two chlorides, as potassium-platinum chloride, PtCl₂2KCl; double fluorides, as potassium-silicon fluoride, SiF₄2KF; double sulphates, as alum or potassium-aluminum sulphate, K₂SO₄Al₂(SO₄)₃24H₂O, etc. It appears probable that some of these double salts are in fact derived from acids more complex than is assumed in the ordinary formulas. Thus it is known that the so-called double fluorides are derived from an acid of the formula H₂SiF₆, called fluosilicic acid, and that potassium-platinum chloride is derived from a similar acid of the formula H₂PtCl₆, called chloroplatinic acid, and probably all the other double chlorides and fluorides, and the analogous double bromides and iodides, are to be referred to similar acids. Double sulphates are generally derived from two molecules of sulphuric acid. Thus alum is formed from sulphuric acid by the substitution of one atom of trivalent aluminum for three atoms of hydrogen in two molecules of the acid, the remaining hydrogen being replaced by potassium, as shown in the formula—

The prevailing theory in regard to the constitution of chemical compounds is competent to explain most of the double salts now known.

Haloid Salts.—This name is given to salts like sodium chloride, NaCl, or common salt, and is derived from *hal*, sea-salt. The haloid salts, also called halides, are the chlorides, bromides, iodides, and fluorides, with which, further, the cyanides are frequently classed. I. A. HENCKS.

Salt Sea: See DEAD SEA.

Salutis. EDGAR EVERSTON; novelist; b. in New York, June 8, 1858. He was educated at Yale College and in Europe and at the Columbia Law School. He has published a life of *Balsaz* (1884); *The Philosophy of Disenchantment* (1885); and *The Anatomy of Negation* (1886), a popular statement of the pessimistic philosophy of Schopenhauer and Hartmann; also *Mr. Lucius's Misadventure* (1887), *The Face that Kills*, and other novels. H. A. B.

Salutes [from Lat. *saluta're*, wish health to, greet, salute, deriv. of *salvus*, *salvus*, safety, health; cf. *salvus*, safe, sound, well; in the army and navy, honors paid to officers

of higher rank or authority by raising or touching the hat, dropping the point of the sword, presenting arms, firing cannon or small-arms, manning yards, dipping the colors, etc. In the personal salute with cannon the number of guns fired depends upon the rank of the person saluted. In the U. S. the President receives 21 guns, the Vice-President 19, the members of the cabinet, the chief justice, the Speaker of the House of Representatives and Governors within their own State or Territory, 17 guns. The general receives 17 guns, lieutenant-general or major-general commanding 15, major-general 13, and brigadier-general 11 guns. Besides these personal salutes there are the national salute of 21 guns, the salute to the Union of one gun for each State, and the old Federal salute of 13 guns. These are fired in honor of certain days and occasions.

In the personal salutes is seen the survival of the custom of the saluter placing himself unarmed in the power of the saluted. The touching or removal of the cap, dropping the point of the sword, presenting arms, firing cannon and small-arms, manning yards, etc., symbolize the removal of the helmet, giving up the weapon, unloading the firearms, exposing the crews, abandoning the guns, etc.

JAMES MERCUR.

Saluzzo, sāl-loot'sō: town; in the province of Cuneo, Italy; 42 miles by rail S. by W. of Turin (see map of Italy, ref. 8-B). The cathedral, semi-Gothic and of the fifteenth century, the Church of St. Martin and St. Bernard, of St. Domenico, etc., all contain objects of interest. In one of the public squares there is a fine monument erected to Silvio Pellico, who was born here. The ancient castle of the Marquises of Saluzzo is used as a prison. Saluzzo manufactures silk, leather, and hats. Pop. 9,716.

Revised by M. W. HARRINGTON.

Salvador, Span. pron. sāl-vā-dor' (often, but incorrectly, called *San Salvador*, from its capital): a republic of Central America; bounded N. W. by Guatemala, N. and N. E. by Honduras, and S. by the Pacific, the Gulf of Fonseca separating it from Nicaragua on the E. Area, 7,255 sq. miles; pop. (1891) estimated, 777,895; it is thus the smallest but the most thickly settled republic in America. The main Cordillera of Central America runs along the northern frontier. Parallel to this, and about 30 miles farther S., another mountain chain, attaining nearly 8,000 feet, crosses from E. to W., and is continued into Nicaragua; this chain is entirely of volcanic origin, and contains nearly thirty active or quiescent craters. The space between the two mountain ranges is an irregular basin or plateau, 2,000 feet in average elevation, and varied by low mountains; this is the finest and most thickly settled part of Salvador. S. of the volcanic range a strip of low land, partly alluvial, fringes the Pacific. The coast is about 200 miles long, partly rocky, but not high. The only very good harbor is formed by the Gulf of Fonseca; the commercial ports are La Unión on the gulf, La Libertad, and Acajutla. The principal river is the Lempa, which drains the plateau and is partly navigable; there are several beautiful lakes, including Cuija, on the Guatemala frontier, and Ilopango. Volcanic and seismic disturbances are very frequent; in the central range eruptions from one or more peaks are almost constantly going on. Slight earthquakes are so common as to be hardly noticed, and severe ones occur at intervals; San Salvador has been ruined no less than eight times. The climate is hot and often unhealthful on the coast, warm on the plateau, temperate in regions above 3,000 feet, where most of the towns are located. Rains are less abundant than in other parts of Central America, though the climate is by no means dry. The rainiest months are from May to October, and in July and August there are frequent torrential showers and thunder-storms. Considerable tracts of forest remain, and are rich in cabinet woods, balsam, etc. The land, especially that formed by disintegrated volcanic tufa, is very fertile, and most of the inhabitants are engaged in agriculture. The most important crops are coffee, indigo, tobacco, sugar, and, for home consumption, maize, beans, and rice. Large herds of cattle are pastured in some districts. Gold and silver are mined on a small scale. About 5 per cent. of the population are classed as whites, 55 per cent. as Indians, and the remainder as mixed races, with a few Negroes; some of the Indians retain their own language and customs, but all are submissive and, nominally, Roman Catholics. As elsewhere in Central America, the educated and intelligent class is small, but controls all the wealth and power. The government is a centralized re-

public; the president is elected for four years, and congress consists of a single house elected for one year. The fourteen departments are essentially governed from the capital. The state religion is the Roman Catholic; other creeds are tolerated, but are almost unknown. There are about 900 public and private schools, with 85,000 pupils; the state maintains a university with faculties of sciences, arts, law, medicine, etc. The only railway runs inland from Acajutla (53 miles in 1898), but others are planned; the common roads are nearly all bad. There is a fairly good telegraph system, and cable communication with the U. S. The principal exports, in the order of their importance, are coffee (about half of the total), indigo, sugar, and silver; the average annual value of the exports in 1894 was about 6,000,000 pesos. The value of the recorded imports is little over half as much, but the figures are probably defective. Nearly one-third of the entire trade is with the U. S.—principally California—and the proportion is increasing. The monetary standard is the silver peso or dollar, equal to 96½ cents of U. S. silver in intrinsic value. Few national coins are in circulation; those of Europe, the U. S., Mexico, Peru, etc., are freely used. The metric system of weights and measures is legalized, but the old Spanish ones are still in general use. The external debt, payable in gold, was in 1893, about \$1,500,000, and the interest is promptly met; the internal debt, partly funded, is about 7,500,000 pesos. Salvador or Cuscutlan was conquered by Jorge de Alvarado in 1528, and during the colonial period it was a province of Guatemala. From 1823 to 1839 it was a state of the Central American Confederation. The numerous revolutions and wars with other Central American republics have generally been caused by attempts to bring about a union of the republics, or struggles in favor of autonomy. See Guzman, *Topografía física de la República del Salvador*; Squier, *The States of Central America* (1858); Reyes, *Vida de Morazan* (1888); Bancroft, *History of the Pacific States: Central America* (1882-87).

HERBERT H. SMITH.

Salvage [from O. Fr. *salvage*, liter., a saving, deriv. of *salver* > Fr. *sauver* < Lat. *salvare*, save, deriv. of *salvus*, safe]: the compensation due for the relief of a vessel, or of property or persons therein, from an impending peril of the sea, by the voluntary exertions of those who are under no legal obligation to render assistance, resulting in the ultimate safety of the object of such relief.

It is not necessary that the peril be immediate. It is enough that it is probable, as where the motive power of a steamer ceases, or a sailing vessel is dismasted. Fire, endangering a vessel afloat, is a marine peril. Recapture from pirates or the public enemy is relief from a sea peril, and, if lawful, will be rewarded with salvage. Recapture by a ship of a neutral power is unlawful.

The crew or passengers of the relieved vessel are not entitled to salvage, as a rule, because in case of a common danger it is the duty of every one on board the ship to give every assistance he can, by the use of all ordinary means, in working and pumping the ship, to avert the danger. Yet if one of the passengers or crew renders services outside and beyond his legal duty he may recover salvage. (*The Commarra*, 108 U. S. 352.) Members of a fire department, who act in the performance of a legal duty in saving a vessel, are not entitled to salvage.

The services must be successful to some extent, for if the property is not saved, or in case of capture is not retaken, no salvage is earned. More than one set of salvors, however, may contribute to the result; and all who materially contribute to the saving of the property are entitled to share in the reward, in proportion to the nature, duration, risk, and efficiency of the service rendered.

The amount of salvage to be awarded is largely a matter of fact and discretion in each case; and an appellate court rarely varies the amount given upon the trial. In determining salvage compensation, admiralty judges consider: (1) the labor expended by the salvors; (2) the promptitude, skill, and energy which they display; (3) the value of the property employed by the salvors, its risk, and their personal risk in rendering the service; (4) the value of the property saved and its risk. Salvage is not to be confounded with Prize (*q. v.*). The latter is more like a gift of fortune, conferred without regard to the loss of the owner, who is a public enemy, while the former is a reward for saving the property of the unfortunate, and should not exceed what is necessary to insure the most prompt, energetic, and daring effort of those who are able to furnish relief.

(*Weekly Rev. Supp. Salmon*, 3 Feb. II, 1914). All property received by the salvers' services must contribute to their compensation, in proportion to its value; and they have a first lien on such property which may be enforced by proceedings in *rem* or they may proceed *in personam* against the salver.

In considering the salvage among those engaged in recovering the salver's services, regard will be had to the risk incurred and the proposed distribution by the various claimants. For example, if the cargo of the salving vessel was not exposed to danger, the *salvors* will not be entitled to share; and the nature of each vessel will be compensated accordingly, as it is its duty to pass and direct the service. After the *salvors* and master are provided for, the balance is divided generally among the navigating members of the salving crew, in proportion to their wages. In a recent case, however, non-navigating members, such as stowaways and cooks, were allowed half-shares according to wages, although they had not taken an active part in the salving service, on the ground that they were bound to take such part as belonged to the vessel. *The Spree*, 1891, Probate 149.

Salvage service may be rendered under a contract. If the liability entered into, the parties are bound by its terms. Under such a contract the salvage may be payable, although the services have been fruitless. See *Martin, Wood and Kellogg* (London, 1879); *Newman, Salvage, Tonnage, and Pilotage* (London, 1895).

Salvandy, salvándy, NARCISSE ARTHUR, CRUZE de: author and author; b. at Coudun, Gers, France, June 11, 1862; was in the army 1882-84; wrote, besides a number of political articles, *Les Armées en Espagne* (1884; 7th ed. 1891); *Salvandy* (1924); *Histoire de Polonais avant et sous le Roi Louis XVIII* (1827-29; 8th ed. 1855). After the Revolution of 1830 he sided with the Doctrinaires; was made professor at Madrid (1841-43) and Turin (1843-45), and Minister of Public Instruction 1837-39 and 1845-49. D. at Châteauneuf, Eure, Dec. 10, 1856.

Salvatierra, salvatí-í-í-í-í-í-í: a town of the state of Coahuila, Mexico; on the river Tama; about 33 miles S.W. of Saltillo (see map of Mexico, ref. 6-43). It has some factories of some importance, and is growing rapidly. Pop. (1895) 10,800.

Salvation: See CHRISTIANITY and SOTERIOLOGY.

Salvation Army: a religious body with a military organization, now perhaps the largest and most powerful missionary agency in existence. It comprises 9,200 corps with 1207 subcorps and 10,000 officers, in 34 countries. It circulates 50,000,000 copies of its 27 weekly and 15 monthly periodicals, and the annual circulation of its books and pamphlets is estimated at 4,000,000. The total sum raised annually by the army is about \$3,350,000.

The object of the army, in the words of its general, is "to effect a radical revolution in the spiritual condition of the enormous majority of the people of all lands; . . . to show the whole course of their lives, so that instead of spending those years in frivolity and pleasure-seeking . . . they shall spend it in the service of their generation and in the worship of God." It had its beginning in the work of the Rev. William Booth, later its general, as an evangelist among the degraded poor of the East End of London. In 1863, having severed his connection with the Salvation Army in order more fully to devote himself to social work, absolutely alone, unaided by any individual or body, interested only in the misery and need of the people, he began work by holding open-air meetings—the first of these being in a tent in the Friends' burial-ground in Whitechapel. This tent was subsequently destroyed in a fire, but the East London Mission was then suitably well established to warrant the renting of a tent. The work began to attract the attention of wealthy philanthropists. General Mosley, M. P., being conspicuous among its earliest and most constant friends. The rapidity with which the work extended was unparalleled, and its true character was soon lost. In 1879 its name was changed to the Christian Mission, and branches were opened in various parts of England, Scotland, and Wales. In 1880, with the opening of France, it began its international career. The devoted band of volunteer workers has been increased by accounts of remarkable conversions, and a renunciation of vice and reckless characters who could not have been reached by any other existing agency. In 1885 some 2000 converts were reclaimed. In organizing the mission Mr. Booth had naturally followed Metho-

distic lines—corps were formed into classes, with leaders; these into leaders' and elders' meetings, with secretaries, treasurers, etc. Stations were united under evangelists, and local councils manipulated the funds. Conferences were composed of these materials, and in the speed of the movement time was wasted in calling the body together, and then its action was often too slow. After much deliberation it was unanimously decided by the conference to place the directing, controlling power in the hands of one man—Mr. Booth. In 1878 the name of the mission was changed to the Salvation Army, and a complete military system adopted. Military titles superseded the churchly nomenclature, and a dead-end enrolled in the British High Court of Chancery constitutes the general of the army the trustee of its entire funds and property in Great Britain. In this dead-end "only those doctrines were included that appeared necessary to salvation, only those regulations which should serve as a skeleton for whatever additions differences of time and nationality might demand. Only those fundamental objects were enounced which were to be the unchangeable pursuit of the Salvation Army so long as a single sinner remained to be saved." Thus its theology is of the simplest. The work in hand is "to subvert a rebellious world to God." This is to be accomplished by the instrumentality of holy men using the means used by the first apostles, and these means will be made effective by the operation of the Holy Ghost, given through and because of the atonement of Jesus Christ. On these lines the ranks are recruited from converts whose frequent lack of scholarship does not deter them from positions of usefulness and trust. Among the early features of the movement were training-homes, from which have graduated some of the most efficient officers. There are upward of forty of these training-homes in existence. With only these objects in view it appears strange that in each of the countries occupied by the army it has had to face universal prejudice and antipathy, which have found expression in systematic restriction and persecution. Through these it has invariably made its way to a position of respect. Nowhere has it had more bitter opponents than in its own home, England. From some of the roughest mobs there, however, army-corps have been recruited. Undoubtedly the apparently irreverent methods pursued by the army are frequently the cause of this opposition, as those in command hesitate at nothing in order to win the attention of the class they aim to reach, displaying wonderful ingenuity in their devices. In Sweden, to gain the students in the University of Upsala, a sensation poster in Latin was circulated with fine effect; while in a district in London a woman officer hired a cab, filled it with musical instruments, trimmed it and herself with streamers, and mounted to the top with a bandourin. Naturally a large number followed to the barracks. In foreign countries the soldiers adopt, so far as possible, the ways of the people, and their ordinary garb conforms to the customary dress of the poorest native. A decided feature from the beginning has been the army's music. It appropriates with the utmost freedom tunes with which all are familiar; and all sorts of musical instruments are used in the meetings and in the open-air parades.

In the army women are not barred by their sex from any position. They compose about half the officers in charge of corps. Though the discipline is strictly military the service is entirely voluntary, any one being at liberty to retire at any time. Having given satisfactory evidence of conversion and signed the articles of war, in which he promises, for love of Christ, to live for God and the army, be obedient to lawful orders, and lead a pure life, a recruit is expected to become an active worker. His tastes, circumstances, and adaptations are well considered, and scope is given for all his talents to find employment. The principle of self-support is applied to every corps, division, and territory. No salaries are guaranteed, and no officer receives more than is required for the supply of actual wants. Gen. Booth's private income is derived from other sources, and he has never drawn any salary or allowance from the army funds.

The memoir of Mrs. Booth, "the mother of the Salvation Army," *The Life of Catherine Booth* (New York and London, 1893), contains a history of the movement which embodied her life's work. All her children are actively engaged in "the war." William Bramwell, the eldest son, is chief of staff at the international headquarters, 101 Queen Victoria Street, London, England. Ballington, the second son, is commander of the forces in the U. S., with headquarters in New York; and Herbert, the third son, is in

command of the Canada forces. Of the daughters, the eldest, Catherine, has since 1881 been in charge of the French work, with the title of *La Maréchale*, and two, Emma and Lucy, have India especially in charge—the latter living with and as the native poor. Other notable names identified with the army's progress are those of Commissioners Booth-Clibborn, Booth-Tucker, Railton, Hanna Ouchterlony, Howard Carleton, Cadman, Coombes, and Ridsdell.

The auxiliary league is composed of persons who, not necessarily indorsing every method used by the army, yet sympathize in its desire to reclaim the fallen and to save the lost, and who are precluded from taking any other part in it by pressure of other duties or ill health. Many persons of influence and position in this way assist in removing prejudice and encouraging the work.

In Oct., 1890, Gen. Booth published *In Darkest England, and the Way Out*, a book in which he dealt with and solved the problem of destitution and crime from the standpoint of the Salvation Army, through which alone it would be practicable to carry out such a scheme as he proposed. Five million dollars would be required, by the general's estimate, to put the whole in working order, but half a million would be sufficient to start it. On Jan. 30 following Gen. Booth publicly signed a deed of trust for the half million dollars, and two parts of the plan—the City Colony and the Farm Colony—are in successful working order and self-supporting, and negotiations are well under way (1894) for the third—the Over-the-sea Colony. Should the plan be fully carried out, the general declares that in England in twenty years no man or woman willing to work would be unemployed. Perhaps in no country has the Salvation Army made more rapid strides, or taken deeper hold, than in the U. S. On Mar. 10, 1880, Commissioner George Scott Railton, in company with seven illiterate yet earnest young women, landed at Castle Garden, New York. After a time the work was very prosperous, but unfortunately, owing to the unfaithfulness of one in its command, a secession took place in Oct., 1884, which resulted in the loss of the official organ, property, and many officers. Commissioner Frank Smith followed in office and was in command some three years, during which a hard struggle was experienced. Commander and Mrs. Ballington Booth took command of the work in the U. S. in Apr., 1887, and since 1890, in particular, the progress of the movement has been rapid. In Nov., 1892, the army was established in 553 cities and towns, having 656 corps and outposts, and during that month the 1,500th officer was commissioned. Five-eighths of the officers are by birth or naturalization citizens of the U. S. In Jan., 1895, there were 2,002 officers. The official organ is the *War Cry*, and there are also a Swedish and a German *War Cry* and a monthly magazine known as *The Conqueror*. It was reported that 14,000,000 persons had attended the army's services during the year 1891 throughout the U. S.

BALLINGTON BOOTH. MAUD BALLINGTON BOOTH.

Salvator Rosa: an anglicized form of the name. See ROSA, SALVATORE.

Salvianus: presbyter of Marseilles; an important Christian writer of the fifth century; b. probably at or near Treves; author of several works, of which the following are extant: 1. *Ad Ecclesiam*, in four books, a tractate against avarice, published under the pseudonym of *Timotheus*; 2. *De Gubernatione Dei*, composed between 439 and 451, in eight books, in defense of God's constant providence; 3. Nine letters. Salvianus's Latin is excellent for the period, and bears evidence of a study of Lactantius, but he is diffuse and very rhetorical. Of the vices of his time he gives a most vivid picture. Best editions by C. Halm (Berlin, 1877) and F. Pauly (Vienna, 1883). M. WARREN.

Salvini, sal-vee-nē, TOMMASO: tragedian; b. in Milan, Italy, Jan. 1, 1830. His father abandoned the profession of literature for the stage. His mother was also an actress. Young Salvini showed a rare talent for acting, and he was placed under the tuition of Gustave Modena, and about 1847 joined the Ristori troupe, and achieved success. In 1849 Salvini took an active part in the war of Italian independence, and became the friend of Mazzini, Garibaldi, and Saffi, with whom he was taken prisoner at Genoa. Retiring to Florence he devoted a year to professional study, preparing among others the rôles of Othello, Saul, Hamlet, and Orosmanes. His theatrical tours in Italy, Spain, and Portugal were a series of ovations. In 1872 Salvini visited South America, where he was received with equal enthusiasm, and in 1873-74 he made a tour in the U. S., giving 128 perform-

ances, as well as twenty-eight in Havana, Cuba. In 1881-82 he again visited the U. S., and made a third tour in 1885-86, since which he has retired from the stage, and lives in Florence. Salvini also acted in Great Britain, Germany, Austria, and Hungary, producing everywhere a profound impression. B. B. VALLENTINE.

Salzburg: capital of the duchy of Salzburg, Austria; 195 miles by rail W. by S. of Vienna (see map of Austria-Hungary, ref. 5-D). It is picturesquely situated at the foot of the Noric Alps, on both sides of the Salza, which here rushes forth from a narrow defile and winds through the city toward the Inn. The city is old, with crooked and narrow streets, but it contains many fine monuments and edifices built of white marble. It is surrounded with walls, pierced by twenty gates, of which the most remarkable is the Sigismund Thor, 425 feet long, hewn through the Mönchsberg. It has a fine cathedral (1614-34), a Benedictine monastery with a library of 65,000 volumes and 900 MSS., a botanical garden, a college, a theological seminary, a medical school, a museum of antiquities, and a public library with 82,000 volumes and 1,400 MSS. After 798 Salzburg was the seat of archbishops who became noted for their ecclesiastical severity. In 1498 the Jews were expelled, and in 1732 30,000 Protestants were compelled to leave their homes. Salzburg has manufactures of paper-hangings, musical instruments, lead-pencils, mirrors, and type, several oil-mills and factories for spinning and weaving cotton, and carries on an active trade with Vienna and Bavaria. Pop. (1891) 27,644.

Salzkammergut: district of the Austrian province of Upper Austria, between Salzburg and Styria; remarkable for the beauty of its scenery and for its salt-works. It comprises an area of 255 sq. miles, with 19,000 inhabitants. On account of the alpine character of the district, agriculture is almost impracticable; the inhabitants are mostly engaged in cattle-rearing and dairy-farming, and in the manufacture of salt from the salt-springs. The most striking feature of the scenery is the lakes, inclosed by forest-clad mountains. The highest peak, Hoher Priel, reaches an elevation of 7,361 feet. The most celebrated of the lakes is Traun, formed by the river Traun. The richest salt-works are those of Ischl and Hallstadt. Revised by M. W. HARRINGTON.

Samana' Bay: a deep indentation in the eastern end of the island of Santo Domingo (Dominican Republic), West Indies. It is 37 miles long and 12 wide, with two entrances, which could be easily defended by forts; it forms a very large and fine harbor, perfectly safe except in the rare event of a cyclone from the E. The principal ports are Sabana la Mar on the south side and Santa Bárbara de Samaná on the north. Although it lies near the route from New York to the Isthmus of Panama, the U. S. Congress refused to ratify a treaty for its purchase in 1870.

HERBERT H. SMITH.

Samar: one of the Visaya group, Philippine islands, East Indies; area, 5,167 sq. miles; pop. (1887) 185,386 inhabitants, most of whom are mestizoes. The mountains of this island are higher and wilder than those of the other islands. The capital is Catbalonga, on the west coast. The principal articles in which trade is carried on are wax, cabinet woods, palm oil and mat-work. Revised by M. W. HARRINGTON.

Samara, sâ-mâ-râ: government of European Russia; bounded E. by the Kirghiz steppes and W. by the Volga. Area, 58,321 sq. miles. It is very fertile and well adapted to agriculture, but thinly peopled. Pop. (1890) 2,665,300.

Samara: capital of the government of Samara, European Russia; on the Volga (see map of Russia, ref. 7-H). It has an extensive trade in grain, fish, caviare, tallow, and hides. Pop. (1891) 99,856.

Samarang: town of Java, East Indies; the capital of the Dutch residency of Samarang; on the northern coast of the island, at the mouth of the river Samarang (see map of East Indies, ref. 8-D). It is tolerably well built, and has an important trade, though its climate is unhealthy and its harbor shallow, and in the wet season even unsafe. Sugar, rice, and pepper are extensively cultivated in its vicinity, and it is the entrepôt for the products of the central part of the island. Pop. 71,440, of whom 3,600 are Europeans.

Samaria [from Lat. *Samari* = Gr. *Σαμάρια*, from Heb. *Shômron*]: an ancient city of Central Palestine, 6 miles N. W. of Shechem, and about half-way between the Mediterranean and the Jordan. It was founded 923 B. C. by Omri, the sixth of the nineteen kings of the northern kingdom of Israel, who

which he captured, and called it after the name of the man (Samari) of whom he bought the hill on which the city was built (1 Kings xvi. 24). This hill, called and Bithenai, sitting on the height of some 800 feet out of a basin about 10 miles in diameter, surrounded on every side by mountains of basalt. The Mediterranean is in full view from the top of the hill. "It would be difficult," says Dr. Robinson, "to find in all Palestine a situation of equal strength, fertility, and beauty combined. In all these particulars it has no equals. The advantage of Samaria." The city shared the ordinary fortunes of the upper kingdom. Twice it was destroyed when besieged by the Syrians. In 722 B.C. it was a scene of two years' looting by Sargon of Assyria, was taken by Ashurbanipal, Sargon, who put an end to the kingdom of the ten tribes. Rebuilt by Sargon, it was very captured by Alexander the Great (332 B.C.), and again by John Hyrcanus (100 B.C.). It was splendidly rebuilt by Herod (40-4 B.C.), who named it Sebaste, in honor of the emperor, the Emperor Augustus. The modern Arabic name is a corrupt form of the Greek name. Nearly no Samaritan colonies still standing attest the magnificence of the Hasmonean city. The partially ruined church of St. John on a steeply faced promontory from the twelfth century, in the fourth century it was claimed that John the Baptist had been buried there, as well as the prophets Elishah and Ishaiah. The modern village on the eastern slope of the hill contains about sixty houses. The population 450 to 500 are noted for their rudeness and insensibility. Samaria was also the name of one of the three provinces into which Western Palestine was divided by the Romans. Its boundaries are given by Josephus (J. W., 3. 7. 10).

Revised by S. H. JACKSON.

Samar'ites (from *Samari*, Samaritan, Samaritan, a Samaritan, from *Samari* a Samaritan, *Samari*, of *Samari*, the ancient inhabitants of the province of Samaria; the ancient inhabitants of the province of Samaria). After the destruction of the kingdom of Israel in 722 B.C., in the first year of Sargon, King of Assyria (1 Kings xvi. 24; xviii. 1), Central Palestine was devastated and annihilated except by a remnant of the Israelites and fugitives (2 Chron. xxxv. 8, 9; Jer. xli. 17). The Samaritan tribes, by Sargon in 722, and again in 722 B.C. (2 Kings xvi. 24, and Esarhaddon in 680 (Jer. i. 20), of exiles from Babylon, Syria, Arabia, and the Eastern lands. Hence the people became an exceedingly mixed race, the main body, however, being of the Israelite stock. Every tribe at first worshiped its own god, but being plagued by the wild beasts, they united in the worship of the God of the land, being entrusted thereto by a prophet sent to them from the palace by the King of Assyria. He restored the worship at Bethel (2 Kings xvii. 34-41). When the Jews returned to Jerusalem (538 B.C.), the Samaritans desired to unite with them in their work, but were rejected by the Jews, owing to their corrupt religion and idolatry (Ezra iv. 1-3). Henceforth, the Jews and Samaritans entertained the most bitter hatred of each other. Time was intensified by the secession of one of the sons of Jeroboam, the son of Nebat, the high priest (Neh. xiii. 26), who became of Manasseh, the Samaritan governor called by Josephus, *Idol.* vi. 7, 2, Manasseh, the brother of the high priest. Under the leadership of this man and others of the Jews, who with him were expelled as a result of their refusal to separate themselves from idolatrous worship, the worship was reorganized (488 B.C.) on the basis of a copy of the Pentateuch that Manasseh carried with him. Bethel was made the center of worship, in accordance with the tenth commandment added by the Samaritans to Ex. xii. and Deut. v., and a temple was built there, probably in the time of Alexander the Great, which continued until it was destroyed by John Hyrcanus (100 B.C.). Temple, *Idol.* viii. 9, 1). The Samaritans lost the fortress of Palestine during the constant wars between Egypt and Syria, and also under the Roman domination. They were severely chastised by Pilate for their religious spirit, then again by Vespasian and others, until, in the reign of Nero and Justinian, on account of their resistance against Christians, they were almost completely destroyed. A remnant clung to their holy place, Bethel, in Nabulus, the successor of the ancient Shechem, as reported by Alexandria, Cairo, Damascus, Aleppo, etc., where they retained the religion of their fathers. And thus they continued during the Muhammadan rule, dwindling day by day, until they are limited to a community of from 100 to 200 at Nabulus. They were lost sight of by the

learned world until the sixteenth century, when Joseph Scaliger opened a correspondence with them. They then gained an interest that they have since retained, owing to their ancient copy of the Pentateuch, and their religious ideas and doctrines, as well as their language and literature.

The Samaritan Pentateuch.—The original MS. is in the synagogue at Nabulus. This, it is claimed, was received by tradition from Abishai, the great-grandson of Aaron, whose name is inscribed upon it. It is mentioned by Cyril of Alexandria, Eusebius, Jerome, Procopius of Gaza, etc., among the Fathers, but was lost sight of subsequently until 1616, when Pietro della Valle procured a copy of it at Damascus, which was then published in the Paris Polyglot of 1645, and subsequently in Walton's Polyglot of 1657. At once a hot dispute arose as to its value, which continued for two centuries—Morinus, Brachmont, Panson, and Hasecamp calling it almost the Samaritan text; Heringer, Heringer, J. D. Michaelis, and Tychsen advocating the superiority of the latter. Griesbach, in his work *De Pent. Sam. Origine* (1815), was the first to compare the two texts thoroughly. His results have been generally accepted by modern scholars—that while the text is an independent one in its origin, it has yet been improved by the Samaritans in order to a cold obscurity and in the interest of their own religion, at times betraying an ignorance of Hebrew grammar and exegesis. It has many features of resemblance to the LXX. Griesbach calculates them at more than 1,000, which have attracted the attention of scholars, so that on the one side Heringer, Hasecamp, Eichhorn, and Ruhn have contended that the LXX. had been translated from the Samaritan, and on the other side Griesbach, Usher, etc., that the Samaritan was made from the LXX. But these views are impossible, and have been abandoned by most recent scholars, who give the text as an independent authority. It was, then, either with the LXX. derived from a common older MS. of Jerusalem, as Griesbach, Nott, and others, or, as the difference between them are quite numerous; they are based on independent original MSS., the original of the Samaritan text having been brought from Jerusalem by Manasseh. The text has been published since Walton by Heringer (Oxford, 1700) in Hebrew square characters, and the variations from the Samaritan text have been noted in the appendix to Petermann's *Versuch einer hebräischen Formelbuch nach der Auslegung der heutigen Samaritaner* (Leipzig, 1868; also *Deutsch. Morph. Gesells.*, v. 1). The text has been discussed in Smith's *Bib. Diet.* by Deissel, and in Kitt's *Cyclop.* (3d ed.) by Samuel Davidson, as well as by those mentioned above.

The Samaritan religion is based on the Pentateuch, and differs from that of the Jews in the rejection of the rest of the Old Testament, and in their regarding as the tenth commandment the obligation to worship God on Mt. Gerizim. Their religion is monotheistic, the name *YHWH* being lost, and *Shema* (the name) substituted for it. They believe in the existence of good and evil spirits, *Qados* (Lev. xvi. 10) being interpreted as a "devil," and the *Qados* of Gen. vi. 4 as "evil spirits." They believe in the Messiah (John iv. 25), on the basis of Deut. xviii. 15, as a prophet, who is like Moses, but not greater than Moses, who remains for all time the greatest. The Shihah passage, Gen. xlix. 4, they refer to Solomon, in whose time the scepter departed from Judah. The Messiah will appear 6,000 years after the creation, and enter into judgment of the world on Mt. Gerizim. Here they find all the sacred places of the past and future. Here Adam was created; here the ark rested; here Adam and Noah erected their altars, Abraham offered Isaac, and the heavenly ladder appeared to Jacob, etc. They do not offer sacrifices, on account of the destruction of the temple, but keep the feasts of the Pentateuch, circumcise their boys on the eighth day, and observe the Sabbath in their synagogues like the Jews. The Samaritans had their sects after the analogy of the Jewish sects, called Essenes, Sabaeans, Gorthonians, and Donibans, mentioned by Epiphanius, *Adv. Haeres.*, i. 11, fourth century. For these, and a full description of their present customs in the keeping of the feasts, see Petermann, *art. Samaria*, Herzog's *Realencyclopädie*; Stanley's *Jewish Church*; and Nott's *Samaritan History, Dogma, and Literature* (London, 1874).

The Samaritan language is a mixture of the Aramaic and Hebrew, in many cases having side by side the two forms; e. g. the article of the Hebrew and emphatic state of the Aramaic; the relatives *Qados* and *Qados*; the Niphal and *Qados*, *Qados*, and *Qados*; the plurals in *Qados* and *Qados*.

and י—. The letters are twenty-two in number, their order being the same as in Hebrew, but their *form* is like the ancient Hebrew and Phœnician, and not like the square character adopted by the Jews subsequent to the Exile. In pronunciation they are the same as Hebrew, except the gutturals, which are all quiescent and interchange readily with one another, being exceedingly weak. The vocabulary is essentially the same as the Hebrew and Chaldee, although many words have been introduced from Arabic, Latin, and Greek. See Uhlemann, *Inst. ling. Samarit.* (Leipzig, 1837); Nicholls, *Grammar of the Samaritan Lang.* (London, 1858); Petermann, *Brevis Ling. Samarit. Gr.* (Berlin, 1873).

The Samaritan literature is limited in extent. (1) The Samaritan Targum is ascribed by tradition to Nathanael the high priest, who died 20 b. c. There is no reason to doubt that it was composed about the same time as the Targum of Onkelos, with which it has many points of agreement, although certainly an entirely independent version. The translation is exceedingly literal and close, even where the sense was not clear to the translator. (Cf. Winer, *De Versionis Pent. Samaritanæ indole* (Leipzig, 1817); Petermann, *Pent. Samarit.*, fasc. i. Genesis (Berlin, 1872); Brüll, *Samarit. Targum zum Pent.* (Frankfort, 1875), in Hebrew square characters. Cf. also *Fragments of a Samaritan Targum*, with an introduction by Nutt (London, 1874), and *Krit. Studien über manuscr. Frag. des Sam. Targ.* von Brüll (Frankfort, 1875).) This Targum is also printed in the great Paris and Walton Polyglots. The Samaritans had also a Greek version, mentioned by some of the Fathers as τὸ *ῥαφαηριανόν*, which has been lost; also an Arabic version, which they still possess. (2) *Chronicles*.—First in importance is the Samaritan Chronicle, or book of Joshua, composed probably in the thirteenth century, taking some of its material from the Hebrew book of Joshua, but adding thereto much of a legendary character, showing that the Jews were from the time of Eli apostates and their oppressors, continuing the narrative until about 850 A. D., where it concludes abruptly. It was published by Juynboll (Leyden, 1848), with Latin translation and commentary. There is also the chronicle *El Tholadoth* (The Generations), professedly by Eleazar ben Amram (1142 A. D.), and then continued by many others until 1859, giving the calculation of sacred times, the age of patriarchs, list of high priests until the present. It was published by Neubauer in *Journal asiatique* (1869). Then comes the chronicle of Abulfath, in the middle of the fourteenth century, a digest of the two previous works, with fresh legendary material, published by Vilmar (Gotha, 1865). Other minor works, corresponding with the Jewish Hagada literature, are found. (3) *Liturgies and Hymns*.—Nutt (p. 143) says that there are nineteen volumes of these in the British Museum, besides those known in the *Carmina Samarit.* of Gesenius (Halle, 1824) and *Karne Shomeron* of Kirchheim (Frankfort, 1851). Petermann publishes specimens in his *Gram. and Chrest.* The present Samaritans have two collections, called *Durrân* (String of Pearls) and *Defter* (Book). These hymns and prayers belong to widely different periods. The earliest are ascribed to the angels. Heidenheim has published many of them in his *Vierteljahrsschrift*. (4) There are also commentaries, theological tracts, and a few recent grammatical works, written in Arabic. See the article *Samaria* in Herzog's *Realencyk.*, by Petermann; Smith's *Dict.*, by Deutsch; Kitto, *Cyclop.* (3d ed.), by Davidson; and Nutt, *Samaritan Hist., Dogma, and Literature* (London, 1874). C. A. Briggs.

Samarkand', or **Samarcand** (probably the ancient *Mara-canda*): capital of the province of Serafshan; comprising the southern part of Russian Turkestan; situated at an elevation of 2,154 feet above the level of the sea, 8 miles S. of the river Serafshan (see map of Asia, ref. 4-D). By the Arabian poets of the Middle Ages it is described as a paradise on account of its beautiful surroundings, and under the dynasty of the Sassanides (833-1000 A. D.) it flourished as a home for learning and all the arts of peace. It lost much by the occupation of Genghis Khan in 1219, but it rose again toward the close of the fourteenth century, when Timur made it the capital of his immense empire, and adorned it with architectural monuments of all kinds—the tomb of Kasim-bin-Abbas, the mosque of Timur, the citadel, Timur's tomb, the Medresse, etc. By the Mohammedans of Central Asia the city is still considered the principal seat of Mohammedan learning, and its eighty-six mosques and twenty-three colleges attract numerous pilgrims and students. In 1868 it was seized by Russia, with the whole dis-

trict of the Serafshan. The Transcaspian Railway has been completed to Samarkand. Pop. in 1889, according to Curzon, 40,000, of whom 6,000 are in the European quarter.

Revised by M. W. HARRINGTON.

Samar'rah: town; in the vilayet of Mesopotamia; on the left bank of the Tigris; 62 miles N. W. from Bagdad (see map of Turkey, ref. 7-J). It was founded by the Caliph Motassem (836) with frightful extravagance. The stable of the caliph could contain 100,000 horses. The city is revered by the Shi'ite Mussulmans, and annually attracts great numbers of pilgrims. Pop. 8,000. The ruins of ancient Opis and of the Median wall, which extends for several miles along the river, are close by. E. A. G.

Sambation [through Heb. from Gr. *σαββατικὴ νόμος*]: a river said by Oriental folk-lore to flow during the week, but to rest on the Sabbath. It is first mentioned by Pliny (*Hist. Nat.*, xxxi., 2). Josephus (*Bell. Jud.*, vii., 5, 1) reverses the order, and says it flows only on the Sabbath. In the Midrash and later Jewish saga it is connected with the reported dwellings of the ten lost tribes (*Jew. Quart. Rev.*, i., p. 20, seq.). It is useless to attempt to identify the river, but the belief had its origin in the many intermittent springs in Palestine, and in the wish to make nature witness to the holiness of the Sabbath. There existed another saga on a river which flowed sand and stones (Bar Hebraeus, in *Mittheil. d. Acad.-Orient. Ver. zu Berlin*, iii., 38), which, because of its name (*Nahar hól*, Sand or Week river), was confounded with the Sambation (*All. Zeit. d. Judenth.*, May 20, 1892, p. 247; *Zeit. f. Assyriol.*, viii., p. 273). Similar traditions exist in the East. See also Neubauer, *Geogr. du Talmud* (1868, p. 33); Brüll, *Jahrbücher f. Jüd. Gesch.* (i., p. 64; *Zeit. f. Volkskunde* (ii., p. 297). RICHARD GOTTHEIL.

Sambre, *sañbr*: a small river of Europe which rises in the department of Aisne, France, flows in a N. E. direction, and joins the Meuse at Namur in Belgium after a course of about 100 miles. It is navigable for a great part of its course, and forms an important part of the system of canals in Northern France and Belgium.

Sam'sen [Jap., liter., the three pleasing threads]: the most popular of Japanese musical instruments. It consists of a neck or finger-board 2½ feet long, and a square drum (7½ by 7 inches), rounded off at the corners and covered with parchment. There are three strings of silk, which the player strikes with a broad pecten, 8½ inches long, of wood, ivory, or tortoise-shell. The parchment covering the drum is of cat-skin, and is double at the point where the player strikes. The instrument is held by the left hand, close to the left shoulder, transversely, so that the drum comes under the right arm. The drum receives the first blow from the pecten or *bachi*, and thus two vibrations are set up. In the fingering the nails are made to press the strings. The instrument is said to have been introduced from Loos about 1560. J. M. DIXON.

Sammon'icus, **QUINTUS SERENUS**: a Roman poet of the third century A. D., whose didactic poem, *De Medicina*, in 1,115 hexameters, is a collection of medical receipts drawn largely from the elder Pliny; correct in versification, but dull and prosaic. Edited by Ackermann (Leipzig, 1786), and in Bachrens's *Poet. Lat. Minores*, vol. iii., pp. 102-158. M. W.

Sam'nites [from Lat. *Sam'nis*, plur. *Samnites*, a Samnite, deriv. of *Sam'nium*, for older *Sabinium*, name of their country, deriv. of *Sabi'nus*, Sabine]: a people of Sabine origin occupying Samnium, the territory of Central Italy S. of the *SABINES* (q. v.). Like the latter, they were a confederation of tribes, but their organization seems to have been more perfect than that of the parent race. They gradually moved beyond the natural boundaries of their territory, and occupied points on the Adriatic, and in the territory of Campania and Lucania, coalescing with the Oscan peoples who inhabited this region. In the northern part of Campania they came in contact with the Romans, and thus was inaugurated the long series of wars which resulted in Rome's conquest of the whole of Southern Italy (272 B. C.). The Samnites probably found the Oscan language in the original territory which they occupied, as well as in Campania, but as their own (the Umbro-Sabellian dialect) was so closely related to it, the mingled product does not seem to have differed much from the original Oscan. G. L. HENDRICKSON.

Samnium: See **SAMNITES**.

Samo'a: group of fourteen volcanic islands of Polynesia, N. E. of the Fiji islands; lying nearly E. and W. between

the parallels 13° 31' N. and 14° 30' S. and lon. 172° 45' W. and 173° W. It consists of three larger islands—Savat (area, 528 sq. miles; Upele 680 sq. miles) and Tutuila (54 sq. miles)—and the smaller Manua group in the northeast. Total area, 1,761 sq. miles. Pop. 34,000. Upele is the most populous, containing 16,500 inhabitants, and on its northern coast is Apia, the principal port and capital of the group. The Samoans are polynesian, though native tradition relates migration on Savat, and in 1996 Olesung, one of the eastern groups, had a submarine eruption close to its shores, so-called by a shower of ashes. The climate is tropical, the rainfall (occurring in December to April) reaches sometimes 150 inches. The soil is very fertile, the vegetation luxuriant, the aspect picturesque. The natives are of pure Polynesian race, gay, kind, pleasure-loving, indolent, fairly civilized, devoted to agriculture and fishing. They are all nominal Christians, almost everywhere being Protestants, the remainder Roman Catholics. In 1861 there were 304 British subjects on the islands, about 60 Germans, and a lot of other nationalities. The chief products are copra, sugar, and coffee. In 1899 considerable plantations of cocoa were begun. U. S. copra was the recognized medium of exchange. The archipelago was discovered in 1792 by Roggeveen. Bougainville visited the islands in 1769 and named them Navigator Islands. They are in direct steam-communication with New Zealand, Australia, and California. The date used on the islands, formerly derived from the East, was in 1862 changed to time from the West, July 5 of that year being changed to July 4, making the date correspond with the rules of navigation.

The islands have been the scene of much strife, much of which can be traced to the efforts of a German company with large interests there to bring about German control. Formerly the islands, with the exception of Tutuila, which had independent chiefs, were governed by the royal houses of Malietoa and Tupua. In July, 1881, by an agreement between Germany, Great Britain, and the U. S., Laupepa became king of all Samoa, and Tanamasesi vice-king. These two chiefs frequently changed places until, Aug. 25, 1887, the Germans proclaimed Tanamasesi king, and Laupepa was deposed as the German king. Mutaafa, the chief of the loyalist party and a relative of the exiled king, made war against Tanamasesi. The Germans, after an encounter (Dec. 19, 1888) resulting from an attempt to disarm Mutaafa's forces, proclaimed martial law. A truce was finally arranged with Tanamasesi pending diplomatic negotiations. At a conference in Berlin between representatives of Germany, Great Britain, and the U. S., Samoa was declared (June 14, 1889) independent and neutral; the Samoans were secured in their right to elect their king and govern themselves according to their native laws and customs; and a supreme court was created to secure the rights of foreigners. Laupepa was re-elected king to the people Nov. 9, 1890. By the treaty signed Apr. 15, 1892, Apia was converted into a municipal district, or international port, and placed under a municipal magistrate. See Robert Louis Stevenson, *A Footnote to History, Eight Years of Trouble in Samoa* (1892).

MARK W. HARRINGTON.

Samos, a mountainous island of the Aegean Sea; separated by the Strait of Kutchuk Boghas, 1½ miles wide, from the promontory of Mt. Nyssa, at whose foot the fleet of Xerxes was defeated on the day of the battle of Plataea (479 B. C.). It is 44 miles long, 15 miles broad, with area of 500 sq. miles. The island is exceedingly fertile, producing an abundance of wheat, olives, grapes, and fruit of superior quality, but its crops, lemon, and pomegranate groves were ruined by the vigorous winter of 1849, and have been only partially recovered. The mountains, lined with forests of oak, cypress, and pine, are rich in marble and silver, lead and copper ores. Mt. Kerki, the loftiest peak, is 5,223 feet high, the summit usually covered with snow. In grand scenery and variety of scenery, Samos is unsurpassed among the Aegean islands. The tunnel, mentioned by Herodotus, which supplied the ancient seaport with pure water, exists in good preservation. In all ages the Samian women have been famous for intrepidity and skill. In former days the island was wealthy and flourishing. Sometimes independent, but constantly attacked, it often changed masters, until in 1453 it was conquered by the Ottomans, and the inhabitants exterminated. Abandoned during a century, it was repopulated in 1587. It took an heroic part in the Greek revolution (1821-27), and asserted its independence, but was handed over to the Ottomans by the allied powers

on conclusion of peace. Since Dec. 11, 1898, it has been a principality, paying an annual tribute of 60,000 piasters, and governed by a Christian prince appointed by the sultan. The inhabitants, almost exclusively Greeks, are industrious, no despising, and ambitious. Valley, the real capital (pop. 7,675), was among the first places in the East to introduce the electric light. Chora, the residence of the governor, is a miniature European town. The annual exports, mostly agricultural products, amount to \$4,000,000. Pop. of the island (1889) 46,001, residing in thirty-one towns and villages.

F. A. GOSWORTHY.

Samothrace, island in the Aegean Sea; N. W. of the Dardanelles; belongs to Turkey. Inactive of harbors, it is really a wooded mountain, 30 miles in circuit, rising to the height of 5,240 feet. Its peak, Mt. Saron, whence, according to Homer, Neptune watched the battles of the Greeks and Trojans, is visible from the plain of Troy. The island was the center of the ancient Cabiric worship, monuments of which are still seen. An earthquake, Feb. 14, 1880, destroyed most of the buildings on the island and many lives. Pop. 1,600.

F. A. GOSWORTHY.

Samoyeds: a people of Northern Russia, in Europe and Asia, from the White Sea on the W. to Cape Chelyuskin on the E., along the Arctic Ocean, and to a considerable but varying distance inland. They appear to be allied to the Lapps and Finns, but are more degraded than either. They are small, filthy, indolent, and much addicted to intoxication, but peaceable and harmless. The herding of reindeer and the collection of fish and furs afford them subsistence. They are said to number 20,000, of whom one-fourth are European. They speak several dialects. Their country is one of the coldest and most desolate of inhabited lands. They are nominal Christians, but preserve much of their old worship.

Revised by M. W. HARRINGTON.

Sanspore [for earlier *sanspore*, from O. Fr. *Saint Pierre* in *herbe de Saint Pierre*, sanspore, later, *Saint Peter's grass*]: an umbelliferous plant, *Crithmum maritimum*, growing on cliffs near the sea in Europe. It is a choice salad-herb and makes a very fine pickle. It is extensively raised in English market-gardens. The golden sanspore is *Isula crithmoides*, a composite sea-coast plant resembling sanspore, growing in the same situations and having the same uses. Marsh-sanspore is *Salicornia herbacea*, a chenopodiaceous salt-marsh plant of Europe and North America.

Revised by CHARLES E. BASKET.

Sampi: an ancient Greek numeral sign (Ϟ) for 900. In form it undoubtedly represents the so-called "Doric *sem*" (M), a symbol inherited from the Phoenician alphabet, and originally indicating a syllable distinct from *sigma*. The old Greek local alphabet seldom made use of both signs, but generally decided in favor of one or the other. Some of the Asiatic-Ionic towns, notably Halicarnassus and Teos, used the *sem* in the form T to denote the sound *ts* (or *sk*), otherwise commonly written with double sigma (*ts*-). That the symbol was generally regarded even in Asia Minor as a superfluous sign is shown by its place after *omega* (800) in the scale of numerals which originated in Miletus. The name *sampi* is due either to the fancied resemblance of the later form to the letter *pi* (π), or, if the name is really old, more probably to the position of the letter after *pi* in the original (Phoenician) alphabet.

Sampierdarena: See SAN PIER D'ARENZA.

Sampson, EZRA: clergyman and editor; b. at Middleborough, Mass., Feb. 12, 1742; graduated at Yale College 1773; became pastor of the Congregational church at Plympton, Mass., Feb., 1775; was chaplain in the army at Cambridge 1775-76; removed to Hudson, N. Y., 1796; was there associated with Harry Crosswell in the editorship of *The Balance*, one of the first literary journals established in the U. S., 1801-04; contributed essays for many years to *The Unitarian Current*, which he edited 1804; became judge of Columbia County 1814, but soon resigned. D. in New York, Dec. 12, 1823. Author of *Remains of the Bible* (1802); *The Sham Patriot Unmasked* (1803); *The Historical Dictionary* (1804), which passed through several editions; and *The Brief Remark on the Ways of Man* (1817; new ed., 1855).

Revised by G. P. FISHER.

Samson [from Heb. *Shimshon*, later, like the sun, deriv. of *shemesh*, sun]: one of the Hebrew judges, whose history is related Jud. xiii. 2-xvi. 31. Few narratives in the Bible have been studied so carelessly as this. The opening formula (Jud. xiii. 2) shows that it is a story like those in

Jud. xvii.-xviii. and xix.-xxi. The author took pains to divide the story into two parts. The first part (xiii. 2-xv. 20) gives an account of the birth and the wild youth of Samson, up to the time when, after the battle of Lehi, "he became judge of Israel, in the days of the Philistines, twenty years." The second part (xvi.) gives an account of the last few weeks or months of his life, when he relapsed into folly, and perished thereby, "he having been judge of Israel twenty years." Samson is the son of the Danite Manoah of Zorah (xiii. 2), living in Mahaneh-Dan (xiii. 25, xvi. 31; comp. xviii. 11-12). To his mother, long barren, the birth of a son was announced by an angel (comp. Luke i. 7, 13). He is a Nazirite by birth (xiii. 5, 7, xvi. 17; comp. 1 Sam. i. 11), a different thing from being a Nazirite temporarily by vow (Num. vi. 2-21). Through his passion for a Philistine woman, he providentially becomes involved in a series of personal quarrels with the Philistines. In these, though he is not blameless, he has the sympathy of the reader. One exploit leads to another, until he becomes judge. No details of his career as judge are given. In his youth, however, the Philistines ruled Israel (xiv. 4), and Israel, judging by the conduct of the men of Judah (xv. 10-13), was in an abject condition; while in his later years the Philistines kept their own side of the border (xvi.). The inference is inevitable that the twenty years of his administration were a success, and fulfill the promise made before his birth (xiii. 5). Many imagine that he was merely a local judge, but, if language means anything, the statement that he "judged Israel" indicates that he was chief magistrate of the nation. Ussher assumes that the twenty years of Samson followed the forty years of Eli, and dates them B. C. 1140-1120. It is more probable that Samson belongs to the time of Philistine oppression, some decades earlier (Jud. x. 7). Revised by W. J. BEECHER.

Samson, GEORGE WHITEFIELD, D. D.: theologian and critic; b. at Harvard, Mass., Sept. 29, 1819; graduated at Brown University 1839, at Newton Theological Institute 1843; was for many years pastor of a Baptist church at Washington, D. C., and president of Columbian College, D. C., 1859-71, when he became president of Rutgers Female College, New York. He traveled in Europe and the East 1848, publishing a series of letters and essays on Italy, Egypt, Palestine, and Sinai; has written several theological pamphlets and critical essays on art, and is author of *To Dæmonion, or the Spiritual Medium* (1852), reissued in an enlarged form under the title *Spiritualism Tested* (1860); *Outlines of the History of Ethics* (1860); *Elements of Art Criticism* (1866); *Physical Media in Spiritual Manifestations* (1869); *The Atonement as assumed Divine Responsibility* (1878); *Bible Revisers' Greek Text* (1880); *Bible Wines* (1883); *Idols of Fashion and Culture* (1887); *Tested Truths as to Relations of Capital and Labor* (1890); *Guizot's Harmony of Historic, Philosophic, and Religious Instruction in French Colleges* (1891); *Classic Text of Authorship, Authenticity of Authority applied to the Old and New Testament Scriptures* (1893).

Samsun' (anc. *Amisus*): town; in vilayet of Trebizond, Asia Minor; a port of large importance on the Black Sea; northern terminus of several trans-Anatolian commercial routes (see map of Turkey, ref. 4-G). It exports wool, silk, sheepskins, goatskins, wax, gums, opium, grain, fruit, wine, valonea, and tobacco. Pop. (1889) 14,500. E. A. G.

Samuel [from Heb. *Sh'mū'el*, for *sh'mū'a'el*, heard of God]: a Hebrew judge, lawgiver, and prophet, whose history is recorded in the first of the two biblical books of Samuel; b. at Ramathaim Zophim, in Mt. Ephraim, probably in the twelfth century B. C.; was consecrated by his mother, Hannah, to the service of Jehovah as a Nazirite before his birth; brought up in the household of the chief priest, Eli, at Shiloh; received in childhood a divine message foreboding the downfall of the family of Eli; assumed the judgeship of Israel about twenty years after the death of Eli, at which time he headed a successful expedition against the Philistines; resided at Ramah (probably the same as Ramathaim Zophim); visited annually the three principal sanctuaries, Bethel, Gilgal, and Mizpeh, and made his sons deputy judges, but in consequence of their misconduct was commissioned by Jehovah to accede to the popular clamor for a king; to which end he anointed Saul as first monarch of Israel, and on his disobedience to a divine command anointed the youthful shepherd David in his place. He died shortly before the close of the reign of Saul, and his spirit was successfully invoked by the "witch of Endor" to announce to Saul the fatal result of the battle in which he

lost his life. Samuel is regarded as the father of prophecy. This does not mean that there had been no prophets before him, but that he gave organized form and increased power to the prophetic activity in Israel. The "companies" of prophets of his own time and the "sons of the prophets" of later times probably owed their origin to him. In connection with prophetic training he gave an impetus to literary and musical culture, thus making possible the great development of these that characterized the reigns of David and Solomon.

The chronology of the life of Samuel is obscure, and great differences of opinion exist. Probably, however, he was a grown man at the death of Eli (1 Sam. iii. 19-iv. 1); then for twenty years he made his influence felt as a prophet, neither he nor Samson, nor any other man, being at that time judge of Israel (vii. 2); then for perhaps eighteen years he was judge (vii. 6, *seq.*), chief magistrate of Israel; then Saul was made king, and Samuel, being thus out-ranked, was no longer chief magistrate, though he continued to be judge till his death (vii. 15). His administration was brilliantly successful, though the accounts of it are very brief. Israel became independent of the Philistines (vii. 13-14). He settled the Amorite question, which had been a source of trouble from the time of Joshua (vii. 14). He organized the administration of justice (vii. 16-17). Though his sons failed to walk in his footsteps, he handed over to his successor a strong and prosperous nation.

Revised by W. J. BEECHER.

Samuel, The Books of: called in the LXX. and Vulgate the first and second books of Kings. The books of Judges and Samuel, either with or without Ruth, are a connected whole, evidently formed, to a large extent, by the process of combining earlier writings. The Talmud attributes the series to the prophet Samuel, with supplementary work by the prophets Nathan and Gad. This can not be correct in the sense that Samuel personally wrote the larger part of these books, but it is probably correct in the sense that the work was initiated by him, and dominated throughout by his spirit. In 1 Chron. xxix. 29 we are told that the affairs of King David, first and last, "with all his reign and his might, and the times which passed over him and over Israel and over all the kingdoms of the countries," are written "upon the words of Samuel the seer, and upon the words of Nathan the prophet, and upon the words of Gad the observer." Evidently, the sources thus described are either a collection of the writings whence the present series, Judges, Ruth, and Samuel, was compiled, or else that series itself, the second alternative being the more probable.

Scholars hold various opinions as to the time when the books of Samuel were composed in their present form, but really there is no reason for dating them later than the lifetime of Nathan, that is, some time in the reign of Solomon. All the many alleged reasons for assigning to them a later date fade out when closely examined.

In any case, the books of Samuel are not continuous, as a literary work, with the books of Kings, though the latter take up the history at the point where the former leave it. The author of Kings habitually names his sources (1 Kings xi. 41, xiv. 19, e. g.), passes a sentence of formal approval or condemnation on each ruler (2 Kings xvi. 2, 3, e. g.), gives his chronology in a formulated system, while the author of Samuel habitually does none of these things. And many additional particulars might be cited to show that the authors of the two series were men very dissimilar in their point of view and their literary habits.

In their contents the books of Samuel are a history of David and his reign, with a preliminary account of the calamities that preceded Samuel, the brilliant administration of Samuel himself, the establishing of the kingdom, the reign of Saul, and especially Saul's relations to David.

Revised by W. J. BEECHER.

Samurai, sā'mōō-rī' (literally, guard): the name given to Japanese warriors under the feudal régime. Before the Tokugawa shogunate the name included even the shōgun and daimios. The samurai were a class apart, numbering in 1870 about 400,000 families, intermarrying among themselves and having a peculiar code of honor, etiquette, and morality. The privilege of wearing two swords, withdrawn in 1876, gave them the name of "two-sworded men." The modern police and gendarmerie and the officers of the army and navy are of samurai stock. J. M. DIXON.

Sanaa': city: capital of the Ottoman vilayet of Yemen, in Arabia. It is situated 7,120 feet above the level of the

and is surrounded by arid mountains (see map of Persia and Arabia, vol. 39-40). The climate is beautiful, though the air is exceedingly rare and dry. It seldom rains, sometimes only for several years, but excellent and abundant water is supplied by wells. Snow falls in winter. The city is enclosed by brick walls, is well built with stone houses, two tiers, and their domes high, and has public squares and a fine hospital. The bazaars are well stocked, and a thriving trade is carried on in cotton, indigo, gum arabic, slaves, and more. Mohair and camel-hair carpets are made. Samsa was important before the time of Muhammad, his temple marking the center. Since 1860 it has been the capital of Yemen. In 1872, being laid pressed by the Beduins, it obtained the protection of the Ottomans, and has since formed part of their empire. Pop. 50,000, of whom 35,000 are Arabs and 15,000 Jews (1890). E. A. GOSWICK.

San Angelo: town; capital of Tom Green co., Tex.; on the Comanche river, and the Gulf, C&N, and S. P. Railways; 227 miles W. of Temple, 146 miles N. W. of Galveston (for location see map of Texas, ref. 3-4). It has an elevation of 1,800 feet above sea-level, is the center of the stock-raising and wool-growing regions of the State; is surrounded by irrigated farms on which much cotton is raised, and is a center for sheep-raising. There are 3 national banks (combined capital \$1,000,000) and 3 weekly papers. Pop. (1890) 4,571; (1900) estimated, 5,300. Editor of "STANDARD."

San Antonio: city, capital of Bexar co., Tex.; on the San Antonio and the San Pedro rivers, and the International and G. N. the San Ant. and Aransas Pass, and the S. Pac. Railways; 75 miles S. W. of Austin, 260 miles N. by W. of Brownsville (for location, see map of Texas, ref. 5-6). It is the largest city in the State; is on a level and fertile plain with a course of limestone hills near by; has an abundant supply of water for manufacturing and domestic purposes from the rivers, the old Spanish acequias, and several artesian wells; and is the site of a U. S. military post, permanently established in 1879. It has an excellent climate, with a remarkably even temperature, and a dry air. The city has over 150 miles of water-main, over 125 miles of sewers, sidewalks, over 70 miles of paved streets, and over 2 miles of electric street-railway. There are 13 theatres and 4 theatres over the river, several large public parks, a U. S. Government building, new county court-house (cost \$1,000,000), several hospitals, gas and electric-light plants, and a number of fine halls belonging to secret societies and social clubs.

Churches and Schools.—San Antonio contains 40 church buildings, the most imposing of which is the Roman Catholic Cathedral of San Fernando (present building erected 1864-7, and incorporating parts of an earlier church edifice, where Santa Anna had his headquarters in 1836). The largest Protestant church is St. Mark's (Protestant Episcopal). The city is the seat of a Roman Catholic bishopric and of the Protestant Episcopal bishopric of Western Texas. San Antonio has public-school property valued at \$1,000,000, a school population of over 13,000, 8 public-school buildings for white pupils and 4 for colored, and over 30 private schools. Besides its share in the great public-school fund of the State, the city has a fund of its own of over \$100,000. There are two academies for boys, St. Mary's College, St. Mary's Hall, Wolfe Memorial School, Ursuline convent and school, a young ladies' school, young ladies' seminary, and two business colleges.

Finance and Banking.—Since 1890 there has been a marked increase in the assessed valuations, which has enabled the city to undertake extensive public improvements. In 1894 the assessed property valuation was \$32,000,000. For the year 1894-95 the receipts were \$428,376; expenditure, \$329,400. bonded debt, \$1,701,500 (of which \$500,000 was for a sewerage system); floating debt, \$225,000. In Jan., 1895, there were 4 national banks with combined capital of \$650,000, 2 private banks, and an incorporated bank.

Manufactures.—In 1890 the census returns showed 7 manufacturing establishments (representing 25 industries) with a combined capital of \$1,648,892, employing 907 persons, paying \$613,195 for wages and \$831,185 for materials, and turning out products valued at \$2,152,260. The principal works include 9 carriage and wagon factories, 7 machine-factories, 5 saws and mineral water establishments, 1 machine-factory, 4 brick and tile works, 4 cement-works, 2 breweries, 2 distilleries, 2 machine-shops, 3 ice-factories, and 4 machine-works. The city also has large interests in stock raising and the shipment of cotton, wool, and hides.

History.—The city was founded in 1714. Among the points of special interest are the mission of San Antonio de Valero, better known as the Alamo, founded in 1720, for many years used as a fort, and the scene of Santa Anna's massacre of Texas patriots in 1836; the First or Mission Concepcion, founded in 1716, and the scene of a battle between Mexican and Texas troops in 1835; the Second or Mission San José de Aguayo, founded in 1796, and decorated by the Spanish artist Goya; and the Third or Mission San Juan Capistrano, founded in 1716, and the scene of the Texans' capture of San Antonio in 1835. The Alamo is the property of the State and is open to visitors. Pop. (1890) 20,550; (1900) 37,073; (1905) estimated, 57,500. J. D. WHEELER, Editor of "Daily Express."

San Antonio River: a stream which rises in Bexar co., Tex., flows S. E. 290 miles, and falls into the Gulf of Mexico at Tappita Santa Bay. The city of San Antonio and the village of Goliad are upon its banks.

Sanballat (Heb.; LXX, *Sanballad*, *Sanballad*; from Assy. *Sin-abullat*, the god Sin gives life): in the book of Nehemiah, the head of the opposition which Nehemiah encountered in rebuilding the walls of Jerusalem. He is called a Horvite, and his daughter is said to have married the son of a high priest. Josephus (*Ant.*, xii., 7, 9) mentions an officer in Samaria bearing the same name, whose daughter was married to Manasse, brother of the high priest Jaddus, and founder of the schismatic temple on Mt. Gerizim. But Josephus places this Sanballat at the time of Alexander the Great, and has evidently confused the biblical person with some other. HERMAN GOERTZ.

San Bernardino: city, capital of San Bernardino co., Cal.; on the Southern Cal. Railway; 60 miles E. of Los Angeles (for location, see map of California, ref. 12-13). It is in an agricultural, fruit-growing, and mining region, the center of the great San Bernardino basin and of the citrus belt. It has mountains on three sides and commands a fine view of Mt. San Bernardino, the loftiest peak of the Coast Range. The city is laid out attractively, with broad streets well paved and interesting at right angles, and has an abundant supply of artesian water. The climate is mild and equable; malaria is unknown; fogs are seldom seen. Among the public buildings are a new court-house, cost \$450,000, the Hall of Records, the public high school, St. Catherine's Academy, several commodious churches and public schools, and 4 hotels. There are 2 national banks with combined capital of \$200,000, 2 State banks with capital of \$110,000, a private bank, 2 building and loan associations, and 2 daily and 3 weekly newspapers. The city has important steam and street railway communications, and contains the large shops of the Southern California Railway. Pop. (1890) 1,671; (1900) 4,012. W. J. BEAVER.

San Blas: town and port of the territory of Tepic, Mexico; on the Pacific coast, in lat. 21° 32' 24" N. (see map of Mexico, ref. 6-E). A sheltered bay just W. of it admits vessels drawing from 9 to 12 feet, according to the season; larger ships anchor in the open roadstead, and freight is discharged on lighters. This is the most frequented port between Acapulco and Mazatlan; a railway to Guadalupe is (1895) in course of construction. Intermittent fevers are prevalent after the rains, but yellow fever is nearly unknown. Pop. about 4,000. H. H. S.

San Blas, Cape: See CAPE SAN BLAS.

San Blas, Gulf or Bay of: a bay on the northern side of the Isthmus of Panama, which here (lon. 79° W.) has its narrowest part, forming the sub-isthmus of San Blas. This is only 31 miles wide, and the navigable estuary of the river Bayano reduces the distance to 18 miles. The proposed "San Blas Route" for a ship-canal was across this neck, but repeated surveys have shown that the high mountains render it impracticable. H. H. S.

San Bonifacio de Ibagué: See IBAGUÉ.

Sanborn, FRANKLIN BENJAMIN: author and philanthropist; b. at Hampton Falls, N. H., Dec. 15, 1851. He graduated at Harvard, interested himself in the anti-slavery cause, and was chosen secretary of the Massachusetts Kansas committee in 1856. He has been an active member of the Massachusetts State board of charities, secretary of the American Social Science Association and of the Concord Summer School of Philosophy. In 1858 he became connected with the staff of *The Springfield Republican*. He published a *Life of Thoreau* (1882), and *Life and Letters of John Brown* (1885). H. A. REEKS.

San Buena (bōw'nā) **Ventu'ra**: city; capital of Ventura co., Cal.; on the Pacific Ocean, and the S. Pac. Railroad; 60 miles W. N. W. of Los Angeles (for location, see map of California, ref. 12-E). Its legal name, as above given, is derived from a famous old Spanish mission; its post-office designation is Ventura. It contains the ancient mission building, public high school, 2 grammar schools, public library and reading-room (founded in 1874), Y. M. C. A. building, electric light, street-railway, water, and sewer plants, several hot springs, a State bank with capital of \$100,000, a private bank, and a daily and 4 weekly newspapers. The principal industries are agriculture and fruit-growing. The equable climate and springs have made it a popular resort for invalids. Pop. (1880) 1,870; (1890) 2,320; (1895) estimated, 4,000.

EDITOR OF "VENTURIAN."

Sanchoni'athon [Gr. *Σανχωνιάθων*, *Σανχωνιάθων* = Phœnician, *Sakkūn-yāthōn*, *Sakkūn* has given]: name of a mythical Phœnician, who is said to have lived before the Trojan war, and to have written a history of the Phœnicians. Philo Herenius of Byblos (Gebal), b. 64 A. D., pretends to have translated this book into Greek, under the name *Φωνικὴ ἱστορία*, or *Tā Φωνικὰ*. Fragments of this work have been preserved by Eusebius (*De Prepar. Evang.*, bk. i., chaps. ix. and x.; bk. iv., chap. xvi.) and the Neo-Platonic philosopher Porphyry (*De Abstin.*, ii., 56). Sanchoniathon is also mentioned by Athenæus (*Deipnosophist.*, bk. iii., ch. c.), Theodoret (*Adv. Gentiles*, Disput. ii.), and Suidas (Müller, *Frag. Hist. Græc.*, iii., p. 561). The statement of Philo has been accepted by Grotius, Mignot, Ewald, Renan, Spiegel, and Thiele, but rejected by Dodwell, Meiners, and Hissman. Lobeck stands alone in assuming that the falsification is due to Eusebius. Modern scholars, while denying the existence of a Phœnician writer by the name of Sanchoniathon, believe that Philo has embodied in his work traditions which were current in his native city (Bunsen, Mövers, Duncker, Rawlinson, Baudissin), though the whole has more or less a pseudographic character (Baudissin, Pietschmann, von Gutschmid). The fragments extant seem to show that Philo culled from various sources. They contain two different so-called Phœnician cosmogonies, one beginning with *πνεῦμα* and *χάος*, the other with *κόλατος* and *βδαι*. Then follows an account of the rise of the human race (*φῶς*, *πῦρ*, *φλόξ*, giants, mankind), and of the beginnings of culture, drawn from three different sources. To this is added the mythical history of the city of Byblos. A still further fragment is preserved by Eusebius on *τὰ ἐν γράμμασι θεοῦ διὰ τὸν ἀνθρώπου* (according to Gutschmid's correction), which probably treated of the writings of the mythical Egyptian Thoth. The tendency of Philo's work, which contains Egyptian, Grecian, Phœnician, and Hebrew elements, is undoubtedly euhemeristic, and in its syncretism endeavors to prove the Phœnician origin of Greek religion. In 1836 Wagenfeld astonished the learned world with excerpts from what he claimed to be a newly found MS. of the whole of Philo's translation, *Sanchoniathons Urgesch. der Phönizier* (Hanover, 1836), but the whole was soon recognized as a fraud. See *Jahrb. für Theol.*, vii., pp. 95, seq.

LITERATURE.—The text is published in C. Müller, *Fragmenta Hist. Græcor.* (iii., p. 561, seq.); Orelli, *Sanchoniathonis Fragmenta* (Leipzig, 1826); transl. in Cory's *Ancient Fragments* (London, 1878, p. 1); Lenormant, *Beginnings of History* (New York, 1882, p. 524). See also Mövers, *Die Phönizier* (i., pp. 117, seq.); Ewald, in the *Abhand. der Königl. RICHARD GOTTHEIL.

San Cristo'bal de los Llanos, or **Las Casas**: formerly *Ciudad Real*; capital of the state of Chiapas, Mexico; on a plain, about 6,700 feet above the sea (see map of Mexico, ref. 9-J). It was founded in 1528 on the site of an Indian village; subsequently it was famous as the residence of Las Casas when he was Bishop of Chiapas. Pop. (1892), with the immediate vicinity, 16,050.

H. H. S.

Saneroff, WILLIAM, D. D.: archbishop; b. at Fressingfield, Suffolk, England, Jan. 30, 1616; educated at Bury

School and at Emmanuel College, Cambridge, where he became fellow 1642; was deprived of his fellowship by the Long Parliament 1649; became chaplain to Bishop Cosin of Durham 1660, in which year he assisted, privately, in the revision of the Prayer-book; obtained from that prelate the rectory of Houghton-le-Spring and was prebendary in Durham Cathedral; was elected master of Emmanuel College, Cambridge, 1662; was promoted successively to the deaneries of York 1663, and of St. Paul's, London, 1664; spent large sums on the repair of St. Paul's Cathedral; was presented by Charles II. to the archdeaconry of Canterbury 1668, and to the archbishopric of Canterbury 1677. He attended Charles II. on his deathbed, and wrote the petition presented to James II. in 1687 against the Declaration of Indulgence. This petition was signed by himself and by six other prelates, for which they were committed to the Tower June, 1688, tried for misdemeanor before the king's bench, and acquitted June 29, 1688. Notwithstanding his grievances, he did not take part in the conspiracies against James; refused to take the oath of allegiance to William and Mary; was deprived of his see Feb., 1691; refused to recognize his deposition; retired to his native place, and attempted, with the aid of the numerous nonjuring clergy, to maintain an episcopal succession. D. at Fressingfield, Nov. 24, 1693. He was the author of several volumes of sermons, letters, and political essays. Many of his unedited MSS. are in the Bodleian Library, Oxford. Revised by W. S. PERRY.

Sanctification [from Lat. *sanctificatio* (deriv. of *sanctificare*, sanctify; *sanctus*, holy + *facere*, make), trans. of Gr. *ἁγιάζω*, hallow, make holy, deriv. of *ἅγιος*, holy]: the work of God's grace by which those who believe in Christ are freed from sin and built up in holiness. In Protestant theology it is distinguished from justification and regeneration, both of which lie at its root, and from neither of which it is separable in fact; inasmuch as the term justification is confined to the judicial act or sentence of God, by which the sinner is declared to be entitled, in consideration of what Christ has done in his behalf, to the favor of God, and of which sanctification is the efficient execution; and the term regeneration is confined to the initial efficient act by which the new life is imparted, of which sanctification is the progressive development. Both regeneration and justification are momentary acts, and acts of God in which the sinner is passive; sanctification, on the other hand, is a progressive work of God, in which the sinner co-operates.

The nature of sanctification, as well as its method and the relation of the divine and human factors in its prosecution, is differently conceived by the several types of theology.

1. The *Pelagian and Rationalistic view* excludes the action of the Holy Spirit altogether; and makes sanctification to be nothing more than continued right action, in the native powers of the free moral agent, by which he gradually conquers evil tendencies, and builds up a holy character.

2. The *Medieval and Roman view* refuses to distinguish between justification and sanctification; and makes both justification and sanctification to be the cleansing from sin, and the infusion of gracious habits by the Holy Ghost for Christ's sake by the instrument of baptism, upon which subjective change the removal of guilt and the divine favor is conditioned. (*Counc. Trent*, sess. 6, can. 7.) It is therefore held to be progressive, and to be advanced by good works, which possess real merit, and deserve and secure increase of grace (*Counc. Trent*, sess. 6, can. 32); as well as by penances, prayers, fastings, etc., which satisfy God's justice and purify the soul. (*Counc. Trent*, sess. 14, ch. viii.; sess. 6, cans. 29 and 30.) If the believer dies before the process of deliverance from sin is perfected, he must complete it in purgatory, the pains of which are expiatory and purifying; and there he may be assisted by the prayers and masses and dispensing power of the Church on earth. (Bellarmin, *Purgator.*, ii., 9.) But it is possible, even before death, for a believer perfectly to conform to all the demands of God's law as graciously adjusted to this life (*Counc. Trent*, sess. 6, ch. xvi., can. 25); and it is even possible, out of love, to perform supererogatory service by obedience to the councils of Christ, which are advisory but not obligatory until voluntarily undertaken. These are voluntary poverty, celibacy and obedience to monastic rule; and they merit more than the mere salvation of the person, and contribute to the "treasury of merits" at the disposal of the Church, which is imputable at the discretion of those holding the jurisdiction to believers on earth or in purgatory not yet fully justified. Bellarmin, *De Monachis*, chaps. vi. and vii.

3. The *Mystical view* of sanctification, though never embodied in any Church creed, has existed as a doctrine and a pathway in all ages and among all Christian denominations. Christian mysticism more or less depreciates the possession of the soul by light upon the objective revelation of the word of God and the necessity of the means of grace and human effort, and emphasizes spiritual intuition, anagogical ratios of religious feeling, the physical communion of the soul with the substance of God, conditioned reason and possibility of mind. Such views gained great vogue in the Church through the writings of the Pseudo-Dionysius, which were published in Greek in the sixth century and translated into Latin by John Scotus Erigena in the ninth century. They qualified the teaching of many ancient evangelical theologians such as Bernard of Clairvaux, Hugo, and Richard of St. Victor, and subsequently Thomas à Kempis. They were taught with great influence among the early Protestants by Schwemkfeld (1490-1551), Jansenius (1584-1641), Wigel (1634-38), and Jacob Böhme (1601-1685), and among the Roman Catholics by St. Francis of Sales (1567-1622), Molinos (1600-37), Madame Guyon (1648-1717), and Archbishop Fénelon (1651-1715). The original mystics held similar views, as is seen in the writings of Deepak Das (d. 1591), William Penn (d. 1718), and Robert Barclay (1648-90). A mystical conception is present whenever sanctification is conceived, not as the goal of effort, but as an immediate gift to the waiting soul.

4. The *evangelical doctrine of sanctification common to the Lutheran and Reformed Churches* includes the following: (1) The soul after regeneration continues dependent upon the constant gradual operations of the Holy Spirit, not a through grace, able to co-operate with them. (2) The sanctifying operations of the Spirit are supernatural, and are effected in connection with and through the instrumentalities of means; the means of sanctification being either internal, such as faith and the co-operation of the regenerated will with grace, or external, such as the word of God, sacraments, prayer, Christian fellowship, and the providential direction of our heavenly Father. (3) In this process the term gradually completes the work of moral purification commenced in regeneration. The work has two sides: (a) the cleansing of the soul from sin and emancipation from a power, and (b) the development of the implanted principle of spiritual life and infused habits of grace, until the soul comes to the stature of perfect manhood in Christ. Sanctification is spiritually and morally to transform the whole man, intellect, affections, and will, soul and body. (4) The work proceeds with various degrees of thoroughness during life, and is never consummated in absolute moral perfection and the subject passes into glory.

In opposition to this doctrine a *theory of perfect sanctification in this life* has been taught from several distinct points of view, e. g.,

1. According to the principles of *Philosophism*, a man is saved who obeys the laws of God to the measure of his own natural ability, since the moral law is a sliding scale, because its demands to the varying ability of its subject; and this is possible in every man.

2. According to the *Mystical* idea, perfection consists in communion in the Divine essence, or, in a less extreme form, in the absorption of human desires and will into the divine will, or a disinterested love; and this may be attained by way of thorough permanent detachment from self and meditation on God.

3. According to the *Roman or Ritualistic* theory, perfection consists in perfect conformity to the law of God, gradually the Church's sake adjusted to the capacities of the spiritual man in this life, and this perfection is attained by means of obedient works and penances, prayers, fasts, and of voluntary self-denial, and ecclesiastical obedience. It only is able within the reach of men, but so is even the rendering of supererogatory service in the way of extra-legal self-denial from a principle of evangelical love.

4. The *Radical* theory of perfection conceives that the incarnation and death of Christ have made it consistent with divine justice to offer salvation to men on easier terms than the old Adam's law of absolute perfection; and that salvation is obtained when these lower terms have been accepted with. "Christian character is estimated by the measure of the gospel, Christian perfection implies the fullest possession of these conditions, and nothing more." See *What is Christian Perfection? Methodist Doctrinal Tracts*; The *George Peck's Christian Doctrine of Perfection*.

A. A. HUNTER. Revised by B. R. WARFIELD.

Sand (O. Eng. *sand*; O. H. Germ. *sand*; Mod. Germ. *sand*; Ital. *sand*; <Indo-Eur. *sandhō*. Cf. Gr. *sandē*, and perhaps Lat. *subellum*, *sand*); granular detritus with texture coarser than clay and finer than gravel. The name gravel is given only to accumulations of rock fragments that have been rolled by currents until their angles are worn away, but sand grains may be angular or rounded; in other respects a gravel is merely a coarser sand, and a sand a finer gravel. Sands are derived primarily from the disintegration of crystalline rocks; secondarily from the disintegration of substances which were themselves formed by the consolidation of pre-existent sands. As the grains which result from the breaking up of various rocks are transported by currents of water or air, they jostle against one another, and some of the blows thus given produce fracture. Some of the grains are also attacked by various reagents and gradually decomposed or dissolved. The blows tend to convert angular fragments into round and to reduce all fragments to smaller sizes. As large fragments strike harder blows than small, they are more rapidly reduced and more rapidly rounded, and the tendency to convert gravel into sand is correspondingly stronger than the tendency to comminute sand. Sand grains whose material is hard and resists decomposition are practically indestructible. Streams, shore-waves, and winds—the principal agents for the transportation of sand—accomplish also its separation from gravel and clay. The best-rounded sands are those found upon deserts, where they are shifted to and fro by the winds. The most abundant material in sand is quartz, and next to it stands feldspar. Hornblende, magnetite, and garnet are of frequent occurrence, and sands freshly derived from crystalline rocks contain all the constituents of the parent rocks. Of the many industrial uses of sand, probably the most important are for the manufacture of mortar and artificial stone. For these purposes angular grains are preferable. See *ROCKS* and *SISTEROPE*.

G. K. GILBERT.

Sand, GEORGE: the pseudonym under which ANASTHÉ LUCIEN AVOUSSE DUPRE (*Madame Dudevant*) published her celebrated novels and dramas. She was born in Paris, July 3, 1804, and educated first at the Chateau de Nohant, department of Indre, by her grandmother, Madame Dupin, a natural daughter of Marshal Saxe, and afterward (1817-20) in an Augustinian convent in Paris. In 1822 she married Baron Dudevant, formerly an officer in the army of Napoleon, to whom she bore two children, but in 1831 separated from him, determined to support herself by literary work; removal to Paris with her daughter, and assumed male dress in order to move about with greater freedom. In connection with Jules Sandeau she wrote *Rose et Blanche*, which was published in 1831 under the pseudonym *Jules Sand*, and the reception it found offered her an opportunity of publishing immediately after a novel written by her alone, *Indiana*, under the pseudonym *George Sand*, which she afterward retained. In 1832 Valentine made her name celebrated, and in 1833 her celebrity rose to sensation with *Lélia*. The book touched in a somewhat popular manner the very delicate question of love and conjugal fidelity. In company with Alfred de Musset she then made a journey to Italy, but at Venice they parted, and in 1836 he published *Confessions d'un Enfant du Siècle*, in which she answered in 1836 with *Elle et Lui*, which produced an immense sensation. The violent movement into which her mind was thrown by her relation to Musset is very apparent in her *Lettres d'un Voyageur* and *Jacques* (1834), and is still more visible in *André* and *Léon Leloni* (1835); but by degrees it subsided. In 1836 she was divorced from Baron Dudevant, and both her children went to live with her. About the same time began her intimate friendship with Chopin, which lasted until 1847, and to which are due the many beautiful passages in music which are found in her later books. To this period of her life (1835-41) belongs a series mostly consisting of minor novels—*Le Secretaire intime*, *Lucien*, *Mitella*, *Mitella*, *La Marquise*, *Mauvais*, *La Dernière Abîme*, *L'Uroque*, *Fantine*, etc.—in which her wonderful talent of artistic representation appears perfectly developed and in its full ripeness. They were published in the *Revue des Deux Mondes*, but in 1841 she quarreled with the editor, and *Hernani* was rejected. She in the meantime had made the acquaintances of Lamennais, Michel the republican, Pierre Leroux the socialist, and influenced by them she became the spokesman of very advanced social and political, moral and religious views, which were promulgated in *Lettres à Marie* (1837), *Spiridon* (1838), *Les Sept Cordes*

de la Lyre (1840), and especially *Horace* and *Consuello* (1842), *La Comtesse de Rudolstadt* (1843), *Le Meunier d'Angibault* (1845), *Le Pêché de Monsieur Antoine* (1846), etc. In *Jeanne* (1844) she returned to the purely artistic novel without any tendency, and there followed some of her most beautiful productions—*La Petite Fadette* (1849), *La Mare au Diable* (1846), *François le Champi* (1848), etc.—but in 1848 she plunged with enthusiasm into the very midst of the Revolution—wrote proclamations and founded newspapers. After the Revolution she wrote during a long period chiefly for the theaters, and some of her plays were very successful. They are, nevertheless, nothing but dramatized novels, without any genuine dramatic effect. She was most successful with the novel, more especially the descriptive and reflective novel, and in this genre even her latest books, *Mlle. la Quintinie* (1863), *Le Marquis de Villemer* (1864), *La Confession d'une Jeune Fille* (1865), *Cadio* (1868), are brilliant and powerful productions. D. June 8, 1876. Her collected works contain *Romans et Nouvelles* (84 vols.); *Mémoires, souvenirs, impressions, voyages* (8 vols.); *Théâtre* (4 vols.); *Théâtre de Nohant* (1 vol.); *Correspondance* (10 vols., 1882-84).
Revised by A. G. CANFIELD.

Sandal-wood [*sandal* is from Arab. *qandal*, from Sanskr. *candana*, sandal-tree]: the agreeably aromatic and precious wood of several trees belonging to the genus *Santalum* and of one or two other trees. The original sandal-wood of India is yielded by *Santalum album*, a tree 25 feet high, with a trunk a foot in diameter. Three kinds or hues were known in Europe as early as the eleventh century—white, yellow, and red, of which the last-named may have been confounded with the inodorous wood of red sanders or *SANTAL-WOOD* (q. v.). After the discovery of the Sandwich islands a large part of the supply of the sandal-wood of commerce came from two or three species of *Santalum* peculiar to those islands, and later from *S. yasi* of the Fiji islands and from *S. austro-caledonicum* of New Caledonia; also from *Fusanus spicatus*, a tree of Western Australia of the same family. The high price this wood brings has caused the reckless extirpation of the tree from the more accessible stations, but in India the original sandal-wood tree is protected by the Government. It is employed as a perfume and for the fabrication of small articles—glove-boxes, caskets, etc. Much is consumed in India in the celebration of sepulchral rites and for medicinal purposes, where the powder, made into a paste with water, is used for making the caste-mark. The principal market is China, where it is most largely used for incense in temples, etc. The Malabar sandal-wood there brings three or four times the price of that of the South Sea islands. The wood yields 1 per cent. of a peculiar essential oil, on which the characteristic fragrance depends. This oil, largely extracted in some parts of India from the fresh wood, has been used in medicine as a substitute for copaiba. The famous and richly carved gates of the temple of Somnauth, supposed to be 1,000 years old, are of sandal-wood. See **SANDALWORTS** and **DYESTUFFS**.
Revised by CHARLES E. BESSEY.

Sandalworts: the *Santalaceae*, a small family of apetalous dicotyledonous plants widely distributed over the world. It is most nearly related to *Loranthaceae*, but incompletely, if at all, parasitic, according with that family in having its ovules and seeds destitute of integuments. The sandal-woods (see **SANDAL-WOOD**) are far the most important representatives of the family. The European species are all herbs, as are the members of *Comandra*, the commonest North American representative; but the Alleghanies have two shrubby genera; one of these, *Pyrularia*, oil-nut, has a large kernel abounding with acrid oil. The quandang-nut of Australia, however, is bland and edible. The Australian cherry (so called), with the stone on the outside, is the nut of an exocarpus, supported on an apparent succulent red berry, which is formed by an enlargement of the tip of the flower-stalk.
Revised by CHARLES E. BESSEY.

Sandarach [via O. Fr. from Lat. *sanda'ra* = Gr. *sandara*, sandarach, realgar, an Eastern word, probably borrowed ultimately from India. Cf. Sanskr. *sindūra*]: a gum-resin from a small coniferous tree, *Thuja articulata*, which grows in Barbary. It occurs in pale-yellow oblong grains or tears, covered with a fine dust, is transparent and brittle, with a vitreous luster on the fracture. According to Unverdorben and Johnston, it consists of three resinous acids. The α -resin forms a white or yellow powder slightly soluble in alcohol and not easily fusible, and is present in but small quantities. The β -resin forms about three-fourths of the

whole, is light yellow, softens at 212° F., and is readily soluble in cold alcohol. The γ -resin is a light-yellow powder, soluble in boiling alcohol, and melts with difficulty, decomposing at the same time. In medicine, sandarach was formerly given internally, and entered into the composition of various ointments and plasters. It is chiefly used as an incense and in varnishes. Its powder is rubbed on writing-paper where erasures have been made, in order to prevent the spreading of ink.
Revised by IRA REMSEN.

Sand Beach: village; Huron co., Mich.; on Lake Huron, and the Flint and Pere Marquette Railroad; 70 miles N. of Port Huron, 120 miles N. by E. of Detroit (for location, see map of Michigan, ref. 6-L). It occupies an elevated site, which slopes back from the lake by a series of terraces; has excellent natural drainage and a good system of water-works; contains valuable mineral springs and large bath-houses; and has considerable dairy, salt, flour, lime, and lumber interests. The U. S. Government has constructed a costly harbor of refuge for the shipping of the Great Lakes. The village has a private bank and two weekly newspapers. Pop. (1890) 1,046; (1895) estimated, 1,500.
EDITOR OF "HURON TIMES."

Sand-blast: a stream of sand propelled by the pressure of air or steam and used for cutting and engraving glass, stone, and other solid substances. The process was invented by Gen. Benjamin C. Tilghman, and was suggested by the well-known effect of wind-blown sand in destroying the transparency of glass. In practice, two kinds of work are performed by the sand-blast, called, respectively, heavy and light work. For the former a high pressure and a correspondingly great velocity are required; for the latter the pressure is light and the velocity low. Ordinarily, for light work, the necessary velocity is given to the sand by means of an air-blast produced either by a rotary fan or positive blower, or by the pressure of the atmosphere acting toward a vacuum maintained by a fan or a steam-jet. For simply depolishing glass or making the so-called ground glass, the current of air is conducted into a rectangular trough of any desired length, narrowed at the bottom to an opening an inch wide, and having its top perforated by small tubes for the admission of the sand. The glass is carried slowly across the opening of this jet, and about an inch below it, by means of a traveling apron. By this process glass is obscured with great rapidity, almost as soon as it is held in position. In order to engrave a design upon the glass, the parts which are to remain bright have to be protected with a composition or by blotting-paper, soaked in glycerin and glue, from which the desired pattern has been cut out.

For heavy work either air or steam may be used; but steam is more readily employed, and, as it cuts twice as fast as air under the same pressure, is generally preferred. The steam is used in a jet, technically called the blast-pipe or gun. As shown in the accompanying sectional drawing, it consists of a hollow bronze cylinder of about 1½ inches external diameter, having a lateral opening near its upper end (by which the steam enters), and tapering somewhat at its lower. Through the top of this cylinder an iron tube passes, secured by a stuffing-box. This is called the sand-tube; its exterior diameter is somewhat less than that of the opening through the cylinder, and it tapers with it at its lower end, though somewhat less rapidly, thus leaving a narrow concentric aperture for the passage of the steam. The exterior cylinder is prolonged beyond this concentric opening to form a socket for a supplementary or directing tube called the nozzle-tube (seen separately on the right). This tube, being the only portion of the blast-pipe which is exposed to wear, is made of sheet-steel, or sometimes of chilled iron. The sand used should be sifted so as to be of uniform size, and should be clean, hard, sharp, and dry.

rotation of the gun is as follows: As soon as the steam jet on it commences great velocity from the annular space at the jet, producing a partial vacuum in the sand-chamber below, and consequently in the rubber tube which connects it with the wood-blast above. On opening a sliding gate in the bottom of this sand-chamber a stream of sand is blown through the tube into the jet of steam, and is forced on a downward spiral course, striking at a high velocity the sand-chamber, which is placed about an inch distant from it. The mass of steam, together with the fragments of the stone and coal, ranges laterally. And if the gun be at rest a vertical jet is gradually run into the material. The angle which is made of this cone made with each other varies, increasing with the hardness of the stone and diminishing with an increase of pressure in the blast. If it is desired to have the jet of the gun parallel, the gun is slightly inclined and is revolved about a vertical axis. The angle of inclination varies of course with the hardness of the stone and with the pressure of the steam employed.

The purpose of ornamentation in stone the wood-blast gun has not revealed. The method employed is simply to send some particles of the stone which are not to be cut away with a suitable tool or template of rubber or other soft material.

Sand-dollar: See CAMEL-ORCH.

SANDHILL, JAMES M. (JAMES M. SANDHILL): novelist and dramatist; b. at Amiens, department of Oise, France, Jan. 18, 1811; studied law at Paris, but devoted himself exclusively to literature; wrote his first novel, *Rose of Amiens* (1831) in connection with George Sand, and published under the pseudonym of *Jules Sand*. In 1833 he was appointed keeper of the Mazarin Library, and in 1836 he became a member of the Academy. His most successful and best known work is *Le Capitaine Corcoran* (1848); as a drama (1851). He also wrote *Le Capitaine de M. Ancêtre*, written in connection with Emile Augier (1854). His novel *Le Capitaine de Corcoran* (1858) has been transformed into a drama (1860). See *Paris*, Apr. 24, 1864. Revised by A. G. CAVENDISH.

Sand-wood, or Sand-lane: any fish of the family *Scombridae*. They are elongated, with a pointed snout, forked tail and silvery scales; they burrow in the sand, and are sometimes extensively employed as bait for other fishes. Some are found on the northern shores of all countries. The common American species is *Ammodytes americanus*.

Revised by F. A. LUCAS.

SANDMAN, ROBERT: religious leader; b. at Perth, Scotland, in 1718 or 1720; studied at Edinburgh; became a Dissenter; married a daughter of Rev. John Glas (for whom the founder of a sect called the Glasites); became an advocate of the reformation; established in 1762 a congregation of the new sect at London, where they became known as *Sandmen*; went to North America and established a church 1768, and settled in the following year at Danbury, Conn., where he died Apr. 2, 1771. He wrote a number of theological and controversial treatises. The Sandmanian sect maintained a feeble existence, chiefly at Danbury, Danvers, and Danbury, Conn., the membership not exceeding 1000 persons. Among their leading peculiarities, some several ascetic practices, are the weekly love-feast, wearing Sunday, and the "kiss of brotherhood"; the washing of feet, formerly one of their practices, has been discontinued. They abstain from blood and everything strangled, and practice a kind of communism, so far as the members and their property subject to the call of the church. Their doctrine had its source from the writings of Sandeman, a Scotch Presbyterian, *Sketches on Sandemanianism*, in which he refers to a friend (Nottingham, 1810; 2d ed. London, 1811). See *Quakers*.

Revised by S. M. JACOBSON.

Sandmanianism: See SANDMAN.

Sanderling: a species of sandpiper (*Calidris arcuaria*), distinguished by the absence of a hind toe, occurring throughout the greater part of the world. It is 7½ to 8 inches long, its very bright gray above, white beneath, with the top of its head showing the breeding season, rufous. F. A. L.

Sanders: See SULLIVAN-WOOD.

Sanders, GEORGE NICHOLAS: b. at Lexington, Ky., Feb. 2, 1807; grandson of Col. George Nicholas Sanders, the signer of the "Kentucky resolutions" of 1792; became at an early age an ardent Abolitionist and politician; was appointed by President Pierce U. S. consul at Liverpool,

and by President Buchanan navy agent at New York; was a prominent supporter of Douglas in the campaign of 1860; resided in Europe during the civil war as a commissioner of the Confederate States, associated with Mason and Pickens; took part with Messrs. Clement O. Clay and James P. Holtz in the peace conference with Horace Greeley at Niagara Falls July, 1864, and after the war settled at New York, where he died Aug. 12, 1870.

Sanders, or Saunders, NICHOLAS, D. D.: polemical writer; b. at Chislewood, Surrey, England, about 1527; educated at Winchester School and at Oxford, where he became fellow of New College 1548 and Shagbolle Professor of Canon Law 1557; left England on account of the religious innovations of Elizabeth; was ordained priest at Rome 1560; accompanied Cardinal Stanislaus Hosius to the Council of Trent, where he gained great renown by his skill in disputation; went to Poland with Hosius; resided several years in Louvain, where he published (1571) his work *De ecclesiis Hieronymus Hieronymus*. In 1572 he was called to Rome by Pius V., and sent in the following year to Madrid, where he was for a long time active in organizing an expedition for the purpose of restoring Catholicism in England. This expedition he accompanied as papal nuncio in 1578. The undertaking failed, and Sanders, pursued by the English, died, in the early part of 1581, in a wood near Limerick, "of an Irish ague." (Hamilton, *State Papers*, ii, 306.) Sanders was styled by Anthony à Wood "the most noted defender of the Roman Catholic cause in his time." He was the author of *The Supper of our Lord* (London, 1605), a work in defense of the "real presence," in reply to Jewell's *Apology* and Nowell's *Challenge*, and in turn answered by the latter in his *Confutation: The Rocks of the Church* (Lancaster, 1566). A *Treatise of the Images of Christ* (1567), directed against Jewell, and of several other polemical works, of which the best known was a Latin treatise against the English Reformation—*De Origine ac Progressu Reformationis Anglicanæ* (Cologne, 1580), which was several times reprinted and translated into French, and into English by David Lewis—*Rise and Growth of the Anglican Schism* (London, 1877).

Revised by J. J. KEARSE.

SANDERSON, JOHN: author; b. near Carlisle, Pa., in 1781; became a teacher in, and subsequently one of the proprietors of, Clermont Seminary; prepared with the aid of his brother, James M., the first two volumes of the *Biography of the Signers of the Declaration of Independence* (1829); resided in Paris 1835-36; wrote an amusing and instructive work, *Sketches of Paris, in Familiar Letters to his Friends* (1838), which was republished in London under the title *The Americans in Paris* (1838), and translated by Jules Janin into French (1843); began a similar work, *The Americans in London*, of which portions were published in *The Knickerbocker Magazine*, and on his return to the U. S. became Professor of Latin and Greek in the Philadelphia High School (1836-44). D. in Philadelphia, Apr. 5, 1844. See Griswold's *Prose-writers of America*.

Revised by H. A. BERNES.

SANDERSON, JOHN BUNTER: physiologist; b. at Newcastle-on-Tyne, England, Dec. 21, 1829; studied medicine in the Universities of Edinburgh and Paris, graduating M. D. at the former 1851; became a fellow of the Royal College of Physicians, London, 1863; practiced medicine in London from 1857 to 1870, where he was assistant physician and lecturer at Middlesex Hospital, and physician to the Brompton Consumption Hospital; in 1871 was made professor at the Brown Institute; in 1874 was elected Professor of Physiology in University College, and in 1882 accepted a call to the same chair in the University of Oxford. He is the author of numerous monographs on physiological subjects.

S. T. ARMSTRONG.

SANDERSON, ROBERT, D. D.: bishop; b. at Rotherham, Yorkshire, England, Sept. 10, 1827; educated at Lincoln College, Oxford, where he became fellow 1866 and reader in logic in 1868; published lectures upon that subject, *Logic and Art Compendium* (1815), which passed through several editions; took orders in the Church of England 1811; became in 1819 rector of Boothby Pannell, Lincolnshire, which post he retained more than forty years; became prebend of Lincoln 1829 and rector of Muston 1833; was indebted to his great reputation as a consultant for the appointment of chaplain to Charles I. 1631, by whom he was made D. D. 1636, Regius Professor of Divinity at Oxford and canon of Christ Church 1642; was named by Parliament one of the Assembly of Divines convened at Westminster 1643, but refused to sign

the Covenant, and had his living sequestered; attended the king as ecclesiastical councillor at Oxford, at Hampton Court, and in the Isle of Wight; was ejected from his professorship 1648, but restored 1660, and shortly after made Bishop of Lincoln, and took part in the Savoy Conference 1661. D. at Lincoln, Jan. 29, 1663. He was the author of several Latin treatises on cases of conscience, the obligation of an oath, etc., written for the guidance of Charles I., and other tracts, collected in his *Works* (Oxford, 1854; 6 vols.), edited by Bishop Jacobson. His *Life* was written by Izaak Walton. His sermons are masterpieces.

Revised by W. S. PERRY.

Sanderson, SYBIL: opera-singer; b. at Sacramento, Cal., in 1864; passed her childhood in San Francisco, and took her first lessons in singing under local teachers. In 1881 she went to Paris and entered the Conservatory; studied later under Jules Massenet, the opera-composer. On May 15, 1889, made her *début* in Paris in Massenet's *Esclarmonde*, which was composed for her. In the previous year she had appeared at The Hague as a test under the name of Ada Palmer. In 1890 she sang in Brussels, in 1891 in London, and in 1892 in St. Petersburg. In 1893 she created the rôle of Phryne in Saint-Saëns's opera of that name. In 1894 she was engaged for the season at the Metropolitan Opera-house, New York, and made her first appearance there on Jan. 16, 1895, in Massenet's *Manon*. Her voice is a clear, brilliant, high soprano.

D. E. HERVEY.

Sandersville: city: capital of Washington co., Ga.; between the Oconee and the Ogeechee rivers, and on the Augusta Southern Railroad; 64 miles N. by E. of Macon, 135 miles N. W. of Savannah (for location, see map of Georgia, ref. 4-I). It is the center of a large cotton-growing region, and contains a private bank and two weekly newspapers. Pop. (1880) 1,279; (1890) 1,760.

Sand-grouse: a name applied on account of their habitat to the birds of the family *PTEROCOLIDÆ* (q. v.).

Sandhopper, or Beach-flea: names given, in allusion to their power of leaping, to various amphipod crustaceans found under sea-wrack near the high-tide mark. Most of the many known species belong to the genus *Orchestia*, as the common species of the New England coast, *O. agilis*. They are known also as sand-fleas and shore-jumpers.

Orchestia agilis (magnified).

Sandhurst: village; in Berkshire, England; 33 miles W. S. W. of London (see map of England, ref. 12-J). It is the seat of the Royal Military College and the Staff College. See MILITARY ACADEMIES.

Sandhurst, or Ben'digo: city of Victoria, Australia; third in size in the colony; 90 miles N. of Melbourne, on Bendigo creek, 760 feet above the sea-level; an important railway junction (see map of Australia, ref. 8-H). It is well built, and contains many public edifices, a fine botanic garden, and five large reservoirs of water. It is in the center of a rich gold-bearing region, and the district produces highly esteemed wines and considerable quantities of cereals, especially barley. The mining industry gives employment to about 7,000 persons, and one of the mines, the Lansell, has reached a depth of over 2,500 feet, the deepest on the continent. The climate is hot and variable; a maximum temperature of 126° F. in the shade has been observed. The mean annual rainfall is 24 inches. Pop. (1891) 37,238.

MARK W. HARRINGTON.

San Diego, -di-ā-gō: city; port of entry; capital of San Diego co., Cal.; on San Diego Bay and the National City and Otay, the San D., Cuyamaca and East., and the S. Cal. railways; lat. 32° 41' N., lon. 117° 13' W.; 480 miles S. E. of San Francisco (for location, see map of California, ref. 13-G). The bay, discovered by Cabrillo in 1542, is pronounced next in excellence on the Pacific coast to that of San Francisco. The first settlement was made in May, 1769, when Father Junipero Serra established here the first of the California missions, that of San Diego; but the present city dates in growth from 1867, when the new town was begun on the water front of the bay. The climate is the mildest and most uniform known, and has made the city a popular resort for invalids from all parts of the U. S. San Diego County is the principal honey-producing county in the State, and markets in the city

large quantities of wheat, wool, honey, fruit, and live stock. There are several gold mines within 50 miles of the city. The principal industry of the region is fruit and nut culture, inaugurated in 1869, and represented by over 2,000,000 trees. The city contains 3 public parks, one with 1,400 acres; U. S. custom-house; free public library (founded in 1882); public-school district library; county hospital; 16 public-school buildings; public-school property valued at about \$200,000; Academy of Our Lady of Peace (Roman Catholic); board of trade and chamber of commerce; gas and electric lights; electric street-railways; water-works; 2 national banks with combined capital of \$400,000, 3 State banks with capital of \$180,000, and a private bank; and 2 daily, 5 weekly, and 4 monthly periodicals. There are several flour and planing mills run by steam-power, large saw-works, factories for carriages and wagons, foundry and machine-shops, a tannery, and other industries. The city has an assessed property valuation of over \$14,000,000, and a bonded indebtedness, chiefly incurred for improved sewerage, of \$375,000. On the peninsula on the opposite side of the bay and connected with the city by steam ferry is Coronado Beach, which contains many fine residences and a hotel with accommodations for 1,200 guests, costing nearly \$1,000,000. Pop. (1880) 2,637; (1890) 16,159; (1894) estimated, 20,000.

H. W. TALCOTT.

Sand-lance: See SAND-EEL.

San Domingo: See SANTO DOMINGO.

Sandpaper: paper one side of which is covered with glue, upon which sharp sand or powdered glass has been evenly sifted and is held by the glue when dry. It is made of many grades and degrees of fineness, and is used in smoothing the surface of wood, by the carpenter and joiner, when giving it its final finish.

Sand Piles: See FOUNDATION.

Sandpiper: any one of several small birds of the family *Scelopacidae*, that frequent sandy shores and utter a piping note. They have a bill about equal to the head in length, covered with a soft skin; the toes, four in number, except in *Calidris*, the hindmost being very small. They are mostly distinguished from the true snipes by their shorter bills and uniformly colored tail-feathers. They are mainly birds of the northern hemisphere, and breed far north, occurring at times in great flocks during their fall migration. They feed along the shore, picking up small crustaceans, molluscs or insects, or probing for them in the mud.

There are about twenty-five species, some of wide range, twenty of which occur in North America, although one or two, like the ruff (*Machetes pugnax*) and the spoon-bill sandpiper (*Eurynorhynchus pygmaeus*), are stragglers from other regions. Among the most common is the spotted sandpiper (*Actitis macularia*), familiarly known as tip-up, which breeds in many parts of the U. S., often at some little distance from the water, and is not so gregarious as most species. The broad-billed sandpiper (*Tringa platyrhynchos*) is an Old World species.

F. A. LUCAS.

The broad-billed sandpiper.

Sands, BENJAMIN FRANKLIN: rear-admiral U. S. navy, b. in Baltimore, Md., Feb. 11, 1811; entered the navy as a midshipman Apr. 1, 1828. Served on the east coast of Mexico during the war with that country; commanded the steamer Fort Jackson in both the Fort Fisher fights in the civil war; promoted rear-admiral 1871. He was long identified with the building up of the U. S. Naval Observatory. He served as an assistant in the very earliest days of that institution, and it was through his earnest efforts that it was equipped with what was then the largest telescope in the world. During his superintendency the observatory ranked among the highest of similar institutions. See Report No. 726, House of Representatives, 52d Congress, first session, Naval Observatory. D. at Washington, D. C., June 30, 1883.

Revised by C. BELKNAP.

Sand star: a genus sometimes given to species of starfish of the orders *Asterasteria* and *Ophiasteria*.

Sandstone: a rock consisting of grains of sand held together by some cementing material. Commonly the grains are made of quartz; sometimes they are almost exclusively quartz; in a few instances feldspar predominates. The cementing material is usually calcareous, more oxide, clay, or siliceous. It more rarely cements the grains or may fill all interstices. Sandstones are generally composed of parallel layers or beds of more or less equally separable, and a thick layer is sometimes divided by thinning planes, an arrangement known as cross-bedding or false bedding. The name arises as it applies to sandstone derived from the disintegration of granite or gneiss, with little rounding or sorting. Sandstone grades successively into conglomerate or concretionary gravel, and into sand, in which the cemented fragments are large and angular. A sandstone easily quarried and wrought is called a freestone, and sandstones are otherwise characterized, according to the nature of the cement, as calcareous, ferruginous, argillaceous, and siliceous. A quartzite is a siliceous sandstone with the interstices completely filled. Sandstone is one of the most important of all building materials, and is extensively employed in the manufacture of grinders, millstones, etc. See *Barnum's Stone*, *Flaxman's Sandstone*, and *Woods*.

(J. K. Gilman.)

Sandusky: city; port of entry; capital of Erie co., O.; 8 miles from the mouth of the Sandusky river, and on the E. and O. of the Cleveland, Cin., Chi. and St. L., the Cleveland and Huron, the Lake Erie and W., and the Lake, Shore and Mich. S. railways; 41 miles W. of Cleveland (for location, see map of Ohio, ref. 2-F). The city is built on regularly with broad streets, has one of the best harbored harbors on the Great Lakes, and is supplied with gas, electric light, electric railway, sewerage, and water-works, the latter on the stand-pipe system. Steamships connect the city with Cleveland, Detroit, Toledo, and the islands in Lake Erie. There are two popular summer resorts, Cedar Point, called "The Coney Island of the West," and Johnson's Island, on which many Confederate prisoners were confined during the civil war. Put-in-Bay, Hilsenhall, and Middle Bass and Pelee islands are easily accessible by steam, and are favorite resorts for fishing-parties. The city contains 18 churches, 7 public-school buildings, 3 parochial schools, 4 national banks with combined capital of \$650,000, and 3 daily, 2 weekly, 2 monthly, and 2 other periodicals. The public buildings include a U. S. government building, United warehouse, court-house, county infirmary, jail, Public Library, and the Ohio State Soldiers' and Sailors' Home, comprising 24 buildings of blue limestone cost, exclusive of ground, \$235,070, with accommodations for 1,400 inmates. Most of the public, business, and residence buildings are made of limestone from local quarries.

Sandusky is noted for its fresh-fish industry, which has an annual value of over \$1,500,000; for wine production, which exceeds \$1,000,000 value per annum; and for its extensive manufacture and shipment of grapes and peaches. It has a prospectus of coal for rail and of iron ore, lumber, and fish for export. The principal manufactures are spokes, hubs, wheels, carpenter's tools, engines, boilers, thrashing-machines, reapers, baskets for the grape and peach trade, and boxes for wine shipments. There is also considerable ship-building. The fish industry is promoted by a large State wharf. The city has important trade relations with Canadian ports, and imports large quantities of codfish, haddock, saffron, sardines, and fish oil. In 1894 the city had an assessed property valuation of \$7,023,060, and a bonded debt of \$492,200. Pop. (1880) 15,838; (1890) 15,471; (1900) estimated, 30,000.

MARY E. LOCKWOOD.

Sand wasp: a hymenopterous insect that digs in the sand, as of the families *Pompilidae* and *Sphegidae*. See *Orthoptera*.

Sandwich: a seaport of Kent, England; at the mouth of the River, 2 miles from the sea; 12 miles E. of Canterbury (see map of England, ref. 16-M). It is one of the Cinque Ports, is surrounded by ancient fortifications, is irregularly built, and has several notable medieval structures. In the fourteenth century it was the most famous of all the English ports. The principal import is coal; principal exports, agricultural products. It forms with Deal a parliamentary borough. Pop. (1891) 2,708.

Sandwich: county-seat of Rowan County, Ontario, Canada; on Detroit river, nearly opposite DeGout (see map of Ontario,

ref. 9-A). It has a convent and Roman Catholic college, and natural springs which make it a favorite place of resort. It is the oldest place in this part of Canada. French soldiers allied to the Algonquians and Hurons were stationed here as early as 1616. Actual settlement began in 1700 or 1701 under Mathé-Cadillac and the place was then called *Polyte de Montréal*. Pop. alone (1881) 2,841.

M. W. H.

Sandwich: city (incorporated in 1850), De Kalb co., Ill.; on the Chi., Burlington, and Quincy Railroad; 36 miles S. W. of Chicago (for location, see map of Illinois, ref. 2-E). It contains a public high school, 2 private banks, and 2 weekly newspapers, and is chiefly engaged in the manufacture of agricultural implements. Pop. (1880) 2,332; (1890) 2,310.

Sandwich: town, Barnstable co., Mass.; on Cape Cod Bay, and the N. Y., N. H. and Hart. Railroad; 60 miles S. of Boston (for location, see map of Massachusetts, ref. 6-W). It lost a large part of its original territory in 1884 to the setting off of the town of Bourne (q. v.). It is a popular summer resort, and contains 10 public schools, a public library, a weekly newspaper, and manufactures of glass, jewelry, broods, and toys. Its banking business is done in Wareham or Yarmouthport. Pop. (1880) 4,242; (1890) 1,510; (1900) estimated, 2,000.

Known as "Onsetville."

Sandwich Islands: the name given by Capt. Cook, after Lord Sandwich (fourth earl), to the group now forming the independent republic of Hawaii. See *Hawaii-Nor*.

Sandy Hill: village, Washington co., N. Y.; on the Hudson river, and the Del. and Hudson Railroad; 52 miles N. of Albany, the State capital (for location, see map of New York, ref. 4-K). It derives good power from the river for manufacturing, has large lumbering interests, and contains stone-quarries, paper-mills and saw-mills, iron-furnaces, machine-shops, large bag-factory, wall-paper, print-works, two national banks with combined capital of \$160,000, a union school library founded in 1867, and a weekly newspaper. Pop. (1880) 2,487; (1890) 2,850; (1900) estimated, 3,500.

Known as "Hershey."

Sandy Hook: a low, sandy peninsula in Monmouth co., N. J.; between the Atlantic Ocean and Sandy Hook Bay, beginning at the Navasink Highlands and extending N. about 6 miles; 20 miles S. of New York (for location, see map of New Jersey, ref. 8-K). It is less than a mile in extreme width, and has a beacon-light on its northern extremity and a lighthouse, 90 feet high, less than a mile S. It was formerly the terminus of a steamboat line which there connected with a railway to Long Branch, but is now used exclusively for U. S. Government purposes. At the northern extremity is an uncompleted fortification, begun on an old plan for the defense of New York harbor and city, and S. of it is the proving-ground where ordnance and armor-plate are tested. Here are also batteries of modern rifled guns and mortars for defending the entrance to the harbor.

Sandys, Eowis: D. D.; archbishop; b. at Hawkshead, Lancashire, England, in 1519; graduated from St. John's College, Cambridge, 1539; took orders in the Church of England; embraced the principles of the Reformation; became vicar of Uxversham and master of St. Catharine's College 1547; prebendary of Peterborough 1549 and of Carlisle 1552; vice-chancellor of Cambridge University 1559; preached a sermon in favor of the royal claims of Lady Jane Grey; was consequently deprived of the vice-chancellorship in July of the same year; was imprisoned in the Tower and the Marshalsea for refusing to proclaim Queen Mary; was liberated and allowed to proceed to the Continent May, 1554; returned at the coronation of Elizabeth 1558; was made Bishop of Worcester Dec. 21, 1559, and of London 1570, and Archbishop of York 1576; was one of the translators of the Bishops' Bible 1568. A malicious plot (1582) charged him with infamous conduct, but its author, Sir Robert Stapleton, was detected and punished. D. at the archiepiscopal palace of Southwell, July 10, 1588. A volume of his *Sermons* was published 1585, was repeatedly reprinted, and was edited for the Parker Society, with a *Biography*, by Rev. John Ayre (1841).

Revised by W. S. PERRY.

Sandys, Sir Eowis: statesman; b. at Worcester, England, about 1501; studied at Christ Church, Oxford, under Richard Hooker; traveled extensively over Europe; was a supporter of the dynastic claims of King James I., by whom he was knighted 1601 and employed in several important commissions; was a leading member of the second Virginia Com-

pany, of which he became treasurer 1619; was instrumental in securing a charter for the Pilgrims of the Mayflower and in establishing representative government in the colony of Virginia, thereby becoming obnoxious to the "Spanish party" at court, and was imprisoned, along with Selden, 1621, for having opposed the royal projects in Parliament. D. at Northborne, Kent, in Oct., 1629. He founded a lectureship on metaphysics at Oxford, and wrote at Paris, in 1599, *Europæ Speculum, or a Survey of the State of Religion in the Western Part of the World*, which passed through many editions. A volume of *Sacred Hymns* (1615), containing translations of 50 select Psalms, is attributed to him.

Sandys, GEORGE: English traveler and author; b. at Bishopsthorpe, York, in 1577; educated at St. Mary's Hall and Corpus Christi College, Oxford; traveled through various parts of the Turkish empire 1610-12; published a *Relation* of his journey (1615), with illustrations, often reprinted, and considered of great value by Orientalists; went to Virginia as colonial treasurer 1621; completed at Jamestown a translation of Ovid's *Metamorphoses* (1626), of which the first five books had previously appeared; built the first water-mill, and promoted iron-manufacture and ship-building in Virginia; returned to England 1624; printed poetical paraphrases of several books of the Old Testament, and translated from the Latin of Grotius the tragedy of *Christ's Passion* (1640); was for some years gentleman of the privy chamber to the king, and passed his latter years at Bexley Abbey, Kent, where he died in Mar., 1644. A *Life* was published by Rev. H. J. Todd, prefixed to a *Selection from Sandys's Metrical Paraphrases* (1839), and a complete edition of his poetical works, with introduction and notes, was published in 1872 by Rev. R. Hooper.

San Felipe de Linares: usually called LINARES (*q. v.*).

San Felipe de los Andes, -fā-lee'pā-dā-lōs-aan'dās, or **de Aconcagua, dā-nā-kōn-kaa'gwā:** capital of the province of Aconcagua, Chili; in a valley at the foot of the Andes; 50 miles N. N. E. of Santiago, with which it is connected by railway (see map of South America, ref. 8-C). It has a considerable trade over the Andes with the Argentine Republic. Pop. (1885), 11,768. H. H. S.

San Fernan'do, formerly **Isla de Leon:** fortified maritime city of Spain; 9 miles by rail S. E. of Cadiz; on the low island of Leon (see map of Spain, ref. 20-C). It is a modern town with an arsenal, an observatory, hospitals, and barracks for troops. The population consists chiefly of Government employees, and the only industry is the extraction of salt from the neighboring tidal marshes. Pop. about 27,000. M. W. H.

Sanford: city, Orange co., Fla.; on Lake Monroe, an enlargement of the St. John's river, and the Jack., Tam. and Key W., the San. and Ind. Riv., the San. and St. Petersb., and the Sav., Fla. and West. railways; 125 miles S. of Jacksonville (for location, see map of Florida, ref. 4-J). It is at the head of large steamer navigation on the river; is an important shipping-point for oranges and for early vegetables and fruit consigned to Northern markets; and contains 10 churches, 2 public schools, railway car-shops, machine-shops, wood-turning mills, cigar and fruit-preserving factories, a national bank (capital \$50,000), an incorporated bank (capital \$31,000), and a weekly paper. It was founded by Gen. H. S. Sanford in 1870. Pop. (1890) 2,016; (1895) estimated, 3,000. Editor of "GATE CITY CHRONICLE."

San Francis'co: city, metropolis, and chief seaport of California; coextensive with San Francisco County; on the end of a peninsula 6 miles wide and 20 miles long, separating the south arm of San Francisco Bay from the Pacific Ocean, and on the N. Pac. Coast, the San Fran. and N. Pac., the S. Pac. railways (of which only the last named has a line running directly into the city); lat. 37° 48' 26" N., lon. 122° 24' 39" W. (for location, see map of California, ref. 7-B).

Site, etc.—Its area is 42 sq. miles, including, besides the entire end of the peninsula across to the ocean, Goat island, with 141 acres, 2 miles E. of the peninsula; Alcatraz island, with 30 acres, 1 mile N. of the peninsula; and the Farallones, six rocky islets, 24 miles off shore in the ocean. Nearly half the area consists of high rocky hills, rising in several points to 800 feet above the sea. The site has much level land, but a large part of this has been supplied by art, the original inequalities of the surface having been graded away. The harbor is part of a bay 50 miles long and 5 miles wide, deep, landlocked, and most beautiful. The city

is supplied with water from Pilarcitos valley, 20 miles to the S., where the rain-water is caught in a large reservoir, and artesian water is found at depths varying from 120 to 160 feet, though from many wells water must be raised by pumping. The city is laid off in rectangular blocks, separated by wide streets, which in the north run with the cardinal points of the compass, and in a portion of the south with the semi-cardinal points. Market Street, which separates the two main surveys, 125 feet wide and 3 miles long, is one of the most important and imposing business streets in the world. Among remarkable features are the peninsular position, fronting to the W. on the Pacific Ocean, to the E. on the bay, and to the N. on the Golden Gate; the wooden architecture in the residence district; the hilly site; the excellent street-car system, with cables over many of the hills; Chinatown; the fruit-market, wonderful in variety and abundance of its supplies; the wharf for Italian fishing-boats; the Seal Rocks, with their sea-lions at the entrance of the harbor; Suto Heights, a pleasure-garden kept open to the public by Adolph Suto; the Suto bath-house; the numerous large hotels; and the peculiar climate, which permits the fuchsia and geranium to blossom in the open air of mid-winter while it compels the wearing of overcoats in mid-summer. Golden Gate Park has an area of 1,050 acres, with abundant evergreen vegetation of beautiful form and color, excellent drives, commodious and elegant buildings for public entertainment, creditable statuary, a highly varied site, a steep hill 900 feet high on the S., and a magnificent ocean beach and surf at its west end.

Climate.—There is almost unbroken coolness of temperature by breezes fresh from the ocean every day. The annual death-rate for each 1,000 inhabitants is 20, a proportion exceeded in most other seaport cities of equal size. The heavy fogs in summer are pernicious to asthmatics, and consumptives find better climates in other parts of the State.

Buildings.—The city-hall, though unfinished at the close of 1894, had cost \$5,000,000. It is the largest building of the city in ground plan. Its material is brick, covered in front with stucco. The branch mint has an imposing front of gray limestone in the Greek style of architecture. The Palace Hotel, of brick, seven stories high, cost with its site \$3,000,000, and is one of the largest and most famous hotels of the world. Other notable buildings are the Academy of Sciences, the Pioneer Hall, both endowed by James Lick; the Cooper Medical College and Lane Hospital (in adjoining buildings); the Hopkins Art Institute, given to the State by E. F. Searles; the Mills building, twelve stories, of brick and stone, with a framework of steel, erected at a cost of \$1,000,000; and several other high buildings of similar construction. The prevalent style of architecture is highly ornamental, with a great multitude of bay-windows designed to catch as much sunlight as possible. The material of nine-tenths of the dwelling-houses and of many of the factories is wood.

Institutions.—As an important seaport San Francisco has a large custom-house, a national marine hospital, a national military post (the Presidio), and on the northern border of the peninsula, and also on Alcatraz and Goat islands, extensive fortifications. The city has a large number of churches and educational and philanthropic institutions. The Mechanics' Institute has property valued at more than \$1,000,000; the Academy of Sciences had an endowment of about \$600,000 from the estate of James Lick, and the Lick Mechanical Art School one of \$540,000.

Government.—The city council (consisting of a board of twelve members, known as the board of supervisors) and the chief executive officers, including mayor, auditor, treasurer, assessor, sheriff, recorder, county clerk, public administrator, and coroner, are elected biennially. The expense of the municipal government in the fiscal year ending June 30, 1894, was \$5,370,000 (\$19 for every resident), including \$1,080,000 for schools, \$600,000 for police, \$400,000 for the fire department, and \$650,000 for repairing, cleaning, and lighting the streets. The debt in excess of the sinking fund was \$260,000, and the assessed value of property \$342,000,000.

Manufactures.—The city has numerous large manufacturing establishments, including a rolling-mill, machine-shops, foundries, shipyards, wire-works, ropewalk, planing-mills, sugar-refineries, and factories for carriages, furniture, boxes, shoes, clothing, tinware, etc. The gross value of the products manufactured in 1894 was estimated at \$90,000,000, including refined sugar, \$18,000,000; glass, \$8,000,000; clothing and shoes, \$8,000,000; furniture and

THE NEW YORK

ASTOR, LENOX AND
TILDEN FOUNDATIONS.

manufactured merchandise, \$9,000,000; mining and other metal work, \$1,000,000; and ship building and repairing, \$500,000. The total value of metal work, exclusive of gold and silver worked at the mine, was \$90,000,000.

Climate.—The winds are strong and constant, but rarely violent. Between noon and the afternoon is only about 5 deg. or that degree can always lead and discharge at the same time. A large stone dry dock and floating dock give facilities for repairs. By possession of a central position on the west coast of the continent, the only secure deep harbor between San Diego and the Columbia river, which are 1,000 miles apart, a situation at the outlet of the only navigable river and large valleys of California, and of the best transcontinental railway route over the mountains of Nevada, and of the large extent of tributary territory and its great agricultural and mineral resources, San Francisco has a high cosmopolitan character. The merchandise imports in 1904 were valued at \$109,000,000; exports of lumber at \$19,000,000; wheat, \$5,000,000; and general merchandise, \$29,000,000. The shipping that enters the harbor in a year measures 1,300,000 tons, of which about half comes from foreign ports. The amount on deposit in the banks is \$130,000,000, and the bank clearances in 1904 were \$450,000,000.

History.—The first settlement of white men was made in 1776, by Spaniards, who then established a military post and a mission of Franciscan friars, who devoted themselves to the conversion of the Indians. After the country passed to the dominion of Mexico, a small village called *San Francisco*, inhabited by Mexicans, grew up about the mission. Another village, called *Yerba Buena*, was laid off near the old anchorage, 3 miles N. E. of the mission, in 1836. The occupation of California by the naval forces of the U. S., with an official announcement of permanence, stimulated the growth of *Yerba Buena*. In Jan., 1847, the name was changed to San Francisco, and a census showed a population of 450. In 1848 the discovery of gold in the Sierra Nevada brought a flood of people from remote countries of the world. Among the notable events of San Francisco were five great fires in 1849, 1850, and 1851; the formation of vigilance committees which in 1851 and 1856 executed criminals by extra-judicial process; the Fraser river fever in 1857, when the market value of real estate fell more than 50 per cent. because of the large migration to British Columbia; and the earthquake of 1868, 71, 1894.

Population.—(1880) 232,959; (1890) 208,000, of whom 127,000 were foreign born, including 30,000 from Ireland, 25,000 from Germany, 10,000 from England and Scotland, 5,000 from Italy, 4,500 from France, and 3,000 from Sweden.

Demography.—See the *Municipal Reports*, published annually by the city since 1901; John S. Hittell, *History of San Francisco and Resources of California*; Theodore H. Hittell, *History of California*; Hubert H. Bancroft, *History of California*. JOHN S. HITTELL.

San Francisco de la Selva de Copiapó: See **COPÍAPO**.

San Francisco Mountain: the loftiest mountain in Arizona; lat. 29° 27' N.; lon. 111° 40' W.; altitude, 12,800 feet. It stands alone, rising abruptly from the Colorado plateau, to a height of 5,000 feet, and is a conspicuous landmark from all directions. Near it are the lesser cones of Mt. Williams, Kendrick, and Saguavet. Its base is 10 miles across, and its crest takes the form of a crescent, with the concavity turned to the east. Geologically, it is partly a remnant of erosion and partly a mountain of circumduction. Its upper part is composed of lava, which was erupted before the plain had been degraded to its present level. The tough lava opposed a more stubborn resistance to the agents of erosion than did the sedimentary rocks of the plain, and not merely held its own while the latter were worn away, but protected and preserved that portion of the strata which it covered. As erosion proceeded, fragments of the volcanic rock fell down upon the sedimentary escarpment, and so nearly covered it that it can be detected at a few points only. The strata preserved under the lava are of Triassic age; the bed which constitutes the surface of the plain is the upper member of the Carboniferous formation. So the mountain is an insular table of Triassic sandstone, standing on a Carboniferous floor, and capped by a volcanic cone. Hence the removal of the Triassic strata by erosion have opened in the plain, and basaltic lava has flowed out, spreading over the surface in broad black sheets and shrouding up hundreds of low cones. From the summit of San Francisco one can look down into the throats of more than a hundred volcanoes. O. K. GILNEY.

Sangallo (It. *Giovanni*), the architect; b. in Florence, Italy, in 1444. He studied engraving, and then became an engraver. His first work as architect was the cloister of the Carminites of Santa Maddalena dei Pazzi in Florence. He built the palace of Poggio Imperiale for Lorenzo the Magnificent, and the Church of the Madonna delle Carceri, of which Lorenzo laid the first stone in 1495. He restored the fortifications of the city of Ostia by order of Cardinal Giuliano della Rovere. On his return to his native place in Florence, he built a monastery for the hermit monks outside the Porta Sangallo, and received the surname of *la Sangallo* from this work. At Milan he began the splendid palace for the Duke Moro which was interrupted, and at Lucca the cupola of the Church of the Madonna. He restored the roof of Santa Maria Maggiore at Rome, under Alexander VI.; this he is said to have gilded with the first gold from America. He constructed the cloister of the Santi Apostoli in Rome, and designed the beautiful facade of the Church of the Florentines. The Gonfaloniere of Florence, Pietro Soderini, made use of Sangallo at the siege of Milan, where he constructed an ingenious bridge and the fortress and the gate of St. Mark. He was called again to Rome by Leo X., who asked him to undertake the direction of the building of St. Peter's, but, being ill, he returned to his own city. D. in 1517. His brother was a remarkable architect, as was Antonio Sangallo, a son of his sister. W. J. STILLMAN.

Sangha, or **Samgha** [Sanskrit, *saṃgha*, assembly or congregation]: the monastic brotherhood, community, or order founded by the Buddha. It consists of men who have renounced all family ties and all worldly desires, and are pledged to devote themselves to meditation, the recital of the law, self-restraint, and the accumulation of merit in order that they may find deliverance from the round of birth and death. The order is open to men of all ranks, provided they are over twenty, have the consent of their parents, are free from disease or bodily defect, are not soldiers or in the service of the state, and are not debtors, slaves, or criminals. They are pledged to celibacy and mendicancy, and depend for support on unsolicited alms. The term *sangha* is sometimes rendered "church" and sometimes "priesthood," but erroneously in both cases, as, except in Tibet, Buddhism has no ecclesiastical organization and no religious rites or ceremonial observances. The *sangha* is also the third member of the *Triratna*, or Buddhist Trinity. See **TRIRATNA**.

San Gil: See **SAN JIL**.

Sangir, or **Sangir Islands:** a chain of islands connecting Celebes and the Philippine Islands, lying between the Sea of Celebes and the Pacific Ocean, belonging to the Netherlands. Area, 823 sq. miles. The largest island is Great Sangir, on which is the celebrated Gunung (or volcano) Abu, a superb pyramid, subject to frequent eruptions. That of 1856 caused the death of 2,500 people; another eruption was contemporaneous with that of Krakatau. The islands produce woods, coconuts, sugar, rice, trepang, and turtles. The inhabitants are Alfurans, pacific, industrious, in part Christian and Mohammedans, in part pagans. Pop. (1888) 76,387. The Taluat Islands to the N. E. are sometimes included in the Sangir group. They have a somewhat greater area, and a population estimated at 5,000. MARK W. HARRINGTON.

Sangkoi: chief river of Tonquin. See **SOUKOU**.

San'greal, Sangraal, or Holy Grail [*Saugreal* is from O. Fr. *saīnt*, holy + *grail*, O. Span. *grail*: Portug. *grail* < Lat. **crataelis*, deriv. of *cratus*, crater, bowl]; according to medieval legends, the cup of emerald which held the wine at the first celebration of the Lord's Supper. St. Joseph of Arimathea, it is related, received some of the blood of the Lord in this cup at the crucifixion. In the earliest form of the legend, *Le petit Saint Graal*, composed about 1160 and ascribed to Robert de Boron, the brother-in-law of Joseph of Arimathea carries this communion chalice to the West. In *Le grand Saint Graal* and *La Queste del Saint Graal*, ascribed to Walter Map, a gentleman of the court of the English Henry II., it is Joseph himself who brings the Grail to England. These romances connect the legend with the stories of King Arthur, several of whose knights undertake its quest, an adventure finally achieved by the maiden knight Galahad. Galahad takes it back to the East, and on his death it ascends to heaven. In the *Conte del Graal* of Gersten de Troyes (about 1190), and the *Parzival* of his German continuator Wolfram von Eschenbach, Percival is substituted for Galahad as the hero of the Grail legend.

The fragment of a Graal romance, *Joseph of Arimathea*, exists in English alliterative verse of the fourteenth century, and has been edited for the Early English Text Society by Rev. W. W. Skeat (1871). H. A. BEERS.

Sangster, CHARLES: poet; b. near Kingston, Ontario, Canada, July 16, 1822, and educated there; was editor of the *Amherstburg Courier* and Kingston newspapers for fifteen years, and in 1868 became attached to the Post-office Department, Ottawa, from which he was retired in 1886. He published *The St. Lawrence, The Saguenay, and other Poems* (1856), *Hesperus and other Poems and Lyrics* (1860).

'Sanguina'ria: a genus of plants containing one species, *S. canadensis*. See BLOOD-ROOT.

San'hedrin, incorrectly but commonly **Sanhedrim** [from Heb. *san'hedh'rin*, from Gr. *συνέδριον*, assembly; *σίν*, with, together + *ἔδρα*, seat]: either of two councils of the ancient Hebrews.

A. *The Great Sanhedrin*.—The Jewish tradition traces its origin to the seventy councilors appointed by Moses (Num. xi. 16-25; comp. Ex. xviii. 13-26), and asserts, without proof, its existence at all periods of the nation's history until after the destruction of Jerusalem by the Romans. The earliest reliable trace of its existence is under the Maccabees (2 Macc. i. 10; iv. 44; xi. 27; 1 Macc. xii. 6). It was in full activity at the time of Herod (Joseph., *Ant.*, xiv. 9-4), and we find constant mention of it in the New Testament (Matt. xxvi. 59; Mark xiv. 5, xv. 1; Luke xxii. 66; John xi. 47; Acts iv. 15, v. 21, 27, 34, vi. 12, 15, xxii. 30, xxiii. 1, 6, 15, 20, 28). It was the supreme "privy council" of the Jews; not only their court of final appeal and last resort, but also an executive and legislative assembly, shaping the general polity of the nation. Its power in matters civil and religious was practically unlimited. It decided all cases brought upon appeal from the lower courts; it had authority over kings and high priests; in it was vested the trial of heresy, idolatry, false prophecy (hence the active part it took against our Lord); and it alone had power to pronounce sentence of death. Its active jurisdiction was confined to Judæa, but the Jews in all parts of the world seem in some degree to have recognized its authority. Owing to the inability to check the constant disorders during the last years of the Jewish commonwealth, its power was greatly curtailed by the Romans, and three years before the death of Christ the right of executing sentence of death was denied, save when confirmed by the Roman authorities (John xviii. 34). In the unsettled condition of affairs attending the fall of Jerusalem it found itself unable to execute civil authority, and from that time until its extinction in the third century its power was merely nominal.

It had seventy-one members chosen from those who were distinguished in birth, learning, or position. In the New Testament are mentioned (1) priests (*ἀρχιερεῖς*), chiefs of different orders of priests; (2) elders (*πρεσβύτεροι*), those venerable from age or position; (3) scribes (*γραμματεῖς*), those learned in the law and tradition. Its officers were president (*Nasi*, chief); first vice-president (*Ab-beth-din*, father of the court); second vice-president (*Ilhakam*, judge); besides a force of secretaries and court officers (Luke xxii. 52). The members sat in a semicircle in a room immediately adjoining the temple, called *הבית החדר* (hall of squares).

Their meeting in the house of the high priest for the trial of our Lord does not seem to have been legal. After the fall of Jerusalem they removed to Tabneh, and finally to Tiberias, where the Sanhedrin became extinct A. D. 425.

B. *The Lesser Sanhedrin*.—A court of twenty-three members appointed by the Great Sanhedrin, sitting in all towns of over 120 households, with jurisdiction over local, civil, and criminal matters. See Matt. v. 22, x. 17; Mark xiii. 9.

LITERATURE.—Selden, *De Synedriis et Præfecturis Juridicis Veterum Ebraeorum* (1650), a mine of learning and the great source from which all knowledge of this subject is drawn, but containing a mass of irrelevant matter; Ugolini, *Thesaurus*, vol. xxv.; Lightfoot gives much valuable information, derived from the Talmud and Mishna (see *Works*); cf. Schürer, *The Jewish People in the Time of Christ*, Eng. trans., second division, i., pp. 163-195.

Revised by S. M. JACKSON.

Sanitary Commission, The United States: an organization formed during the civil war for the purpose of distributing relief to the soldiers of the Union army. On Apr. 15, 1861, the day of President Lincoln's call for 75,000 men,

the women of Bridgeport, Conn., organized a society with the somewhat vague idea of affording relief and comfort to the volunteers. In Charlestown, Mass., on the same day, and at Lowell a few days after, the women of those cities formed similar societies. On Apr. 19 the ladies of Cleveland, O., organized an association for the care of the families of volunteers. The Women's Central Relief Association (founded at a public meeting in the Cooper Union, New York, Apr. 29, 1861) sent a committee to Washington to confer with the medical bureau and the War Department in order to learn more definitely in what way, with least embarrassment to the Government and most help to the army, the women could serve the volunteers. They presented to the Government their plan, based very much on the sanitary commission of Great Britain, asking for the appointment of a scientific board, to be commissioned with ample powers for visiting all camps and hospitals, advising, recommending, and, if need be, enforcing, the best-known and most approved sanitary regulations in the army.

The Government not unnaturally dreaded the possible collision of such a body with the medical and military authorities, and required that the consent of the medical bureau should be obtained before such a commission was appointed. This consent was denied. The best that could be secured was the appointment of a doubtful semi-official commission, with the privilege of advising with the medical bureau, of visiting the army in the field, and of recommending to the War Department sanitary regulations and reforms. A few things soon became obvious, and guided their course:

1. The great object of such a commission must be to develop, strengthen, and support the regular medical and military authorities and methods—to stimulate the departments having the supply of food, transportation, camp equipment, drainage, and incite them by kind and wholesome criticism and counsel, and by the force of public opinion, to do their utmost to prevent pestilence and the spread of scurvy, and the lessening of needless exposures of every kind.

2. The Sanitary Commission became very early in its history thoroughly convinced that to prevent evils to the health of the army was greatly more important and serviceable than to attempt to cure them after they appeared. It accordingly gave its attention chiefly to prevention, by a system of camp-inspection and the promulgation of counsels touching the choice of camp-sites, the importance of drainage and police, and the character and cooking of food. By the appointment of skilled medical inspectors it established at once an advisory and tolerably friendly relation with the surgeons in the field.

Among the policies of the Sanitary Commission was the prevention of incompetency, inefficiency, and contracted ideas in the medical bureau. Another preventive measure which it inaugurated was the erection from its own models of pavilion hospitals, designed to make contagion and pestilence less easy and fatal. Its plans became the type of the great general hospitals which were erected at the base of the Union armies.

One of the earliest services of the Commission was the establishment of soldiers' homes at the chief places where new regiments were concentrating, to take care of the sick and supply the defects in the unperfected arrangements of the quartermaster's bureau for receiving them.

As soon as the capture of Fort Donelson the Commission, finding the Government transportation of the sick to hospitals very rude and inadequate, began to organize a system of hospital steamers. These boats, supplied with every comfort, with surgeons and nurses, plied between the ports nearest to the seats of war and the nearest general hospitals, and transported in comparative comfort tens of thousands of sick and wounded men. The cars in which the largest portion were transported were places of torture to wounded men. The Commission devised a sort of hospital-car, in which the common stretcher upon which the wounded man was carried from the field could be converted into a hanging bed in the car. The car was so hung on gutta-percha springs as to obviate jolting.

The wants of the hospitals and camps very early in 1861 had exhausted 60,000 articles which had been forwarded to the Commission. By September of that year it became plain that a demand for extra food and extra clothing was going to exceed anything that the unorganized and intermittent beneficence of the people would furnish. The organization of over 7,000 aid societies, which offered opportunities to millions of women to take some active share in the war, was one of the Commission's best services. On Sept. 5, 1861,

depot of supplies were established at New York, Boston, Philadelphia, Washington, Cincinnati, and Wheeling. General and associations were in evidence at Boston for New England, at New York for the state and part of New Jersey, at Philadelphia for Pennsylvania, Delaware, and Western New Jersey, at Cincinnati, Columbus, Cleveland, in Chicago, at Iowa, and Wisconsin, for the great Western States, which throughout the war were admitted to the greatest aid and sympathy. Types and other customs had made hundreds of cities and villages comfortable.

Medical Care Relief.—The medical department, having no independent organization, often suffered from the inevitable preoccupation of the quartermaster's department with the more urgent duty of forwarding military stores. The Sanitary Commission, aware of the chief means of sustenance, had money and horses of its own—often forty-four horse teams at a time—and this enabled it at periods when transportation of medical stores was most embarrassed to forward hospital and sanitary supplies to thousands of immediate battle lines in advance of the medical department. After Antietam (Sept. 17, 1862) nearly 10,000 wounded Union soldiers, besides many Confederate soldiers, were left an immense proportion of the whole population in the woods and fields, without any adequate supply of surgeons, and with not a tenth part of needed medical stores, which were locked up in the block of the railway between Baltimore, the base of supply, and the battlefield. A wagon-train loaded with medical stores had, however, been sent forward from the Sanitary Commission only for some time to meet this anticipated difficulty. For three days the medical director received no Government supplies, and the wounded were mostly dependent meanwhile on the stores of the Commission.

General Relief Services.—Early in the war new regiments, fresh from recruitment offices, arrived at Washington and other centers with sick men and exhausted soldiers, compelled to walk many miles to their camps, with no Government provision of food for them at the depots. The Sanitary Commission at once established near the principal army soldiers' homes, where weak and sick men could be recuperated, received, restored to health, and forwarded to duty. Forty soldiers' homes and lodges, in short, were maintained by the Sanitary Commission in its broad field, reaching from Washington to Brownsville, Tex., and from Louisville, Ky., to Port Royal, S. C.

The Hospital Directory.—This was an organized effort to identify and keep the run of the names of all private soldiers who passed through the general hospitals, so that a soldier's friends could follow him, know where he lay, if he lived or died, and what became of him when out of hospital. The central office at Washington was opened to the public Nov. 27, 1864; branches were soon established at Philadelphia, Louisville, and New York.

Quarantine Bureau and Warehousing Agency.—This agency, free of all cost to soldiers, was designed to obviate the accumulations of malleability, or want of strength to win their own way as to secure correct papers, among soldiers passing through the homes and depots of the Commission.

Special Examination of Hospitals.—This was one of the duties undertaken by the Sanitary Commission. It organized a corps of army physicians and surgeons of assumed position, under Dr. Henry W. Clark, of Boston, as inspector-in-chief, who visited all the general hospitals in the country, and reported in a thorough and exhaustive manner (in 2,500 folio pages) to the medical committee of the Sanitary Commission. The object was to attain such information in regard to the practical management of the hospitals as might furnish suggestions to the surgeon-general for improvements in the system.

History of Field Hospitals.—The most scientific and permanently valuable part of the work of the Sanitary Commission was its effort to collect, tabulate, and turn to account such returns as a system of careful inspection could supply touching the effects of applied or neglected hygiene, of diet, of long marching and heavy equipment, of tent and fixed hospitals, the mortality of young recruits, the influence of climate, age, drill, nationality, of previous occupations, or of other connection upon soldiers; the height, weight, strength, and force of the enlisted men.

Account of History of the Commission.—The earliest call for aid published by the Commission was June 21, 1861. In two week papers were addressed to the people at large, the names of the managers and companies. In Mar., 1862, it looked to the Sanitary Commission must disband for want of funds, but its funds were determined not to abandon the enterprise. The first large contribution received was \$100,

000, by telegram dated San Francisco Sept. 10, 1862. Supplies had been running in out of all proportion to the money necessary to move and distribute them. This splendid gift from distant California awoke a general enthusiasm. From that date, after every great battle, money and supplies came pouring in from other quarters, but with each of them came a still greater drain on the stores and the treasury. In the beginning of 1864 a series of great fairs was inaugurated, either by officers of the Commission, or by the friends, in aid of its treasury or of the independent treasury of its branches. They occurred at Chicago, Cincinnati, Cleveland, Philadelphia, Albany, Baltimore, Boston, Brooklyn, New York, Philadelphia, and many other towns and cities. The net product reached \$2,736,929.84. The total amount of money received from the people by the Sanitary Commission up to May 1, 1866, was \$4,082,014.26; but at least \$9,000,000 more was raised and expended in its interest by its branches. Free transportation by railway and express companies and communication by telegraph lines saved the Commission at least two-thirds of the cost in these departments of its work. The aggregate value of the services rendered by the public to the Commission has been estimated at \$23,000,000.

Internal Organization.—The original board consisted of nine persons, with power to add as many more associates as they deemed necessary. The order of the Secretary of War creating the Commission was dated June 9, 1861. The board had a general supervision of the work, the defining of its policy and measures, which were committed to secretaries, heads of bureaus, and agents for execution. To them was presented by the general secretary a sketch of the work founded on the reports of the heads of the various bureaus. The pressure and complexity of the business compelled the board to appoint from its members a standing committee charged with all the responsibility of the Commission during the intervals between its sessions. This committee consisted of Rev. Dr. Hallows, Dr. W. H. Van Buren, Prof. William Gilks, E. T. Strong, and Dr. C. H. Agnew, and C. J. Stillé was afterward added. It was necessary that this standing committee should be constituted of gentlemen living near each other, as their meetings were held necessarily daily, and New York thus became their headquarters. For further details see Moss's *History and Work of the Sanitary Commission*.

Abridged by C. H. Adams.

Sanitary Engineering: See DRAINAGE, PLOWING, and SEWERAGE.

San Jacinto: a river of Texas, which rises in Walker's, and flows S. E. 120 miles to San Jacinto Bay, an arm of Galveston Bay; navigable 45 miles. On its banks, 2 miles S. W. of the junction of the river and Buffalo bayou, the closing battle of the war of Texan independence was fought Apr. 21, 1836. Gen. Houston, in command of the Texan forces, had been gradually falling back eastward, toward San Jacinto river and bay, before the advance of the Mexican army under Gen. Antonio Lopez de Santa Anna from the W. The armies were marching on parallel lines, Houston's object being to reach the river and hold the ferry at its mouth; Santa Anna's to cut off his retreat and capture him. They reached the bay boundary almost simultaneously, and took position within a mile of each other. On the 26th some skirmishing took place, with but little result. On the 28th, with the cry, "Remember the Alamo!" the Texans made a sudden charge, and at the expiration of an hour Santa Anna had fled, and the whole of his army not slaughtered in the action had surrendered. The force of the Mexicans was 1,536; that of the Texans about 700. The latter had 6 men killed and 26 wounded.

San Jil, Sanjil, or San Gil.—(heef): a town of the department of Santander, Colombia; 20 miles S. S. W. of Bucaramanga, in a narrow valley, 2,600 feet above the sea. It is the center of an agricultural district (sugar-cane, cotton, and tobacco), and manufactures Panama hats. Pop. about 10,000.

H. H. S.

San Joaquin (wā-keen) River: a stream which rises at the foot of a small glacier near the summit of Mt. Lyell, on the eastern border of the Sierra Nevada, California, flows S. W. for nearly 100 miles, then turns N. W. and traverses the magnificent valley of the same name, and at last, joining with the Sacramento, enters Suisun Bay. The discharge to the sea is through the Golden Gate. At high water the outflow of the Tulare system of lakes is discharged by the San Joaquin, which is navigable to Stockton for large steamers for a good part of the year. The river is some 350 miles long.

Revised by J. C. Russell.

San'jo Saneyosh'i: statesman; b. at Kioto, Japan, in 1836, of an old princely family. He early began to take a prominent position in state matters. His efforts were directed to the restoration of the imperial power, and his co-operation at court was invaluable to Saigo and the other leaders of the malcontents in the provinces. After the restoration in 1868 he became vice-premier, and in July, 1871, premier, a position which he held until 1886, when he became chancellor. D. Feb., 1891. J. M. D.

San José, -hō-sā': capital of Costa Rica (since 1823) and of the province of San José; in a valley at the foot of a chain of volcanic mountains; 95 miles by rail from the port of Limon on the Caribbean Sea, and 60 miles by mixed route from Puntarenas (see map of Central America, ref. 8-J). It is the commercial center of the republic, and lies in one of the richest agricultural districts; has a cathedral, national library, university, various Government buildings, and two fine parks. San José is about 4,000 feet above the sea, and consequently has a temperate climate; the water-supply is good, but there is no drainage. Owing to the frequency of earthquakes, all the buildings are low, and the churches are without towers. San José was founded about 1750. Pop. 25,000. H. H. S.

San José: city; capital of Santa Clara co., Cal.; on the Southern Pacific Railroad; 8 miles S. E. of San Francisco Bay, 47 miles S. of San Francisco (for location, see map of California, ref. 8-C). It is in the heart of the beautiful Santa Clara valley, and is connected with San Francisco by three lines of railway and a waterway through the bay, and with the Pacific Ocean at Santa Cruz and Monterey by rail. The city is laid out in the form of a parallelogram, with streets ranging from 60 to 100 feet in width. There are four public parks—Washington Square, 28 acres, containing the State Normal School (cost \$200,000); the Plaza, 4 acres, containing the new city-hall (cost \$150,000); St. James's Park, 2 blocks in the center of the city, opposite the court-house and Hall of Records (cost \$500,000); and Alum Rock Park, 7 miles E. of the city, 400 acres, containing numerous mineral springs, and connected with the city by a beautiful boulevard and by railway. The city contains a U. S. Government building that cost \$200,000.

Churches and Schools.—San José contains a Roman Catholic Cathedral and 2 other Roman Catholic churches, 7 Methodist Episcopal, 4 Presbyterian, 4 Baptist, 3 Lutheran, 2 Protestant Episcopal, 2 Christian, and one each Congregational, Friends, Jew, Seventh-day Adventist, and Unitarian. There are also a Young Men's Christian Association, Young Men's Institute, Union Chapel, Spiritual Union, Salvation Army barracks, Theosophical Society, Christ's Rescue Mission, and Florence Night Mission. The public-school system comprises a high school, 6 grammar schools, and 6 kindergartens, with an enrollment of 4,000 pupils and an annual cost of maintenance of over \$90,000. The Roman Catholic Church maintains Notre Dame College, St. Joseph's College, Notre Dame Academy, and St. Aloysius's School, and the Methodist Episcopal Church the University of the Pacific, half a mile N. of the city. There are 2 commercial colleges, 4 private schools, a public library, and 4 daily, 9 weekly, and 5 monthly periodicals. The charity institutions include the O'Connor Sanitarium (Roman Catholic), the Pratt Home for Old Ladies, and the Home of Benevolence, maintained by the Ladies' Benevolent Association.

Finances and Banking.—The city has annual receipts and expenditures of about \$275,000, net debt of \$300,000, and a property valuation of \$17,800,000. Unassessed realty belonging to the city, parks, reservations, etc., estimated, \$1,000,000. In 1894 there were 6 State banks with combined capital of \$1,590,000, and a national bank with capital of \$500,000.

Business Interests.—Lying in the center of a great fruit-growing region, the dominant industry is the preparation and handling of the fruit product. There are three large canneries, one the largest in the world, numerous packing-houses and shipping firms, a large woolen-mill, and an extensive yard for granite-polishing and marble-cutting.

History.—The pueblo of San José was established in 1782 by the Spaniards. Under the first constitution of California the State capital was located here. The completion of the overland railway in 1869 greatly promoted the prosperity of the city, and since 1880 its growth has been rapid. Pop. (1880) 12,567; (1890) 18,060; (1894) with suburbs, estimated, 30,000. CHARLES H. ALLEN.

San José de Cucuta: See CUCUTA.

San Juan, -hōo-aan': a western province of the Argentine Republic, between Chili, Rioja, San Luis, and Mendoza. Area, 29,700 sq. miles. A great part of the surface is covered with mountain-chains, parallel to the Andes, and 7,000 to 13,000 feet high. In the west there are arid tablelands, and in the east extensive *travesías* or dry deserts, which could be reclaimed by irrigation. Most of the inhabitants are gathered in the three fertile valleys of Tulán, Jacal, and Fertil. Cattle and sheep are raised and exported to Chili, but agriculture is the principal occupation. There are extensive vineyards, and the wines of San Juan, resembling Malaga, are noted. Until 1884 the province was frequently devastated by civil wars. Pop. (estimated, 1893) about 150,000. San Juan, the capital, on the San Juan river, was founded in 1561, and has a population of about 15,000. On Oct. 27, 1894, it was partly destroyed by an earthquake. HERBERT H. SMITH.

San Juan Bautista, -bow-tees'tā': capital of the state of Tabasco, Mexico; on the west or left bank of the river Grijalva, which is navigated by small steamers to this point (see map of Mexico, ref. 8-J). It is built on flat land, has few public or private buildings of any pretension, and is hot and somewhat unhealthful. It controls the trade of the upper Grijalva and portions of Chiapas. Pop. 11,000. H. H. S.

San Juan de Fuca, Strait of: the entrance to Puget Sound and the Gulf of Georgia; lies S. of Vancouver's Island and N. of the State of Washington. Its entrance is in lat. 48° 23' 30" N., lon. 124° 43' 48" W.

San Juan del Norte: See GREYTOWN.

San Juan del Río: a town of the state of Querétaro, Mexico; 28 miles E. S. E. of Querétaro; 6,500 feet above the sea (see map of Mexico, ref. 7-G). It owes its importance principally to rich silver mines in the vicinity. The place is beautifully situated and surrounded by gardens. Pop. about 10,000. H. H. S.

San Juan del Sur: a port of Nicaragua; on a bay of the Pacific, where the coast is nearest to Lake Nicaragua (see map of Central America, ref. 7-H). The harbor is good and safe. This was the Pacific terminus of the Central American transit route, now abandoned; it is the only cable-station on the Pacific side, and the commercial port of Southwestern Nicaragua. The proposed interoceanic ship-canal will terminate just N. of this place. H. H. S.

San Juan de Nicaragua: See GREYTOWN.

San Juan de Puerto Rico: capital and most important city and port of the island of Puerto Rico, Spanish West Indies; on a bay of the northern coast (see map of West Indies, ref. 5-J). The city is built on the western extremity of a low coral island which shelters the bay; the latter forms one of the safest and most commodious harbors in the West Indies, but the entrance is somewhat difficult, requiring a pilot. San Juan was founded by Ponce de Leon in 1511; subsequently it was strongly fortified and repulsed several attacks by English fleets. The most important exports are coffee and sugar. Pop. (1887) 26,387. H. H. S.

San Juan River, Nicaragua: See NICARAGUA.

Sankey, IRA DAVID: evangelist; b. at Edinburgh, Lawrence co., Pa., Aug. 28, 1840; in business at New Castle, Pa., 1855-70, when he joined Dwight L. Moody in evangelistic work in Chicago, Ill. They labored together in Great Britain 1873-75, and again in 1883. Mr. Sankey is the author of several popular sacred tunes, and has published a compilation entitled *Sacred Songs and Solos*.

Sāṅkhya [Sansk. *sāṅkhya*, enumerative (see below), from *sāṅkhyā*, number] is the name of the oldest one among the products of Indic speculation that was elaborated into a complete system. For the names of the other five systems, see SANSKRIT LITERATURE. Native tradition makes the Sāṅkhya system older than Buddha (older, say, than 500 B. C.), and maintains that Buddha in the establishment of his doctrines was greatly influenced by it; and this tradition is supported by many correspondences between the two systems. The origin of the rationalistic Sāṅkhya is to be sought in the reaction from the idealistic monism of the Upanishads (see VEDĀNTA), and is to be localized in the same region that brought forth also Buddhism. Originally the system must have maintained an open hostility to the Brahmanical system, as appears indeed from its polemics against Brahmanical ceremonialism. But in the first pre-

Christianity elsewhere, the Brahmins began to make friends with the Sāṅkhyas and to treat their doctrine as not irreconcilable with those of the Vedānta. Later, the Sāṅkhyas appeared as a conscious recognition of the infallibility of the sacred Brahminical literature; and their system, in turn, was received into the number of the six "orthodox" systems. Indeed, Sāṅkhyan doctrine pervades the whole classical Sanskrit literature so far as it concerns itself with a philosophical idea from Manu's law-book and the *Yogasūtra* down to the Purāṇas.

The accuracy of Kapila, the founder of the system, and of his alleged pupil Asuri, are wholly unknown. It is not even probable that the first Sāṅkhyas taught composed any works. The oldest authority of whom we can speak with any certainty is Paninīyasa, who flourished a little after the beginning of our era, but of whose writings only scanty fragments are left. The full bloom of the system belongs in the first centuries after Christ, a time when commerce between Alexandria and India was active; so that the Indian system was, and without influence upon the Hellenic system and Neoplatonism. The oldest extant complete treatise on the system, however, is probably of an late date as the fifth century; this is Jayarāśikha's *Sāṅkhyasūtra*. The two most important treatises are the *Sāṅkhyasūtra* of Uśanaka (about 700 A. D.) and Vāchāspadīyā's *Monist* of Sāṅkhyas *Doctrines of Sāṅkhyasūtra-kāṇḍa* (about 1100 A. D.). Later than this, but before the sixteenth century, is the *Tattva-saṁśā*, a brief compendium of the system, and the basis of many commentaries and supercommentaries. Next in the *Sūtra* in importance is the *Sāṅkhyasūtra*, ascribed to Kapila, but most probably dating from about 1400 A. D. The important commentaries upon it are by Aniruddha (1500), Yāgyavalkya (after 1500), and Vāṇikān Mahādēva (about 1500). The *Sāṅkhyasūtra* was translated by Colebrook (1820), Tasson (1820), Panthier (1830), Windischmann (1841), and with elaborate explanations by Bartholomew Sahibān (1850), and John Davies (1851); and with Gāṇḍapādīyā's comment by Wilson (1847). The *Tattva-saṁśā*, with a comment, was translated by Ballantyne (1850), and the *Sāṅkhyasūtra*, with extracts from the comment, also by Ballantyne, by Pitardward Hall, 1855. Dr. Hall treats of the history of the Sāṅkhyas literature with acuteness and good learning in his introduction to the *Sāṅkhyasūtra* (London, 1863). Recently complete translations of the *Sāṅkhyasūtra-kāṇḍa* and of the commentaries to the *Sāṅkhyasūtra* have been published by the present writer under whose edition of the text of the *Sūtra* and of Yāgyavalkya's commentary appears in Leaman's *Harvard Oriental Series* (Cambridge, 1903). By Garbe also, lately, *Die Sāṅkhyas-Philosophie*, an exhaustive treatise upon the system, its literature, history, and contents, was published at Leipzig in 1894.

The designation "enumerative philosophy" was applied to the system because of the great importance attached by the Sāṅkhyas to the establishment of their twenty-five *guṇas* and to their numerous classifications in general. The system has reference accordingly to externals and not to the essence of the system. Its fundamental doctrine is constant pessimism. Conscious life is suffering. Pleasure, the lot of comparatively few, is mixed with pain, and leads only to sorrow. This is all closely connected with the wheel of birth in the transmigration, with its horrible sequence of death after death. The cycle of birth, life, and death (*Samsāra*) has no beginning; and, for those beings who hang upon the things of this world, it has also no end. In only one way—on this point all the Indian systems are agreed—can one escape the necessity of rebirth: namely, by the recognition of the highest truth. One of the preliminaries to this recognition is a life of complete renunciation. In one other point the Sāṅkhyas agree with the general Indian view: namely, in not attempting to subvert the superstitions of the popular religion, the gods, demigods, and demons, the heavens and the hells. All these supernatural beings, however, stand, as do we, within the *Samsāra*; none they attain to the recognition of the highest truth and thereby to release from existence, they too are still under the power of death, and must keep changing their bodies; but are that on a lower plane even than the man who has attained the highest aim. There is no place in the Sāṅkhyas for an actual god (*īśvara*), who, as others suppose, created the world and sustains and governs it. The deism with which the system of such a god is denied is one of the characteristic features of the genuine early Sāṅkhyas; which accordingly, properly called atheistic (*akīrtana*).

The Sāṅkhyas recognize two eternal entities, matter and soul. The world of matter is, for the Sāṅkhyas system, in contrast with the Vedānta, real; and is derived from a final cause by a gradually philosophical method. The Sāṅkhyas doctrine proceeds from the principle that the effect is nothing else than the cause in a certain phase of development; that from the phase which is physically perceived by us the preceding phases are each to be inferred, one after another, until we arrive at a principle which has only the character of cause, and not also that of effect. The last inferable principle is the primeval material (*pralaya*), often inappropriately translated by "nature", out of which, in accordance with law, the world is evolved. The originator of the Sāṅkhyas doctrine believed that he recognized in the world of matter three substances of constituents (*guṇas*), usually and very erroneously rendered by "qualities", unequal and mingled in varying proportions; of which the first exhibits the characteristics of lightness, of light, and of delighting; the second, those of mobility, of exaltation, and of pain-causing; the third, those of heaviness, of destruction, and of stupefaction; and to which respectively he gave the names of *saṁskṛta*, *rajas*, and *tamas*. And he set up the theory that the primeval matter consisted of these three constituent substances. The undeveloped primeval matter is accordingly the condition of equilibrium of the three *guṇas*.

It is in consequence of a disturbance of this equilibrium that the world enters upon a course of development. First arises the *buddhi*, the fine substance of that internal organ to which belong the functions of determining, discriminating, and judging. From the *buddhi* proceeds the *aśubhāra*, the fine substance of that internal organ whose function it is to put things into relation to the ego or soul. Since these internal organs correspond to what we mean by the nervous system, we should say in modern phrase that the Sāṅkhyas look upon the nerve-substance as the first and finest development of the primeval matter. The *aśubhāra* produces the organs of sense and the subtle elements; from which proceed in turn the five gross elements (ether, air, fire, water, earth), that is, the visible world in all its manifoldness.

When the time of its persistence is at an end, the universe is dissolved; and in such case that each product or set of products, beginning with the gross elements and proceeding in the reverse order, resolves itself into the material cause from which it was developed. By this process of reabsorption, finally, the three *guṇas* at last attain again their original condition of equilibrium. The primeval matter is again precisely the same and in the same state as it was in the time before its evolution; and so it persists until the dawn of a new period of a new world-evolution. This cycle of becoming, existing, and passing away never had any beginning and will never have any end.

As for the physiological side of the system, it is to be observed that the higher and lower corporeal organisms—whether of supernatural beings, of men, or of beasts—are composed of like constituents and do not differ in principle. Besides the gross-material perishable body, each organic being possesses a fine or inner body (*liṅga-parika*), which, with the soul, passes from one gross body into another. The fine body is composed of the inner organs (*buddhi* and *aśubhāra*), the internal sense (*manas*), and the external senses (*indriyas*), and the five fine elements; it is not only the basis of the metempsychosis, but also the bearer of the personality, since it alone is concerned with all those conditions and processes which we term psychic. The functions of the senses and of the inner organs, perception, feeling, thinking, willing, are in the first instance, according to the Sāṅkhyas system, purely corporeal mechanical processes, and would remain unknown did not the soul (*ātman* or *parusha*), which is of purely spiritual nature, make them known by its "illuminating" power. This is the sole function of the *ātman*.

The Sāṅkhyas system—again in sharp contrast with the Vedānta—teaches that there is an endless plurality of souls, which have existed from all eternity, are individual, and yet wholly like each other. Each one of these souls by itself is all-pervasive and infinitely great, like matter; but, for the rest, essentially different from all material principles. The souls are unchangeable; are unconcerned spectators of the processes that go on whether within or without the body; are unaffected by pleasure or pain; and, albeit incapable of any activity, willing, or wishing, they yet exert by their mere presence an existent influence upon the dispensation of nature. Matter—that is, not only external

things, but also our inner organs—is likened to a dancer that executes a dance before the soul as spectator.

The purpose of the Sāṅkhya is to bring us to understand the absolute difference of the soul from matter; and, especially, even from the finest modifications of matter as exemplified in the inner organs: forasmuch as the intelligent recognition of this difference releases the soul from the bonds of matter and puts an end to the series of rebirths. And hereby is attained that absolute deliverance from sorrow which every wise man is to strive for. All other means for doing away with sorrow—because their effect is only transitory—are worthless. An offshoot of the Sāṅkhya system is the Yoga philosophy. See YOGA. R. GARBE.

Translated by C. R. LANMAN.

San Laz'zaro: a small island of the Venetian lagoons, first mentioned in the twelfth century, when a hospital for lepers was established there. After the disappearance of leprosy it was used for other hospital purposes, until the Venetian republic ceded it to Peter Mechitar and his Armenian followers who had fled before the Turks. The Armenian church and convent contain many objects of interest.

San Leandro, -lā-aan'drō: town; Alameda co., Cal.; on the S. Pac. Railroad; 9 miles S. E. of Oakland, the county-seat; 15 miles E. of San Francisco (for location, see map of California, ref. 7-C). It is in an agricultural and fruit-growing region, and has manufactories of agricultural implements and hardware, a State bank with capital of \$25,000, and two weekly newspapers. Pop. (1894) estimated, 2,800.

San Lucar de Barrameda (anc. *Ebora*): fortified port and town of Spain, in the province of Cadiz; on the Guadalquivir, near its mouth; 15 miles N. by W. of Cadiz (see map of Spain, ref. 19-C). It exports large quantities of wines and fruit. It is a popular summer resort for sea-bathing. Pop. (1887) 22,667.

San Lucas, Cape: See CAPE SAN LUCAS.

San Luis, -lōo-ees': an interior province of the Argentine Republic; surrounded by Mendoza, San Juan, La Rioja, Córdoba, and the territory of La Pampa. Area, about 18,000 sq. miles. In the north much of the surface is mountainous; the Salinas desert separates the province from La Rioja. The southern part is a plain included in the Pampas, but partly taken up by arid salines. Owing to the dryness of the climate little of the land is available for agriculture without irrigation, but cattle and sheep are raised in large numbers and exported both to Buenos Ayres and to Chili. The mountain region is rich in gold, silver, copper, graphite, etc. The inhabitants suffered greatly during the civil wars. Pop. (1892) about 100,000. San Luis, the capital, is a town of 8,000 inhabitants, on a plateau 2,502 feet above sea-level; from this point nearly the whole province and the distant Andes can be seen. It is an important station on the railway from Buenos Ayres to Chili. HERBERT H. SMITH.

San Luis Obis'po: city (incorporated in 1874); capital of San Luis Obispo co., Cal.; on the Southern Pacific Railroad; 9 miles N. of San Luis Obispo Bay, with which it is connected by railway to Port Harford, and 90 miles N. W. of Santa Barbara (for location, see map of California, ref. 10-D). It is in an agricultural, dairying, and stock-raising region, and contains 5 State banks with combined capital of \$720,000, the Academy of the Immaculate Heart of Mary (Roman Catholic), and a daily and 2 weekly newspapers. Pop. (1880) 2,243; (1890) 2,995. EDITOR OF "TRIBUNE."

San Luis Potosí: an interior state of Mexico; bounded by Coahuila, Nuevo Leon, Tamaulipas, Vera Cruz, Hidalgo, Querétaro, Guanajuato, and Zacatecas. Area, 24,446 sq. miles. In the central and northern parts there are extensive high plains included in the Mexican plateau; these are varied by mountains and hills. The eastern and southern portions are on the mountainous border of the table-land, and are exceedingly varied in scenery and climate. Agriculture is the most important industry, the principal crops being maize and wheat on the plateau, sugar-cane, cotton, and coffee in the warm valleys, and maguey, used for the manufacture of pulque and the spirituous liquor called mezcal. The mines (of silver, gold, lead, etc.) are among the most valuable in Mexico; salt is obtained from salines on the plateau. In the western part the grazing industry occupies much of the land. The manufactures are increasing in importance, and altogether this is one of the richest and most progressive of the Mexican states. Pop. (1893) estimated, 550,670; a large proportion are of Indian or mixed race. HERBERT H. SMITH.

San Luis Potosí: capital of the state of the same name; in a valley on the mountainous border of the plateau, 6,200 feet above the sea; 362 miles by railway N. N. W. of Mexico (see map of Mexico, ref. 6-G). It is regularly laid out with wide streets and numerous small squares ornamented by trees; the outskirts have so many gardens and trees that, from a distance, only the higher towers can be seen. The cathedral and many churches are richly ornamented. San Luis has a university, school of engineering, mint, etc., with considerable manufactures; it is an important railway center and has a large and increasing trade. The silver mines (discovered in 1583), which first gave importance to the place, are nearly abandoned. The climate is dry and temperate. Pop. (1892) 62,573; this includes numerous suburban villages, the city having about 40,000. HERBERT H. SMITH.

San Marcos: town; capital of Hays co., Tex.; on the San Marcos river, and the International and Gt. Northern, and the Mo., Kan. and Tex. railways; 31 miles S. of Austin, the State capital (for location, see map of Texas, ref. 5-H). It is in an agricultural region, and contains 2 national banks with combined capital of \$130,000, Coronal Institute (Methodist Episcopal, South, chartered in 1879), public-school building (erected in 1890, cost \$10,000), a U. S. fish-culture station, grounds of the Texas Chautauqua Association, water-works, electric lights, several steam-gineries and cottonseed-oil mills, an interesting group of boiling springs, and 3 weekly newspapers. Pop. (1880) 1,232; (1890) 2,335.

ISAAC H. JULIAN, EDITOR OF "PEOPLE'S ERA."

San Mar'i'no: the oldest and smallest independent republic in the world, situated in eastern Central Italy (see map of Italy, ref. 4-E). It is governed by a legislative senate of sixty members elected for life, an executive council of twelve, two-thirds of whom go out every year, and two presidents elected for six months. This has been the form of government since 1847, when the constitution was considerably changed. Area, 32 sq. miles, embracing five small villages, with a population of about 8,200. The capital, of the same name, is perched on the crest of a mountain 2,635 feet above the sea. It is said to have been founded early in the fourth century by St. Marinus, a converted stone-mason, who fled from Rimini (12 miles N.) during the Diocletian persecution. Borgo, 500 feet lower down, is the residence of the principal inhabitants. The other three villages are Serravalle, Faetano, and Monte Giardino. There is a standing army of thirty-eight officers and 950 men, and an annual revenue of about 227,000 lire. The principal products are fruit, silkworms, and wine, and there is some good pasturage. Gunpowder is manufactured. See histories of the republic by Melchiorre Delfico (Milan, 1804) and Cazeneuve (Paris, 1887).

San Martín, saan'määr-teen', José, de: general; b. at Yapeyú, Misiones (now in the Argentine Republic), Feb. 25, 1778. His father was governor of Misiones, but returned in 1785 to Spain, where young San Martín early entered the army as a cadet. He distinguished himself in the wars with France, attaining the rank of lieutenant-colonel. Meanwhile he had adopted republican ideas; in 1811 he resigned and went to London, where he was associated with Miranda and other noted Spanish-American republicans. In 1812 he and other young officers sailed for Buenos Ayres with the object of offering their services to the patriot junta of that colony. On his arrival San Martín was commissioned to organize a regiment of cavalry. This force, the Mounted Grenadiers, was distinguished throughout the war for independence. About Aug., 1812, San Martín and his friends organized the secret society called the Lautaro Lodge; this speedily became the most important political influence in the country, and most of the subsequent successes were directly or indirectly due to it. At the end of 1813 San Martín succeeded Belgrano as commander of the patriot forces in Upper Peru or Bolivia. By the reverses of 1814 the patriots were practically driven out of all the South American colonies except those in the basin of the Plata. The patriots of the Plata basin had repeatedly attempted to attack the central Spanish power in Peru by way of La Paz and Lake Titicaca, but they had always been driven back, the mountain region being unfavorable for cavalry. San Martín conceived the idea of opening a new line of attack by crossing the Andes into Chili; this scheme he was able to carry out through the support of Pueyrredon, director of Buenos Ayres, and the secret influence of the Lautaro Lodge. He drilled and organized his army during two years, and on Jan. 17, 1817, began his march with 4,000 men.

—**San Miguel**: *San Miguel*, which is 12,000 feet above sea-level, or 4,000 feet higher than St. Bernard where Napoleon made his celebrated passage. The Spaniards were defeated at Cambrón, Feb. 12, and San Miguel was occupied three days after. San Martín was immediately nominated supreme director of Chile, but declined. And the office was given to O'Higgins. On Feb. 12, 1818, the independence of Chile was proclaimed. The Spaniards, strongly reinforced from Peru, won the battle of Cancha Rayada, Feb. 19; but were again completely defeated by San Martín at Maipo, Apr. 5, 1818, their power in Chile being essentially ended. Meanwhile San Martín had been busily engaged in the second part of his great plan—the invasion of Peru by sea. A fleet was organized and placed under command of Lord Cochrane, and, after several brilliant naval exploits, San Martín's army of 4,500 men was transported to the Peruvian coast in Aug., 1820. By skilful maneuvering the Spaniards were forced to evacuate Lima, which was occupied by San Martín July 9, 1821; three weeks later the independence of Peru was proclaimed, and San Martín was chosen supreme protector. At this time another patriot army under Bolívar was approaching from the north, and Peru was threatened with a country between the two patriot leaders. San Martín generously sacrificed his own ambition to the cause. After an interview with Bolívar at Guayaquil, July, 1822, he resigned his office to the Peruvian congress (Aug. 22, 1822), and in September sailed for France; there he passed the remainder of his life in companionable poverty. D. at Boulogne, Aug. 17, 1850. The final triumph of the war was achieved by Bolívar and his generals, but the independence of South America was largely due to San Martín. See Mitre, *Vida de San Martín*; an English abridged translation by Filling, entitled *The Emancipation of South America* (1899); and *Memories of Gen. Miller* (1926). See also *La Sena e Hvos*—HARRIS H. SMITH.

San Miguel: *San Miguel*, a town of Salvador; capital of a department of the same name; in the eastern part of the republic; on the river San Miguel (see map of Central America, ref. 6-F). It is the center of a rich agricultural region (sugar, etc.). The climate is warm and insubrious. Pop. about 12,000. The San Miguel volcano, 10 miles to the S. W. of the town, is 6,000 feet high, and one of the most active in Salvador. H. H. S.

San Miguel de Allende: See ALLÉNDE.

Sanmukha, *Sanmukha*; poet; b. in Naples, Italy, July 28, 1808; educated at the academy of Pontano; traveled much, and early received great favor from King Frederick III. of Naples and secured for his poems; followed the king into exile in 1821, when he was driven from the throne by the Spaniards, and did not return until after his death. D. in Naples, Apr. 27, 1859. A collected edition of his Italian poems appeared at Padua in 1784. The last known is *Aradia Veneta*, 1802; Turin, 1896, which is a series of 515, partly in prose, partly in verse, and hence one of the earliest of prose pastiches. His Latin poems comprise *De Porta Virgilio* (1829); also *Epitheta*, 1826, *Epitheta*, and epigrams, among which is the famous poem in praise of Venice, which gained a reward of 600 ducats from the senate.

San Nicolás de los Arroyos: a town of the province of Buenos Ayres, Argentine Republic; on the river Paraná, close to the boundary of Santa Fé. It is built on a high bluff overlooking the river; is the center of a rich grazing district (cattle and sheep); and of agricultural colonies settled by Italians. There are many flouring-mills; a meat-freezing establishment, etc. San Nicolás is a port of call for ocean steamers, and is an important railway center. Pop. (1892) 25,000, and growing rapidly. H. H. S.

San Pier d'Arena, or Sampierdarena, *San-pi-er-dà-rena*; town; in the province of Genoa, Italy; occupying a narrow band about 9 miles W. of Genoa (see map of Italy, ref. 3-C). Though it is a suburb of Genoa, it has a distinct organization. The churches contain some valuable works of art, and there are some noticeable public buildings as well as private palaces. There is much commercial and manufacturing activity. Pop. (1890) 22,000.

San Rafael: town; capital of Marin co., Cal.; on the coast of San Pablo, and the N. Pac. Coast and the San Fran. and N. Pac. railways; 15 miles N. of San Francisco (for location, see map of California, ref. 7-B). It is in an agricultural, sheep, and stock-raising region at the base of Mt. Tamalpais; is a widely known resort for invalids; has hourly communication with San Francisco by two railways and by fer-

ries, and contains six churches, a public high school, San Rafael Institute (opened in 1881), St. Vincent's Male Orphan Asylum, a library, a private bank, and two weekly newspapers. Pop. (1880) 2,276; (1890) 3,290.

EDITOR OF "MARIN COUNTY JOURNAL."

San Remo: town; in the province of Porto Maurizio, Italy; 26 miles by rail E. N. E. of Nice; railway station on the line from Genoa to Nice (see map of Italy, ref. 4-B). It is picturesquely situated on a slope descending to the sea, with rich olives behind it, and surrounded by luxuriant orchards of lemons and oranges. There was an old town with steep and narrow streets. The new town is a favorite resort of invalids, for whom ample accommodation is provided, and is preferred by many to either Nice or Mentone, as being more sheltered than the former and less confined than the latter. Pop. 16,330.

San Roque, *San Roque*; town; in the province of Cadix, Spain; on the Bay of Gibraltar; 8 miles S. by W. of Gibraltar (see map of Spain, ref. 96-D). It was built by the Spaniards after the loss of Gibraltar. It produces great quantities of fruit and vegetables, in which it carries on a considerable trade with Gibraltar. Pop. (1887) 5,730.

San Salvador, or **Banza Congo**: town of the province of Luanda, Portuguese colony of Angola, Western Africa; in the basin of the Congo river; lat. 6° 29' S., lon. 14° 47' E. (see map of Africa, ref. 6-D). It is the ancient *Ambaca*, capital of an indigenous kingdom, but destroyed about 1550. In the seventeenth century it revived under Portuguese influence, and became an important center of trade and religion, but it has again fallen into decay. It is of importance only as a center for mission-work. Pop. 700, with a thinnest sort of whites. M. W. H.

San Salvador: capital and largest city of the republic of Salvador, Central America; on a branch of the river Lempa, and at the southeastern base of the national volcano of San Salvador; 2,270 feet above sea-level (see map of Central America, ref. 4-E). It was founded in 1538 and removed to its present site in 1553. This locality seems peculiarly subject to earthquakes; over sixty have been recorded in a single year, and occasionally they are very destructive. The city was more or less completely overturned in 1575, 1593, 1625, 1636, 1708, and 1809. On Apr. 16, 1854, it was reduced to a heap of ruins by a succession of severe shocks. An attempt was then made to found a new capital at Nueva San Salvador, 9 miles distant; but the old city, having been rebuilt, regained its supremacy, and was again destroyed, with the neighboring villages, Mar. 19, 1878. As rebuilt, all the houses and public edifices are low and surrounded by wide grounds; the cathedral and many other buildings are of wood. San Salvador has a university, national palace, normal college, national theater, etc. It is the center of a rich agricultural district, and has a thriving trade. Pop. with the suburbs, about 35,000; of the city proper, about 25,000. Its port is La Libertad, connected with it by a road which is possible for carts only during a part of the year; a railway is projected. HARRIS H. SMITH.

San Salvador Island: See BAHAMA ISLANDS.

Sans-Culottes, *san k'ul'ot* [=Fr., *liter.*, without breeches; *sans*, without + *culotte*, breeches]: a name bestowed early in the first French Revolution upon the lower classes of the populace from the fact that they wore pantaloons instead of knee-breeches, the latter garment distinguishing the dress of the bourgeoisie and nobility.

San Sebastián: capital of the province of Guipuzcoa, Spain; on a peninsula in the Bay of Biscay, surrounded with strong walls and defended by a citadel (see map of Spain, ref. 12-G). Its harbor, though not safe, is frequented by large vessels. A large import trade in French and English goods is carried on, and during the summer the town is much resorted to as a watering-place. Pop. (1887) 29,047.

San Severo: town; in the province of Foggia, Italy; 18 miles by rail N. W. of Foggia and 141 N. E. of Naples (see map of Italy, ref. 6-F). The district is fertile in grain and fruit, and not lacking in pasturage. The town, of mediæval origin, has suffered severely from earthquakes on several occasions. Pop. 20,880.

Sanskrit Language: the literary language of the Aryan inhabitants of India. Two principal reasons have led to its study: the intrinsic interest attaching to the very extensive Sanskrit literature, which reveals the thought and life of a large and highly endowed part of the human race; and,

second, the fact that, of all the Indo-European languages, the Sanskrit has, on the whole, best conserved the pristine features of their common parent-speech—a consideration appealing with especial force to most of the cultivated European races, inasmuch as their languages are descended from this parent-speech. The application of the comparative method to the study of genetically related tongues is due in largest measure to the study of Sanskrit, which has thus proved to be the most important factor in the revolutionizing of some parts of classical philology and in the creation of Germanic philology. Moreover, with the broadening of the conception of philology, the conception of comparative philology has also grown broader; instead of being confined to phonology and to the morphology of word and of sentence (comparative grammar), it includes the whole intellectual life of a people, as that life is manifested not only in its language, but also in its literature, its antiquities, its customs and laws, its religion, its philosophy. These subjects when treated comparatively form chapters of comparative philology; and these are the very subjects which receive and are yet to receive especial illumination from ancient India.

The languages of India may be divided primarily into Aryan and non-Aryan (see *Ethnology* under INDIA, and especially DRAVIDIAN LANGUAGES, and Constable's *Hand Atlas of India*, plate 10); the Aryan constitute, with the IRANIAN LANGUAGES (q. v.), the Indo-Iranian group of the Indo-European family of languages. For the relation of this group to the others, see INDO-EUROPEAN LANGUAGES. The Aryan languages of India show three principal stages of development: (1) Old Indic or Sanskrit; (2) Middle Indic or Prākṛit (see PRĀKRIT LANGUAGES); and (3) New Indic or Bhāṣā. The old Indic belongs locally to the Punjab and the Indo-Gangetic plain. The name Sanskrit is applied to the ancient and sacred language of India, the tongue in which the Vedas, Brahmanas, Upanishads, epics, etc., are written. It is difficult to say just how long it was a true vernacular; but, under the influence of learned writers and grammarians, it has maintained for 2,000 years a more or less artificial existence as a means of communication, spoken and written, for the learned of India. The word Sanskrit is a Sanskrit word meaning "elaborate," and it doubtless connotes a certain antithesis to Prākṛit, which means the "ordinary" or "vulgar" (idioms). It is in its broader sense that the term Sanskrit is applied to the language of the widely different periods of Sanskrit literature; in a narrower sense, it is often used as the equivalent of "classical Sanskrit," the language of the later classical works as distinguished from the archaic dialects of the Veda and Brahmanas.

There is, properly speaking, no Sanskrit alphabet. The Hindus of the different parts of India write the language usually each in his own vernacular alphabet. The alphabet which prevails in Hindustan proper is the one called *Nāgarī*, or *Devanāgarī*; and this, of all the Indic alphabets, is the one adopted by Occidental editors of Sanskrit works. It is written from left to right. Alberuni (in his *India*, written about 1030 A. D., chap. xvi.) mentions among the principal alphabets the *Nāgarā* of Malwa. *Nāgarā* means "of the city," and refers perhaps to the very famous city of Ujjain, once the capital of Malwa. The alphabet is probably derived from a Semitic source. By far the most important discussion of this subject is that of G. Bühler, *Indian Studies*, No. 3 (Vienna, 1895).

The system of sounds, in the native order of arrangement, is as follows: Vocalic: *a, ā, i, ī, u, ū, ṛ, ṝ, l, e, ai, o, au*; the breathing *h* and nasalization *ṁ*; consonantal:

Mutes.	Surd.	Surd asp.	Sonant.	Son. asp.	Nasal.	Semi-vowels.	Sibilants.
Guttural	<i>k</i>	<i>kh</i>	<i>g</i>	<i>gh</i>	<i>ṅ</i>
Palatal	<i>c</i>	<i>ch</i>	<i>j</i>	<i>jh</i>	<i>ñ</i>	<i>y</i>	<i>ç</i>
Lingual	<i>t</i>	<i>th</i>	<i>d</i>	<i>dh</i>	<i>n</i>	<i>r</i>	<i>ṣ</i>
Dental	<i>t</i>	<i>th</i>	<i>d</i>	<i>dh</i>	<i>n</i>	<i>l</i>	<i>s</i>
Labial	<i>p</i>	<i>ph</i>	<i>b</i>	<i>bh</i>	<i>m</i>	<i>v</i>	..

and the sonant guttural aspirate *h*. The vowels are written with different characters according as they are long or short. The *a, i, and u* vowels are pronounced as in Italian, save that the short *a* has the value of the neutral vowel in *but*. The *ṛ* is like the common English *l*-vowel in *ankle*, and the *r*-vowels are simply untrilled *r*-sounds with vocalic value in syllable-making. Of the mutes, the unspirated surds and sonants and the nasals of the guttural, dental, and labial series are familiar: the surd aspirates *kh, th,*

ph are like the simple surd with following breathing, as in *blockhead, pot-hook, uphill*; and the sonant aspirates are rendered in practice as in *abhor*, etc., though their strict value is matter of question. The whole palatal series is secondary, and derived by modification of original gutturals (see PALATALIZATION: pronounce *c* and *j* as in *dolce, jar*). The linguals are pronounced with the tip of the tongue reverted upward to the dome of the palate. A most striking peculiarity is the prevalence of the *a*-sounds, which make up over one-quarter (28 per cent.) of all the sounds of any ordinary piece of text. And since original *e, o, and a* (cf. *ददार्का = dadārka*), often also vocalic *n* and *m*, have all been leveled in Sanskrit to one uniform *a*, it is not strange that short *a* aggregates about one-fifth of all Sanskrit sounds. The word-accent is a pitch-accent, not a stress-accent. For the phonetic relations of Sanskrit to the parent-language, see Brugmann's *Comparative Grammar of the Indo-Germanic Languages*.

For the phonetic changes of the language, reference must be made to the grammars. Several general statements may be made, however: hiatus is avoided; when a surd is concurrent with a sonant, either the surd is changed to a sonant or else the sonant to a surd (assimilation, regressive or progressive); consonant groups are abbreviated. The laws of phonetic combination (*samdhī*) wear indeed an artificial aspect in the classical period; yet even there the *rationale* of many or most of them is discernible; and in the Vedas the case is quite otherwise, and the *samdhī* quite simple.

As for morphology, the Sanskrit surpasses, on the whole, all the cognate tongues in transparency of structure, thus contrasting sharply with the Latin, which has been likened, morphologically, to "a venerable ruin." Its words invite analysis and are, for the most part, easily analyzable into roots, suffixes of derivation, and inflectional endings. This feature of the language is exhibited incidentally with wonderful clearness and completeness by Whitney in his *Roots, Verb-forms, and Primary Derivatives of the Sanskrit Language* (Boston, 1885). The Sanskrit roots come nearer in form and meaning to their Indo-European prototypes than do the roots of any other of the related languages. It was this conservation of old material, coupled with its surpassing transparency of structure, that made the study of Sanskrit so fruitful in results and so suggestive of new and rigorous methods to be pursued in etymologizing and in the science of language generally.

In the noun three numbers, singular, dual, and plural, are distinguished; and the dual is actually used probably to a larger extent than in any other Indo-European language. There are the usual three genders, the feminine themes ending prevalently in a long vowel. The cases are eight: nominative, accusative, instrumental, dative, ablative, genitive, locative, and vocative; and their proper uses are so precisely like those of the Indo-European case-system that it suffices, in lieu of a general description of them, to refer to INDO-EUROPEAN LANGUAGES. The declension of adjectives is essentially the same as that of substantives. The pronouns are of course of three persons, and except in the first and second persons show three genders. Their inflection is peculiar, but offers striking parallels to the facts of the cognate tongues (with *sa-s, ā, ta-d*, cf. *ṣ, ṛ, rō*, Ang.-Sax. *se, seō, dæ-t*; with *i-d*, cf. Lat. *i-d*, Eng. *i-t*). The numerals agree well with those of the parent-speech (thus *tri* = three; *nava* = nine). See INDO-EUROPEAN LANGUAGES.

The verb shows, as in Greek, etc., the distinctions of voice, tense, mode, number, and person. The voices are active and middle. In the present system there is a special passive inflection; elsewhere the middle serves also as passive. There are four tense-systems, present, perfect, aorist, and future. The modes are indicative, subjunctive (mostly Vedic), optative, and imperative. There are three numbers and three persons. There are also secondary conjugations, passive, intensive, desiderative, and causative. Most important is the distinction between verbs without the thematic *a*-vowel and verbs with it (*-mu* verbs and *-va* verbs). The retention of ancient accentual conditions is very remarkable, and in general the whole system of conjugation casts floods of light upon innumerable inflectional forms of the related languages.

The syntax is very bald and simple: partly because of the ample number of case-forms for the expression of all the most important logical relations; and partly because, in the case of the verb, although there is an abundant wealth of mode and tense forms, the Hindus never came to turn them to account, as did the Greeks, for the nice expression of modal and temporal relations.

The most comprehensive historical grammar is W. D. Whitney's *Sanskrit Grammar, including both the Classical Language, and the Older Dialects, of Veda and Brāhmaṇa* (2d ed. Boston, 1896). The Vedic prose-inflections have been fully treated by Lammann, *Journal of the American Oriental Society*, x, 225-501. The verbs are treated with great completeness in Whitney's *Roots, Verb-forms, etc.* For the nouns, see J. H. Speyer's *Sanskrit Nouns* (Leyden, 1890). The best dictionary is the great Sanskrit-German *Wörterbuch* of Böhtlingk and Roth (2 vols., St. Petersburg, 1852-75). Of more moderate size and cost, and yet comprehensive, are the Sanskrit-English dictionaries of A. A. Macdonell (New York, 1900), and Carl Cappeller (Köten, 1901). There is a *Sanskrit Grammar for Beginners*, by Max Müller, abridged by Macdonell (New York, 1896). Lammann's *Sanskrit Reader with Vocabulary and Index* (Boston, 1895) is a companion volume to Whitney's grammar, and is made with especial regard for the needs of such as study the language without a teacher. For comparative study may be recommended Victor Henry's *Short Comparative Grammar of Greek and Latin* (New York, 1890). An English manual in which Sanskrit is made the primary subject, to be illuminated by the related tongues, is a desideratum; such a work has appeared in Dutch, C. C. Uhlenbruch's *Handboek der Indische Kerkleer, in vergelijking met de der Latijnsche Kerkleer* (Leyden, 1894).

CHARLES R. LAMMANN.

Sanskrit Literature: one of the several bodies of literary products of ancient India. (Compare PILA and PRAKARTI.) In its broader sense, the term Sanskrit literature includes the Vedas (which are the oldest literary monuments of any part of the human race, the Indo-European family) and the post-Vedic literature. In its narrower sense, it means post-Vedic literature only. The latter terminus of the post-Vedic period is not clearly definable; indeed, literary works were written in Sanskrit all through the Middle Ages, and are still so written even to-day. Aufrecht's *Katalogus Catalogorum*, an orderly assembling of the contents of the various catalogues of Sanskrit manuscripts, enumerates more than 20,000 titles of Sanskrit works. This great quantity is of measurable variety in style and contents. In quality it is, upon the whole, distinctly inferior to the Greek. Nevertheless, the Vedas have a very high degree of importance from the light they shed on the history of religions; the *Itihāsa-sūtras* are of great interest to the student of ancient antiquities; the *Dharma-sūtras*, to the student of the history of law; the *Upanishads* and their sequels, to the student of the history of philosophic speculation; the *śaśtras*, to the student of popular tales; the critical history of the epics illuminates many aspects of the problems concerning the genesis of popular epics; the Hindu dramas are interesting both in themselves and often on account of their relations to the legendary material on which they are based; and the grammar, rhetoric, music, medicine, mathematics, and astronomy of the Hindus, like their philosophic speculations, may no longer be ignored by writers upon the history of the several sciences.

The history of Sanskrit literature is divided into two periods, the Vedic period and the classical period. These names, as is elsewhere often the case. But in all this history there is very little like a fixed chronology. The Hindus are the antipodes of the record-loving Egyptians, as indeed we might expect from the Indic views of life that go with the popular belief in transmigration and with pessimism. On the other hand, it is possible to determine the relative age of very many works, and this relative chronology offers many interesting and not insoluble problems.

3. **THE VEDIC PERIOD.** 1. *Mantra*.—The Sanskrit word *mantra* means "knowledge," and especially the "sacred knowledge," handed down in the triple form of *ṛc*, *sāman*, and *yajus*, and including the well-known collections called *Rig-veda*, *Sāmaveda*, and *Yajurveda*, which bodies of text are often ascribed to be the triple *vidyā*, or "triple knowledge." *ṛc* is a hymn of praise, and especially a stanza of praise that is spoken as distinguished from one that is sung (*sāman*), or from a sacrificial formula (*yajus*). The Hindus hold that the Vedas have existed from all eternity and survive the mortal fluctuations of the universe, and that they have no human authors, but are "seen" by the Rishis or "seers," to whom they are from age to age "revealed." The *Ātharvaveda* is of later date and randomness than the others. These four collections, called *śaśtras*, consist of sacred texts, mostly poetical, called *mantras*. They embody only a part of the great mass of Mantra material which originated and

was handed down by memorial tradition, orally from generation to generation long before the existence of the collections. Of the Mantras not now extant in any collection we find remnants scattered about in various books. To each of these collections is attached a body of subordinate works called *Brāhmaṇas*, and yet another of works called *Sūtras*. A cross-division is thus involved, so that the oldest Indic books are classed, first, according to the Veda to which they belong, and, second, according to their character as Mantra, Brāhmaṇa, or Sūtra.

2. *Brāhmaṇas, Upanishads*.—The Brāhmaṇas are the oldest Indo-European monumental prose extant. In the texts of the old Yajus Saṁhitās the sacred formulas are mingled with prose passages, explanatory, prescriptive, and legendary. A single such passage is a *Brāhmaṇa*, "the dictum of a *brāhman* or priest," "a priestly discourse." The separate collections of Mantras naturally suggested a similar treatment of these priestly discourses. Such a collection of discourses is itself also called a Brāhmaṇa, and is practically a compendium of the wisdom of a priestly school. The older Brāhmaṇas contain descriptions of the sacrificial ceremonies, accounts of their origin, and legends to illustrate their efficacy. Conscious philosophic speculation plays a subordinate part. In the later Brāhmaṇas the descriptions of the ritual are relegated to systematic treatises; the theosophic and philosophic passages become, with the growth of asceticism and hermit-life, more lengthy and important, and receive—as containing matter appropriate for the meditations of the forest-hermits—the special name of *Āraṇyaka*, or Forest-treatises, and *Upanishads*. From the hand of O. Böhtlingk are the best editions of the two most important Upanishads: the *Ithāsa-āranyaka-upanishad* (St. Petersburg, 1880); and the *Chāndogya-upanishad* (Leipzig, 1880), both in text and in German translation. Vols. i. and xv. of Max Müller's *Sacred Books of the East* contain versions of the principal Upanishads. W. D. Whitney translated the *Kaṭha-upanishad* (*Transactions of the American Philological Association*, 1890, vol. xxi.).

3. *Sūtras*.—The Brāhmaṇas presuppose a thorough acquaintance with the details of the sacrifices. When the ceremonies had grown to tremendous length and complexity, it became necessary to have systematic treatises for the use of the celebrants. Such works are the "Rules for the Sacrifices" or *Gṛantha-sūtras*, so called because they stand in intimate relation to the Veda or "sacred texts" (*grāṇi*) and continually cite these texts, and serve as rules to them, prescribing the manner and the occasions of their employment with the various ceremonies.

Usage and observance, crystallized into sacred ceremony, invest the whole life of an Aryan Hindu—nay, even his prenatal and post-mortem existence. The books that describe these observances are called *Gṛhya-sūtras*, or "Rules of Domestic Usage." Vols. xxix. and xxx. of the *Sacred Books* contain translations of the most important ones. The proper subjects of these rules are the "sacraments" (*samskāras*—such as name-giving, investiture with the sacred cord, marriage) and the "simple sacrifices" (*pāka-yajñas*) of the householder.

There is a third class of Sūtras, called *Dharma-sūtras*, which prescribe rules for the everyday life of these who would conform to the example of the virtuous, and of which the legitimate subjects are much more varied than those of the *Gṛhya-sūtras*. They embrace all sorts of injunctions and restrictions relating to etiquette, to eating and sleeping, to purification and penance, and to the details of the daily life of the student and householder and hermit, and even extend to the duties of the king and to the beginnings of civil and criminal law. The most important Dharma-sūtras are Englished in vols. ii. and xiv. of the *Sacred Books*. Out of these were developed the *Dharma-pātras* or metrical law-books like those of Manu (q. v.).

These Sūtras embody the *Kalpa* or "ceremonial," and constitute one of the six classes of works which have to do either with the conservation and interpretation of the Vedic texts or else with their practical application; and they are accordingly styled *Vedāṅgas*, "limbs or members of the Veda." Their names are enumerated in the memorial verse,

śikṣā kalpa vyākaraṇaṁ nirukṭhi dhanda jyotiṣam,

that is, "phonetics, ceremonial, grammar, etymology, metrics, astronomy." The above are the principal general divisions of the Vedic literature.

4. The *Rigveda* is, of the several collections, the most im-

portant. It consists of 1,017 hymns, each containing on an average about ten double lines, so that the text is somewhat less than that of the two Homeric poems together. Its more significant division is into books, hymns, and stanzas (*maṇḍala, śukta, ṛc*). There are ten books. Of these, books ii.-viii. are called "Family-books," as containing each the hymns ascribed to a single family or clan in which they doubtless originated and by which they were handed down as a sacred inheritance. Thus book iii. contains the hymns of Viśvāmitra and his tribe; book vii., those of Vasishtha; and so on, the names being those of the most famous sages or eponym heroes of Indic antiquity. The hymns of book ix. are addressed to the deified drink Soma. The tenth comprises hymns ascribed to very different authors, while the first consists of fifteen groups, each attributed to some ancient poet-sage. The soma is the juice of a plant believed to be of the milkweed family, and now classed as *Sarcostemma brevistigma*; and the Soma sacrifice appears to have been an exceedingly important feature of the Vedic religion. Certain principles of arrangement within the books are discernible: thus in books ii.-vii. the hymns to the fire-god Agni (*agnis*) come first; then those to Indra, the Jupiter Pluvius; and so on. The oldest hymns may have originated as early as 1200 or 1500 B. C., but it is not feasible to assign a precise date. Geographically, the early Vedic Aryans may be referred to the land of the Punjab and Indus. Their religion is a worship of the anthropomorphized forces of nature, and is in many ways most instructively primitive. The best works on this subject are E. W. Hopkins's *The Religions of India* (Boston, 1895) and H. Oldenberg's *Die Religion des Veda* (Berlin, 1894).

The Brāhmanas of the Rigveda are the *Āitareya* and the *Çāṅkhāyana* or *Kāṇḍikā*; and each of these is supplemented by an Aranyaka of similar designation; and part of each Aranyaka forms an Upanishad (translated, *Sacred Books*, vol. i.). To this Veda further belong Aṅvalāyana's *Çrāuta-sūtra* and *Çāṅkhāyana's Çrāuta-sūtra*, both edited in the *Bibliotheca Indica* (Calcutta); and also Aṅvalāyana's *Grhya-sūtra* and *Çāṅkhāyana's Grhya-sūtra*, edited and translated, the first by A. F. Stenzler, and the second by H. Oldenberg.

5. *The Sāmaveda* is a Veda of *sāman*. A *Sāman* is properly a tune, not a text; but the word *sāman* came to be used of the text to which a given tune was sung, a stanza of the Rigveda modified for chanting. Of the 1,549 stanzas of the Sāmaveda (edited and translated by T. Benfey, Leipzig, 1848), 1,474 occur also in the Rigveda.

6. *The Black Yajurveda* belongs to the period of the highly developed ritual. At least five schools of the older Yajurveda possessed special Sanhitās, of which four are extant. Of these, the *Taittiriya* has been published by A. Weber (Berlin, 1872) and the *Maitrāyaṇiya*, by I. von Schröder (Leipzig, 1881-86). In all these older texts sacred formulas are confusedly mingled with prose passages. To remedy this confusion a new school, called Vājasaneyins, arranged a Sanhitā of "clear formulas," that is of formulas clear of Brāhmana passages. The word for "clear" (*śukla*) means also "bright" or "white"; and it is perhaps with reference to this double meaning that the older Yajus texts were called "Dark" or "Black." The Brāhmana of the White Yajurveda or *Vājasaneyi-Samhitā* is the *Çatapatha*, much of which has been Englished by J. Eggeling, *Sacred Books*, vols. xii., xxvi., and xli. *Samhitā, Brāhmana*, and *Çrāuta-sūtra* (Kātyāyana's) have all been published by A. Weber (Berlin, 1852-59).

7. *The Atharvaveda* Sanhitā, as compared with that of the *Rigveda*, represents a lower plane of life and thought. It contains magic incantations for the warding off of the most diverse malign influences, and prayers and charms for success in the various affairs of life, as love, gaming, quarrels, journeys, etc. The text was published by Roth and Whitney (Berlin, 1856), and Whitney has left the manuscript of a translation, in course of publication (1895) in Lanman's *Harvard Oriental Series*.

8. *Vedic Bibliography*.—The first complete edition of the *Rigveda* was issued by T. Aufrecht in Roman letters (Berlin, 1861-63; 2d ed. Bonn, 1877). Max Müller's great six-volumed quarto edition, in Nāgarī letters, with native commentary, etc., was begun in 1849 and completed in 1874 (London). A new edition of this in four volumes quarto was issued in 1892 (London). Octavo editions, also in Nāgarī, were issued by Müller in 1873 and 1877. The greatest achievements in Vedic exegesis are those made by Roth, and contained chiefly in the St. Petersburg lexicon. H. Grass-

mann has published a *Wörterbuch zum Rigveda* (Leipzig, 1875), and a complete translation (Leipzig, 1877). For a succinct sketch of the Vedic literature, with numerous references to other sources of information, see A. Kaegi's *Rigveda* (Englished by R. Arrowsmith, Boston, 1886), notes 1-26, or Lanman's *Sanskrit Reader*, pp. 352-59.

B. THE CLASSICAL PERIOD. 1. *Epos*.—The most important works of this period are the great epics. These are treated separately. See MAHĀ-BHĀRATA and RĀMĀYANA.

2. *The Purāṇas*.—These are pseudo-historical works, often in prophetic tone, and in metrical form. Their name means "old," but the extant Purāṇas are held to be not over a thousand years old. The *Bhāgavata-Purāṇa*—or most of it—was published and translated by E. Burnouf (Paris, 1847). Of the *Viṣṇu-Purāṇa*, H. H. Wilson gave an analysis and translation (2d ed., enriched with notes, by Fitzedward Hall, 6 vols., London, 1864-77). Of this and other Purāṇas, as the *Agni-Purāṇa*, the *Mārkaṇḍeya-Purāṇa*, there are cheap Hindu editions. The *Viṣṇu* treats of the evolution and dissolution of the universe, of the *yugas* or ages, of mythical geography, the heavenly bodies, and the origin of the castes; gives many ancient legends, accounts of the Vedic literature, the dynasties of kings, the history of the god Krishna, etc. The Purāṇas are in fact a kind of encyclopædic digest of Indic knowledge, but in many ways quite untrustworthy.

3. *The Artificial Epics*.—These are called *Kāvya*, and the oldest are referred to the fifth or sixth century of our era. They take their material from the great popular epics, but can never themselves have been popular, since only the learned could understand them. In them the epic element gives place more or less to the lyric and descriptive, and they are often not without real poetic merit and genuine feeling. There are six of them that the Hindus call "great Kāvya"; and among the six the most noted are the *Raghuvamśa*, or "The Ancestry and Deeds of Rāma," and the *Kumāra-sambhava*, or "Birth of the War-god," both ascribed to the famous Kālidāsa, and both edited and translated by A. F. Stenzler, the latter translated also by R. T. H. Griffith into English verse. See especially the masterly fifth canto.

4. *The Drama*.—The real beginnings of the drama may be seen in the *Rigveda*, where there are not a few hymns in the form of genuine dramatic dialogue. In the *Mahābhārata*, too, are passages of similar character. And the public recitations of the epics were in fact really dramatic performances. The earliest direct allusion to this subject is made by Pāṇini, probably in the fourth century B. C., who speaks of "rules for actors" (*nāṭa-sūtras*). The word *nāṭa*, with many derivatives, including *nāṭya*, Anglo-Indian *nauteh*, and *nāṭaka*, "drama," comes from the root *nāt* or *nṛ*, "to dance," and perhaps warrants the inference that the Hindu drama originated in pantomime. From the statement of Patanjali (about 143 B. C.), who mentions the slaying of Kansa by Krishna as a subject of dramatic representation, it would seem that the oldest performances were of a kind like to the mediæval mysteries. There has been much debate (A. Weber, E. Windisch) as to whether the Greek drama influenced that of the Hindus. The question is unsettled. The Hindu play is divided into acts, with benediction in place of a prologue, with prelude and with interacts; and it is peculiar in that the women and inferior characters speak not Sanskrit but Prākṛit. The dialogue is in prose, with lyrics interspersed. Lévi enumerates the titles of some 375 dramatic works; of the extant dramas hardly more than fifty are of considerable literary value.

The *Mṛcchakaṭikā*, or "Earthen Toy-cart," is held to be the oldest. It is ascribed to King Çūdraka, and the scene is laid at Ujjain. It is a love-story with political underplot. The Sanskrit work most famous as literature is the *Çakuntalā* of Kālidāsa (about 550 A. D.). For this and his dramas *Vikramorvaç* and *Mālarikā*, see KĀLIDĀSA. To Çri Harshadeva—apparently the King of Kanauj at the time of HUYEN-TSANG (q. v.), about 630 A. D.—are ascribed the *Ratnavali* and the *Nāgānanda*. Bhavabhūti is said to have flourished at this same court of Kanauj about 700 A. D. He was author of the *Mahāvīra-carita*, or "Life of the Great Hero," and *Uttara-rāma-carita*, or "Later Life of Rāma," which together form a dramatized version of the *Rāmāyana*, and of the *Mālatī-mādhava*, a domestic drama. These are held in high esteem by the Hindus, but Bhavabhūti, as compared with Kālidāsa, is more artificial, more unboundage to the rules of the writers on dramatic composition. Bhaṭṭa Nārāyaṇa's *Veṇī-samhāra*, or "The Seizing of the

to him as emperor; but later he went over to the republicans, and by heading a revolt at Vera Cruz Dec. 2, 1822, was the chief instrument of Iturbide's downfall. During the presidency of Guadalupe Victoria, 1824-28, Santa Anna lived in retirement; but the political struggles of 1828 brought him again into prominence. By a pronunciamento in favor of Guerrero he materially aided him to attain the presidency, and was rewarded by high commands in the army. In 1829 he was sent against the Spanish army, which had invaded Mexico under Gen. Barradas; the latter was forced to capitulate at Tampico Sept. 11, and this success added immensely to Santa Anna's popularity. In 1832 he headed the revolt by which Bustamante was overthrown and Gomez Pedraza, the constitutional president, was restored for the remainder of his term. Santa Anna himself became a presidential candidate, and was elected for the term beginning Apr. 1, 1833. He assumed the executive only at intervals and for short periods. At first the chair was occupied by Vice-President Gomez Farias, an enlightened statesman who instituted many reforms. These excited violent opposition in the Church and army, secretly fomented by Santa Anna, who, whenever he acted as president, posed as the champion of religion and order. By such intrigues he obtained the support of the reactionists, had Farias banished in 1835, abolished the federal constitution, and became practically dictator, though commonly acting through vice-presidents who were his subservient tools. Texas seceded in 1836. Santa Anna marched against the rebels, stormed the Alamo, and massacred its garrison Mar. 6, 1836, but was defeated and captured by Houston at the battle of San Jacinto Apr. 21-22. To obtain his release he recognized the independence of Texas in a treaty which was repudiated at Mexico; all his popularity was lost, and when he returned to Jalapa he signified his intention of retiring to private life. The French invasion of Vera Cruz in 1838 brought him out again; he was given command of the army, defeated the French Dec. 5, and, having lost a leg in the engagement, became at once a popular hero and martyr. In 1839 he supported Bustamante against the federalist revolts, and was for a short time acting president. In 1841, partly by intrigue and partly by open rebellion, he deposed Bustamante and caused himself to be chosen president with dictatorial powers, increased by the new constitution of June 12, 1843. This led to fresh revolts. In Dec., 1844, his opponents seized the capital during his absence; he was defeated, captured, and banished, taking up his residence in Havana. Fresh changes brought his party again into power; he was recalled in 1846, and in December of that year was again elected president, but, as usual, only assumed the executive at intervals. During the war with the U. S. he commanded the Mexican army, and was repeatedly defeated by Taylor and Scott (see TAYLOR, ZACHARY, and SCOTT, WINFIELD); after the capture of Mexico he resigned and left the country. In 1853 he was recalled by a conservative revolution, was made acting president, and on Dec. 16, 1853, declared himself perpetual dictator, with the title of supreme highness. But the liberals, under Alvarez and Comonfort, speedily excited a civil war. After a vain attempt at conciliation Santa Anna fled from the capital Aug. 9, 1855, and soon left the country. In his absence he was tried and condemned for treason and his estates were confiscated. He was never again prominent in Mexican affairs, though he kept up a series of intrigues in the U. S. and elsewhere, and vainly offered his services to the French invaders and to Maximilian. In 1867 he made an attempt to enter the country, but was captured and exiled. After the amnesty of 1874 he returned, but lived in obscurity. D. at Mexico, June 20, 1876. HERBERT H. SMITH.

Santa Barbara: city; capital of Santa Barbara co., Cal.; on Santa Barbara channel, and the S. Pac. Railroad; 14 miles E. of Elwood (for location, see map of California, ref. 11-D). There is regular steamer communication with San Francisco, San Diego, and San Pedro. Santa Barbara is in a sheltered nook of the shore, is protected on the N. by the Santa Ynez Mountains, and from its dry, equable climate has become one of the most noted midwinter health resorts on the Pacific coast. The temperature ranges from 50° to 55° in winter, and from 65° to 70° in summer. The city has beautiful surroundings, with luxuriant roses and tropical plants, many attractive residences, a Spanish and a Chinese quarter, and an excellent bathing-beach. There are a public high school, primary and grammar schools, St. Vincent's School, manual-training school, free kindergarten, collegiate school, commer-

cial college, College Hospital, 2 national banks with combined capital of \$200,000, 2 State banks with capital of \$60,000, 3 libraries (Public, Franciscan Mission, and Natural History), and 2 daily and 3 weekly newspapers. The Spanish Mission, founded by Junipero Serra in 1786, is within a mile of the city; it includes a church with two towers, a refectory, a dormitory, and a garden, and is still in charge of Franciscan monks. Other points of interest are the springs containing sulphur, sulphuretted hydrogen, iron, alumina, and potash; the Parra Grande, or great grapevine, which annually yields about 8,000 lb. of fruit, at Montecito, 4 miles distant; and numerous avenues of magnolias, bananas, and date-palms, fields of pampas grass, groves of walnut, orange, prune, olive and loquat trees, and interesting Chinese vegetable gardens. The city is in an agricultural and stock-raising region, and has large wool, olive oil, asphaltum, petroleum oil, and fruit-growing interests. It has received the popular name of the American Mentone. The harbor was first visited by Sebastian Vizcaino in 1603. The presidio established by Gov. Felipe Neve in 1782 was maintained till the arrival of Gen. Frémont. Pop. (1880) 3,460; (1890) 5,864.

G. E. THURMOND.

Santa Catharina: an island of the state of Santa Catharina. It is 34 miles long by 3 to 5 miles wide, and is separated from the mainland by a channel which forms an excellent harbor. The surface is partly hilly. On the western side is the capital of the state, sometimes called Santa Catharina, but properly DESTERRO (q. v.). H. H. S.

Santa Catharina: a maritime state of Brazil, bounded by Paraná, the Atlantic, Rio Grande do Sul, and the Argentine Republic. Area, 28,627 sq. miles. A low coast belt lies between the ocean and the Coast Range, which here rises to 5,000 or in parts to 6,500 feet. This range is succeeded by an irregular plateau which falls gradually westward. The coast belt and mountains are covered with forest, araucaria predominating above 3,000 feet. The plateau is occupied in part by open grass-lands, in part, especially toward the W., by tracts of forest. The principal rivers are the Pelotas or upper Uruguay, on the southern boundary; the Iguassú, a branch of the Paraná, on the northern boundary; and the Itajahy, flowing to the Atlantic. The climate is essentially tropical on the coast, temperate on the plateau. Santa Catharina, though it has a fertile soil and other natural advantages, has developed very slowly. Agriculture and grazing are almost the only occupations. There are considerable agricultural colonies of German and Italian immigrants. A little coal is mined. Pop. (1888) estimated, 236,346. H. H. S.

Santa Clara: town (founded in 1852, received new charter in 1867); Santa Clara co., Cal.; on the S. Pac. Railroad; 3 miles W. by N. of San José, and 48 miles S. E. of San Francisco (for location, see map of California, ref. 8-C). It is in the center of the beautiful and rich agricultural valley from which the town takes its name, and contains a State bank with capital of \$125,000, a public high school, Santa Clara College (Roman Catholic, opened in 1851), Academy of Our Lady of Angels (Roman Catholic), convent school, a library, and two newspapers. The University of the Pacific (Methodist Episcopal, opened in 1852) is about midway between Santa Clara and San José. Pop. (1880) 2,416; (1890) 2,891; (1895) estimated, 3,000. EDITOR OF "JOURNAL."

Santa Cruz, or St. Croix: an island of the Danish West Indies; in the Virgin islands group; 37 miles S. of St. Thomas. Area, 83 sq. miles. The surface is hilly, with considerable plains near the coast; the soil is fertile and well watered. Sugar and rum (known as Santa Cruz rum) are the principal products and exports. The common language is English. Santa Cruz was discovered by Columbus in 1493, was occupied in turn by Spanish, English, and French adventurers, and was sold by the French to a Danish company in 1733. Chief town, CHRISTIANSTED (q. v.). H. H. S.

Santa Cruz: a territory of the Argentine Republic; occupying the southern part of Patagonia S. of lat. 46° S., and bounded S. and W. by Chili. Area, 111,000 sq. miles. The greater part is a terraced plateau, which, especially near the Andes, contains good pasture-land. Some of this has been taken up by sheep-farmers, but the civilized population does not exceed 2,000. There are a few roving Indians, who sell guanaco-skins to the traders. Capital, Gallegos. The Santa Cruz river, from which the territory takes its name, has its sources in several beautiful lakes on the western slope of the Andes; it is navigable for small craft, and its estuary forms the port of Santa Cruz. H. H. S.

Santa Cruz: an eastern department of Bolivia, bordering on Brazil. Area, 196,017 sq. miles. Spurs of the Andean chain rise in various places, occupying a comparatively small area in the western part; all the rest is a plain, level only by a few hills and including in the eastern part portions of the floodplains of the great Paraguay, which flow past beyond the frontier. Most of the drainage, however, is toward the Amazon and Uruguay. The plains have few inhabitants except Indians and are very imperfectly tilled. They include considerable tracts of forest and great areas of open land known as the llanos de Chiquitos, from the Chiriguano Indians. A little-used road crosses in the floodplain frontier. The civilized population is gathered in the mountain region, which has a rich soil and valuable gold mines. Pop. 171,000. Capital, Santa Cruz de la Sierra. HENRI H. SMITH.

Santa Cruz: city, capital of Santa Cruz co., Cal.; on Monterey Bay, at the mouth of the San Lorenzo river, and on the Southern Pacific Railroad; 75 miles S. of San Francisco. The location, see map of California, ref. 8-C. The surface lies gradually from the sea to circling plateaus, covered with handsome cliffs to the mountains, which shelter the city from the N. winds. With an average winter temperature of 52° and summer temperature of 62°, a magnificent bathing beach, attractive drives of 10 miles along the sea-shore, and good roads through mountain scenery to the famous Red Tree grove, 5 miles distant, Santa Cruz is a favorite resort all the year. The San Lorenzo river and its branches are spanned by eight bridges within the city limits, and furnish fresh-water bathing and boating-places. The city has numerous covered streets, a public park of 200 acres overlooking the city and bay, several public plazas, water-works, electric light plant, street railways (operated in part by electricity), and several large hotels. There are 14 schools, 7 public-school buildings with 1,500 pupils, public school property valued at \$190,400, School of the Holy Cross (Roman Catholic), a business college, and a Free Public Library containing 15,000 volumes. The banking interest comprises 6 State banks for savings and loans, with a combined capital of \$300,000; the industrial establishments include sawmills, foundries, soap and glue works, and planing-mills, and the trade reports show large shipments by rail and water of powder, lime, and bituminous rock. There are 2 daily, 11 weekly, and 2 monthly periodicals. In 1905 the city had an assessed property valuation of \$12,200,000. The city is built on the site of the Santa Cruz Mission, founded by the Spaniards in 1791. Pop. (1890) 11,898; (1900) 23,000; (1905) 23,500. LUCY URBANOWICZ McCANN.

Santa Cruz (Span. prop. san-tú-krooth'), ARABIAN: general and politician; b. at La Paz (now in Bolivia) about 1794. He was of mixed white and Indian blood. He entered the Spanish army and attained the rank of colonel; but being opposed by the patriots in Dec., 1820, went over to them, was made general, and led an invasion of Upper Peru in 1825. Under Bolívar he was acting president of Peru from Aug., 1826, to June, 1827. Gen. Sucre, president of Bolivia, having been deposed, Santa Cruz was elected president of the republic for the term of ten years beginning Jan. 1, 1828; at the same time he received the military title of great marshal. His internal policy was progressive and the country was very prosperous; but almost from the first he encountered the idea of uniting the Pacific coast republics, and at this time was assailed by civil wars, and there were several attempts to the presidency. Orbegoso, who had been deposed, appealed for aid to Santa Cruz, who marched into the country (1828), successfully defeated Gamarrá and Orbegoso, and in Oct., 1829, proclaimed the Peruvian-Bolivian confederation. This consisted of the states of North Peru, South Peru, and Bolivia, each with a president, Santa Cruz himself being the chief executive, with the title of proconsul. His execution of slavery excited general horror. A British army invaded Peru, and after many months of fighting Santa Cruz was finally defeated at the battle of Yungay, Jan., 1839. He resigned and left the country, and the confederation was at once dissolved. Santa Cruz subsequently lived a dissipated life in Europe, a political means of keeping him out of the country. D. at St. Nazaire, France, 1860. HERBERT H. SMITH.

Santa Cruz de la Sierra: capital of the department of Santa Cruz, Bolivia, on a tributary of the Orinoco, or upper Amazon. As its name indicates, it was originally founded in the highlands, but was removed to its present location like Laredo in 1590 (or 1575?). As the frontier town

in this direction it has a considerable trade with Brazil and with the half-civilized Indians of the plains. Most of the men are engaged in trading, etc., at distant points; hence the permanent population (about 10,000) is largely composed of women. H. H. S.

Santa Cruz de Santia'go, or de Tenerife: capital of the Canary Islands; on the northeast coast of Tenerife. It has an excellent harbor, making the city the chief commercial port of the islands. Wine, brandy, cochineal, tobacco, and agricultural products are exported. The town and harbor are strongly fortified. Pop. of commune, 10,010.

Santa Cruz Islands: an archipelago of Melanesia, between the Solomon Islands and the New Hebrides, between parallels 8° 41' S. and 11° 40' S., and meridians 162° E. and 165° E.; under British protectorate, but claimed by the French, and very little known. They consist of a dozen volcanic islands and many islets, with a total area of about 300 sq. miles, and an estimated population of 5,000. The largest island is the Santa Cruz or Niteli, with an area of 215 sq. miles. The inhabitants present a mixture of the Melanesian and Polynesian types, the former prevailing, and differ much from island to island. They have uniformly proved hostile to visitors, and even missionaries have as yet got no foothold on the islands. MARK W. HARRINGTON.

Santa Fé, Span. prop. san-tá-fé': a province of the Argentine Republic; on the west side of the river Paraná; between Chaco on the N., Corrientes and Entre Ríos on the E., Buenos Ayres on the S., and Córdoba and Santiago del Estero on the W. Area, 50,969 sq. miles. The surface is level, and the greater part is included in the open pampas, but in the north there are extensive forests. The climate is mild and healthful, and Santa Fé is one of the most favored provinces in being generally free from floods and droughts. Its progress, especially since 1904, has been wonderfully rapid, mainly owing to the influx of immigrants and the establishment of agricultural colonies. The level surface has facilitated the construction of a network of railways, and the Paraná is a safe channel for seagoing vessels. In the construction of public works a heavy provincial debt has been contracted, and the finances are in bad condition. Grazing and wheat-raising are the principal industries; maize, flax, lucerne, and, in the north, sugar-cane are largely cultivated. There are extensive flouring-mills and other manufactures. Pop. about 300,000, over one-third of foreign birth. ROSARIO (p. 20) is the principal city and river-port. Santa Fé, the capital, is on the Santa Fé river, an arm of the Paraná. It was founded in 1573, and has a thriving trade, especially in cattle and lumber. The port does not admit large vessels, except when the river is flooded. Pop. about 20,000. HERBERT H. SMITH.

Santa Fé: city; capital of New Mexico and of Santa Fé County; on the Santa Fé creek, and the Atch. Top. and S. Fé and the S. Fé Southern railways; 30 miles E. of the Rio Grande, 50 miles N. E. of Albuquerque (for location, see map of New Mexico, ref. 10-S). It is the oldest and in many respects the most curious settlement in the U. S. The streets are narrow and crooked, and most of the buildings are of adobe, or sun-dried brick. The principal open space is the plaza, containing a soldiers' memorial monument, and having on one of its sides a long, one-story structure known as the Governor's Palace. The city is the seat of a U. S. military post, Fort Marcy, and of a Roman Catholic archbishopric. It is in an agricultural and stock-raising region, which contains gold, silver, copper, lead, zinc, anthracite coal, marble, a variety of building-stones, and gypsum. The city has a national bank with capital of \$150,000, 3 libraries, and 3 daily and 4 weekly newspapers.

Public Buildings.—The Governor's Palace, built in 1598, with walls 5 feet thick, has been used continuously as the official residence of the chief executive, under whatever title and superior authority he has served. In it Gen. Lew. Wallace wrote *Ben-Hur* while governor of the territory. One end of it contains the quarters and priceless treasures of the New Mexico Historical Society, and the other the post-office. The Capitol is an attractive building of cream-colored sandstone and cost \$200,000. Other buildings of note are the U. S. Government building, county court-house, penitentiary (cost \$150,000), New Mexico School for the Deaf and Dumb (opened 1885), St. Vincent's Hospital, and a Roman Catholic orphan asylum.

Churches and Schools.—The oldest church in the city, also said to be the oldest in the U. S., is San Miguel, built about 1550, destroyed by the Indians, and rebuilt in 1710.

The cathedral of San Francisco, of light brownstone, is built around a former cathedral whose history dates back to 1622. The educational institutions comprise 3 public schools, the University of New Mexico (Congregational, opened 1880), St. Michael's College (Roman Catholic, opened 1859), the Presbyterian Academy (opened 1881), Academy of Our Lady of Light (Roman Catholic), Whitin Hall School (Congregational), the Ramona Industrial School for Indian girls (memorial to Helen Hunt Jackson), and a Roman Catholic school for Indian boys.

History.—As far back as 1541 the place existed as an Indian pueblo or town, with a population estimated at upward of 15,000. About 1605 it was occupied by the Spaniards, who gradually reduced the Indians to slavery and opened and worked the rich mines of gold and silver. In 1680 the Indians revolted, expelled the Spaniards, closed up and obliterated all traces of the mines, and burned all the Spanish archives and church ornaments. The Spaniards under Vargas recaptured the pueblo in 1692, and the territory was held by Spain till 1821, when Mexico declared and perfected its independence. In 1846 U. S. troops under Gen. S. W. Kearny took possession of the city; in 1848 the territory was ceded to the U. S.; and in 1851 Congress created the Territory of New Mexico, with Santa Fé as its capital. Pop. (1880) 6,635; (1890) 6,185. G. J. HAGAR.

Santa Fé de Bogotá: See BOGOTÁ.

Santalaceæ: See SANDALWORTS.

Sant-Aldegondé: See MARNIX, PHILIPP, van.

Santal-wood, Sanders, or Saunders: the heart-wood of a tree, *Pterocarpus santalinus*, found in the East Indies, Ceylon, and Madagascar, and on the coasts of Coromandel and Malabar. It occurs in large billets, compact, hard, and of a dull murky red. Its coloring-matter is supposed to be similar to, if not identical with, that of barwood. It is only developed by age, and, while it is abundant in the trunks, is not found in the young branches. Weidel isolated two peculiar bodies from santal-wood: (1) *Santal* ($2C_6H_5O_2H_2O$), colorless crystals, tasteless, odorless, insoluble in water, bisulphide of carbon, benzene, and chloroform, and slightly soluble in alcohol and ether. Its alkaline solution is yellow, but becomes rapidly red in the air, and gives red precipitates with lime and baryta. Its alcoholic solution assumes a dark red with ferric chloride. He obtained 3 parts from 1,000 of wood. (2) *Santaline* ($C_{11}H_{14}O_4$), which is a magnificent scarlet, with a green metallic iridescence, is insoluble in water, slightly soluble in alcohol and ether, and imparts a reddish purple to alkaline solutions. Santal-wood is used chiefly on the Continent to give a bottom to woolen cloth to be subsequently dyed with indigo, yielding by this combination a fine blue (*bleu de Nemours*), which is purple blue by reflected light. It also imparts a dark red to woolen and cotton goods, which assumes a rich brown on passing through a bath of bichromate of potash; with sumac it gives a dark brown, with fustic a light brown. Revised by IRA REMSEN.

Santa Maria: a name for PUERTO DE SANTA MARIA (q. v.).

Santa Maria: town (settled in 1874); Santa Barbara co., Cal.; on the Santa Maria river, and the Pacific Coast Railway; 13 miles from the ocean, 31 miles S. of San Luis Obispo (for location, see map of California, ref. 10-D). It is in an agricultural, fruit-growing, and stock-raising region, and contains 4 churches, 3 public-school buildings (high school cost \$15,000), 4 hotels, State bank with capital of \$25,000, and 2 weekly newspapers. Pop. (1880) 300; (1890) 900; (1895) estimated, 1,500. EDITOR OF "SANTA MARIA TIMES."

Santa Maria, Domingo: statesman; b. at Santiago, Chili, Aug. 4, 1825. He graduated at the University of Santiago; was admitted to the bar in 1847; held minor Government offices, and early became known as a pronounced liberal. Being involved in the insurrection of 1851-52, he was banished for a year to Peru; was elected to congress on his return, and became widely known for his brilliant oratory; and during the political struggles of 1858-59 was again banished, traveling in Europe. President Perez recalled him, and made him Minister of Finance 1863-64. During the war with Spain he negotiated a treaty of alliance with Peru. In 1868 he was appointed judge of the Supreme Court. He supported the administration of President Pinto, was his Minister of Foreign Affairs and of the Interior, and finally Minister of War during the second year of the contest with Bolivia and Peru. His vigorous measures won him great popularity, and he was elected to succeed Pinto Sept. 18, 1881-Sept. 18, 1886. The war was brought to a successful

end in 1883, and in the same year the Araucanian Indians were finally subdued. Subsequently he was president of the senate. D. at Santiago, 1890. H. H. S.

Santa Maria di Capua: See CAPUA.

Santa Marta: capital and port of the department of Magdalena, Colombia; on a bay of the northern coast; 40 miles E. N. E. of the mouths of the Magdalena (see map of South America, ref. 1-B). It was founded by Rodrigo de Bastidas in 1525, as the capital of the province of the same name, which corresponded in part to the modern department. During the colonial period it was very important as a port and center of conquest; Quesada, marching from this place, conquered the plateau of Bogotá. The town was repeatedly attacked by Indians, and taken and sacked by English and French corsairs; the ruins of the Spanish forts erected for its defense may still be seen. The harbor is one of the best on the coast; a short railway runs to Ciénega, and (1895) projected to Cerro de San Antonio on the Magdalena. Santa Marta is an episcopal see, and has a cathedral, seminary, hospital, etc. Pop. about 6,000. HERBERT H. SMITH.

Santa Marta, Sierra Nevada de: an isolated group of mountains in Northern Colombia (department of Magdalena), near the coast, and immediately S. E. of the town of Santa Marta. Brettes and Nufiez, who first scaled the highest peak in 1891, found it to be 17,018 feet above sea-level; other estimates make it higher. From the sea the snow-crowned summits present a magnificent sight. The group is completely separated from the Andean system, and has a different geological structure. H. H. S.

Santa Maura, saan'taa-mow'raa, or Leuca'dia: one of the Ionian islands; formerly a peninsula, but since the seventh century B. C. separated from Western Greece by a strait about a mile wide. Area, 180 sq. miles. Pop. 25,000. Its history has been mainly that of the other IONIAN ISLANDS (q. v.). Hills traverse it from north to south, terminating in white cliffs, whence its ancient name *Leucas* (Gr. *leukos*, white). One of these cliffs served as a place of execution of criminals. This is still called Rock of Sappho's Leap, from the tradition that the poetess and other unhappy lovers cast themselves hence into the sea. E. A. G.

Santa Monica: city; Los Angeles co., Cal.; on the Pacific Ocean, and the S. Cal. and S. Pac. railways; 17 miles W. of Los Angeles, the county-seat (for location, see map of California, ref. 12-F). It is a popular summer resort, is engaged in ostrich-farming, lumbering, and milling, and contains one of the longest ocean wharves in the world (extending 4,700 feet into Santa Monica Bay), 7 churches, grammar and high school, public library, water-works, electric lights, 2 State banks with combined capital of \$115,000, and a weekly newspaper. The Pacific branch of the National Home for Disabled Volunteer Soldiers is here. Pop. (1880) 417; (1890) 1,580. EDITOR OF "OUTLOOK."

Santa'na, Pedro: general and politician; b. at Hincha, Santo Domingo, June 29, 1801. He was a lawyer and wealthy landowner until 1844, when he headed the revolution by which the eastern part of the island became independent of Haiti; was president of the Dominican Republic, then formed, 1844-48; repulsed the invasion of Souloque 1849; deposed Jimenes, and was president for a short time. He was president by regular election 1853-57, and again defeated Souloque in 1855 and 1856. After the deposition of Baez, Nov., 1858, Santana again assumed the presidency, but despairing of bringing about order, he ceded the republic to Spain in Mar., 1861. He was appointed lieutenant-general in the Spanish army, and quelled an insurrection in Azua. D. at Santo Domingo, June 14, 1864. H. H. S.

Santander: capital of the province of Santander, Spain, on a promontory in an inlet of the Bay of Biscay, where a spacious and perfectly safe harbor is formed by two mountains, and provided with convenient quays and docks (see map of Spain, ref. 12-F). The surrounding hills are beautifully covered with vineyards and forests, and rich in mineral springs and iron and copper ores. The rivers and the sea teem with fine fish. There are several good manufacturing establishments. Wheat and ores are the principal exports. Pop. (1887) 41,829.

Santander: an interior department of Colombia, on the east side of the river Magdalena; surrounded by Magdalena, Venezuela, Boyacá, Antioquia, and Bolívar. Area, 16,291 sq. miles. It is traversed by the Eastern Cordillera of the Andes, and two-thirds of the surface is essentially mountainous. Near the Magdalena and in the eastern part there are extensive plains. The river Sogamoso divides the

mountain region by a deep gorge, flowing to the Magdalena. The drainage of the northern part is to Lake Maracay. The soil, climate, and natural productions embrace everything found in Colombia) but the roads are good mule-tracks, and the difficulty of communication has retarded the development of the department. The principal occupation is agriculture, the most important crops being coffee, cacao, and tobacco. Gold, silver, emeralds, etc., are mined on a small scale. There is a considerable trade with Venezuela. Pop. (1885) estimated, 800,000. Capital, Bucaramanga.

HERBERT H. SMITH.

Santander, FRANCISCO DE PAULA: general and statesman; b. at Barranquilla, Colombia, New Granada, Apr. 2, 1792. He was a student at Bogotá when the war for independence began in 1810; joined the patriots, and served through an arduous campaign; was with Bolívar in the llanos and he commanded an advance division in the invasion of New Granada, and by his opportune aid with the main army, enabled Bolívar to gain the victory of Boyacá Aug. 7, 1819. Santander was promoted general of division on the field, was appointed vice-president, or governor, of Cundinamarca, and on Sept. 7, 1821, was elected vice-president of Colombia under Bolívar. During the latter's campaign to the south and Peru, 1823-27, he governed the republic with wisdom and energy, completely cleared it of hostile forces, obtained the recognition of foreign powers, and sent more than 8,000 men to re-enforce the liberator. He was elected vice-president in 1827. After Bolívar's return in that year he led the federalist opposition to him, though he did not openly revolt; and when Bolívar assumed absolute power in 1828 Santander was deposed. Soon after he was arrested and sentenced to death in a charge which proved of emptying at an attempt to assassinate Bolívar. The sentence was commuted to banishment and loss of rank, and he went to Europe. In 1834, after the dissolution of the republic of Colombia, Santander's honors were restored, and he was invited to return. Before his arrival he was elected president of New Granada Mar. 9, 1832, and held the post until the beginning of 1837. Subsequently he was an active member of congress. D. at Bogotá, May 4, 1864. Santander was one of the ablest statesmen of his country and time, and he is properly regarded as the founder of New Granada, the modern Colombia. H. H. S.

Santa Paula, *span'lah;* town; Ventura co., Cal.; on the S. Pac. railroad; 16 miles N. E. of San Buena Ventura, the county seat, and 65 miles N. W. of Los Angeles (for location, see map of California, ref. 14-B). It is the center of a rich agricultural region, the place of residence of many of the wealthiest farmers in the Santa Clara valley, and a noted health resort. The valley is surrounded by mountains ascending in excellent water, petroleum, asphaltum, and valuable building stone and timber. It has the largest bean-crop in the country (yielding an average of a ton per acre), peach orchards and lemon groves, and a great honey industry. The town contains 11 churches, 3 public-school buildings, a national bank with capital of \$75,000, and 3 weekly newspapers. The principal industries are the refining of petroleum, and the manufacture from it of over fifty articles of commerce, the manufacture of printing-inks, the cement of building-stone and asphaltum, and the drying of fruit and beans. Pop. (1890) 188; (1890) 1,047; (1894) estimated, 1,200.

ERROR in "CROCHER."

Santarem, sãnt'cãr'ã; a town of the state of Pará, Brazil, on the river Tapajós, 3 miles above its junction with the Amazon (see map of South America, ref. 3-F). It is the most important river-port between Manaus and Pará; is the center of an agricultural and grazing district; and one of the entrepôts of the Tapajós. Near it is an agricultural colony, partly composed of immigrants from the Southern U. S. Pop. about 9,000. H. H. S.

SANTERRE, MANUEL FRANCISCO DE BARROS E SOUZA, Viscount of; politician and historian; b. at Lisbon, Portugal, Dec. 18, 1791. His father was a courier. He accompanied the royal family to Brazil in 1807, held diplomatic positions in Europe from 1814, and was minister of Portugal to Denmark 1819-20. From 1823 to 1827 he was director of the archives of Portugal. Under the regency and Dom Miguel he was Minister of State 1827-33. After the fall of Miguel he returned to Paris, where the remainder of his life was spent. His numerous works in French and Portuguese are rather collections of historical material than well-arranged histories, but they are very valuable. Among them are *Revue des Annales Portugaises* (1842); *Essai sur l'histoire*

de la cosmographie et de la cartographie pendant le moyen âge (8 vols., 1840-52; continued by Mendes Leal); and *Quatro elementos das relações políticas e diplomáticas do Portugal* (10 vols., by Santarém; continued by Ribeiro da Silva, D. in Paris, Jan. 18, 1854. H. H. S.

Santa Rita Durão, rit'ã-dô-crown; José, da; poet; b. near Marianna, Minas Geraes, Brazil, 1767. He studied in Rio de Janeiro and at Coimbra, and became Doctor of Theology at the University of Coimbra, Dec. 24, 1796. After a sojourn in Rome, where he made the acquaintance of his compatriot, Basílio da Gama, and felt powerfully the influence of the Italian poets, he became professor at Coimbra (before 1778). Here he pronounced an elegant and truly interesting Latin oration (*Josephi Durani, Theologi, Conimbricensis O. E. S. A. pro omnia studiosorum institutione oratio* (Coimbra, 1778). Here also he wrote his epic, *Caracorum* (Lisbon, 1783), an account of the discovery and settlement of Bahia, by Diego Álvares (called *Caracorum* by the aborigines). The poem has been several times printed, but the best edition is in Varnhagen, *Epica brasiliensis* (Lisbon, 1845). D. in Lisbon, Jan. 34, 1784. A. R. MASON.

Santa Rosa: city (located in 1854); capital of Sonoma co., Cal.; on the San Fran. and N. Pac. and the S. Pac. railways; 61 miles N. of San Francisco (for location, see map of California, ref. 6-B). It is widely known for its roses, which bloom all the year in the open air, and is the center of a region peculiarly adapted to fruit-culture, hop and grain growing, hay-making, and dairying. The city is laid out on a site nearly level, with wide streets and broad sidewalks bordered with trees. There are nine churches; one, the Baptist, was built entirely from a single tree, a giant redwood from the Guerneville forest. The educational institutions comprise the public schools with 1,500 pupils, the Santa Rosa Seminary and the Ursuline Academy (Roman Catholic), the Santa Rosa Ladies' College (non-sectarian), and the Pacific Methodist College (Methodist Episcopal South, opened in 1861). The court-house is an imposing structure, and, with adjacent county buildings, cost \$200,000. The city has an excellent gravity water-supply, gas-works, two electric-light plants, several flour-mills, and extensive fruit-drying and canning works. There are a national bank with capital of \$150,000, 3 State banks with combined capital of \$620,000, and 2 daily and 3 weekly newspapers. In 1894 the city had receipts of \$40,318, and an assessed property valuation of \$3,822,652. Pop. (1880) 3,516; (1890) 5,220; (1894) 7,250. JAMES W. OATKES.

Santa Rosa de los Osos: a town of the department of Antioquia, Colombia; 26 miles N. E. of Medellín; on a plateau of the Andes; 3,500 feet above sea-level. It owes its importance to rich gold-deposits in the vicinity; there are over forty regular works, but the methods of working are antiquated. The climate is cold for Colombia (mean, 57° F.), and very salubrious. Pop. (1892) 10,052. H. H. S.

Santa Rosalia: city of Southern Chihuahua, Mexico; on the Mexican Central Railway; 335 miles S. of El Paso (see map of Mexico, ref. 3-E). It is celebrated for its hot sulphur springs, long known to be curative by the natives and much resorted to by invalids. They are especially useful in inflammatory rheumatism. Pop. estimated at 8,000. M. W. H.

Santa Tecla, or Nueva (nôô'vã) San Salvador: a town of Salvador; 8 miles S. W. of San Salvador; beautifully situated in a valley on the south side of the San Salvador volcano. After the destruction of San Salvador by the earthquake of 1854 an attempt was made to remove the population to this place, which was officially declared to be the capital in 1855. The latter arrangement was never carried out, but the newly founded city has prospered. Pop. (1890) 13,715. H. H. S.

Santee Indians: See SIOUAN INDIANS.

Santee River: a stream formed in South Carolina by the union of Wateree and Congaree rivers. It is 150 miles long and is navigable throughout for steamboats. Its lower course is through pine-forests and low rice-lands. It reaches the Atlantic through the North and the South Santee.

Santerre, sãnt'ãr', ANTOINE JOSEPH; revolutionist; b. in Paris, Mar. 16, 1752; was a brewer by trade, and acquired influence by his wealth and generosity. His brewery in the Faubourg Saint-Antoine became a frequent meeting-place for the Jacobins. As commander of a battalion of the national guard, he took part in the storming of the Bastille July 14, 1789, and played a conspicuous part in the riots of the Champ de Mars, the attack on the Tuilleries (June 20,

1792), and the insurrection of Aug. 10. He was appointed commander-in-chief of the national guard of Paris, with the rank of general of division, and governor of the Temple during the imprisonment of the king, whom he escorted to the scaffold. In the summer of 1793 he was made a general of division and sent to the Vendée at the head of an army of 20,000 men, but was beaten at Coron Sept. 18, 1793; recalled and arrested as an Orleanist, he did not regain his liberty till after the fall of Robespierre. After this he withdrew into private life. D. Feb. 6, 1809. See Carro, *Sant-erre, sa vie politique et privée* (Paris, 1847).

Santi, saan'tē, GIOVANNI: painter; father of Raphael Sanzio; b. at Castello di Colbordolo, in the duchy of Urbino, Italy, about the middle of the fifteenth century. His master in painting is unknown, but he seems to have formed his style from that of Melozzo da Forlì and other great painters of his time. Giovanni Santi's best-known work is the fresco in the Dominican church at Cagli (1482). There is a *Visitation* at Fano, and a *Madonna with Saints* in Sta. Croce there. A *St. Jerome* in San Bartolo at Pesaro; an *Enthroned Madonna with Four Attendant Saints*, at the Pieve of Gradara; a *St. Sebastian*, in the oratory of that saint at Urbino, besides a votive picture of the Buflì family in the Franciscan church there, and a fresco of a *Madonna and Child* in Raphael's house in Urbino are recognized as Santi's work. The Brera at Milan and the National Gallery in London possess examples of his art. He was also a poet; a MS. in the Vatican Library (*Codex Ollobonianus*, 1805), consisting of 344 folio leaves in *terza rima* exists, celebrating the virtues of Duke Federigo di Monte Feltro, and is interesting, as it contains allusions to the artists of the time and Giovanni Santi's sentiments and opinions on art. D. in 1494. W. J. STILLMAN.

Santiago, or **Santiago de Chile**, sañ-tē-aa'gō-dā-chee-lā: capital and largest city of Chili; on a plain by the little river Mapocho; 68 miles E. S. E. of Valparaiso, its port (116 miles by rail); 1,755 feet above sea-level (see map of South America, ref. 8-C). It is the most populous city on the Pacific slope of America except San Francisco; is the center of Chilean wealth, fashion, and culture, and exhibits more luxury and taste in building than any other capital of South America. The situation, on the plateau called the valley of Chili, is very fine. The plain, naturally dry, has been improved by an elaborate system of irrigation which keeps the city gardens and parks always green. The snow-capped Andes, including the giant of the range, Aconcagua, are in plain view on the E., contrasting with the barren rocks of the Coast Range on the W. A single rocky hill, Santa Lucia, rises within the city limits, and has been transformed by private munificence into a beautiful park and pleasure-ground. The Alameda, a very wide street, crosses the city and is its main artery; it is ornamented by four rows of trees, with a central promenade and two driveways, and is set at intervals with statues, some of them spoils of the Peruvian war. Many of the finest public and private buildings and retail stores are on this street. The cathedral, municipal buildings, etc., face the old Plaza de Armas, now the Plaza de la Independencia. Among other public edifices may be mentioned the Hall of Congress, fronting a fine square, the mint, the opera-house, said to be the finest in America, and the Exposition Hall. Nearly all the better class of buildings are of stone, and many show great architectural taste. The residences are generally of two or at most three stories, and set in extensive grounds ornamented with orange-trees, etc.; for this reason the city occupies a very large area in proportion to its population. Dwellings are furnished with taste, often with great luxury. There are several public parks, and a well-stocked botanical garden. As a center of learning Santiago has a renowned university and various other institutions of higher education; a national library with 70,000 volumes and 40,000 manuscripts; a museum, academy of fine arts, observatory, etc. It is connected by railway with the northern and southern provinces, and with the coast. Commercially it yields in importance to Valparaiso. Santiago was founded by Valdivia, the conqueror of Chili, in Feb., 1541. Earthquakes are frequent, but have never been very destructive. The climate is changeable, ranging from 23.9° to 91.1° F. Pop. (1885) 189,332; in 1894 probably 225,000. The province of Santiago, of which the city is also the capital, has an area of 5,223 sq. miles, and a population of about 425,000. HERBERT H. SMITH.

Santiago de Compostela, -dā-kom-pōs-tā'lā: city; in the province of Corunna, Spain; at the confluence of the Sar and

the Sarela; 33 miles S. by W. of Corunna (see map of Spain, ref. 12-B). It is the see of an archbishop, and has a magnificent cathedral, a university, and several educational and religious establishments, from which it chiefly derives its importance. The cathedral is said to contain the bones of the patron of Spain, the apostle James. It was built in the eleventh century in the form of a cross, 270 feet long and 204 feet broad, and contains six naves formed by beautiful Gothic pillars. Before the Reformation this church was annually visited by great crowds of pilgrims, but the number of visitors has since decreased and the city decayed. There are manufactures of linen, silk, leather, and paper, and the vicinity is rich in cereals, vegetables, fruit, and wine. Pop. (1887) 24,302.

Santiago de Compostela: the name given to JAMES (q. v.), the son of Zebedee, as the patron saint of Spain.

Santiago de Cuba, -dā-koo'bā, or simply **Cuba** (in old books often called *St. Jago de Cuba*): city and port of Cuba; on a bay of the south coast, near the eastern extremity of the island (see map of West Indies, ref. 5-E). The harbor is one of the finest in the West Indies, but it is separated from the interior by rugged mountains which retard communication; hence the port is only the third in Cuba in importance. The city, surrounded on three sides by mountains, is very picturesque, but hot and subject to epidemics of yellow fever. The houses are generally low, but well built; there are few public edifices of note. The town has several fine squares and public gardens. Short railways run to the interior. Santiago is the center of the Cuban copper region. The principal exports are sugar, rum, coffee, cacao, fruits, and copper ore. Pop. (1891), with the district, 71,307; of the city proper, about 40,000. HERBERT H. SMITH.

Santiago del Estero, -dāl-ās-tā'rō: an interior province in the northern part of the Argentine Republic; surrounded by Santa Fé, Córdoba, Catamarca, Tucumán, Salta, and the territory of El Chaco. Area, 31,500 sq. miles. It is a plain, the greater part included in the region of mingled forests and open lands called the Gran Chaco; in the southern part there are true open pampas. The principal rivers are the Salado and Dulce, neither of which is navigable. Nearly all the civilized population is gathered in the north. S. of the Salado, about 18,000 sq. miles in extent. Grain, grain-planting, and timber-cutting are the only important industries. Pop. (1890) about 250,000 (including wild Indians). Santiago del Estero, the capital, on the Dulce, was founded in 1552, and (disregarding the first settlement of Buenos Ayres) is the oldest town in the republic. It is much decayed, and has frequently suffered from overflows of the river. Pop. 8,000. HERBERT H. SMITH.

Santiago de los Caballeros, -dāl-lōs-kā-baal-yā'rō, or **de la Vega**: town of the Dominican Republic, West Indies; in the central plain called the Vega Real; 85 miles N. N. W. of Santo Domingo, on the road to Puerto Plata (see map of West Indies, ref. 5-H). This is the most beautiful and fertile part of the island, and is free from the heat and fever of the coast. The town is the most populous in the interior of the republic, and has a thriving trade, especially in tobacco. Pop. about 10,000. H. H. S.

Santillana, sañ-tēel-yaa'nā, INIGO LOPEZ DE MENDOZA Marquis of: soldier and poet; b. at Carrion de los Condes, Spain, Aug. 19, 1398; son of the grand admiral of Castile; was created Marquis of Santillana by Juan II. of Castile for his services in wars against Aragon and the Moors, and after the battle of Olmedo against the King of Navarre in 1446 received the title of Conde del Real de Manzanares. Upon the death of Juan in 1454 Mendoza retired from public life and devoted himself to literature. His best-known work is *Los Proverbios*, or *Centiloquio* (1496), a collection of 100 proverbs in rhyme. He wrote also *Diálogo de Bias con Fortuna* (1448); *Doctrinal de Privados* (1453); the *Comedia de Ponza* (a dramatic poem); and *serranillas*. D. at Guadalupe, Mar. 25, 1458. His works have been edited by Andador de los Rios (Madrid, 1852).

Santley, CHARLES: baritone singer; b. in Liverpool, England, Feb. 28, 1834; studied at Milan under Gaetano Navarini under Garcia on returning to England. He sang the part of Adam in Haydn's oratorio *The Creation*, at St. Martin's Hall in London, Nov. 16, 1857. In 1859 he appeared in the opera of *Dinorah* with the Pyne and Harrison Company at Covent Garden theater; and in 1862 made his debut in Italian opera. He made a tour in the U. S. in 1871. In London he sang in *Zampa* and *The Waterman*, with the

and Tom Company in *The Flying Dutchman*, and for part of the musical festivals and concerts. In 1899 he took a tour in Australia, and passed through New York in 1900 en route to England. H. R. VALLBERG.

Santo Domingo, or Haiti (*domo-dōnēō*; *San Domingo*, and formerly *Louisiana*, or *Hispaniola*): an island of the Greater Antilles, West Indies, between the Caribbean Sea and the Atlantic; separated from Cuba on the W. N. W. by the Windward Passage, and from Puerto Rico on the E. by the Mona Passage. Length from E. to W., 403 miles. Area 98,804 sq. miles, divided between the republic of Haiti (area 47,700) to the west and the Dominican Republic to the east. From the sea it appears to be a mass of mountains; actually there are several east and west ranges separating extensive plains such as the beautiful Vega Real in the Dominican Republic and the plain of Artibonite in Haiti. The country everywhere is very fine, some of the mountains reaching to 8,000 or 7,000 feet. The island is abundantly wooded and one of two of the rivers are navigable for short distances. The most important streams are the Artibonite in Haiti and the Yaque, Yuma and Ozama in the Dominican Republic. In the southwest there are two considerable salt lagoons in the Dominican Republic and Ponds in Haiti. The coasts broken by deep indentations from several great bays; the largest of these is Samaná Bay, but the principal commercial ports are Port-au-Prince, Cap-Haïtien, Santo Domingo, and Puerto Plata. The soil of the entire island is very fertile and the mountain forests contain many cabinet-woods and dyewoods. The island does not appear to be rich in minerals. A little gold is obtained, and some platinum, coal, etc., are reported. The climate is hot and occasionally unhealthy in some of the coast towns, mild and salubrious in the interior, the temperature varying with the elevation. The wet season, from April to October, is characterized only by a higher temperature and more abundant rains. Hurricanes are occasionally destructive from July to October. Several severe earthquakes are recorded. The island has no volcanoes.

History.—Santo Domingo, called Haiti by the natives, was discovered by Columbus and Pinzon at the end of 1492, and was the first part of the New World settled by the Spaniards. (See *Colombus*.) The natives, a mild race of Arawak stock, were at first very friendly; later they rose against their oppressors, but were beaten in several wars by Columbus and his successors, and were reduced to the semi-slavery of the *encomendados*; they soon disappeared and their land was only tenanted by the mixed race. Gold-mining, even with enforced Indian labor, was never very profitable, and agriculture became the chief occupation. Negro slaves were introduced as early as 1502, and later great numbers were brought, especially to the western part of the island. Santo Domingo (founded in 1496) became the chief city, and about 1520 was the capital of Spanish America. The island was the point from which subsequent discoveries and conquests were made. From it were settled Cuba (and some Mexico and California), Darien (and hence Peru, Chili, and Ecuador), Santa Marta, and New Granada, Puerto Rico and Florida, Venezuela, and Jamaica. But after the rich discoveries on the mainland, the island was neglected and partly depopulated, and it became the prey of the buccaniers. About 1625 some French buccaniers from Tortuga formed permanent establishments which soon increased in strength; and by the treaty of Ryswick (1697) the western part of the island was definitely ceded to France. This French colony became very prosperous; but the Negro slaves were ten times as numerous as the whites, and the free mulattoes, who were debased from legal rights, were very dissatisfied. The French Revolution of 1789 was quickly followed by a revolt of the mulattoes; both they and the whites appealed to the slaves, and in 1791-92 a terrible Negro insurrection broke out in the French part of the island. The blacks, under different chiefs, massacred the whites as they came out; royalist and republican, white, black and mulatto factions strove for supremacy; and in 1808 the isolated colony was invaded by the British and Spaniards. The French Assembly conciliated the blacks by a grant of compensation (1793); under their favorite leader, Toussaint Louverture, they resisted the British, who were driven out in 1798. Meanwhile, in 1793, Spain had ceded the eastern part of the island to France; it was occupied by Toussaint, who had appointed general-in-chief of the island since 1797, but in reality was dictator. He governed, notwithstanding the name of France, until 1801, when he pro-

claimantly declared independence. In 1802 Bonaparte sent a large force under Leclerc to subdue him. After some resistance he was conquered and sent a prisoner to France. Dessalines, Christophe, and others headed fresh rebellions, and the French were finally driven out in Dec., 1803. On Jan. 1, 1804, Dessalines declared the independence of Haiti, then including the whole island; soon after he proclaimed himself emperor; but he was assassinated in 1806. His successor, the Negro Christophe, proclaimed himself king, but could hold only the northwestern part of the island. The southwestern part formed a republic under Pétion, and the eastern part was seized by Spain. On Christophe's death (1820), Boyer, the successor of Pétion, assumed his dominion; in 1821 the eastern part rebelled against Spain and formed a republic under the protection of Colombia, but was shortly after conquered by Boyer; thus the whole island was united in the republic of Haiti, and this was the most prosperous period of its history. Boyer was overthrown in 1843, and in 1844 a revolution in the east resulted in the formation of the Dominican Republic. For subsequent history, descriptions of the two countries, and bibliography, see HAITI and DOMINICAN REPUBLIC.

QUESTED H. SMITH.

Santo Domingo: capital and most important city and port of the Dominican Republic, island of Santo Domingo, West Indies; on a bay of the south coast; at the mouth of the river Ozama (see map of West Indies, vol. 5-F). It was founded by Bartholomew Columbus in 1496, and is the oldest existing town of European origin in the New World. Many of the buildings and the fortifications date from a very early period, and some of them are associated with the history of Columbus. A fine statue of the discoverer adorns the principal square. The cathedral is a large but bare and rather unsightly building; in it is shown a crypt supposed to contain the remains of Columbus. They were certainly brought from Spain and buried in this cathedral, and it is claimed that the bones transferred to Havana in 1793 were those of another member of the family. Santo Domingo is the principal emporium of the southern part of the republic, and exports coffee, sugar, cabinet-woods, etc. The harbor is exposed to south winds, and is in fact little more than an open roadstead. Pop. about 25,000. H. H. S.

Santon: See *DAZYMUS*.

San'tonin: a crystallizable principle obtained from the drug *Santonica*, or Lavan wormseed. Santonin occurs in flat, quadrilateral, colorless prisms, is inodorous and nearly tasteless, and practically insoluble in water. In overdose it is poisonous to the animal system, producing convulsive tremblings, dilatation of the pupils, and enfeebling of the functions of the heart and lungs. It also causes the urine to acquire an unnatural yellow, and, what is very singular, it produces yellow vision by staining the humors of the eye, the field of view appearing as if seen through a yellow-tinted medium. Santonin is exceedingly poisonous to the round-worm, *Ascaris lumbricoides*, a parasite infesting the intestines in man, and is consequently used in medicine as an anthelmintic or vermifuge. From its poisonous properties it must be given with care. Revised by H. A. BAZE.

Santorin, *san-tō-rēn'*, or *Thera*, *thā-rā*: Greek island in the Aegean Sea; the most southern of the Cyclades. It is crescent-shaped, being the eastern portion of the circumference of a vast crater. Geologically, it is intensely interesting on account of the volcanic phenomena which have taken place in it. Sometimes land in the immediate vicinity has risen from the sea and formed islets, some of which still exist. A prodigious eruption began in Jan., 1866, and continued two years. On its cessation the inhabitants, who had fled in terror, returned to the island. Apparently Santorin was inhabited from earliest antiquity. On some of the rocks may be seen the most ancient specimens of Greek writing known. Pop. (1889) 23,000. Capital, Thera. See Virlet in *Bulletin de la Société géologique de France*, vol. lii.; also Fouqué in *Mission scientifique à l'île Santorin*, *Arch. des Missions*, second series, vol. iv., 1867.

E. A. GUSTAVUS.

Santos, *san-tā*: city and principal port of the state of São Paulo, Brazil; on a low peninsula (formerly an island) fronting the Bay of Santos; 40 miles by railway S. of São Paulo (see map of South America, vol. 7-F). The harbor is one of the best in Brazil, and vessels load directly at wharves. The city has many large warehouses and some good public buildings; but the climate is hot, and, owing to the yearly

epidemics of yellow fever, Santos is the most unhealthy port in Brazil. It is the outlet of the greater part of São Paulo, and exports more coffee than any other port in Brazil except Rio de Janeiro. Great numbers of immigrants pass through it. Santos was founded in 1539. Pop. about 20,000. Six miles S. of it is the small town of São Vicente, the oldest permanent settlement in Brazil (founded 1532), and until 1681 capital of the captaincy of the same name. H. H. S.

Sanzio, RAPHAEL: See RAPHAEL.

São (sown) Carlos: See CAMPINAS.

São Francisco River: a river of Brazil, rising in Minas Geraes near lat. 20° 30' S., flowing N., then N. N. E., and finally curving to E. S. E., and entering the Atlantic in lat. 10° 29' S. Length about 1,800 miles. It traverses the states of Minas Geraes and Bahia, and below its great bend separates Bahia and Sergipe on the S. from Pernambuco and Alagoas on the N. Among the great rivers of South America, the São Francisco ranks in length with the Orinoco; but, unlike the Orinoco, Amazon, and Paraguay, it is essentially a highland river, the greater part of its course being over the surface of the Brazilian plateau; and it is nowhere bordered by extensive forests. Its most remarkable feature is its division into an upper and a lower course by a series of rapids and a great cataract. These mark its descent from the plateau, after it has attained its full volume, only 200 miles from the sea. The cataract of Paulo Afonso is sometimes called the Niagara of Brazil, and it approaches Niagara in grandeur though differing greatly in appearance. The great river is here forced through a narrow gorge—in one place only 51 feet wide—and after rushing down a slope, forms three successive falls, with a total depth of 265 feet. The torrent is churned into a mass of foam, producing an effect of indescribable grandeur. Above this fall there are several rapids, and below it an unnavigable space where the river forms a deep cañon; the total obstructed portion is about 190 miles long. Below it the river is freely navigable from Piranhas to the sea, 148 miles; at Penedo, 30 miles above the mouth, it is nearly a mile wide. The bar, at high water, admits vessels of 15 feet draught. Above the falls there is a navigable space from Pirapora to Sobradinho, 984 miles. Of the numerous affluents the most important are the Paraupeba and Rio das Velhas on the right and the Paracatu, Urucuiyá, Carinhanha, Corrente, Rio Grande, and Rio Preto on the left. All of these are navigable for greater or less distances. The São Francisco was opened to free navigation in 1867, but no foreign commerce has been attracted to it. Brazilian steamers ply regularly on the upper course, which is connected with Bahia by railway; the Rio das Velhas is also navigated. The principal industry of the basin is cattle-raising, but it contains much agricultural and mining land. See Burton, *Exploration of the Highlands of Brazil* (1869); Halfeld, *Relatório concernente á exploração do Rio de S. Francisco* (1858) and *Atlas e Relatório* (1860); Roberts, *Relatório sobre o exame do Rio S. Francisco* (1880); Wells, *Three Thousand Miles through Brazil* (1886).

HERBERT H. SMITH.

São Gonçalo, Rio: See LAGOA DOS PATOS.

São João (-zhō-own') **da Barra, or da Parahyba**, -daa-pā-rah-ee-bā (formerly *Parahyba do Sul*): city and port of the state of Rio de Janeiro, Brazil; on the right bank of the Parahyba river, near its mouth. Formerly it was the commercial center of the lower Parahyba valley, but its importance has decreased since Campos has been united to the Bay of Rio de Janeiro by a railway. It is a port of call for coasting steamers, and exports sugar. The bar is passable only during spring tides; at other times vessels anchor in the roadstead. São João has an important sugar-factory. Pop. about 7,000. H. H. S.

São João d'El Rei, -del-rā'ēē: a town of the state of Minas Geraes, Brazil; 66 miles S. W. of Ouro Preto (see map of South America, ref. 6-G); is connected with Sabará and Rio de Janeiro by railway, and is the commercial center of a large district. It was founded about 1670, and was long famous for its gold and diamond mines. Cattle and hogs are raised in the vicinity, and hides, lard, and the favorite Minas cheeses are exported. Pop. about 10,000. H. H. S.

São Leopoldo: a town of the state of Rio Grande do Sul, Brazil; on the Rio dos Sinos, a branch of the Guahyba or lower Jacuhy; 20 miles N. of Porto Alegre (see map of South America, ref. 7-F). The first German colony in Brazil was established here in 1824, and the town is the center of a thriving agricultural region almost entirely peopled by

Germans or their descendants; it has railway and steamboat communication with Porto Alegre. German is the common language. Pop. about 7,000. H. H. S.

São Luiz: See MARANHÃO (the city).

São Miguel: See ST. MICHAELS.

Saône, sôn: a river of France which rises in the department of Vosges, at an elevation of 1,299 feet above the level of the sea; flows S. and joins the Rhône at Lyons. Its entire length is 282 miles; it is navigable for a distance of 170 miles below the city of Gray, department of Haute-Saône. It is joined by the Doubs on the left side.

Saône-et-Loire, -ā-lwāär: department of France; between the rivers Saône and Loire, and mostly occupied by the mountains of Côte-d'Or. The mountains are low, and rich in coal and iron, and on their slopes is produced the celebrated Mâcon wine. On the pastures along the rivers large herds of cattle and horses are reared. Iron plates and rails, machinery, etc., are manufactured in Creusot and other towns. Area, 3,302 sq. miles. Pop. (1891) 619,523.

Saône, Haute: See HAUTE-SAÔNE.

São Paulo, sown-pow'lo: a southeastern maritime state of Brazil; bounded by Minas Geraes on the N. and E., Rio de Janeiro on the E., the Atlantic on the S. E., Paraná on the S., and Matto Grosso on the W. and N. W. Estimated area, 112,330 sq. miles, but the boundary with Minas Geraes is unsettled. The Brazilian Coast Range, here divided by the Parahyba valley into two parallel chains, traverses the southeastern part, and is separated from the ocean by a narrow strip of lowland. Back of the mountains the surface is an irregular plateau, varied by hills and by the deep valleys of rivers which flow westward to the Paraná. The coast-strip mountains and a wide tract back of them were originally covered with forest, and this is the most fertile and thickly settled portion of the state. Bordering the Paraná and its branches there are other extensive forests inhabited only by a few roving Indians. The river Paraná forms the western boundary, and its branch, the Parapanémá, separates São Paulo from Paraná. The Pardo, Tieté, and Aguapehy are important branches of the Paraná, obstructed by falls near their mouths, but partly navigable in their upper courses. On the Atlantic side the only important river is the Parahyba. The principal harbors are the Bay of Santos and the channel formed by the island of São Sebastião. The climate of the plateau is mild and salubrious; some coast towns, as Santos, are hot and unhealthy. A little gold is washed in the river-beds, and there are deposits of excellent iron, marble, etc. The forests are rich in cabinet woods. São Paulo is the most populous and thriving of the Brazilian states and the most important coffee-producing region of the world; the coffee zone includes the Parahyba valley and the forest strip back of the mountains; sugar-cane is extensively planted, especially in the coast belt; and on the plateau the grazing industry is important. The people, called Paulistas, have always been noted for their enterprising spirit. During the colonial period they discovered the mines of Minas, Goyaz, and Matto Grosso, settling in those regions and the southern province; and their slave-hunters were long a terror to the Indians of Paraguay. Of late they have covered a large part of the state with railways, encouraged exploration and settlement toward the Paraná, and developed manufactures; and they have given some of the best statesmen, authors, and engineers to Brazil. The captaincy of São Paulo, originally called São Vicente, was formed in 1534, with its capital at São Vicente, on the Bay of Santos; this was changed to São Paulo in 1600. The captaincy originally included all of Southern Brazil; Rio de Janeiro, Minas Geraes, Santa Catharina (with Rio Grande do Sul), Goyaz, Matto Grosso, and Paraná were successively cut off from it. Pop. (1888) estimated, 1,396,242; the calculated annual increase is 3.5 per cent. There are many German and Italian immigrants. H. H. SMITH.

São Paulo: capital and principal city of the state of São Paulo; on a small branch of the river Tieté; 236 miles W. S. W. of Rio de Janeiro (870 miles by railway), 38 miles from its port of Santos (see map of South America, ref. 6-G). Owing to its situation on the plateau and near the Tropics of Capricorn, it has a mild and very agreeable and healthful climate. It is well built, and has the aspect rather of a European than of a Brazilian town; there are a number of public gardens and parks. The old Jesuit college is used as the state-assembly building; other notable edifices

sionally fighting with muskets, and at the Garita San Cosme it did excellent service as infantry. After the war it was stationed at West Point to assist in the instruction of cadets at the U. S. Military Academy. In 1853 a detachment accompanied Stevens's survey of the Northern Pacific Railroad. In 1858 the company formed part of the Utah expedition, returning to West Point in the fall of the same year. In the fall of 1858 a detachment was sent to the Pacific coast, where it was engaged until 1861 in opening and repairing roads, constructing bridges, and in fortifying San Juan island at the time of the boundary dispute. In 1861 this detachment proceeded to Washington, where it was engaged upon the defenses and in the instruction of volunteer troops in the preparation of siege-material. The main portion of the company was engaged during the summer of 1861 in the defense of Fort Pickens. In the fall of 1861 it joined the Army of the Potomac. An act of Congress of Aug. 6, 1861, added three companies, of 150 men each, to the engineer troops, and authorized one company of topographical engineers. In 1863 the Corps of Engineers and of Topographical Engineers were merged into one, and the strength of the battalion of engineers thus became five companies. One of these was not organized, however, until 1865. From the fall of 1861 until the end of the civil war the battalion formed part of the Army of the Potomac, and its services were invaluable. Under Capt. Duane (afterward brigadier-general and chief of the Corps of Engineers) the original company had been thoroughly instructed in pontoniering, sapping, and mining. This instruction pervaded the battalion, and it was thus enabled to give lessons to the volunteers which could be obtained from no other source. A number of volunteer regiments were organized as engineer troops, and in addition to these many infantry and artillery troops served as engineer soldiers when occasion required, the high character and intelligence of the volunteers rendering it an easy matter to find men capable of being quickly instructed in these duties. For mining at Vicksburg and Port Hudson practical miners were selected from the different regiments, and temporarily organized as military miners. The sapping at these sieges was done by details from the infantry, as it had been in the seventeenth century, before the time of Vauban. In all cases these troops served under the engineers when on engineer duty.

The most remarkable feats in this branch of the service during the war were, in mining, the Petersburg mine (July, 1864); in sapping, the siege of Fort Wagner before Charleston, July to Sept., 1863; and in pontoniering, the bridge across the James river at Charles City Court-house. The latter was over 2,000 feet long in pontons, besides 200 feet of trestle-work. It was built by the regular battalion of engineers, two companies of the Fifteenth New York and part of a company of the Fiftieth New York, in all about 450 men, in about five hours on the evening of June 15, 1864, the approaches having previously been prepared by the First New York Engineers. The stream was rapid and deep, in some places 85 feet. This was the longest floating bridge ever constructed by an army in the field. Another long bridge was built by the same troops over the Chickahominy in 1862. That stream was a less difficult one, and a large portion of the bridge was built on trestles and cribwork.

Upon the reduction of the army in 1870 the number of enlisted men in the battalion of engineers was limited to 354, one company being reduced to a skeleton of ten sergeants and ten privates; and in 1875 the number was further reduced to 200. In 1884 the number was increased to 450 and in 1889 to 500. One company of 100 men is stationed at the Military Academy at West Point, engaged in the instruction of cadets in practical military engineering. The others are stationed at the engineer school of practice at Willets Point, N. Y. They are kept thoroughly drilled as infantry, and are well instructed in field fortification, sapping, mining, pontoniering, field-sketching, and the service of submarine mines. The officers of the battalion are temporarily detailed from the Corps of Engineers, usually serving with it four or five years.

Napoleon I. considered the proper proportion of engineer troops to infantry to be 1:40. Since his day the advances in the art of war have largely increased this proportion. It should be especially large in a country like the U. S., where the army is rather a magazine of military knowledge than a force capable of resisting a powerful enemy. In France the proportion is about 1:21; in Great Britain, 1:20; in Germany, 1:25; in Russia, 1:18; in Austria-Hungary, 1:19; and in the U. S., 1:25.

O. H. EBNST.

Sappey, sâp'pâ', MARIE PHILIBERT CONSTANT, M. D.: anatomist; b. at Bourg, department of Ain, France, Aug. 10, 1810; graduated M. D. from the Paris School of Medicine in 1843; in 1844 passed the *concours* for associate professor of surgery; in 1868 was appointed Professor of Anatomy. He is a member of many French and foreign medical and scientific societies, and an officer of the Legion of Honor. His great work is his *Traité d'anatomie descriptive* (1847-63, numerous editions).

S. T. A.

Sapphire [from O. Fr. *saphir* < Lat. *sapphirus* = Gr. *σάπφειρος*, from Heb. *sappir*, sapphire]: a gem, among the purest forms of corundum. However, it is not usually called sapphire by dealers in gems unless blue, the red stones being called rubies, the yellow ones Oriental topaz, the green Oriental emeralds, and the purple Oriental amethyst, industrially used for wire draw-plates, watch-jewels, phonograph points, etc. *Asteria* is a variety of sapphire which when cut round shows a star of bright rays, due to its crystalline structure. See CORUNDUM, RUBY, TOPAZ, and PRECIOUS STONES.

Revised by GEO. F. KUNZ.

Sappho, sâf'ô (Gr. *Σαπφώ*): the world's greatest poetess; b. at Eresos or at Mytilene in Lesbos, toward the latter part of the seventh century B. C., contemporary of Alcæus and Solon. In consequence of political troubles she had to take refuge in Sicily, but returned to Lesbos in course of time and there she died. The literary mythmongers of antiquity made up stories out of supposed allusions in her verses. Of this order is the romance of her hopeless love for the fair youth Phaon, and of her leap from the Leucadian rock. But the poetess of love fared worse with the comic poets of Athens, who could not understand the Lesbian songstress and who wrought their wicked will on her memory. To them Sappho was a courtesan; to them the school of maidens whom she trained in the service of the Muses and to whom she addressed her burning verses was a school of vice. Nowadays few are found to controvert the thesis that Sappho was a lofty as well as an ardent soul, to whom all lovers of true womanhood as well as of true art must do homage. Her poems, written in the Æolic dialect, "few but all roses," were arranged in nine books after the number of the nine Muses and according to the measures employed. Of these only two poems remain entire or nearly so, and there are besides a number of fragments, enough at all events to show her ardor, her tenderness, her playfulness, her love of art, her love of nature. In the handling of the language, and of the metrical form she was a supreme artist, and if nothing else remained, the Sapphic strophe would be a monument of her genius. Editions of her poems have been published by Neue (Berlin, 1827); by Bergk, *Poeta Lyrici Græci*; by Wharton, with English translations (2d ed. 1887). See the elaborate work by Cippolini, *Saffo* (1890).

B. L. GILDERSLEEVE.

Sapporo, or Satsûpôro, sâp'pô-rô: a town in Yezo, Japan, and once the capital of the island; in a plain about 20 miles from the mouth of the Ishikari river (see map of Japan, ref. 3-E). When the colonization department (*Kaitakushi*) began its work in 1871, Sapporo became a center of activity. Planing-mills, silk-factories, an agricultural college with model farm attached, a brewery, etc., were organized. A mission from the U. S., with Gen. Horace Capron at its head, was located here, and professors from the U. S. were intrusted with the organization of the college. Since the breaking up, in 1881, of the very expensive colonization department, Sapporo has been merely chief town of one of the three prefectures of the island. Its port is Otaru, 22 miles distant, with which it is connected by a railway which extends inland 40 miles to the coal mines of Poronai.

J. M. DIXON.

Saprophytes [Gr. *σάπρος*, rotten + *φυτόν*, a plant]: plants which live upon the organic matter of dead plants or animals, or at least on their dead parts, as distinguished from PARASITES (*q. v.*), which live upon and obtain their food from living plants or animals. They are all colorless plants, or at least they are not green, and have suffered a greater or less structural degeneration of their vegetative organs, as in the case of parasites. In fact the effect of saprophytism upon the plant appears to be essentially the same as that of parasitism, a result to be anticipated, since in some cases a parasite may become saprophytic, while in others a saprophyte may become parasitic.

Saprophytes occur in four of the six great branches of the vegetable kingdom. Thus of the protophytes, some of the bacteria are saprophytes. Of the phycophytes, the black

moths (*Microgaster*) and the water-moths (*Hydropsyche*) contain many saprophiles. In the saprophiles there are thousands of species of saprophiles, in many of the families of the fungi of the great classes *Ascomycetes* and *Basidiomycetes*, the latter well represented by the rosette, puff balls, etc. The *Hyphomycetes* and *Trichomycetes* contain no saprophiles, and in *Anthophytes* there are few, very species, which are strictly saprophiles. The *Indianas* (*Monotropa*) and their relatives are doubtfully saprophiles, and the same may be said of a few of the orchids. In the other hand, many farm and garden plants under cultivation, are partially saprophilic, obtaining much of their food from the decaying organic matter used for enriching the soil. The saprophiles in the vegetable kingdom are estimated at from 50,000 to 30,000 species, the greater portion of which are saprophiles. CHARLES E. BERRY.

Sap-rol: See **DRY RICE**.

Sapoteo Chino: a corrupt name used in the U. S. for *Passiflora* *chino*. See **CHINA**.

Sapoteo: the yellow-bellied woodpecker (*Sphyrapicus* *seco*) of North America, so named on account of boring its nest in other wood-eating trees to obtain the sap. It is readily recognized by its black throat and decidedly yellow under parts. F. A. L.

Sapoteo: See **ALABAMA**.

Saggarah, or **Makharah** (cf. Egypt, *Sakar*, or *Soker*): a name of Egypt, W. of the site of Memphis, which has given its name to a group of pyramids and to the ancient necropolis of Memphis. The necropolis was in use from the earliest dynasties down to Roman times. The earliest monuments are the pyramids and mastabas and the latest the tombs of the Apis bulls. The whole region is honey-combed with subterranean funeral chambers. The mastabas are rich in representations of scenes of ordinary life in the fifth and sixth dynasties, and some of the pyramids are inscribed with religious texts. The most notable of the Saggarah are the Step Pyramid (see **PYRAMIDS**), the tombs of the Apis bulls (see **SERAPHRIS**), and the tombs of early rulers, such as Ty and Ptahhotep, of the fifth dynasty (see **MENPHIS**). From Saggarah came the oldest cemetery in the world, that of a son of Pepi I. of the fifth dynasty, probably above 6,000 years old. C. R. G.

Saracenic Art: the art of the countries ruled by the Saracens (q. v.). The Arabs who followed Mohammed and his followers had little industry of the finer sort and no letters. With the singular ability they possessed of impressing ideas with their enthusiasm, making them reverences, embracing, talk, Arabic, and fight for Islam, they absorbed and assimilated the far more artistic races of the Mediterranean. The Byzantine style became their type in architecture. The workmen of Syria and Egypt developed new styles under the new dominion, as has been shown under **SARACENIC ART** (q. v.). Saracenic art therefore includes the great work of Syria, Egypt, Asia Minor, the islands, such as Cyprus and Rhodes, and, to its largest extension, of the North African coast and of Southern Spain, all from about 700 to 1400 A. D. Turkish art would thus be excluded by the date and Persian by its eastern situation. R. S.

Saraceni (from Lat. *Saraceni*, *Saracen*, a *Saracen*, from Arab. *Sarac*, *Sarac*, *Sarac*, deriv. of *Sarac*, east, deriv. of *Sarac*, rise): a name originally applied to a tribe or tribes inhabiting the eastern slopes of the Sinai, the great mountain range which reaches from Syria to Yemen (Glaser, *Saraceni*, *Saraceni*, and *Saraceni*, *Arabians*, Berlin, 1890, p. 206). Later Greek and Latin authors used this local name to designate the Semitic Bedouin tribes on the southern frontier of the empire, as even the *Arabians* as a whole (Ammianus 22:4, 23:1). After the rise of Islam, the use of the word was further extended, and included the followers of the prophet, wherever they might be. It has also been used as a term of reproach for wild, uncivilized, pagan, etc. See *Saraceni*, *Saraceni*, *Die Alte Geogr. Arabien* (Bern, 1875, 1880; C. Bousset, *Geographie, Hist. Melchiorische* (Lay-son, 1880, p. 196). See **MOORS**. RICHARD GOTTEN.

Saragosa (Spain, *Saragosa*, and *Cesaris Augusta*): name of the province of Saragosa, Spain; on the Ebro; 60 miles by rail N. E. of Madrid (see map of Spain, ref. 444). It was founded by the Phoenicians. Under the Romans it was a flourishing city, and reached the summit of its prosperity when (in 1118) it became the capital of the kingdom of Aragon. After the union of Aragon and Castile when Madrid became the royal residence,

Saragosa lost some of its splendor, and in 1808 it was nearly destroyed by the French, by whom it was twice besieged during the Peninsular war. The first siege lasted from June to Aug., 1808; the second began on Dec. 30, and the bombardment continued till Jan. 27, 1809, when the city was entered by general assault. The inhabitants offered a determined resistance, and it was not until Feb. 20 that the place capitulated; 80,000 lives were lost during the siege, mainly by disease. Of the two cathedrals, one is an old building in Gothic style and the other is a highly ornamental edifice of the seventeenth century, which contains a pillar upon which, it is said, the Virgin descended from heaven, 4. n. 40. The university (1474) is attended by about 800 students. Saragosa has also an academy of sciences, a library with 18,000 volumes, a law school, and a medical school. Cloth, chocolate, silk, soap, and hats are the principal industrial products. Pop. (1887) 92,407.

Saragosa, Mald of: See **LOUISIANA**.

Sarajva, *sa-ri-va*, *Josef Antonio*: statesman; b. in Bahia, Brazil, 1822. He graduated in law 1844; was president successively of Piahy, Alagoas, São Paulo, and Pernambuco; entered the lower house of parliament 1855, and became senator 1869; was sent on a special mission to the Rio de la Plata 1864, and was prominently connected with the events which led to the wars with Uruguay and Paraguay. As early as 1867 he formed part of a liberal ministry; later he became the leader of the moderate liberals, and from 1890 to 1897 was several times premier. H. H. S.

Sarajevo, *sa-ra-ye-vo*, *Serajewo*, or *Bosna Serai*, *bo-na-se-ri*: town; on the river Milatzka, near its junction with the Bosna; 122 miles S. W. of Belgrade (see map of Austria-Hungary, ref. 10-4). It was formerly capital of Bosnia, and is now of the Austro-Hungarian district of Serajewo. Because of its picturesque appearance and fine situation it is called by the Mussulmans the Damascus of the North. It has iron-works and manufactures side-arms, and is the commercial entrepôt of the province. Pop. (1885) 26,264. To the east, on a cliff 350 feet above the Milatzka, is the imposing castle, built in the thirteenth century by the Hungarian general Castroman, which has given the name to the town.

ROWEN A. GOSWICK.

Sarakhs, or **Serakhs**, *sa-ra-ks*: fort and town of military importance at the northeast angle of Persia; on the plain to the left of the Tajand or lower Heri-rod, where this stream enters the Tarooman plains. The fort is large but ill-provided, the town small and poor. Water is supplied by a canal 10 miles long to a point on the Tajand, where the water flows throughout the year. Opposite the town the stream has water only in the spring or after heavy rains. Sarakhs is of high strategic importance, and the numerous ruins of forts in the vicinity attest that this has long been recognized. Two or three miles to the E., on the other side of the river, is the Russian frontier post of Sarakhs, which is rapidly growing. M. W. H.

Sarasette, *PAULO MARTIN MELIUS*: violinist; b. at Pamplona, Spain, Mar. 10, 1844; entered the Paris Conservatory Jan. 1, 1856, and gained the first prizes for solfeggio and violin; studied harmony in Reber's class, and soon started on a successful career as a concert violinist. He has traveled through Europe and the U. S., playing with the greatest success. He has a very large repertoire and has composed much for the violin. D. E. H.

Sarasya'H (i. e. River of pools): the name of several streams of India. The principal one is a string of pools 125 miles long (fading itself in the sand several times and often dry in places), which rises in the Siwalik hills in the South-east Punjab and empties into the Ghaggar, which lower down loses itself in the Bikanir desert. It is the sacred river of the *Rig-Veda*, where it is referred to as a powerful stream, "the finest of the seven sisters," "the first in beauty and abundance." Many shrines and sacred places are scattered along its course. M. W. H.

Saratoff: government of Russia: W. of the Volga, and S. of Penza and Simbirsk. Area, 122,624 sq. miles. Although a large portion of the government consists of desert steppes, much rye, wheat, and oats is exported, bees and silkworms are extensively reared, and fisheries, distilleries, and many kinds of manufactures are in operation. Pop. (1890) 2,427,690, among whom are about 120,000 Protestant Germans.

Saratoff: city of Russia; capital of the government of Saratoff; on the Volga; 500 miles by rail S. E. of Moscow (see map of Russia, ref. 8-F). It has many fine public build-

ings of stone, 2 cathedrals, 30 churches, and a museum with a fine-art gallery and a library. It manufactures cloth, linen, tobacco, leather, earthenware, rope, etc., has large breweries, distilleries, vinegar-factories, and foundries, and carries on an extensive trade in grain, cattle, and fish. Pop. (1890) 123,410.

Saratoga, Battle of: a decisive battle of the Revolutionary war in the North American colonies. Burgoyne, in command of the British forces, had crossed the Hudson Sept. 13 and 14, 1777, and encamped his army on the heights and plains of Saratoga. Gates, who commanded the Americans, had in the meantime moved his army up to Stillwater and taken possession of Bemis's Heights, to the S. of Saratoga, near the river—a strong position—which he fortified. On Sept. 19 Burgoyne attacked the left wing of the American army under Benedict Arnold, and succeeded in holding the field, though he sustained a loss of over 500 men, that of the Americans falling below 400. Burgoyne then discovered that he had a dangerous foe in his front. He also learned of the capture of his fleet of boats laden with supplies by Lincoln's militia in his rear, and the destruction of his communications with Canada; but, receiving promise of aid from Sir Henry Clinton from below by way of the Hudson, he fortified his position and awaited the latter's coming. As Clinton did not arrive, Burgoyne, finding himself in danger of being cut off from retreat, and his supplies being nearly exhausted, determined to risk a battle, and on Oct. 7 advanced at the head of 1,500 men, with six pieces of artillery. His right was at once attacked by a New Hampshire brigade and Morgan's riflemen. Arnold, who had been relieved from command after the battle of Bemis's Heights owing to some misunderstanding with Gen. Gates, and acting without orders, placed himself at the head of the troops, and with great daring and recklessness led them into action. The British lines were repeatedly broken and Burgoyne with difficulty regained his camp, but with the loss of his able second, Gen. Frazer. Gen. Arnold was also severely wounded in the leg. Renewing the assault, the Americans gained a lodgment in the camp, when darkness put an end to the conflict. During the night Burgoyne retreated and took possession of the heights in his rear. Afraid of being surrounded, he continued his retreat next day to Saratoga. As he received no aid from Clinton, and as every line of retreat was closed to him, it was decided in council to propose a cessation of hostilities while terms of capitulation were being negotiated. Gates at first demanded an unconditional surrender, which Burgoyne refused, but on the 17th terms were agreed upon—the British to march out with the honors of war, and be permitted to embark for England, on condition of not serving against the U. S. again during the war. The number of prisoners surrendered was 5,752. Gates's army numbered upward of 10,000. The terms of the surrender were not ratified by Congress, Burgoyne's army being retained as prisoners until the close of the war. Burgoyne and several other officers, however, were permitted to depart; forty-two guns, between 4,000 and 5,000 muskets, and a large supply of ammunition were among the valuable captures.

Revised by F. M. COLBY.

Saratoga Springs: village (incorporated in 1826); Saratoga co., N. Y.; on the Adirondack, the Del. and Hudson, the Fitchburg, and the Sar. Mt. McGregor and Lake George railways; 38 miles N. of Albany, 182 miles N. of New York (for location, see map of New York, ref. 4-J). It is in the foot-hills of the Adirondack Mountains, has a small valley running through its center, is one of the most famous summer resorts, and is noted for the number and variety of its mineral springs. It is also widely known for the political conventions that have been held here. The village has the Holly system of water-works, supplied from mountain springs; efficient fire department; electric street lights; 3 public parks, Woodlawn, Yaddo, and Congress; several art galleries; and a large number of costly summer residences. It has wide, clean streets and extensive drives.

There are nearly forty mineral springs, of which the best known are the Congress, Vichy, Hathorn, Kissingen, Victoria, High Rock, Carlsbad, Red, Columbian, Royal, Magnetic, Geyser, Patterson, Favorite, Excelsior, Empire, and the Star. They are alterative, diuretic, cathartic, and tonic. (See also MINERAL WATERS.) Four miles E. is Saratoga Lake, a favorite place for regattas, with a straight-away course 3 miles long and wide enough to accommodate fourteen racing sculls abreast. The Saratoga Racing Association has grounds

near the village, with a mile-track and a grand stand accommodating 5,000 persons, and Woodlawn Oval, with the Saratoga Athletic Clubhouse, in the north end, has all conveniences for track and field sports.

The principal public buildings are the new Convention Hall, seating 5,000 persons (cost \$100,000); the town-hall, containing the courts and theater; and the armory of the Twenty-second Separate Company, N. G. S. N. Y. Of hotels, the largest are the Grand Union, the United States, and Congress Hall. These, with eight other large and numerous small ones, have accommodations for 40,000 guests. During the summer season they expend \$40,000 for orchestral music.

There are 2 Presbyterian, 2 Baptist, 2 Methodist Episcopal, and Congregational, Protestant Episcopal, and Roman Catholic churches. The educational institutions comprise seven public schools, including an academic and central grammar school, with enrollment of 2,300, and annual cost of \$40,000, and the Temple Grove Female Seminary, with accommodations for 200 pupils. The charitable institutions include the Children's Home, the Emergency Hospital, and the Home of the Good Shepherd. There are three libraries (Athenæum, Temple Grove Seminary, and Union Free School) with about 10,000 volumes, and a monthly, 2 daily, and 6 weekly periodicals. The annual receipts and expenditures of the village are about \$125,000 each; bonded debt, \$200,000; property valuation, \$6,000,000. In 1895 there were 2 national banks, with combined capital of \$225,000 and surplus of \$155,000. The principal industries are the bottling of mineral waters and the manufacture of medical supplies.

The name Saratoga is derived from the Indian, meaning "Hillside of the Great River." The territory was deeded, by the Indians to the Dutch in 1684. Rip van Dam was the first white owner of the original springs, and Sir William Johnson was the first who thoroughly tested their efficacy. The first hotel was established in 1774. Some of the mineral waters have been bottled and exported to various parts of the world since 1826. The Saratoga battle-field, where Gen. Burgoyne surrendered to Gen. Gates on Oct. 17, 1777, is 12 miles S. E. of the village. Pop. (1880) 8,421; (1890) 11,975; (1895) estimated, 15,000.

LA MONTE WALDRON, EDITOR OF "DAILY SARATOGIAN."

Sarawak: a British dependency on the northwest coast of Borneo. It was granted in 1842 to Sir James Brooke, with the title of rajah, by the Sultan of Brunei. He was succeeded in 1868 by his nephew, Sir Charles Brooke, and in 1888 the state was placed under the protection of Great Britain. Area, 50,000 sq. miles. Pop. about 300,000, consisting of native races—Malays, Dyaks, Tayans, and Muruts, as well as some Chinese. The capital, Kuching, has about 25,000 inhabitants, and carries on a large and steadily increasing trade in timber, edible birds' nests, gutta-percha, sago, antimony ore, and rice, in exchange for which it imports European manufactures and tobacco. The revenue for 1893 was \$457,123; expenditure, \$478,198.

Revised by M. W. HARRINGTON.

Sarcocolla [= Lat. = Gr.; *sarx*, *sarx*, flesh + *κόλλα*, glue] a nauseous gum-resin produced by *Penae sarcocolla*. *P. mucronata*, *Sarcocolla vulgaris*, etc., evergreen shrubs of the order *Penaeaceae*, ranging from the Euphrates to the Cape of Good Hope. It is seldom used in civilized regions.

Sarcophagus [= Lat., from Gr. *sarxophagos*; scil. *αἶμα*, *liter.*, flesh-consuming stone; *sarx*, *sarx*, flesh + *φαγῆναι*, eat]; primarily a limestone found in Assos in the Troad, used for making coffins which were supposed to have the property of destroying the corpse within a brief period. The name came thus to be applied to all stone coffins, and loosely also to any large coffin of other material. The earliest specimens are those of Egypt, which were made of granite, basalt, limestone, alabaster, and jointed wood. In the course of time the forms underwent considerable change. The earliest are from the fourth dynasty and are rectangular, with a flat or curved cover, with little or no ornamentation, and in the shape of an Egyptian house. From the Middle Kingdom the specimens are mainly of wood, the tops being intersected by lines of inscriptions, with figures of gods in the open spaces. Outside they were painted and adorned with false doors, while the interiors were adorned with sacred texts. In the New Kingdom both stone and wood were used, and a more artistic form employed. Sacred texts were placed on papyrus rolls instead of on the coffins, so that the flat sides were no longer needed for this purpose. As a consequence a

lunar shape was given to the coffin, and the deceased was thus represented lying at full length. In the latter dynasty the rectangular shape was again employed, and in those times the wooden coffin was customary. Among other people the sarcophagus has been more or less employed and various beautiful forms have been discovered, but their great use has been an essential bar to their general use. The term in its etymological significance has nothing to do with the Egyptian conception of the sarcophagus; rather the two are historically opposed.

CHARLES R. GILBERT.

Sarcoplasm: See HORMONY (Muscular Tissue).

Sarcosine [from Gr. *sarx*, *sarx*, flesh]: a product of the decomposition of Oxalic acid (q. v.), the crystalline constituent of juice of flesh, discovered by Chevreul. It forms mother crystals, soluble in water with ease, but insoluble in ether and with difficulty in alcohol. It is neutral in reaction, though it forms salts with acids, which react with carbonate is obtainable from other sources than from oxalic acid or by the action of methylamine on chlorosulfate of acid.

Sari: See CHALCEDONY.

Sardapappus [Latin form of the Assyrian name]: according to an inaccurate classic tradition, the last king of Assyria. He was noted for avarice and voluptuousness, and in order to escape falling into the hands of the besiegers of Nineveh, ended his worthless life by burning himself in his palace. It seems certain that the original of Sardapappus is Ashurbanipal, King of Assyria, 668-626 B. C. His brother, King of Babylon, who made war against him, was Sardanapallus, and this may be the source of the story that Ashurbanipal was burned. It is also possible that one of his weak successors, on the Assyrian throne met this fate, especially the one reigning at the time of the capture and destruction of Nineveh. Ashurbanipal's large library was mostly a matter of statistics, a form of alliance with the king of some other country. The story related by late classic writers of the tomb erected for himself, with an epitaph stating that there is nothing of life beyond eating and drinking, had its rise, of course, in one of those triumphal monuments which Assyrian kings were accustomed to set up in conquered lands, like the one of Sargon, Ashurbanipal's great grandfather, found on Cyprus in 1845. Ashurbanipal's title to fame and gratitude is the library of clay tablets in the cuneiform character which formed part of his great treasure at Nineveh. Many thousands of these tablets are now in the British Museum. Cf. Carl Bezold's *Catalogue of the Cuneiform Tablets in the Kouyunjik Collection of the British Museum* (3 vols., London, 1899-1903). Many of the best Assyrian two-reliefs have likewise come from the palace of Ashurbanipal.

D. G. LLOYD.

Sardis: See SARDIS.

Sardine (from Lat. *sardinia*, from Gr. *Σαρδία*, Sardis): a name applied to a number of fishes belonging to the family Clupeidae and especially to those preserved in oil and pickled in its brine. The true sardine of the Mediterranean and contiguous ocean is the *Sardinella* or *Clupea pilchardus*, and a very near relative of this species (*Sardinella sagax*) is found in the Atlantic ocean. The sardine of the Mediterranean is small, sleek, and partly dried, then scalded in hot oil, and finally hermetically sealed in tin boxes with hot salted oil and butter. The space space in each box is filled with salt, and, the lid having been soldered on, the box is closed by a short time to the action of steam or hot water. These sardines are largely exported to various countries, where they are esteemed as a delicacy. The real sardine is something like a small pilchard; but many of the fish used as sardines, especially those prepared on the Atlantic coast of France, are sprats, pilchards, or small herrings. The sardines of the U. S. and British North America are small herrings, and even the mahaden (*Brevoortia meridionalis*) See FORESTERS.

Revised by F. A. LUCAS.

Sardinia, an island belonging to Italy in the Mediterranean Sea, nearly halfway between Spain and Italy and between Europe and Africa, and S. of Corsica, from which it is separated by the Strait of Bonifacio, 74 miles wide. It is divided into the two provinces of Cagliari and Sassari. Area of the island, 9,844 sq. miles. Pop. (1893) 741,362. A range of mountains—whose highest peak, Gennargentu, situated about in the center of the island, rises 6,233 feet—traverses the island from N. to S., and sends out branches to both sides. These mountains are in some places completely naked

and barren, but in others they are covered with forests or with fine pastures, and almost everywhere they contain marble, alabaster, lead, copper, iron, rock-crystal, etc., though mines and quarries are not much worked. Between the foothills of the central range lie large tablelands or slightly sloping valleys, in which sandy and stony districts alternate with tracts of fertile soil. Along the coasts, which are in most places steep and rugged, are found extensive salt-marshes and lagoons, which are very unhealthy owing to malaria. Some improvement, however, is being effected by drainage-works. Agriculture takes the first place among the occupations of the inhabitants, in spite of backward farming and heavy taxation. Wheat, maize, and beans, wine, olives, figs, and oranges, tobacco, linseed, cotton, hemp, cheese, butter, and wool are raised in large quantities. Horses are extensively bred, and considerable numbers of cattle, sheep, etc., are kept. The fisheries along the coasts, especially of tunny, anchovies, and sardines, are valuable, but are mostly in the hands of foreigners. Salt is the only manufacture of any importance. In 512 B. C. the island was conquered by the Carthaginians, from whom it was wrested by the Romans in 238 B. C. For several centuries after the time of Thierius it prospered greatly, and was one of the principal granaries of the Roman empire. While owing allegiance to the Eastern empire and the pope it was overrun by the Goths, Vandals, and Saracens. In 1496 it came into the possession of Aragon, and, after a brief period of Austrian rule, in 1720 was given to the house of Savoy, under which it was long neglected. Old forms of society kept the majority of the population in ignorance and indolence, while feudal tenure and feudal jurisdiction were not finally abolished until 1850.

Revised by R. A. REMERS.

Sardinia, Kingdom of: a former kingdom, comprising Savoy, Piedmont, Genoa, and Sardinia, with a total area of 28,769 sq. miles, and a population of over 5,000,000. It was formed Aug. 24, 1720, by a treaty between Austria and Victor Amadeus II., Duke of Savoy. The house of Savoy began to make itself felt in the history of Europe as early as the eleventh century, partly by the loyalty and vigor with which its members supported the emperors against the popes, partly by the shrewdness with which they managed to profit by the wars between Germany and France, in which they could not help being implicated. In 1311 Amadeus III. was created Count of Savoy by the Emperor Henry V., and in 1416 Amadeus VIII. was created Duke of Savoy by the Emperor Sigismund. In the war of the Spanish Succession (1700-18) Duke Victor Amadeus II. (1676-1700) was a claimant for the Spanish throne, and by the treaty of peace at Utrecht (1713) he received the island of Sicily and the title of king. Sicily he was compelled to yield to Austria in 1730, but as a compensation he received the island of Sardinia, from which he took his title of king, and thus was formed the kingdom of Sardinia. In 1801 the elder line of the house of Savoy failed, and the younger line ascended the throne with Charles Albert (1801-49). In his foreign policy Charles Albert was rather unsuccessful, but his interior administration was prudent and vigorous. The material resources of the country were developed with great sagacity, and the state was brought to a most prosperous condition. In 1848 he granted a free constitution, and the whole of Italy looked naturally to Sardinia and Charles Albert as the leaders in a war for liberty and independence. Charles Albert declared war against Austria, but on Mar. 23, 1849, was thoroughly defeated at Novara. He resigned the crown to his son, Victor Emmanuel II., who succeeded in the task of uniting the scattered Italian nation into one free state, for a history of which see ITALY.

Sar'dis, or **Sardes** [= Lat. = Gr. *Σάρδεις*; Turk. *Sart*]: ancient city of Asia Minor; capital of Lydia; situated at the foot of Mt. Tmolus, on the river Pactolus. Under Croesus and its subsequent masters, the Persians, it was one of the wealthiest and most magnificent cities of Asia Minor. Declining under the Romans, and utterly destroyed by earthquake during the reign of Tiberius, it was rebuilt but never regained its former importance. In 1401 it was razed to the ground by Tamerlane, and its site has been almost abandoned ever since. Among its ruins a theater, stadium, gymnasium, the temple of Cybele, and two early churches may be distinguished. One of the "seven churches of Asia" was at Sardis (Rev. iii. 1-5).

R. A. GROVESOME.

Sardonyx: See CHALCEDONY.

Sardon, sār'don, VICTORIEN; dramatist; b. in Paris, Sept. 7, 1831; studied medicine, then history; gained his liveli-

hood as a teacher and by writing for papers, magazines, and cyclopædias; tried his fortune as a dramatist in 1854 with the *Taverne des Étudiants*, which failed; tried again in 1860 with *Candide* and *Monsieur Garat*, which succeeded; and then wrote a number of plays with a rapidity almost unparalleled: *Les Pattes de Mouche*, *Piccolino*, *Les Femmes fortes*, and *Nos Intimes* in 1861; *Les Ganaches*, *La Papillonne*, and *Les Premières Armes de Figaro*, in 1862; *Bataille d'Amour* and *Les Diables noirs* in 1863; *Don Quichotte* and *Les Pommes du Voisin* in 1864; *Les Vieux Garçons* and *La Famille Benoitton* in 1865; *Nos Bons Villageois* and *Maison neuve* in 1866, etc. Most of these plays made a great and decided success, and the author took rank by general consent as the first playwright of his age, ruling the stage wherever there is one. The most prominent of his later works are *Séraphine* (1868); *Patrie* (1869); *Fernande* (1870); *Divorçons* and *Daniel Rochat* (1880); *Odette* (1881); *Fédora* (1882); *La Tosca* (1887); *Cléopâtre* (1890); *Thermidor* (1891); *Gismonda* (1894). He received the decoration of the Legion of Honor in 1863, and was received as member of the French Academy May 23, 1878.

Revised by A. G. CANFIELD.

Saree': town; in the province of Mazanderan, Persia; on the Tejen, 18 miles from its mouth in the Caspian Sea (see map of Persia and Arabia, ref. 2-H); center of a rich and fertile country; is an old place, mentioned by Firdausi, but long ago lost its importance. In 1836 cholera destroyed nearly the whole population, and since that time it has been rising very slowly. Pop. estimated at 8,000.

Sargas'so Seas [*Sargasso* is from Span. *sargazo*, seaweed]: areas in the North Atlantic, North Pacific, and other oceans, having an abundance of the seaweed *Sargassum bacciferum*. The best known is that in the North Atlantic, which is the central area of a whirl of currents, and is a region of light winds. It extends from the Azores to the Antilles, and from lat. 16° N. to lat. 38° N., but the sargasso is most abundant W. of lon. 45° W. The seaweed is found in the Gulf Stream and neighboring waters, and is often cast upon the shores of the West Indies and Florida. In the Sargasso Sea it is in streaks, often scores of feet long, or in islands which may cover many acres, but the outlines of which are constantly changing. It forms a thin superficial layer and offers no resistance to ships. There are twenty to twenty-five plants, on the average, to each square mile, and each plant when pressed together makes from a pint to a quart when wet, or about one-eighth of this when dry. The plant vegetates freely on the Sargasso Sea, but has not been found fructifying there. Its color is greenish olive, varying with age from yellowish to whitish, and bears many berry-like lumps or floats. The patches of seaweed have a veritable fauna of fish, crustaceans, and molluscs numbering sixty or seventy species, several of which have developed marked features of protective imitation. One remarkable fish (*Antennarius marmoratus*), 2 to 4 inches long, can be distinguished from the plant only by close inspection. The Sargasso Sea has remained substantially in the same place and with the same characteristics for the 400 years since Columbus's first voyage.

MARK W. HARRINGTON.

Sargent, AARON AUGUSTUS: U. S. Senator; b. at Newburyport, Mass., Sept. 28, 1827; was in early life a printer and editor; emigrated to California in 1849; studied law while editing *The Nevada Journal*; was admitted to the bar 1854; was district attorney of Nevada County 1855-56; vice-president of the Republican national convention at Chicago 1860; M. C. 1861-63 and 1869-73, and U. S. Senator for the term 1873-79. Became U. S. minister to Germany 1882; resigned in 1884. He was the author of the first Pacific railway act passed by Congress. D. in San Francisco, Cal., Aug. 14, 1887.

Sargent, CHARLES SPRAGUE: arboriculturist; b. in Boston, Mass., Apr. 24, 1841; graduated at Harvard College 1862; from that time served in the Union army until the close of the civil war, attaining the rank of major; then traveled in Europe; appointed director of the Arnold arboretum and botanic garden of Harvard College in 1872, holding that position six years; in 1878 appointed Arnold Professor of Arboriculture in Harvard College; in 1879 became special agent of the tenth census to collect statistics in regard to the forests of the U. S.; became head of the forest division of the northern transcontinental survey; in 1888 became editor of *Garden and Forest*; has written many papers for scientific and other journals on botany, forestry, etc. He is the author of *Report on the Forests of North America*

(being vol. ix. of the *Reports of the Tenth Census of the United States, 1883*); *The Woods of the United States, with an Account of their Structure, Qualities, and Uses* (1885); *The Silva of North America* (begun in 1891); and *Notes on the Forest Flora of Japan* (1894).

Revised by CHARLES E. BESSKY.

Sargent, EPES: journalist and author; b. at Gloucester, Mass., Sept. 27, 1813; educated at the Boston Latin School and Harvard College; was editorially connected at different times with the *Boston Advertiser* and *Atlas* (1837), the *New York Mirror* (1839) and *New Monthly Magazine* (1845), and the *Boston Evening Transcript* (1846). In 1847 he settled at Roxbury, near Boston, and devoted himself entirely to literary work. He was an industrious compiler of readers and speakers for schools; edited many reprints and collections, and wrote a number of successful plays, such as the *Bride of Genoa* (1836) and *Velasco* (1837), besides tales for the young, poems, and novels, some of which were once popular, but are mostly forgotten. Some of his songs were spirited and were set to music. The best known of them is *A Life on the Ocean Wave*. Perhaps his *Life of Henry Clay* (1842) and his *Songs of the Sea* (1847) have the best title to remembrance among his original writings. D. in Boston, Dec. 31, 1880.

H. A. BEERS.

Sargent, JOHN SINGER: portrait and figure painter; b. in Florence, Italy, of American parents, in 1856; pupil of Carlus Duran, Paris; honorable mention, Paris Salon, 1878; second-class medal, Paris Salon, 1881; medal of honor, Paris Exposition, 1889; Legion of Honor 1889. He is one of the greatest living portrait-painters. His works are distinguished by consummate technical skill, and are excellent in the representation of character. He has painted many portraits in Paris, London, New York, and Boston. He lived in Paris for a number of years, from about 1872 to 1885, then went to London where he has since resided. He visited the U. S. in 1888, 1889, and 1891. His picture of a Spanish dancer, *La Carmencita*, first exhibited at the Society of American Artists, in New York in 1890, was bought by the French Government in 1892. He is a member of the Society of American Artists (elected 1880), an associate member of the National Academy, and a member of the Société Nationale des Beaux-Arts, Paris.

W. A. C.

Sargent, WINTHROP: soldier; b. at Gloucester, Mass., May 1, 1753; graduated at Harvard 1771; became captain of one of his father's ships 1775; navy-agent at Gloucester 1776; served at the siege of Boston as captain of artillery, and subsequently in the Long Island, New Jersey, and Pennsylvania campaigns, attaining the rank of major; was connected with Gen. Rufus Putnam's Ohio Company; was made by Congress surveyor-general of the Northwest Territory 1786; became its secretary 1787; was its Governor 1798-1801; was adjutant-general of St. Clair's expedition against the Miami Indians 1791, and in Wayne's expedition 1794-95, being wounded in the former; was a member of the American Academy of Arts and Sciences and of the Philosophical Society, and an original member of the Society of Cincinnati as delegate from Massachusetts; aided Dr. Benjamin S. Smith in preparing his *Papers Relative to certain American Antiquities* (1796); published *Boston*, a poem (Boston, 1803); was Governor of Mississippi Territory 1790, and again 1801. D. in New Orleans, June 8, 1820.

Sargent, WINTHROP: author; grandson of Maj. Winthrop Sargent; b. in Philadelphia, Pa., Sept. 23, 1825; graduated at the University of Pennsylvania 1845, and at Cambridge Law School 1847; practiced his profession in Philadelphia, and subsequently in New York; edited from original MSS., with a valuable introductory memoir, *The History of Braddock's Expedition against Fort Duquesne* (Philadelphia, 1855); edited *The Loyalist Poetry of the Revolution* (1857) and several reprints of curious Revolutionary tracts; and was author of *The Life and Career of Major John André, Adjutant-General of the British Army in America* (Boston, seventy-five copies only, 1861), a work of extraordinary research. He wrote largely for *The North American Review* and other magazines; was an accomplished bibliographer; was for many years engaged in preparing a *catalogue raisonné* of books relating to America (unfinished). D. in Paris, France, May 18, 1870.

Sar'gon [Assyr. *Sharru-kenu*, the true king]: King of Assyria 722-705 B. C.; founder of the last and most illustrious Assyrian dynasty 722-606 B. C. He appears to have been a usurper, though probably of royal stock. Numerous records

of life began, written on clay cylinders and papyrus and on golden tablets, and give a full picture of the royal activities. He was a great general and waged successful wars with the Thubians, Egyptians, Philistines, Hebrews, and many other peoples. In his first year he took Jerusalem, carried the leading inhabitants of Israel into exile, repossessed the land by captives from Babylonia and elsewhere, and thus set an end to the kingdom of Israel. But for the moment, one might suppose (from 2 Kings xvii), that this was done to Sargon, the predecessor of Sargon. In the closing years of his reign he built a new palace at Khorsabad, near Nineveh, where he was murdered 705 B.C. (See ARYAN and ARYANIAN EXPLORATIONS). In the *Kudurrû-Nûr* (vol. 1, Leipzig, 1889) Hugo Winckler has given all accessible Sargon inscriptions in transliteration and German translation. The perfect to the source gives the earlier bibliography; vol. ii (Leipzig, 1899) gives the inscriptions in the same form. D. G. LYNCH.

Sarmat'ia (in Gr. *Sarmatia*): the ancient name for the vast region extending from the Baltic to the Black Sea, and from the Volga to the Vistula.

Sarmiento, sár-men-tyó, DOMINGO FAUSTINO: statesman and educator; b. at San Juan (now in the Argentine Republic) Feb. 18, 1811. He was poor, and from his sixteenth year engaged in teaching, for which he showed a great aptitude, the idea of promoting popular education became a passion with him even while his own studies were hampered by lack of means. In 1830 he fought against Rosas and Goyena, and was forced to fly to Chile. Returning to San Juan in 1836, he established a newspaper; this, though not a political sheet, was seized, and after suffering imprisonment he again fled to Chile. Encouraged by Manuel Montt and others, he was able to carry out some of his educational schemes, established a normal school at Copiapó and from 1844 to 1847 lectured in Europe and the U.S., studying school systems. The results of these studies were embodied in 1847 in a report to the Chilean Government, which was published and had a wide circulation. In 1852 he took part in the overthrow of Rosas. From that time, aided by the Government, he devoted himself to the cause of popular education in Buenos Ayres and the provinces. In 1856 he organized the department of public instruction, of which he became the chief. He was Minister of Public Instruction 1860, and at the latter in 1861; subsequently was governor of San Juan and minister to the U.S., and while occupying the latter position was elected president of the Argentine Republic. During his term, Oct. 12, 1868 to Oct. 12, 1874, the Paraguayan war was brought to a successful close, and an insurrection was put down. The president was indefatigable in promoting education; schools and colleges were founded in all parts of the country; American and European teachers were invited to Argentina, and a national observatory was established. At the same time railways and other improvements were rapidly pushed forward. Dr. Sarmiento was debarred from election only by the constitutional provision. Among his numerous published works are biographies of Lincoln and Quirós, and *Crónicas y heróicas*. D. at Asunción, Paraguay, Sept. 11, 1888. HERBERT H. SMITH.

Sarmiento de Gamboa, sár-men-tyó (often written Pedro de Sarmiento Gamboa): navigator; b. in Galicia, Spain, about 1500. He was long prominent on the Peruvian coast, and was with Mendana in the discovery of the Solomon Islands, 1569. In 1579 he was sent from Callao with a fleet of seven vessels to explore the Strait of Magellan and instruct Drake, who was expected to return that way; Drake missed the Pacific and returned by the Cape of Good Hope; the Sarmiento explored the coasts of the strait and returned in 1580 to Spain, where he submitted a report of his voyage (published). Philip II. resolved to fortify the strait; he then prepared to dispatch Sarmiento, toward the end of 1582, with twenty-four vessels and 2,500 men; Diego Flores Valdez was associated with him. Eight vessels were lost in a storm, and at the entrance of the strait Valdez deserted with his men. In Jan., 1583, Sarmiento established a colony of 400 men at San Felipe (afterward called Port Famine), and returned to Europe, but was captured by an English vessel and kept a prisoner until 1588. Nearly all the colony died of starvation; a survivor was rescued by Cavendish in 1587, and another by Meric in 1589. Sarmiento died soon after his release. HERBERT H. SMITH.

Sarnia: a port of entry; capital of Lambton county, Ontario, Canada; it is situated at the head of Lake St. Clair, and opposite the Michigan town of Port Huron, and is the

terminus of a tunnel under the St. Clair river (see map of Ontario, vol. 5-B). Point Edward (formerly Port Sarnia) is a northern suburb of the town. Sarnia has thriving manufacturing, and extensive commerce by rail and steamers. Pop. (1901) 6,694.

Sarno: town of Southern Italy, province of Salerno, about 12 miles N. of the city of Salerno (see map of Italy, vol. 7-F). It is situated on the western slope of the spur of the Apennines which divides the valley of the Volturno from that of the Sarno. Silk, cotton, linen, and hempen fabrics are manufactured and exported. Besides the more common products of Southern Italy, cotton is grown extensively in the vicinity. Pop. 11,681.

Sarpe'don (in Gr. *Sarpedon*): in Greek mythology, son of Zeus and Laodamia, grandson of Hecuba, Prince of Lycia. He fought on the side of Troy in the Trojan war, and was slain by Patroclus. His body was carried back to Lycia by the brothers Sleep and Death, where it was given honorable burial by his kinsmen. The story is told in the *Iliad* of Homer. J. R. S. S.

Sarpi, sár-pe, Pietro, commonly known under his monastic name, Fra Paolo: ecclesiastic and historian; b. at Venice, Aug. 14, 1582; entered the order of the Servites in 1595; became provincial in 1579 and procurator-general in 1585. As such he resided at Rome, where he enjoyed great favor at the papal court, and kept up constant intercourse both with leading churchmen like Bellarmine and with the foremost scientists of the day. While his eagerness for knowledge was thus stimulated, his faith seems to have been weakened and he was regarded with suspicion. In 1595 he returned to Venice and devoted himself for some years to the study of mathematics, physics, astronomy, and medicine. Several important discoveries—that, for instance, of the circulation of the blood—have been ascribed to him, but the evidence in his favor is insufficient. In 1606 the republic chose him her counselor and theologian in the controversies with Pope Paul V. concerning the relations between Church and state. Sarpi opposed the papal claims with great energy, and wrote several works against the censures pronounced by Rome, and especially against the interdict under which the Venetian republic was placed. At different times attempts were made upon his life, and, in spite of his caution, he was dangerously wounded Oct. 5, 1607. After his recovery he was offered a private residence by the government, but he preferred to spend the rest of his days in his monastic cell, where he died Jan. 14, 1623. His chief work, the *Istoria del Concilio Tridentino*, was published in London in 1619, through the agency of Marco Antonio de Dominis, and under the pseudonym *Pietro Soave Polano*. It was translated into English in 1629 and 1676. It was ably written, but its partisan spirit and erroneous statements called forth several rejoinders, the principal one being Pallavicini's work on the same subject (1656). A collected edition of his works, including his letters, appeared at Venice in 6 vols. in 1677. His *Life* was written by Bianchini in 1596 and by Miss A. G. Campbell in 1875. See also T. A. Trollope, *Paul the Pope and Paul the Friar* (London, 1860), and *Fra Paolo Sarpi, the Greatest of the Venetians*, by Rev. Alexander Robertson (London, 1894). These accounts are favorable. On the other side, see Gino Fontanini, *Storia Arcana della Vita di Pietro Sarpi* (1863); C. Cantù, *Gli Eretici d'Italia* (1870); and the *Civiltà Cattolica*, sixth series, vol. xii. (1867). J. J. KEASE.

Sarracenia [Mod. Lat., named in honor of Dr. Sarrasine, of Quebec]: a genus of North American herbs of the family *Sarracenaceae*, remarkable for the expanded petal-like style, and especially for the hollow pitcher-shaped leaves (see *PITCHER-PLANT*), usually half full of water, and containing many drowned insects. Of the six species *S. purpurea* is the commonest. Its roots, and those of *S. variolaria*, at one time had a great reputation as a remedy in smallpox.

Revised by CHARLES E. BERRY.

Sarsaparilla [from Span. *sarsaparilla*; *sarsa*, bramble, and probably *Parillo*, the name of a physician]: the dried roots of certain species of smilax, indigenous in the northern part of South America and in Central America, especially *Smilax affinis* and *S. medina*. The medicinal species of smilax are climbers, growing from a large woody rootstock, from which long fleshy roots grow horizontally in all directions. These vary in thickness from that of a quill to that of the little finger, and consist of a thick cortical portion covered with a thin epidermis of various colors, a

thin ligneous layer, and a central medulla, which often abounds in starch. The roots have scarcely any smell, but when chewed produce a disagreeable acrid impression in the mouth, which persists for some time. Sarsaparilla contains a crystallizable principle called parillin, upon which such medicinal virtues as the drug possesses most probably depend. There are various sorts of sarsaparilla, obtained from different localities, which are most easily grouped into the mealy and non-mealy, according to the proportion of starch they contain. Of the mealy are Honduras, Guatemala, and Brazilian or Lisbon sarsaparilla, and of the non-mealy Jamaica, Mexican, and Guayaquil. Sarsaparilla was at one time held in high esteem as a medicine, principally as a remedy for syphilis, but it is now accorded but feeble power, and where used is prescribed simply to assist the action of more potent drugs.

Revised by H. A. HARE.

Sarsfield, PATRICK, Earl of Lucan: Jacobite soldier; b. in Ireland about 1645; served on the Continent in the English Life Guards, under the Duke of Monmouth, and against him at Sedgemoor 1685; was at the Revolution a member of the Irish Parliament and one of the wealthiest and most influential Irish Roman Catholics; adhered to the cause of King James, to whom he offered his services in 1689; fought at the battle of the Boyne July 1, 1690; surprised the English artillery before Limerick, and compelled William III. to raise the siege Aug., 1690; commanded the Irish reserve at the battle of Aughrim July 12, 1691; exhibited great gallantry in the second defense of Limerick; obtained honorable conditions of surrender Oct., 1691; retired to France with a corps of Irish volunteers; distinguished himself at Steenkirke Aug., 1692, and was killed at the battle of Landen July 19, 1693.

Sartain, JOHN: engraver, designer, and literary editor; b. in London, England, Oct. 24, 1808; became an engraver and did some important work, including some of the plates for William Young Ottley's works on early Italian prints. He removed to the U. S. in 1830, and settled in Philadelphia. He is generally thought to have introduced mezzotint engraving into America. He also practiced oil-painting and miniature-painting on ivory and vellum. Afterward he was editor and proprietor of *The Foreign Semi-monthly Magazine*, and having bought *The Union Magazine* renamed it, and became the founder of *Sartain's Union Magazine*. He was the designer of several public monuments, among which is that to Washington and Lafayette in Monument Cemetery, Philadelphia.

Revised by RUSSELL STURGIS.

Sarthe, sãrt: department of France, extending on both sides of the Sarthe; comprises an area of 2,396 sq. miles. The surface is mostly level, and the soil often light and sandy. Wheat and wine are produced, but the rearing of cattle, poultry, and bees is the chief occupation. The manufactures comprise iron, glass, porcelain, and falence. Capital, Le Mans. Pop. (1891) 429,737.

Sarti, GIUSEPPE: composer; b. at Faenza, Italy, Dec. 28, 1729; received his musical education in Bologna; composed his first opera in 1752, *Pompeo in Armenia*, which had success; was director of the opera at Copenhagen 1756-65; visited London in 1769-70; was chapel-master at the Cathedral of Milan 1779-84; went in that year to St. Petersburg as director of the opera. D. in Berlin, July 28, 1802. He composed over thirty operas, of which none, however, made any great impression, but of his church music his terzetto, *Amplius Lava Me*, is still remembered. He was the teacher of Cherubini.

Sarto, ANDREA, del; properly ANDREA D'AGNOLO, named *del sarto*, or [son] of the tailor, from his father's calling: painter; b. probably at Gualfonda, in Tuscany, in 1487. It is commonly stated that his family name was Vannucchi. He was apprenticed to a goldsmith, then to Giovanni Barile, a Florentine painter of no eminence, and finally to Piero di Cosimo, an artist of ability, with whom Andrea remained for some years. He was still a very young man when he painted the frescoes at the convent of the Servi, in Florence, on the square of the Annunziata, and those of the convent of the Scalzo in the old Via Larga, now Via Cavour. By the time he was twenty-five he was one of the best fresco-painters in Florence, and also a consummate painter in oil. From that time until his death he was the generally accomplished artist, capable of any kind of work, and incapable, in a sense, of error, as his nickname, *Andrea senza errore*, suggests. Without great elevation of style or much originality of conception, he was still a painter of delightful pictures,

the color of which is especially to be enjoyed. In 1518 he went to the court of France and painted for King Francis I., and the story is told that the king intrusted money to him to be used in the purchase of pictures in Florence, and that Andrea misappropriated it. He was certainly in Florence again in 1521, and never left Italy, and rarely Florence, after that time. D. in Florence, Jan. 22, 1531. Of his numerous frescoes, those in the convent of the Servi represent scenes in the legendary *Life of St. Philip, a Birth of the Virgin*, in which a lovely female figure is asserted to be a portrait of the artist's wife, and a *Procession of the Magi*. In a cloister adjoining is the noble fresco of the Holy Family called *La Madonna del Sacco*, because St. Joseph is leaning on a large full sack. The frescoes in the Scalzo convent are in monochrome, a series of biblical subjects with ornamental borders. At Poggio a Caiano is a very important fresco of *Cesar receiving Tribute*. Of his easel-pictures one of the finest is in the Louvre, *Charity*. There are also there two pictures of the *Holy Family* and an *Annunciation*. In the London National Gallery is a valuable portrait of himself. In the Pitti Palace there are two *Annunciations*, a *Deposition from the Cross*, the portraits of himself and wife, and a dozen other pictures of value. In the Uffizi Gallery is the *Madonna di San Francesco*. Very many other paintings are to be seen in public and private galleries throughout Europe.

RUSSELL STURGIS.

Sarto'ris, ADELAIDE (Kemble): See KEMBLE.

Sarts: a name applied to the sedentary natives, as distinguished from the nomads, in Turkestan and neighboring parts of Central Asia, whatever their ethnic relations, but sometimes limited to the sedentary population of Turkish language and relationship in Russian Turkestan. As thus limited they number about 700,000, are homogeneous, devoted to trade, are Mohammedans, and have a considerable sacred literature.

M. W. H.

Sartwell, HENRY PARKER, M. D., Ph. D.: botanist and physician; b. at Pittsfield, Mass., Apr. 18, 1792; surgeon in the U. S. army during the war of 1812-15; settled at Bethel, Ontario co., N. Y., 1821, and at Penn Yan 1832; for more than forty years was an enthusiastic botanical collector, forming an herbarium of 80,000 species, owned by Hamilton College, Clinton, N. Y. About 1846 he devoted his whole time to the study of the genus *Carex*, and brought out *Carex Americana Septentrionalis Exsiccata* (2 parts, New York, 1848; part iii. unfinished). D. at Penn Yan, Nov. 15, 1867.

Saskatchewan: district of the Northwest Territories of Canada, between lats. 52° N. and 55° N., with Keewatin and Manitoba on the E. and Alberta on the W. Area, 107,042 sq. miles. It is a well-watered and wooded country, thickly scattered with lakes, especially in the northern half, and is crossed from W. to E. by the Saskatchewan river. It is generally level or gently rolling, but a series of lofty hills follow along the south bank of the river just named. A large part of it is considered suitable for colonization, and it is made accessible by a railway extending from Prince Albert southward to Regina on the Canadian Pacific Railway, and by the Saskatchewan, which is navigable. The population in 1891 was 11,150, of whom over half were Indians and nearly one-fourth half-breeds. The latter are mostly of French descent, and, with a few of pure French race, are for the most part settled about Batoche on the South Saskatchewan. The agricultural products are yet small, and include live stock, wheat, barley, oats, peas, and potatoes. There is also a considerable production of pelts, mostly musk-rat. The chief settlements are Battleford and Prince Albert.

MARK W. HARRINGTON.

Saskatchewan River: a river which rises on the eastern slope of the Rocky Mountains in two main branches, flows eastward for about 1,200 miles, and empties into Lake Winnipeg. A few of the minor branches of the South Saskatchewan have their sources in the U. S. It is a part of the drainage system that reaches Hudson Bay through Nelson river, which is one of the great hydrographic basins of North America. From the junction of the North and South Saskatchewan to Lake Winnipeg the river flows through the deserted bed of Lake Agassiz. The sources of the north and south branches are stated by Dr. Hector to be but a few miles apart, in a nucleus of lofty summit-glaciers about lat. 51° 40' N., lon. 117° W., near Mt. Hooker, 15,700, and Mt. Brown, 16,000 feet in height, where the Rocky Mountains are 200 miles in breadth. Thence diverging 300 miles apart, midway, they unite at 550 miles in direct distance eastward.

a smooth and lustrous fabric of silk, of Chinese invention. Of the warp threads only one in every five or ten is raised to allow the shuttle to be passed, but each thread is raised in regular succession as the shuttle is thrown. It is woven with the right side uppermost.

Satin Bower-bird: See BOWER-BIRD.

Satinet: a coarse fabric, of which the warp is cotton and the weft woolen; originally, an inferior variety of satin.

Satin-spar: a fibrous variety of carbonate of lime, of snowy whiteness, found in England, Scotland, and elsewhere, which when polished has a luster resembling that of satin. A fibrous kind of GYPSUM (q. v.), also called satin-spar, is softer than the above, and is frequently made into ornaments resembling cat's-eye.

Satin-wood: a name given to several kinds of ornamental wood. The best is from Guiana, and is the wood of *Ferolia guianensis*, now included in the genus *Parinarium*. Florida satin-wood is from *Xanthoxylum floridanum*, a kind of prickly-ash tree. The West India satin-wood is from different trees, some of it of the very best and others of the poorest quality. The rich and fragrant satin-wood of India is usually of good quality. It comes from the *Chloroxylon swietenia*, a cedrelaceous tree which yields a sort of wood-oil. Satin-wood is used in making workboxes, hair-brushes, and cabinet-work.

Revised by L. H. BAILEY.

Sature [viā O. Fr. from Lat. *satūra*, *satūra* (sc. *lanx*, dish), a dish filled with various kinds of fruits, food composed of various ingredients, a mixture, medley, liter., fem. of *satur*, filled with food, sated]: a form of composition, which, as an attack on the weakness and wickedness of humanity, belongs to all mankind and to universal literature. Prose is at its service as well as poetry; it may take the shape of sermon as well as song. It may be dramatic, as in comedy, mask, and mummery. It may be epigrammatic, as in lampoon and pasquinade. It may be indirect, as in parody and travesty. It may be a formal diatribe; it may be an informal skit. Satire is older than comedy, for the *silli* of XENOPHANES (q. v.) were satirical and every phase of satire was represented in Greek literature. But the great models of satirical art are found in Roman literature. Whenever satire as literature is mentioned Horace and Persius and Juvenal come up to the mind, and the satire is assuredly most congenial to the Italian temperament, ancient and modern. Nor were the Romans slow to claim satire as their especial province. *Satura quidem*, says Quintilian (x., 1, 93), *tota nostra est*, and the loss of the Greek forerunners has enabled the Romans to make good their claim here as in the whole field of didactic poetry to which satire stands related as does the application to the sermon. The first appearance of *satura* in Roman literature is in the *satura* of ENNIUS (q. v.), where it is evidently a medley in verse; the *Satura Menippea* of VARRO (q. v.), of which we have considerable fragments, are in prose and verse, as is the so-called *Satiricon* of PETRONIUS ARBITER (q. v.).

The subjects of Ennius and of Varro covered a wide range, and their miscellaneous character corresponds to the original meaning of the word. In the hands of Lucilius the *satura* was largely used as an instrument for personal attack on the characters of those who had stirred the poet's indignation, and, though the fragments of Lucilius show that motley was the wear of his muse also, still the Lucilian satire has narrowed the range of the word, just as the mocking epigram has prevailed over all the other Greek forms, and just as elegiac has become synonymous with plaintive. In its function, then, the satire was assimilated to that especial form of the Old Attic comedy which dealt with personal abuse, the form known as the *lampuchōidia*; and when the native historians of Roman literature followed the established fashion of paralleling Roman with Greek and tried to adjust the growth of Roman comedy to Aristotle's schemes for Greek comedy, the *satura* naturally took the place of the Old Attic comedy, and the resemblance was emphasized by Horace and Persius themselves. Cratinus, Aristophanes, and Eupolis were claimed as brothers of the same guild. In view then of the largely doctored accounts given by the Romans, both of their history and their literature, scholars may be forgiven for questioning the very existence of the dramatic *satura*, which is said to have been a manner of acted lampoon, akin to the rude *versus Fescennini* of the populace; and it has been recently maintained that this is only another Roman adaptation, another reconstruction of early Roman literary history

after Greek models, just as so much Roman political history has been reconstructed after Greek models. Still it is not to be denied that there is a dramatic element in the classic satires of Rome. It comes out in sundry of the satires of Horace and is awkwardly conspicuous in Persius, but perhaps both these poets are simply living up to a theory. In Juvenal, the third of the great Roman satirists, the dramatic element is not a marked feature, and his declamatory rhetoric has had more influence on modern satire than Horace's *bonhomie*, or the priggish wisdom of Persius. By concentration, then, and crystallization the satire proper came to be as we still have it. Poetry became the medium and the hexameter the form, and though the satirical spirit might manifest itself in prose-fiction with interlarded verse, as in Petronius, or in the various measures employed by Catullus and Martial, satire as such had received its type, and that type is still potent. The accepted satire is in verse and that verse the heroic verse of the nationality—in French the alexandrine, in English the decasyllabic. French satire is represented by Boileau, English satire by Dryden and Pope, for Dryden and Pope are the models, not Butler—*Abraham* and *Achitophel* and the *Dunciad*, not *Hudibras*. Of course, if the term satire is widened to meet the definition given at the outset of the article it will be necessary to include a vast body of literature: Lucian and Apuleius, *Reynard the Fox*, *Tytl Eulenspiegel* (*Howleglas*), the *Piers Plowman* of Langland, the *Epistolæ Obscurorum Virorum*, and so on, down through moralists, essayists, and novelists without number, of all nationalities and of every century. Momus, the spirit of mockery and fault-finding, the son of Night, appears early in the list of Greek divinities, and his worship and his influence are universal. B. L. GILDERSLEEVE.

Satire Ménippée, *sa'tēer'mā'nēepā'*: a famous French satire, so called from the Greek philosopher Menippus, who used in his works the form of prose interspersed with verse, in which it is composed. It is due to the collaboration of Pierre Le Roy, Jacques Gillot, Nicolas Rapin, Jean Passerat, Florent Chrestien, and Pierre Pithou, and appeared in 1594, after having circulated privately in manuscript. It was aimed against the league, and its fuller title was *De la Vertu du Catholicon d'Espagne et de la tenue des Etats de Paris*. It reflects the temper of the bourgeoisie, worn out by the civil strife, and putting the peace and unity of their country above party. Good editions are those of Ch. Read (1876) and C. Labitte (1880).

A. G. CANFIELD.

Satisfaction: See ACCORD AND SATISFACTION, JUDGMENT, MORTGAGE, PAYMENT, and RELEASE.

Satow, *saat'ō*, ERNEST MASON, B. A., C. M. G.: scholar and diplomatist; b. in London in 1842. Appointed student interpreter in Japan in 1861, he was present at the action at Kagoshima, Sept., 1863, and acted as interpreter at the bombardment of Shimonoseki, Sept., 1864. In 1876 he was promoted to be second secretary of legation at Tokio, and in 1883 received the decoration of the cross of St. Michael and St. George. During this period he had obtained a profound acquaintance with the language, history, and antiquities of Japan. In 1884 he was transferred to Siam as agent and consul-general at Bangkok, and became minister resident in the following year. He was transferred to Montevideo in 1888, and in 1893 was promoted to be envoy extraordinary and minister plenipotentiary at the court of Morocco. He has published an English-Japanese dictionary, and has contributed valuable articles to the *Transactions of the Asiatic Society of Japan*.

J. M. DIXON.

Satpura, *sāt-poo'rā* [from Sanskr. *śata-*, hundred + *pu'ra-*, castle, fortified town]: a name originally restricted to the mountains which divide the Nerbudda and Tapti valleys, Northern India, but now generally applied to the great range or table-land which, commencing E. of the famous Amarkantak plateau, runs nearly up to the western coast. Accepting Amarkantak as the eastern boundary, the Satpuras have a range from E. to W. of about 600 miles, and in their greatest depth exceed 100 miles from N. to S. The shape of the range is almost triangular; from Amarkantak, 3,328 feet above the level of the sea, an outer ridge runs S. W. to a point in the Bhandara district. The average height at the crest of the chain is but little under 2,000 feet above the sea; the highest peak, Dhupgarh, in Hoshungabad, rises as high as 4,454 feet. Nearly the whole range consists of trap; toward the W. a series of craggy peaks is met with.

Satrap [viā O. Fr. from Lat. *satrapes* = Gr. *σατράπης*, from O. Pers. *khšatrapāvā*; *khšatra-*, rule, power + *pā-*,

provinces of a satrapy or province of ancient Persia. The satraps imitated the tyranny of their royal masters, and on the decline of the old Kingdom some of the satraps became independent monarchs.

Sa-tsu-ma: a province of Japan, situated at the south-west end of the island of Kjusiu (q. v.), and having for its chief town Katsunuma (q. v.). The ruling family of Chikuzumi has been represented during the nineteenth century by men of singular ability. Under them was reared a race of soldiers and statesmen who contributed the chief element in the downfall of the shogunate, and have, with the clan of Chosin, ruled Japan ever since. The peasants were called *satsuma* from the arrival of Korean settlers, transported at the close of the sixteenth century. The art reached its perfection about 1840 under the direct fostering care of the lords of *satsuma*. This ware is of a cream color, and has a mottled surface. J. M. DRUCE.

Satōpōro: See SATURO.

Saturday [O. Eng. *Saterdag*, *Saterdag*, *Saterdag*, *Saterdag*, *Saterdag*, *Saterdag*; Lat. *Satur* was, Saturn + O. Eng. *dag*, day; the seventh and last day of the week. It is the Jewish Sabbath, and is called *Dies Sabbati* in the Roman Catholic liturgy.

Saturn (Lat. *Saturnus*): the ancient Latin god of planting and sowing, and hence of agriculture in the widest sense, the deity of which was ascribed to him. He was considered as a mythical king of Latium, under whose penitential reign the blessings of agriculture were first disclosed to the human race. His memory was cherished most faithfully by the laboring people and was perpetuated in the great popular festival of the SATURNALIA (q. v.), the observances of which were suggestive of the old Saturnian reign of plenty and equality. In later Roman mythology he was identified with the Greek Cronus. G. L. HENRICSON.

Saturn—the sixth planet in order of distance from the sun, and the third of the superior planets. It travels at a mean distance of 887,000,000 miles from the sun. Saturn completes its orbit in a period of 10,759.2198 days, or 29 years and 167 days. Its synodical period, or the interval between successive oppositions, exceeds a year by about 124 days on an average. Its volume exceeds the earth's about 700 times, and the mean density is so small that its mass exceeds the earth's only about 94 times. In fact the mean density is less than that of any other member of the solar system except, of course, the comets, being only .71 when the earth is taken as unity; if the density of water be taken as the unit, that of Saturn is about .73, or less than the density of mahogany. Its mean diameter is about 70,000 miles, its compression about $\frac{1}{6}$, so that the polar diameter is about 8,500 miles less, and the equatorial diameter about 1,000 miles greater. Saturn is distinguished among all the planets by the remarkable complexity of structure and by the number of subordinate bodies of which it is the center. The gaseous orb is girt by a mighty system of flat rings, visible even in a very small telescope; the span of which from outside to outside amounts to 167,000 miles, or more than six times the circumference of the earth. There are two chief bright rings, the outermost nearly 10,000 miles in width, the innermost about 17,500 miles in width, while between them there is a gap about 1,500 miles across. Inside the system of bright rings there is a dark ring (discovered by the elder Bond, of Harvard Observatory), which has a breadth of about 8,700 miles. Between this ring and the planet intervenes a space more than 10,000 miles in width. After a careful investigation, in which Laplace, Adams, and Clerk Maxwell have taken part, astronomers have been led to the conclusion that the rings are not continuous bodies, but consist of multitudes of small satellite rings, composed probably with vaporous matter, traveling in flat orbits around the central orb. This is, in fact, the only possible interpretation of the actual existence and configuration of the rings; for no system of continuous rings could continue to travel in dynamical equilibrium around Saturn, or under the strains to which the tremendous attractive power of Saturn would subject them. The globe of Saturn is marked like that of Jupiter, by belts, but they are less distinct. The tint of the planet as a whole is yellowish, and the belts show considerable variety of color. An equatorial belt, nearly always seen, is a creamy white; the dark belts are either pale or uncommonly cinnamon-colored; while the polar regions show a faint tinge of azure. As in the case of Jupiter, the conclusion to which we are led by the

careful study of these belts and of the probable condition of Saturn's globe is, that we do not see a solid or liquid orb, but only the outer parts of a deep and cloud-shaded atmosphere. In fact, the general evidence in Saturn's case is identical with that of Jupiter, and there are some points which afford even more convincing evidence as to the condition of these planets.

Satellites—Saturn is attended by eight satellites, which move in orbits outside the ring. All but the outer one move in the plane of the ring. The brightest of all is Titan, which was therefore the first discovered, having been found by Huyghens as far back as 1656. The faintest satellite is Hyperion, next outside of Titan, which was discovered by Bond, of Cambridge, Mass., and two days later by Lassell, in England, in 1848. This satellite exhibits a remarkable peculiarity in its perturbations by Titan, resulting in a revolution of its pericenter occurring in less than twenty years, and in a curious libration between the two bodies. These perturbations form a very interesting chapter in celestial mechanics, which has so far defied the efforts of the best mathematicians to work out a complete and satisfactory solution.

The outer satellite of all is Iapetus, which has the remarkable peculiarity of being much brighter on one side of the planet than on the other, showing that it performs a revolution on its axis in the same time that it revolves around the planet, and that it is much whiter on one side than on the other.

The positions of the satellites of Saturn can be found at any time from a diagram given annually in *The American Ephemeris*. The following is a list of these satellites, with their times of revolution:

ELEMENTS OF SATURN'S SATELLITES.

NAME.	Sidereal revolution.	Distance in radii of Saturn.
Mimas	9 h. 47 m.	0.003
Enceladus	1 d. 13 h. 23 m.	4.512
Tethys	1 d. 21 h. 24 m.	6.889
Dione	2 d. 17 h. 41 m.	6.599
Rhea	4 d. 12 h. 37 m.	9.542
Titan	9 d. 20 h. 45 m.	23.145
Hyperion	21 d. 21 h. 7 m.	28.040
Iapetus	79 d. 7 h. 55 m.	34.758

S. NEWCOMB.

Saturnalia [= Lat. *litet*, *ant.* plur. of *Saturnalia*, pertaining to Saturn, deriv. of *Satur* was, Saturn]: the old Latin festival of the god Saturn, celebrated in ancient Rome with feasting and mirth. Slaves were permitted freedom of speech and act, and all classes threw off care and toil. During the republic it was celebrated on Dec. 17; Augustus made it embrace the 17th, 18th, 19th, but popularly it included seven days. Of these seven days, the first two were the true Saturnalia, and the three following were the Opalia, in honor of Ops, while the last two were called Sigillaria, from the *sigilla* or clay toys exchanged as presents at that time. The Christian Christmas festival has retained in many parts of the world traces of the observances of the Saturnalia. Revised by G. L. HENRICSON.

Saturnian Verse: See METRIS.

Sat'yr-drama: in Greek literature, the fourth play of the tetralogy, which was made up of a tragic trilogy and this afterpiece. It received its name from the chorus, which was regularly composed of satyrs. The action was taken from mythology and not from everyday life, and the tone was merry. The satyr-drama held most faithfully, of all dramatic forms, to the original character of the Dionysian festival, and may be regarded as a survival of the time preceding the perfected organization of tragedy. It was, in fact, a tragedy drunk with new wine, and in the Æschylean stage of the trilogy the subject of the satyr-drama was so chosen as to burlesque the fundamental theme and thus relieve the tension of the spectators. Æschylus, whose tragic strain often comes perilously near the line of travesty, was the greatest master of the satyr-drama, but the only extant specimen of a complete satyr-drama is the *Cyclops* of Euripides, made familiar to English readers by the translation of Shelley, who was attracted to it by the spirit of revolt.

B. L. GILDERSLERVE.

Satyr [from O. Fr. *satire* < Lat. *satyrus* = Gr. *satyros*, satyr]: in Grecian mythology, the companions of Dionysus, demons of the forest, akin to the mountain nymphs and the

dancing Kuretes. In their earliest form they were caricatures of the elder or bearded Dionysus; they were half-animal, and were depicted in early vase-paintings with long sharp-pointed ears, long horse-tails, long hair, and long, pointed beards. They were half-animal, not only in form, but in character; they were lustful and sensual, and vase-paintings represent them as ravishers of the nymphs and Bacchantes, and even of Iris. This antique type of satyr was supplanted by a less sensual type, which was created by Praxiteles in his famous statue, and has remained the norm of the Satyr. In the Satyr of Praxiteles we have the Puck of antiquity, the figure of a lusty youth, in which the animal nature is brought out by the goat-ears, the teat-like protuberances (*phrea*) on the neck, the animal cast of countenance, stump nose, bristly hair, thick lips, cynical smile, and diminutive tail. In some cases sprouting horns on the forehead indicate a transition stage between the Satyr and Pan and Panisks. The Satyr must be carefully distinguished from Pan and Silenus, and especially from the Faunus of the Romans, a creation that arose from their confounding the Satyrs and Pans. J. R. S. STERRETT.

Saugerties, saw'ger-teez: village; Ulster co., N. Y.; on the Hudson river at the mouth of Esopus creek, and on the West Shore Railroad; 12 miles N. of Kingston, the county-seat (for location, see map of New York, ref. 7-J). It is in an agricultural region, has good water-power for manufacturing, and ships large quantities of bluestone, limestone, and agricultural products. There are 7 churches, 4 graded schools forming Union Free School District No. 10, a parochial school, a Young Men's Christian Association with library and reading-room, a national bank with capital of \$200,000, a state bank with capital of \$125,000, a savings-bank, manufactories of paper, blank books, brick, and wood-pulp, and a daily, a monthly, and 2 weekly periodicals. Pop. (1880) 3,923; (1890) 4,237; (1895) estimated, 6,000.

EDITOR OF "DAILY POST."

Saugor: island and town of India. See SAGAR.

Sauk Center: city (founded in 1857); Stearns co., Minn.; on the Sauk river, and the Gt. North. and the N. Pac. railways; 117 miles N. W. of St. Paul, the State capital (for location, see map of Minnesota, ref. 8-C). It is in an agricultural region, has several flour-mills and other manufactories, and contains 10 churches, public graded and high schools, private academy and training school, a national bank with capital of \$50,000, 2 private banks, and 2 weekly newspapers. Pop. (1880) 1,201; (1890) 1,695; (1894) school census, 1,955.

EDITOR OF "HERALD."

Sauk Rapids: village (located in 1850); capital of Benton co., Minn.; on the Mississippi river, and the Gt. North. and the N. Pac. railways; 75 miles N. W. of St. Paul, the State capital (for location, see map of Minnesota, ref. 8-D). It has excellent water-power and extensive quarries of fine granite, is engaged in farming and dairying, and contains 6 churches, high school, German Lutheran school, steam sawmill, planing-mill, feed-mill, and 2 weekly newspapers. Pop. (1880) 598; (1890) 1,185; (1895) estimated, 2,800.

EDITOR OF "SENTINEL."

Saul [from Heb. *Shā'ul*, liter., asked for]: the first King of Israel, a son of Kish, of the tribe of Benjamin; was anointed by Samuel; fought with great success against the Philistines, Moabites, Ammonites, Edomites, and Amalekites, and governed well in the earlier part of his reign, but afterward became possessed of "an evil spirit from the Lord," committed great cruelties, and fell, together with three of his sons, in the battles of Mt. Gilboa against the Philistines, about 1055 B. C. The history of the latter part of Saul's reign is simply a part of the history of David. For further details concerning Saul, see the articles DAVID and JEWS.

Sauley, sō'see', LOUIS FÉLICIEN JOSEPH CAIGNART, de: numismatist and Hebraist; b. at Lille, France, Mar. 19, 1807; studied at the École Polytechnique; was appointed Professor of Mechanics at the military school of Metz in 1838, and shortly after keeper of the museum of artillery; gained celebrity first as a numismatist by his *Essai de Classification des Suites monétaires byzantines* (1836); studied Assyrian and Celtic inscriptions, and wrote *Les Campagnes de Jules César dans les Gaules* (1860), but devoted himself more especially to Hebrew antiquities; visited the Holy Land in 1850, and wrote *Voyage autour de la Mer morte et dans les Terres bibliques* (2 vols., 1852-54); *Études sur la Numismatique judaïque* and *Histoire de l'Art judaïque* (1858); *Voy-*

age en Terre-Sainte (1865); *Les Derniers Jours de Jérusalem* (1866); *Histoire d'Hérode* (1867); *Étude chronologique des Livres d'Esdras et de Néhémie* (1868); and *Sept Siècles de l'Histoire judaïque* (1874). D. in Paris, Nov. 4, 1880.

Saulsbury, WILLARD: U. S. Senator; b. in Kent co., Del., June 2, 1820; educated at Delaware and Dickinson Colleges; was admitted to the bar 1845; was attorney-general of Delaware 1850-55, and U. S. Senator 1859 to 1871, when he was succeeded by his brother ELI (b. Dec. 29, 1817), who was re-elected for third term Jan. 16, 1883. In 1874 Willard Saulsbury was appointed chancellor of Delaware. D. at Dover, Apr. 6, 1892. Another brother, GOVE, was Governor of Delaware 1865-71.

Sault Sainte Marie, soo'sānt-mā'ree, Fr. pron. sō sāt-māa'ree: village; port of entry; district of Algoma, East Ontario, Canada; on the St. Mary river, the St. Mary Falls Ship-canal, and the Canadian Pac. Railway; opposite the city of the same name in Michigan; 622 miles W. of Montreal (see map of Ontario, ref. 6-H). It has a water-power canal, electric-light plant, a pulp and paper mill operated by water-power (cost over \$1,000,000), branches of the Imperial Bank of Canada and the Canadian Bank of Commerce, schools for Indian boys and girls, and two weekly newspapers. The village is in an agricultural and mineral region, is a popular summer resort, and is the seat of the Anglican Bishop of Algoma and of the Roman Catholic Bishop of Northern Canada. Pop. (1891) 2,414. CHASE S. OSBORN.

Sault Sainte Marie: city; capital of Chippewa co., Mich.; on the St. Mary river, near the outlet of Lake Superior, the ship-canal around the rapids, and the Duluth, St. Shore and Atlantic, and the Minneapolis, St. P. and St. Marie railways (for location, see map of Michigan, ref. 2-I). It is connected with a village of the same name on the Canadian side by an international railway bridge, 1½ miles long, which cost \$1,000,000. Navigation between Lakes Superior and Huron is facilitated by a lock and canal, which cost about \$1,000,000. The U. S. Government is building a second lock, which will be the largest in the world, and will cost with improved approaches \$5,000,000. The annual tonnage passing through the canal is greater than that of the Suez Canal. The city has direct connection by the bridge with the Canadian Pacific railways. There are 6 churches, 6 public-school buildings, public-school property valued at \$75,000, parochial-school property valued at \$8,000, 2 national banks with combined capital of \$150,000, a state bank (savings) with capital of \$50,000, a building and loan association, a monthly and 2 weekly periodicals, water and sewer plants, electric lights and street-railways, and an assessed valuation of \$1,600,000. The industrial establishments include 23 sawmills, 2 cigar-factories, 2 brick-yards, 2 machine-shops, foundry, flour, shingle, and planing mills, shipyard and marine railway, and a branch of the State fish hatchery. Pop. (1880) 1,947; (1890) 5,764; (1894) 7,185. CHASE S. OSBORN, EDITOR OF "NEWS."

Saumaise: See SALMASIUS.

Saumur, sō'mūr': town of France, department of Maine-et-Loire; on the Loire; 80 miles S. E. of Angers; is famous for its rosaries made of cocoanut-shells, has manufactures of linens and cambrics, and trades in wine, corn, hemp, and spirits (see map of France, ref. 5-D). It was the seat of the celebrated Protestant academy founded in 1598 by the national synod of Montpellier, and suppressed by a royal edict of Jan. 8, 1685. That academy developed the first French school of criticism in modern theology. Pop. (1891) 12,527.

Saunders: See SANTAL-WOOD.

Saunders, FREDERICK: author; b. in London, Aug. 14, 1807; established himself in the publishing business in New York in 1836, and subsequently was for some time an assistant editor of the *New York Evening Post*. In 1858 he received the appointment of assistant librarian of the Astor Library, which office he continued to hold until the beginning of 1876, when he was made chief librarian and acting superintendent. He has published *Memories of the Great Metropolis* (1852); *Salad for the Solitary* (1854); *Salad for the Social* (1856); *Pearls of Thought and Mosaic* (1858); *Festival of Song* (1865); *About Woman, Love, and Marriage* (1868); *Evenings with the Sacred Poets* (1872); a revised and illustrated edition of *Salad for the Solitary* and the *Social* (1872; new ed. 1883); *The Story of the Famous Books* (1887); and *The Story of the Discovery of the New World by Columbus* (1892).

Revised by H. A. BEERS.

Saunders, Remondino Marciano; jurist; b. in Caswell Bay, N. Wales, 1770; studied at his University of North Wales; he did not graduate, resided some years in Tennessee where he was admitted to the bar 1812; returned to North Wales; was a member of the Legislature 1815-20, a member of that body two years; member of Congress 1827-28; 1831-35; attorney-general of North Carolina; was a member of the board of commissioners on claims toward France 1837; judge of the Supreme Court of the State 1837-39, when he was displaced by Alex. Holden; minister to Spain 1840-50; was subsequently again a member of the Legislature, and took a leading part in promoting the construction of railways in North Carolina. D. at Raleigh, Apr. 24, 1867.

Saunders, Thomas William; legal writer; b. in England, 1818 or 1814; entered the Middle Temple in 1832; called to the bar 1837; was employed as a revising barrister in the counties of Essex 1840-49. He was a magistrate of the Thames valley from 1878 until within a few weeks of his death, and was remarkable for the leniency of his sentences. D. at Haverham, Hants, 1890, 29, 1890. His voluminous works, among the more important of which are *Law and Practice of Municipal Registration and Elections* (ed. 1873); *Law and Practice of Orders of Affidavits and Proceedings in Habeas Corpus* (ed. 1888); *Practical Magistrate's Courts* (ed. 1892); *Treatise on the Law of Association and Representations upon the Sale of Goods* (1894); and *Treatise upon the Law Applicable to Insurances*. F. STURGES ALLEN.

Saunders, Nicholas; mathematician; b. at Thirlestree, Leicestershire, England, in 1689; lost his sight by an attack of smallpox in infancy, but was carefully instructed by his father; learned Latin and Greek at academies; was taught the higher mathematics by private tutors, and displayed such mastery of all the allied sciences, including astronomy, that in 1707 he lectured upon them at the University of Cambridge, and on the recommendation of Sir Isaac Newton was in 1711 chosen to succeed Whiston as Lucasian Professor of Mathematics. D. Apr. 19, 1755. After his death appeared his *Elements of Algebra* (1749), to which he prefixed a biographical sketch by his son John. His *Method of Fluxions* appeared in 1755.

Saunders, Joseph

Sauria (Gr. *sauris*, lizard) the group of reptiles common to most countries. See LIZARD.

Saurin, Jean

Sauris (Mod. Lat.; Gr. *sauris*, lizard + *gêis*, look, appearance) a group of vertebrates containing the reptiles and some which are distinguished on account of many structural peculiarities which mark them off from the mammals and some from the fish-like forms (*Ichthyosaurus*) and others. In their development they have both annular and linear (see CONVERGENCE). In the adult the lower jaw is united to the skull by a quadrate bone; a parasphenoid bone is lacking; there is a single occipital condyle for ar-

thulation with the neck; and the coracoid bone, except in bird-like forms, is well developed. They are either oviparous or viviparous. In both there is a tendency to develop scales upon the surface of the body. Though birds and reptiles are seemingly very different in the Mesozoic age there were many structural resemblances between them.

J. H. KROMBEY.

Saururus (Mod. Lat.; Gr. *sauris*, lizard + *ur*, tail) a subgenus of birds characterized by a tail of many vertebrae, each vertebra bearing a single feather on either side. The digits of the hand are free from one another and clawed; the jaws furnished with teeth; the pelvis not ankylosed with the sacrum; the sternum small. The only known member of the group is the *Archaeopteryx lithographica*, from the Jurassic strata of Solenhofen, Bavaria. See ANOMALOPTERYX. F. A. L.

Saur, Saur-pika, or Skipper: a fish (*Neomachirus auratus*) of the family *Scombridae*. These fishes go in great shoals and are very active, leaping far above the surface of the water. Although small, they are esteemed for the table.

Sausalito: town; Marin co., Cal.; on San Francisco Bay, and the N. Pac. Coast Railroad; 6 miles N. of San Francisco (for location, see map of California, ref. 7-B). It is a yachting, fishing, and bathing resort, and is principally engaged in agriculture, dairying, and stock-raising. A fine walk, leading around the promontory by way of Lime Point to Point Bonita, the north horn of the Golden Gate, affords good views of the entrance to San Francisco Bay. The town is the southern terminus of the railway, and has regular steamboat connection with San Francisco. Pop. (1880) 476; (1890) 1,254.

Saussure, Horace Bénédict, de; physicist and geologist; b. at Cordon, Switzerland, Feb. 17, 1740; studied under his uncle, Charles Bonnet, and under Haller, and was appointed Professor of Physics and Philosophy at the University of Geneva in 1762. In 1768 he began a series of scientific mountain-excursions, crossing the Alps fourteen times by eight different routes, ascending Mont Blanc in 1787 and Monte Rosa in 1789, encamping for seventeen days on the Col du Géant, and visiting the Jura, Vosges, and Auvergne Mountains, Germany, England, Sicily, and Italy. The result was a multitude of the most valuable observations on the minerals, botany, geology, and meteorology of the countries he visited. These were published in his *Voyages dans les Alpes* (4 vols., Geneva, 1779-96). Among his minor works are *Sur l'Hygrométrie* (1783) and *De Aqua* (1771). In 1789 he resigned his chair, but after the annexation of Geneva to France was appointed Professor of Natural History at the central school of the department of Léman. D. at Geneva, Jan. 23, 1830. See *Dr. Saussure and the Alps* (Great Explorers Series, London, 1892).

Savage, James, Jr.; D.; antiquary; b. in Boston, Mass., July 12, 1784; graduated at Harvard 1804; was active in politics for a few years, after which he devoted himself to literary work. Besides publishing many pamphlets on historical and political subjects, he edited several works of importance relating to New England history. He compiled on the basis of Farmer's *Register a Genealogical Dictionary of the First Settlers of New England, showing Three Generations of those who came before May, 1632* (Boston, 4 vols., 1822-64), a work of great value, displaying extraordinary industry and research, but confused in plan, unequal in execution, and disfigured by the exhibition of spleen against many of the parties to the colonial controversies of the seventeenth century. D. in Boston, Mar. 8, 1874.

Savage, Minor J.; clergyman and author; b. at Norridgewood, Me., June 10, 1841; educated at Bowdoin College and Andover Theological Seminary, where he graduated in 1864; was a Congregational missionary in California; pastor of churches at Framingham, Mass., and Hannibal, Mo.; in 1873 became a Unitarian and took charge of a church in Chicago; in 1874 became pastor of the Church of the Unity, Boston. He is the most popular representative among Unitarians of the scientific interpretation of religion. Among his numerous works are *Christianity the Science of Manhood* (Boston, 1873); *The Religion of Evolution* (1876); *Life Questions* (1879); *Heaven* (1882); *Beliefs about the Bible* (1883); *My Creed* (1887); and *Evolution of Christianity* (1892).

Savage, Richard; poet; claimed to be the illegitimate son of Anne, Countess of Macclesfield, by Richard Savage,

Earl Rivers, alleging that he was born in London, Jan. 10, 1698; was reared in poverty. He obtained a tolerable education in a grammar school at St. Albans, and was afterward apprenticed to a shoemaker; but having displayed literary tastes, he went to London about 1716, where he obtained the patronage of Steele, and of Wilks and Mrs. Oldfield, the actors, and assumed the name of his alleged father. In 1717 he translated from the Spanish a play, *Woman's a Riddle*, which had a run of twelve nights; produced in 1723 a successful tragedy, *Sir Thomas Overbury*; in 1726 a volume of *Miscellaneous Poems and Translations*; in 1728 *The Bastard*, a Poem, which speedily ran through five editions; and in 1729 his best work, *The Wanderer, a Moral Poem*. In 1727 he was condemned to death for killing a man in a tavern brawl, but was pardoned in opposition to the wishes of his alleged mother; was then taken into the house of Lord Tyrconnel, but soon quarreled with his protector; subsisted thereafter upon money subscribed by Pope and his literary circle; obtained from Queen Caroline an annual stipend of £50 in consequence of some verses he had written on her birthday; resided several years at Bristol, where he was thrown into prison for debt Jan., 1743. D. there Aug. 1, 1748. He is now best remembered by the pathetic *Life* written by his friend Johnson. For an exposure of the improbability of Savage's story, see W. Moy Thomas in *Notes and Queries* (1858). Revised by H. A. BEERS.

Savanilla: See SABANILLA.

Savan'na [from Span. *sábana*, large cloth, sheet, savanna (in this sense also *sabana*, with accent on second syllable) < Lat. *sa'bānum* = Gr. *sáβanon*, linen cloth, towel]: a grassy plain in a tropical region, yielding pasturage in the wet season, and often having a growth of under-shrubs. It corresponds to the prairie of more northern latitudes. The word is chiefly used in tropical America.

Savanna: city; Carroll co., Ill.; on the Mississippi river, and the Chi., Mil. and St. P., and the Burlington Route railways; 10 miles W. of Mt. Carroll, the county-seat (for location, see map of Illinois, ref. 2-D). It is an important shipping-point, and has several manufactories, a State bank with capital of \$50,000, and two weekly newspapers. Pop. (1880) 1,000; (1890) 3,097.

Savan'nah: city (originally Yamacraw Bluff); port of entry; capital of Chatham co., Ga.; on the Savannah river, and the Cent. of Ga., the Fla. Cent. and Pen., and the Sav., Fla. and West. railways; 18 miles above the mouth of the river, 115 miles S. W. of Charleston (for location, see map of Georgia, ref. 5-K). It has an excellent landlocked harbor, which has been improved by the U. S. Government since the war of 1861-65, with 23½ feet of water between the city and the bar. The city is partly built on a bluff 40 feet above the level of the river, has an area of 6 sq. miles, was laid out on a plan original with the founder, and is adorned with a large variety of ornamental trees and shrubbery. Since 1884 the city has been drained thoroughly and provided with an improved system of sewerage and twenty-five artesian wells, the latter having a total capacity of over 6,500,000 gal. per day.

Streets and Buildings.—The streets are laid out at right angles to each other, are lighted by electricity, and have over 25 miles of electric railway. There are many fine shell-road avenues leading to places of interest in the suburbs. The principal wholesale houses are on Bay Street; the chief shopping thoroughfares are Congress and Broughton Streets; and the fashionable promenade is Bull Street to Forsyth Park and the Parade-ground. Among the notable public buildings are the city-hall, court-house, U. S. Government building, the Oglethorpe Club-house, formerly the Masonic Hall, in which the ordinance of secession was adopted; the Telfair Academy of Arts, containing valuable collections of paintings, statuary, casts, and other works of art; Hodgson Hall, in which are the library and collections of the Georgia Historical Society; the Commercial Club-house; and the Independent Presbyterian Church, considered one of the handsomest church edifices in the South.

Parks and Resorts.—Savannah has 34 public parks and squares, with a total area of 65 acres. The largest is Forsyth Park, 10 acres, which is noted for its beautiful fountain and trees. Adjoining it is the Parade-ground, 20 acres, which contains a Confederate memorial monument. Johnson Square contains a monument to Gen. Nathanael Greene; Madison Square, one to Sergt. Jasper; and Monterey Square, one to Count Pulaski. The favorite seaside resorts are the Tybee island beach, at the mouth of the river; Thunderbolt, on

Thunderbolt river; White Bluff, 9 miles W. of the city, and reached by a fine shell road; the Isle of Hope and Beaulieu, on the Skidaway river. The Sea Islands are also much frequented. Bonaventura, 4 miles S. of the city, one of four cemeteries, is widely known for its avenues of ancient live-oaks, whose branches are covered with long, waving gray or Spanish moss.

Churches, Schools, etc.—The city is the seat of a Roman Catholic bishopric and contains 41 churches of various denominations. On the site of Christ Church, the oldest Protestant Episcopal edifice, John Wesley established the first Sunday-school in America. The city has a school population of over 10,000, a public high school, 9 public-school buildings, public-school property valued at over \$300,000, a private secondary school for boys, and Savannah Academy (non-sectarian, chartered in 1864). There are 3 libraries containing over 25,000 volumes; 14 charitable institutions; 19 social and literary clubs; 3 free dispensaries; 5 hotels; and 2 daily, 7 weekly, and 2 monthly periodicals.

Finances and Banking.—In 1898 the city had a net debt of \$3,494,450, and an aggregate assessed valuation of \$33,424,663. In 1895 there were 2 national banks with combined capital of \$800,000, 6 State banks with capital of \$2,250,000, a safe and trust company with capital of \$125,000, a private bank, and 16 loan companies.

Business Interests.—Savannah is the third largest cotton-shipping port in the U. S. Besides cotton it exports large quantities of rice, lumber, and naval stores, and ships vegetables and melons to Northern cities. In the fiscal year 1893-94 its exports of domestic merchandise aggregated a value \$25,527,468, and its imports of foreign goods \$302,948. The principal industries are the manufacture of fertilizers, rice cleaning and polishing, and foundry and machine-shop work. In 1890 the city had 187 manufacturing establishments, representing 42 industries, with combined capital of \$2,977,450, employing 1,643 persons, paying \$42,766 for wages and \$2,597,652 for materials, and turning out articles valued at \$4,467,688.

History.—The city was settled by Gen. JAMES EDWARD OGLETHORPE (q. v.) in 1733; repulsed a British attack in 1776; was captured by the British in Dec., 1779, and was held by them to the close of the war. It received a city charter in 1789. In 1796 and 1820 it suffered severely by fire. At the beginning of the war of 1861-65 the fortifications of the harbor were seized by the State authorities, and during the war the city was a Confederate military post. Gen. Sherman invested the city on Dec. 10, 1864, the Confederates abandoned it, and the Union army took possession on Dec. 21. Pop. (1880) 30,709; (1890) 43,189; (1895) estimated at 62,107.

THOMAS M. NORWOOD.

Savannah: town; capital of Andrew co., Mo.; on the Chi., Gt. West. and the Burlington Route railways; 2 miles W. of the One Hundred and Two river; 14 miles N. E. of St. Joseph (for location, see map of Missouri, ref. 2-D). It is in an agricultural, fruit-growing, and stock-raising region and contains 8 churches, a graded public school with high school department, 2 State banks with combined capital of \$44,340, 4 newspapers, a large flour-mill, and a creamery. Pop. (1880) 1,206; (1890) 1,288; (1895) estimated, 1,500.

EDITOR OF "REPUBLICAN."

Savannah River: a stream which forms the boundary line between Georgia and South Carolina. From its source to its mouth on Tybee roads its channel is 450 miles long, while the distance in a direct line is only 250 miles. With its tributaries it drains an area of over 8,000 sq. miles. The Savannah is a turbid stream, and the current in the upper portion of the river and its tributaries is rapid and carries a great deal of silt, particularly during the seasons of freshets. Bars are therefore formed in the broader portions of the river where the current is less rapid. At Savannah the mean rise and fall of tide is 6½ feet. The tidal wave ordinarily ascends to a point about 28 miles above Savannah or 45 miles from Tybee roads. The river is navigable to Savannah for vessels drawing 22 feet of water, and by small vessels to Augusta, 231 miles. Under appropriations of Congress improvements in the river and harbor of Savannah (1895) in progress, having in view the securing of a 26-foot channel to Savannah.

Savary, *sā'vā'ree'*, ANNE JEAN MARIE RENÉ, Duke of Ravenna; general; b. at Marcy, department of Ardennes, France, Apr. 26, 1774; entered the army in 1790; served on the Rhine and in Egypt; was raised to the rank of colonel after the battle of Marengo, and in 1803 became general of brigade.

ive provisions will be seen in the fact that in the years from 1817 to 1872 the interest paid by the Government to savings-banks exceeded that which it had received from investments on their account by the sum of £4,169,427 10s. 5d. As an incentive to industry and economy, and a check to pauperism, the Government could afford to bestow this bounty upon savings-banks, but only upon terms that would tend to exclude from any considerable share in it the opulent classes, whom the liberal interest allowed and the security afforded by savings-banks would naturally attract. Trustees in England are made liable only for their own personal malfeasance, but in Ireland they are made liable for losses, unless by their rules they limit their liability to a fixed sum, which is not to be less than £100. The Government has never conceded its liability to make good the losses sustained by savings-banks, though in one instance of exceptional hardship Parliament appropriated £30,000 as a partial restitution to depositors.

The following table gives the number of depositors and the balance to the credit of savings-banks, including interest, on the books of the national debt commissioners in quinquennial periods from 1817 to 1882. The year 1861 is also included, as marking the highest limit reached by savings-banks before their decadence. This began under competition with the post-office savings-banks, from which, however, the savings-banks afterward recovered:

Year ending Nov. 30.	Number of depositors.	Amount to credit of savings-banks.	Year ending Nov. 30.	Number of depositors.	Amount to credit of savings-banks.
1817.....	* 9,291	£231,028	1857.....	1,366,560	£35,255,722
1822.....	* 204,584	6,546,690	1861.....	1,609,103	41,790,788
1827.....	* 395,000	14,188,708	1862.....	1,558,189	40,809,578
1832.....	440,861	14,416,885	1867.....	1,385,782	36,792,912
1837.....	636,389	19,711,797	1872.....	1,425,147	40,000,462
1842.....	875,098	25,406,642	1877.....	1,509,847	44,238,686
1847.....	1,096,066	30,236,632	1882.....	* 1,552,988	* 44,594,451
1852.....	1,309,934	31,912,413	1887.....	* 47,262,222

* Partly estimated.

Since 1887 the deposits of trustee savings-banks have been decreasing, while those of the post-office savings-banks have been rapidly growing.

Post-office Savings-banks.—In 1861 a system of post-office savings-banks was established, which, however, was little more than an expansion and adaptation to existing conditions of the scheme of Patrick Colquhoun, made prominent by Whitbread in 1807. No arbitrary interference with the existing system of savings-banks was attempted, but these were left to hold their own in competition with the new system as best they could. The practical operation of the latter may be briefly stated: Certain post-offices throughout the United Kingdom are designated at which sums of not less than one shilling or some multiple thereof will be received for transmission to the central office in London. Not exceeding £30 in one year, or £150 in all, or £200 including interest, is received from any one person. The depositor receives a book in which his deposits are entered, and a receipt for each deposit is also forwarded to him in due course from the central office. The moneys are invested in the public funds, and deposits of not less than £1 or multiples thereof receive interest at the rate of 2½ per cent. per annum. The Government is responsible for the repayment of all moneys received, thus affording to depositors perfect security. A depositor may apply at any post-office savings-bank in the kingdom for the purpose of withdrawing money, and may direct payment of the same to be made to him at that or at any other post-office savings-bank. His order is forwarded to the Postmaster-General, by whom a warrant for the designated amount is drawn upon the postmaster where payment is to be made, which is forwarded to the depositor, who presents the same, together with his book, and receives his money.

The system was inaugurated by opening in England and Wales 301 postal savings-banks, which number was increased before the close of the year to 1,629. The system was extended in the following year to Ireland and Scotland. In 1866 the number of postal savings-banks in the United Kingdom was 3,369, or more than five times the highest number under the old system; on Mar. 31, 1882, the number was 6,645, and on Mar. 31, 1891, it was 10,063. In the ten years from Sept., 1861, to Sept., 1871, there had been deposited, including interest, £44,198,743, withdrawn £28,044,539, leaving due depositors £16,154,204. During the calendar year 1881 there was deposited £11,345,957; interest

credited, £826,990; withdrawn, £9,469,668; balance due depositors Dec. 31, £36,194,495. In 1892 the number of postal savings-banks was 10,519, the amount deposited was £21,384,903, and the total amount due depositors £75,853,079.

Penny savings-banks, military savings-banks, and savings-banks for seamen have been established as auxiliaries of the general system, for the purpose of meeting the special needs of classes for which the ordinary savings-banks did not hold out adequate inducements or facilities. The penny savings-banks have commonly been tributary to the larger institutions, making them the depositories of their aggregate accumulations. The military and seamen's savings-banks have been conducted independently. Their statistics are unimportant, and fail to exhibit any distinctive features concerning the thrift of the classes they represent, for large numbers of these prefer to deposit in the regular institutions.

Savings-banks in the U. S.—Shortly after the successful inauguration of savings-banks in Great Britain upon a popular and practical plan these institutions began to attract attention in the U. S. The first organization of which there is record was effected in the city of New York, Nov. 29, 1816. The first to go into practical operation was in Philadelphia, which as a purely voluntary association began to receive deposits Dec. 2, 1816, which would indicate an organization effected prior to that in New York. The first to become incorporated was in Boston, Dec. 13, 1816, and it organized and began business in the spring of 1817. Thus the U. S. anticipated Great Britain in giving to this interest the sanction and protection of law. The savings-bank of Salem, Mass., was next incorporated Jan., 1818, and commenced business in April following. The savings-bank of Baltimore opened as a voluntary association for receiving deposits on Mar. 16, 1818, and was duly incorporated in December of that year. The example of these cities and towns was rapidly followed by others.

The plan of organization of savings-banks is not altogether uniform. In some States there is a large body of corporators, empowered to enlarge their number indefinitely, who elect from their number annually a board of trustees or directors, to whom the management of the institution is committed. In others the corporators are a defined and limited number, who are themselves the trustees and responsible for the management. These are commonly empowered to fill vacancies that occur, though in some cases this is done by designated authority outside of the board. In the Northeast savings-banks are managed by trustees for the depositors; in other parts they are frequently managed by corporations with capital stock.

AGGREGATE SAVINGS-DEPOSITS OF SAVINGS-BANKS, WITH THE NUMBER OF DEPOSITORS AND THE AVERAGE AMOUNT DUE TO EACH BY STATES, TERRITORIES, AND GEOGRAPHICAL DIVISIONS IN 1893-94.

STATES, TERRITORIES, AND DIVISIONS.	Number of depositors.	Amount of deposits.	Average to each depositor.

* Partly estimated.

able to resist the prophetic spirit which compelled him to speak his Master's words. The sentence of excommunication followed (1497). The *Arrabbiati* got possession of Florence. Fra Girolamo's letters to foreign sovereigns, urging them to call a council to dethrone the Borgia and elect a new pope, fell into the hands of his enemies. On Apr. 7, 1498, occurred the famous attempt at a "trial by fire," to decide whether he was divinely commissioned, but its fiasco turned the people against him, and on the night of the following day the convent of San Marco was attacked by an infuriated mob. The signoria sent thither officers to demand the surrender of the prior, who, with two of his brethren, was conveyed to the dungeons of the Bargello, and brutally tortured the same night. These barbarities were continued for weeks, and suspended only when the life of their victim was in danger. In the delirium of agony Savonarola sometimes gave confused answers as to his prophetic gifts, but no confession of guilt could be extorted from him. His destruction, however, was inevitable. The pope threatened Florence with an interdict and with every other form of vengeance if she spared the hated friar. Sentence of death was pronounced on May 22, 1498, and the next day he and his two friends and fellow monks Domenico and Silvestro were publicly hanged and then burned in the Piazza della Signoria and their ashes thrown into the Arno. The judgment of history has acquitted Savonarola of the charges brought against him in his own day, and the sincerity of his faith and the disinterestedness of his aims are as unquestioned as the purity of his life and the power of his intellect. Even the Roman Catholic Church, through Popes Paul V. and Benedict XIV., has declared his works irreproachable, and placed him among the servants of God. In the convent of San Marco are preserved various objects of interest once belonging to the martyred prior, such as his Bible filled with annotations by his own hand, etc., and a portrait, probably by his friend Fra Bartolommeo. He was of middle stature, dark complexion, plain in feature, pallid and worn with abstinence; his expression severely noble, but benevolent, and when animated his keen dark eyes glowed like flames. It is incorrect to speak of him as "a reformer before the Reformation," for he had no thought of leaving or opposing the Church. Yet his insistence upon the Bible as the surest guide to the knowledge of spiritual things, and his protests against the corruptions of the Church, had unquestionable influence in hastening the Reformation which followed so shortly after. Among the many works of Savonarola the best known is his *Triumphus Crucis de Veritate Fidei* (Florence, 1497; Eng. trans. *Triumph of the Cross*, London, 1868; also translated *Sorrow and Hope: Meditation on the 31st Psalm, written in Prison*, 1894). The principal *Life of Savonarola* is by Prof. Pasquale Villari (2 vols. 8vo, Florence, 1860; translated into English by Horner, London, 1863; 2d ed. 1888), with full references to authorities and a list of Fra Girolamo's works, both published and unpublished; see also W. R. Clark's *Life and Times of Savonarola* (1878).

Revised by S. M. JACKSON.

Savory: popular name of the *Satureja hortensis* (summer savory) and of the *Satureja montana* (winter savory), labiate garden-herbs of Old World origin, employed in domestic cookery for their flavor.

Savoy: formerly a political division of the kingdom of Sardinia, and originally the family possession of the dynasty now reigning in Italy. In 1860 it was ceded to France, and it is divided into the two departments of Savoie and Haute-Savoie. Savoy is the loftiest mountain region of Europe, containing the highest peak, Mont Blanc. Bounded N. by the lake of Geneva and E. by Piedmont, it is covered by the Graian Alps, and entirely broken up into mountains and valleys. It contains very little arable land, but that which it contains is most carefully cultivated, planted with vines and mulberry-trees, and generally produces wheat enough for home consumption. The mineral wealth of Savoy is not great, though coal, lead, iron, etc., are found, and to some extent worked. But the pastures which cover the mountains are very important, and feed large herds of cattle and sheep; dairy-farming is the principal occupation. The area of the two departments is—Savoie, 2,224 sq. miles, with (1891) 263,297 inhabitants; Haute-Savoie, 1,667 sq. miles, with (1891) 268,267 inhabitants. The Savoyards are an honest, industrious, intelligent, and hospitable race, deeply attached to their native country. They emigrate in large numbers, but when they have amassed enough wealth they return to live in their fatherland.

Savoy Conference: a conference between Episcopalians and Presbyterians held in London soon after the Restoration. The Episcopalians were determined to restore the Church of England to what it was before the civil war, but the Presbyterians, who mainly had been in possession of church benefices and church power for many years, contended for some modification of the former system. A royal commission was issued on Mar. 25, 1661, appointing certain Church of England and Presbyterian divines to confer together, and gave them authority to review the Book of Common Prayer, to compare it with ancient liturgies, to consult respecting exceptions made to it, and by agreement to make alterations such as would satisfy tender consciences and restore unity to the Church. The instrument appointed "the master's lodgings in the Savoy," London, as the place of meeting. As the terms of the commission specified advice and consultation as purposes of the meeting, friendly conference seemed necessary; but the Episcopal party manifested no disposition for anything of that kind. They required written communications from their opponents stating their exceptions to the Liturgy, and to them gave answers both uncourteous and captious, not indicating any disposition to conciliate, but foreclosing the possibility of removing Presbyterian objections. They said: The alterations asked, if allowed, would be a virtual confession that the Liturgy was an intolerable burden, a cause of schism, and would justify past nonconformity. Taking such ground, it mattered not what the objections made might be—none was admissible; and therefore to advise and consult was a thing out of the question. It had been arranged that, while the rest of the Presbyterian brethren employed themselves in drawing up exceptions against the Book of Common Prayer, Baxter should prepare additions. In one fortnight he accomplished his task and presented his reformed Liturgy. The author tells us that he compared what he did with the Assembly's Directory, the Book of Common Prayer, and Hammond's *l'Estrange*; but he seems to have borrowed little or nothing from these sources, beyond introducing or allowing the use of the creeds—sometimes the use of the Athanasian Creed—the *Te Deum*, and the Psalms in order for the day. A rejoinder to the bishops' answers touching exceptions made to the Liturgy followed on the part of the ministers, but no effect was produced by it. At last it was settled that there should be a formal debate, to be conducted by three persons on each side. Strangers were allowed to be present, and the room was full of auditors, young Tillotson, the eminent preacher and archbishop of later days, being among them. The debate turned upon vague abstractions and upon subtle theological distinctions, occasionally interrupted by outbursts of temper and uncivil personalities. As might be expected, the hall of the Savoy Palace became an arena for logical gladiatorship, the object of the meeting was a strife for victory, and the end of the conference was hopeless disagreement. Baxter's *Reformed Liturgy* was reprinted, edited by Charles W. Shields, under the title *The Book of Common Prayer as Amended by the Presbyterian Divines of 1661* (Philadelphia, 1864; 2d ed. New York, 1883).

Revised by S. M. JACKSON.

Savoy Declaration: an ecclesiastical document, deriving its name from the Savoy Hospital in London, where it was framed. Before the death of Oliver Cromwell a meeting was convened by notice from the clerk of the council of state, addressed to the Congregational elders resident in London. Cromwell, though not favorable to the proceeding, yet permitted it; but the ministers did not meet until after his decease; then they assembled in the Savoy Sept. 29, 1658, to declare the principles of their faith and polity. The business was disliked by people about the court, who feared it might lead to fresh divisions between the Independents and Presbyterians. There might be political intrigues at the background of the movement, for Cromwell said in reference to some of its projectors, who were republican officers, "They must be satisfied, or we shall all run back into blood again." At all events, when the meeting came to be held nothing was done which the Protector would have disapproved. The Declaration did not clash with the sentiments of broad charity so dear to his heart. As to doctrine, the Declaration is substantially the same as the Westminster Confession. Its speciality consists in its outline of ecclesiastical order. Whereas the covenants or mutual agreements into which Congregationalists had entered at the formation of their churches in the time of the civil wars generally contained some references

in another light breaking in upon them from God's word, there is in the Savoy Declaration no language of that kind; and it seems to be assumed in the document that Congregationalism, as to the knowledge of its principles, had by that period attained to something like completeness.

JOHN STODOLSKY.

Savoy. The: a spot between the Strand and the Thames Embankment, London, remarkable for its ancient buildings and historical associations. The Savoy Palace was first built by Peter, Count of Savoy, uncle of Eleanor of Provence, queen of Henry III. It came into the possession of John of Gaunt, and within its walls John, King of France, was confined after the battle of Poitiers (1356). In 1381 it was burned during Wat Tyler's insurrection. It was rebuilt toward the close of the reign of Henry VII., who made it a hospital or refuge for 100 poor people. It afterward became a resort for abandoned characters, until the reign of Queen Anne, when the institution was dissolved, and the buildings began to fall into ruin. In 1811 the shattered walls were swept away, with the exception of the chapel wall built in 1515. This chapel was much injured by fire in 1793, but was restored at the expense of Queen Victoria. See *Memorials of the Savoy*, by W. J. Loftie.

Saw (H. Eng. *saw*; < O. Eng. *sage*; O. H. Germ. *saga* < H. G. *sagum*, edge), a thin plate of metal usually having sharp angular teeth upon one edge, used for dividing materials by a cutting, crumbling, or abrasive action.

The word has been known and used from a very remote period. W. M. Flinders Petrie has discovered indisputable evidence that bronze saws having jeweled teeth were used by the ancient Egyptians for cutting the hardest stones, and a two-handled saw of iron 6 ft. 8 in. long by 4½ inches wide was found by Lyaudet at Murooud. Saws are mentioned in the Bible. Some of the Christian martyrs in apostolic times "were seen sawing." The Greek carpenters used saws that were quite similar to some in use at the present time. In a painting discovered at Herculaneum two men are shown at the end of a bench supported by two long-legged "incuses." The piece of wood to be sawn through is secured by straps in the shape of the figure seven, the ends pass through, and are seen below the bench. The saw has a perfect resemblance to our frame-saw. Clovis, a hunter for Chastaigne, speaks of an ingenious saw with which a thief sawed out the bottom of a chest. Pliny says that among the Belgæ saws were used for cutting white marble. The saws of the Japanese and other Oriental peoples have their teeth so shaped that the saw cuts when pulled by the workman, and not when pushed; such saws are superior, inasmuch as they are not liable to flexure and consequent breakage by the force employed, and can be used much longer, and therefore require less strength to operate than the saws used in Europe and America.

The uses to which saws are put suggest their classification into reciprocating and cross-cut saws. The first have their teeth specially adapted for dividing materials in a direction parallel to their faces. In the second class the teeth are designed for cutting at right angles in the direction of the face. There are over 100 varieties in each of these classes, and each with reference to the execution of a specific kind of work. These several varieties may be arranged in four groups, viz., reciprocating saws, circular saws, cylinder or drum saws, and endless-hand saws.

The reciprocating saw is the oldest, and there are more of this variety than of all others combined. Circular saws, having parallel teeth, were known to the ancient Egyptians, who used such saws in shaping small stones, but there is no evidence that they were used by them for cutting wood. Circular saws were used for cutting the spaces between the teeth of wheels for clocks and watches (the teeth were afterward shaped by a file) many years before they were applied to the cutting of wood, and may properly be regarded as anticipating the tool called a mill, commonly used for such purposes. The circular saw was patented in England by Samuel Miller on Aug. 5, 1777, although it is known it was used in Holland nearly a century before. The use of this form of saw has become indispensable in saw-mill establishments. Cylinder or drum saws are mentioned in the invention of Hippocrates (b. 460 B. C.), and were used by him in the operation of trepanning the skull. Such saws are largely used for cutting out bottom-boards, knees for blocks, and similar forms. They are also used for making curved staves for barrels, tubs, pails, and other articles of woodwork.

The endless-hand saw (sometimes called ribbon-saw) consists of an endless band or ribbon of steel, one edge of which is provided with teeth of a form suitable for the work expected of the saw, which in use is strained over two large wheels placed one over the other, and is made to move by turning one of these wheels, the wood to be divided being pressed forcibly against the descending portion of the saw. The hand-saw was invented in 1808 by William Newberry, of London, England. Notwithstanding the many valuable features of the invention it did not attract attention until its principle was embodied in a sawing-machine invented by Tancard, of Paris, in 1846; but it is to the persistence of M. Péro, another Frenchman, that the world is indebted for the practical development of this invention. W. F. DUNBAR.

Sawakin: See SHAKIN.

Sawfish: See PRISTINE.

Saw-fly: a hymenopterous insect of the family *Tenthredinidae*. See ENTOMOLOGICAL and HYMENOPTERA.

Sawmill: usually a building containing mechanism for operating saws; the term is also applied to the combination of a saw with its actuating machinery.

Marble was cut by power-saws as early as A. D. 900, and it is not at all improbable that mills for preparing lumber were also in use at that time. The ancient method of preparing boards, planks, and joists, was to split round logs with wedges, and then hew the rough lumber resulting in the required dimensions. This process is still used in making certain kinds of lumber, such as staves for heavy casks and strips for wooden hoops.

The first reliable evidence of the employment of sawmills for cutting lumber relates to one at Augsburg, Bavaria, in 1322. Soon after the discovery of Madeira, in 1493, sawmills were erected there for the purpose of making lumber for exportation to Portugal. In 1427 there was a sawmill in the city of Breslau, and in 1480 the magistrates of Erfurt established one in a forest which they had purchased. The first sawmill in Norway was built about 1330, and the number of such mills rapidly increased in that country. A sawmill was in operation at Lyons, France, as early as 1553. On the Danube, near Ratibon, in 1575, there was a sawmill having "gang-saws" by which several boards were cut at the same time. A work published at Lyons in 1578 by Jacobi Bessoni gives illustrations of two forms of sawmills having gang-saws; in one of these the saws have teeth on each edge. The first sawmill in Holland was erected at Zaandam in 1596. A sawmill was first operated in Sweden in 1663. The building of sawmills in England was violently opposed, because it was thought that the hand-sawyers would be deprived of their means of living; one erected in 1653, near London, had to be abandoned, and it was not until over one hundred years later (in 1768) that another attempt in this direction was made. A wealthy timber-merchant, under the patronage of the Society of Arts, caused a sawmill driven by wind to be constructed at Limsbous. This mill was destroyed by a mob, but the damage having been made good by the Government, it was rebuilt and allowed to run without interference. Some years earlier a sawmill had been erected at Leith, in Scotland. Probably the first sawmills in America were the three, driven by wind, which were erected at New Amsterdam (now New York) in the year 1623; one of these was located on Nut (now Governor's) Island. In 1706 the first sawmill in Canada was built on the river Richelieu, near Montreal, by a Mr. Sawyer, of Lancaster, Mass. (who had been made prisoner by the Indians), as the ransom of himself and son. In 1803 there was a steam-sawmill in New Orleans run by an engine built by Oliver Evans, of Philadelphia. This mill was burned by the hand-sawyers.

All these mills were of the vertical reciprocating type; their saws were strained in a strong rectangular frame, or gate, to which a vertical reciprocating movement was given by a crank on a revolving shaft, usually placed below it. The gate was moved in and kept from swerving by suitable vertical guides. The log to be cut was secured upon a sliding carriage automatically moved a certain distance at each stroke of the saw, until finally the saw had cut its way from end to end of the log. In mills in which but one saw was used the log had to be moved laterally after each cut a distance equal to the thickness of the lumber required; this necessitated as many longitudinal movements of the log as there were cuts made, but in the best mills which had abundant motive power several saws (called a gang), placed the thickness of the intended lumber apart, were strained in the

same gate, and then the entire log could be cut into boards by a single traverse of the carriage.

In the more recent gang-saw mills there are two gates, in one of which there are but two saws, through which the log is first passed and made parallel-sided; it is then turned upon one of these sides and passed through the second gate, in which there is a sufficient number of saws to cut the log into the desired thickness of boards or planks.

Circular saws, driven by steam or water power, have been largely used for the manufacture of lumber, especially in the U. S., where their use for that purpose originated in a patent granted on Mar. 16, 1820, to Robert Eastman and J. Jaquith, of Brunswick, Me. Multitudes of other patents for circular-saw mills have been granted, covering more or less valuable improvements, but this form of mill remains a very wasteful means of converting timber into lumber.

The band-saw has been adapted to the sawing of logs, and is used to a large extent on the Pacific coast of the U. S. for utilizing the large timber of that region; this form of saw is less wasteful and works rapidly.

W. F. DUFFEE.

Sawyer, LEICESTER AMBROSE: biblical scholar; b. at Pinckney, N. Y., July 28, 1807; graduated at Hamilton College, Clinton, N. Y., 1828; studied theology; was ordained as a Presbyterian minister in 1832, and from 1840 to 1847 was teacher in Central College, Ohio, after which he preached in several places; subsequently was editorially connected with the *Utica Morning Herald*. Author of *Elements of Biblical Interpretation* (New Haven, 1836); *Mental Philosophy* (1839); *Moral Philosophy* (1845); *A Critical Exposition of Baptism* (Cincinnati, 1845); *Organic Christianity, or the Church of God* (1854); and *The Reconstruction of Biblical Theories, or Biblical Science Improved* (1862). In 1838 he began a new translation of the entire Bible, which he completed about 1862. The New Testament was published at Boston, Oct., 1858. The prophetic books of the Old Testament were issued Dec., 1860, and the book of Daniel, with the apocryphal additions, was separately issued in 1864. The remaining (earlier) portions of the Old Testament were not published.

Revised by W. H. WHITSITT.

Sawyer, PHILETUS: U. S. Senator; b. at Whiting, Vt., Sept. 22, 1816; went to Wisconsin 1847; engaged in the lumber business at Oshkosh on an extensive scale; was a member of the Legislature 1857 and 1861; mayor of Oshkosh 1863-64; was a delegate to the Loyalists' convention 1866, and sat in Congress as a Republican from 1865 to 1875, when he declined a re-election. He served on several important committees connected with the business interests of the Northwest, and became chairman of the committee on Pacific railways. He was U. S. Senator from Wisconsin 1881-93.

Sawyer, THOMAS JEFFERSON, D. D.: clergyman; b. at Reading, Vt., Jan. 9, 1804; graduated at Middlebury College 1829; was pastor of a Universalist church in New York 1830-45, and again 1852-61, having in the interval been principal of the Liberal Institute at Clinton, Oneida co., N. Y.; taught theology in the same institution; resided on a farm at Clinton 1861-69, after which he became Professor of Theology in Tufts College, Medford, Mass., an institution which he had been instrumental in founding (1852), as he had also been in the establishment of the theological department of the St. Lawrence University (1856). He has defended the doctrines of Universalism in public discussions with clergymen of other denominations, and some of these polemics have been published, the most important being the discussion with Rev. Isaac Westcott, entitled *The Doctrine of Eternal Salvation* (New York, 1854). In opposition to the views of Henry Ward Beecher, he published *Who is our God? the Son or the Father?* (1859).—His wife, CAROLINE M. FISHER, b. at Newton, Mass., Dec. 8, 1812, was married 1832; has written much in prose and verse for periodicals, especially *The Christian Messenger*; published several translations from the French and German, and edited *The Ladies' Repository*, a Universalist monthly magazine. She also published the *Poems of Mrs. Julia H. Scott* (1854), preceded by a *Memoir*.

Saxe, JOHN GODFREY: poet and humorist; b. at Highgate, Vt., June 2, 1816; graduated at Middlebury College 1839; was admitted to the bar at St. Albans 1843; practiced law in Franklin County 1843-50; was editor of the *Burlington Sentinel* 1850-56; was State's attorney of Vermont one year, after which he devoted himself chiefly to literature and to popular lecturing; was Democratic candidate for Governor 1859 and 1860. Author of several volumes of humorous poems, the longest of which were delivered at college com-

mencements and other anniversary occasions. His published works include *Progress* (1846); *New Rape of the Lock*; *The Proud Miss McBride*; *The Money King* (1859); *Clever Stories of Many Nations*; *The Masquerade* (1866); and *Leisure Day Rhymes* (1875). More than forty editions of his collected poems have been issued in the U. S. and in England. D. at Albany, N. Y., Mar. 31, 1887.

Revised by H. A. BEERS.

Saxe, MARSHAL: the name by which Maurice, Count of Saxony, is generally known. He was born at Goslar, Oct. 28, 1696; a son of Augustus II. the Strong, Elector of Saxony and King of Poland, and Aurora von Königsmark. In his twelfth year he was in the army of Prince Eugene, and in 1711 received formal recognition from his father, who raised him to the rank of count, but his debaucheries and dissipations, in which he surpassed even his father, developed as early and as rapidly as his brilliant talents. He served in a campaign against the Turks in 1717, and two years later went to France, bought a regiment, was appointed *maréchal de camp*, and studied with great energy mathematics, mechanics, and fortification. In 1726 the estates of Courland elected him duke, but, declining the proposed marriage with the duchess, he maintained his ducal authority against her opposition with great difficulty, supporting a small army by means of the money lent him by Adrienne Lecouvreur, the actress. In 1727 he withdrew to Paris. At the outbreak of the Austrian War of Succession he offered his services to his native country, but by the fault of Count Brühl they were not accepted, and he received a French command. He took Prague by storm in 1741, and fought with great distinction in Bohemia, Bavaria, and on the Rhine; but his fame as a great general he gained chiefly by his campaigns in Flanders from 1744 to 1748. He won a brilliant victory at Fontenoy May 11, 1745, and at Raucourt Oct. 11, 1746. He took Brussels, Bergen-op-Zoom, and Maastricht, and conquered the whole of Belgium. The enthusiasm of the French people and king knew no bounds; honors were heaped upon him; he was made marshal-general of all French camps and armies, and presented with the palace and estates of Chambord, where he led a princely life, and died Nov. 30, 1750. His *Réveries*, written in 1731, but afterward revised and much enlarged, is full of ingenious and audacious ideas; his *Lettres et Mémoires*, published in 1794, have also some interest.

Revised by F. M. COLBY.

Saxe-Altenburg: a duchy of the German empire; area, 511 sq. miles; pop. (1890) 170,864; budget of 1895, 3,847,116 marks; public debt (July, 1893), 887,450; is situated N. E. of the Thuringian Forest, and consists of two separate parts called the eastern and the western district. Capital, Altenburg. By the division of 1485 the country fell to the Albertine line. In 1553 it was returned to Duke Johann Friedrich the Magnanimous, of the Ernestine line, and was under dukes of its own from 1603 to 1672, when the reigning family became extinct, and it fell to Saxe-Gotha. As the line too became extinct the country fell, according to the convention of Nov. 15, 1826, to the Duke of Saxe-Hildburghausen, who gave up his own country, Hildburghausen, and became Duke of Saxe-Altenburg. His descendants are still reigning.

Revised by M. W. HARRINGTON.

Saxe-Coburg and Gotha, -gō'tā: two duchies which together form a constitutional and hereditary monarchy, under the sovereignty of a duke, and an independent member of the German empire; area, 755 sq. miles, of which 217 1/2 miles belong to Coburg and 538 sq. miles to Gotha; separated from each other by the Thuringian Forest—Coburg to the S. and Gotha to the N. Pop. (1890) 206,513. Capitals, Coburg and Gotha. Each duchy has a legislative chamber of its own (Gotha 19 and Coburg 11 deputies). These deputies also form a common diet for the united duchies. Coburg has a budget of 1,238,200 marks, with a debt of 3,213,800 marks; Gotha, a budget of 4,204,150, and a debt of 140,100. There is also a budget of 2,012,182 marks, common to the two duchies. Since the accession of Duke Ernst II. in 1844, the two small duchies have formed the starting-point for much intellectual progress. The union of the two countries dates from 1826. The house of Saxe-Coburg, founded in 1680, became extinct in 1699. The contest concerning the heritage ended in 1720. The Duke of Saxe-Saalfeld received the country. The Dukes of Saxe-Saalfeld-Coburg reigned till 1826, when they ceded Saalfeld to Meiningen, and received Gotha, whose own dynasty had died out. Ernst II. was succeeded in 1893 by his nephew, the Duke of Edinburgh.

Revised by M. W. HARRINGTON.

Saxo-Lauenburg: the name of the former duchy of Lauenburg (L. 1.), from the twelfth to the eighteenth century.

Saxo-Welfingen: a duchy of the German empire, area, 1,700 sq. miles; pop. (1890) 229,852; budget, receipts, 7,105,000 marks; expenses, 6,410,000; public debt, 11,708,074 marks; as situated to the S. of the Thuringian Forest. Capital, Bismarck. The reigning line was founded in 1091 by Bernhard, third son of Kuno the Pious. In 1629 Duke Bernhard acquired the duchy of Hildburghausen, with Saalfeld and other estates, but, having allied with Austria in 1690, he was expelled to Altona, and was succeeded by his son Georg.

Revised by M. W. HANSEN.

Saxo-Welfmar: a grand duchy of the German empire; area, 1,700 sq. miles; pop. (1890) 229,852; annual budget 1890-91, 7,105,000 marks; public debt, 11,708,074 marks in 1891. It consists of three districts—Weimar, Neustadt, and Eisenach—situated along the Elbe and the Thuringian Forest. The capitals are Weimar and Eisenach, and there is a university at Jena. The reigning line descends from William, third son of Johann III., the ancestor of the living Ernestine line. In 1623 the house was divided into the lines of Weimar, Eisenach, and Jena. That of Jena became extinct in 1801, and the countries were again united in 1741 under Ernst August. The congress of Vienna enlarged the country with 31 geographical sq. miles and 77,000 inhabitants, and made it a grand duchy. In 1850 Carl Alexander began the reign.

Revised by M. W. HANSEN.

Saxifrage [*sax* O. Fr. from Lat. *saxifraga* (see *herb*), *fraga*, *maidenhair*, *bliss*, *bliss*, of *saxifraga*, stone-breaker; *maiden*, *stature* + *fraga*, *freedom*, break; applied to some plants as growing in clefts of rocks, to others as supposed to break up stones in the bladder; a name popularly applied to a very great number of plants of widely different characters, though properly limited to plants of the genus *Saxifraga* (family *Saxifragaceae*). This large genus comprises many species and high northern species, some of them highly ornamental in culture. Some species were once used in medicine, but none have active properties. The U. S. has numerous species, some of which are natives of Europe also. The early saxifrage (*S. virginiana*) is a very common spring flower in the eastern U. S. The swamp-saxifrage or meadow plantain (*S. pennsylvanica*) is common in wet grounds in the same region, and its radical leaves are gathered and used as potherbs in spring.

Revised by CHARLES E. BESSEY.

Saxifrage Family: the *Saxifragaceae*; a group of about 20 genera of dicotyledonous herbs and shrubs, comprising the saxifrages, buttercups, gooseberries, currants, grass-of-Parnassus, monk-orange (*Pseudoliparis*), and numerous other plants, many of them ornamental and some useful. Some few are cultivated. The family is moderately represented in the U. S. The true *Saxifragaceae* are most nearly related to the *Ranunculaceae*, from which they differ in the delicate, succulent, and succulent seeds, and in the tendency to succulentation of the corolla, and in possession of opposite leaves without genuine stipules.

Revised by CHARLES E. BESSEY.

Saxo Grammaticus: *Historia*; b. in Denmark, date unknown. He was probably secretary to Bishop Absalon, from whom he received valuable assistance in his work. His *Gesta Danorum*, or *Historia Danica*, consists of sixteen books, and dates to the year 1190. The last six books contain reliable historical material, but his representation of the heathen era, based on Norse inscriptions, old songs, the writings of the Icelandic, etc., is untrustworthy in the extreme. His sentence is received from the correctness and elegance of his Latin, which excited the admiration even of Erasmus. His work was first printed in Paris in 1514 under the direction of U. Fagius. The best edition is that by P. E. Müller (H. S. Copenhagen, 1894-95). It was translated into Danish by P. E. Müller in 1872, and by Grundtvig in 1878. C. Christensen is also said to have made a translation, which has been used. The classical Danish version is by N. A. Holm (1878).

Saxo: see *LOW DUTCH LANGUAGE*.

Saxa, Low: see *FLAVIUS*.

Saxons (Fr. *Saxons*; Celtic, *Saxones*, *Saxmyn*, perhaps from *Saxa*, a battle-knife): a Low German tribe that lived on both sides of the Elbe in its lower course and on the middle and S. coast (family *Saxones*). They were first mentioned as Saxons in 957 A. D., when they appeared on the coast of Gaul. Their name survives in Saxony, Prus-

sian Saxony, the minor Saxon states, etc. (On the relations of the Saxons to the Angles of Britain, see *Anglo-Saxons*.) They were early colonists of Normandy and France, where they were soon compelled to give way before the Franks. There is a large number of so-called Saxons in Transylvania, descendants of the Low German colonists introduced in 1140 and 1147 by the Hungarian kings. They are one of the dominant races of that region, and preserve the use of the German language, which, however, is considerably corrupted. At home the Saxons enlarged their territory by conquest north and northwest to the North Sea, the Vistula, and the Rhine, and east to the Weser and Waere, the southern Harz, the Elbe, and the lower Saale. After many years of heroic contest with Charlemagne in defense of their national religion and national independence they were forced to accept Christianity and to acknowledge the supremacy of the Holy Roman empire.

Saxony: province of Prussia, between Hanover, Brandenburg, Silesia, Hesse-Nassau, the kingdom of Saxony, and Thuringia; area, 9,740 sq. miles; pop. (1890) 2,500,010. The western portions are occupied by the Harz Mountains; the rest is low and level, sloping northward and watered by the Elbe and its affluents. The soil is very fertile and very well cultivated, and many branches of manufacture are developed with great energy and success. Capital, Magdeburg.

Revised by M. W. HANSEN.

Saxony, Kingdom of: a part of the German empire, comprising an area of 5,767 sq. miles, with (1890) 5,592,784 inhabitants. It lies between Prussia and Austria, a position fraught with great political difficulties and the principal cause of most of the historical vicissitudes of the country. It belongs to the North German mountainous region, two-fifths of the surface being mountainous (Erzgebirge S., Lausitzergebirge E., with the Saxon Switzerland), two-fifths hilly, and one-fifth lowland. The principal river is the Elbe, with its affluents, the Black and the White Elster, the Mulde, and the Pleisse. The population is very dense, 600 per sq. mile; 56,000 Wends, nearly all settled in the government of Hagen, live among the Germans, who belong partly to the Franconian and partly to the Thuringian tribes. In administrative respects the country is divided into four governments—Bautzen, with 470,739 inhabitants; Dresden, with 350,530; Leipzig, with 271,122; Zwickau, with 1,110,283. The principal towns are—Dresden, with 280,844 inhabitants; Leipzig, with 357,122; Chemnitz, with 138,954; Zwickau, with 14,105; Plauen, with 47,007; Glauchau, with 21,405; Freiberg, with 28,935; and Meissen, with 22,446. With respect to creed, there are 3,337,830 Protestants, 129,509 Roman Catholics, 870 other Catholics, 11,510 of other Christian sects, and 2,268 Jews. Agriculture is carried on with a high degree of perfection. Wheat, rye, oats, barley, millet, etc., are cultivated; also flax. The vine is grown along the Elbe. Cattle-breeding is important; sheep especially are very numerous. The arboriculture is excellent; 28 per cent of the total area is covered with forest. Mining is an old occupation here, especially in the Erzgebirge, and is very flourishing. Silver, iron, gold, lead, sulphur, arsenic, zinc, etc., are produced; 2,500,000 tons of coal and about 450,000 tons of brown coal are annually raised. Manufacturing industry is much developed; Chemnitz, Zwickau, Plauen, Zittau, Bautzen, and Leipzig especially are important. Linen, cotton, and woolen goods, paper, chemicals, metal ware and machinery, straw goods, porcelain, musical and mathematical instruments are manufactured. Leipzig has large type-foundries and printing-establishments. The commerce is also very comprehensive; its principal center is Leipzig, which is also the seat of the highest commercial court of Germany. The most important financial institutions are the Bank of Leipzig, the Saxon Bank in Dresden, and the Agricultural Bank of Bautzen. The kingdom is better provided with railways than any other part of Germany; 1,736 miles were in operation in 1892. Public education stands very high; the numerous educational institutions comprised, in 1891, a university in Leipzig, a mining academy in Freiberg, an academy of arboriculture at Tharand, a polytechnic school in Dresden, an industrial school at Chemnitz, 5 commercial schools, 24 schools for the exact sciences, 15 gymnasia, and 2,171 Evangelical and 109 Roman Catholic public elementary schools. The Government is a constitutional monarchy, established in 1831 and modified in 1849, 1861, 1863, 1865, 1868, and 1874. In all foreign affairs and in many important interior questions the authority of the German empire has wholly superseded that of

the particular Saxon Government, which is independent with respect to the interior administration. The reigning king is Albert, who ascended the throne Oct. 29, 1873; the representation of the people is composed of two chambers. The finances are in good order. The budget estimate for each of the years 1892-93 was 97,683,109 marks, with a special revenue and disbursement of 51,405,100 marks, relating to public works. More than half the total revenue is derived from state domains, forests, and railways, the last alone giving, in 1892, a net revenue of 30,597,450 marks. The total debt in 1892 was 625,780,750 marks, nearly all incurred in the acquisition of railways and telegraphs, and the promotion of other works of public utility. The total income of all classes of the population was estimated in 1892 at 1,584,950,632 marks, an increase of 17,000,000 marks over the preceding year. The army forms the Twelfth Corps of the German imperial army. The Saxon colors are green and silver.

History.—That German tribe which the Romans called Saxones was in ancient times settled between the Eider, the Elbe, and the Trave. Charlemagne made war upon them 772-804, and subjugated them, and Saxony became a dukedom, belonging to the Frankish and afterward to the German empire. Under Otto the Magnificent, Thuringia was united to it, and Otto's son, Henry, became King of Germany in 919. His successor, the Emperor Otto I., gave the dukedom of Saxony to Hermann Billung. Under the house of the Billungs, Saxony made war upon the Emperor Henry IV. in 1073, but in 1106 the house became extinct, and under the Emperor Lothar, in 1125, the country came into the possession of Duke Henry of Bavaria. His son, Henry the Lion, increased the dukedom, but when he was placed under the imperial ban his dominions were scattered, and, after being reduced to a small piece of land, the dukedom of Saxony was given to Margrave Bernhard of Ascania. The house of Ascania branched off in 1260 into two lines, of which one, the Wittenberg, became extinct in 1422, while the other, the Lauenburg, reigned until 1680. The title of Duke of Saxony followed the Wittenberg branch; it was changed in 1355 to that of elector, and both land and title were bestowed on Frederick the Valiant, Margrave of Meissen, in 1423. Thus the name of Saxony, which originally designated a tribe, became a princely title, and was transferred to countries with which it had no historical connection. Since 1088 the house of Wettin has reigned in the margraviate of Meissen. In 1485 the grandsons of Frederick the Valiant, Ernst, and Albert, divided the inherited countries, so that Ernst received Thuringia, and Albert, Meissen, and two lines were thus formed, which still flourish, the Ernestine and the Albertine, of which the former reigns in the Saxon duchies, the latter in the kingdom of Saxony. After the Peace of Westphalia, in 1648, the rise of Brandenburg became an impediment to the development of the electorate. The Elector Augustus embraced Roman Catholicism in 1697, became King of Poland, and involved Saxony in war with Charles XII. of Sweden. His successor, Augustus, sided with Maria Theresa of Austria against Frederick of Prussia, and in the Seven Years' war Saxony suffered heavy losses. Under Frederick Augustus III. (1763-1827) the country again began to rise, though it had some very hard years also during this period. As a member of the German empire it took part in the war against France, and concluded an alliance with Prussia in 1806, but after the defeat at Jena it concluded an alliance with Napoleon and entered the Confederation of the Rhine, after which the elector received the title of king. By the Peace of Tilsit the King of Saxony obtained the duchy of Warsaw, which had just been established, and portions of Prussia and Austria, but after the battle of Leipzig he was taken prisoner by the allied Russians, Prussians, and Austrians, and at the Congress of Vienna (1815) was deprived of 7,720 sq. miles of territory. In the long period of peace from this moment, and up to 1866, the country became very prosperous, though a narrow and short-sighted policy of government presented many obstacles to its development. The revolutionary years of 1848-49 brought many great and beneficial reforms to Saxony. Aug. 9, 1854, King John ascended the throne, and both he and his minister, Beust, made a most stubborn opposition to the Prussian policy, and showed a decided partiality for Austria as the leader of the small states. The war of 1866 brought the independence of Saxony in imminent danger, and the king, John, saved his crown only by entering the North German confederacy, over which Prussia presided, by paying 30,000,000 marks in

war indemnity, and by dismissing Beust. The liberal party in Saxony hailed this event with enthusiasm, but the party consisting of the court, the nobility, and the army officers continued hostile to Prussia. In 1870-71 the Saxon soldiers fought under the leadership of the crown prince, afterward King Albert, as true allies by the side of the Prussians, and the interior development of the country has not only kept pace with that of the rest of Northern Germany, but in some respects even advanced beyond it. A new modification of its constitution took place Oct. 12, 1874, giving to the lower house of representatives a more democratic character, while the upper house is still strongly aristocratic in its membership. Revised by M. W. HARRINGTON.

Saxton, JOSEPH: inventor; b. in Huntingdon co., Pa., Mar. 22, 1799. His mechanical ingenuity was early shown by improvements in the machinery in his father's nail-factory. At the age of eighteen he went to Philadelphia, and there invented a machine for cutting the teeth of chronometer wheels, an original escapement with a compensating pendulum, and made the clock which marks the time from the belfry of Independence Hall. In 1828 he went to London, where he resided for nine years. He was placed as chief assistant in the Adelaide Gallery, then the great scientific repository, and while there constructed a magneto-electric machine by which the first magnetic spark was produced. He also constructed the apparatus used by Wheatstone in his experiments on the velocity of electricity in its passage through a wire. He next invented a locomotive differential pulley, by means of which high speed may be given to vehicles by horses traveling at a slow rate, and a medal-ruling machine for tracing lines on metal or glass, representing by an engraving the design on the face of the medal. He returned to the U. S. to superintend the construction of the machinery and balances for the Philadelphia mint, and subsequently was placed in charge of the construction of the standard weights and measures for the U. S. This position he filled with ability, furnishing the State capitals and the custom-houses with accurate sets of weights and measures. A gold medal was awarded him at the London Exhibition of 1851 for a large class-balance of extreme precision. He was one of the original corporators of the National Academy of Sciences. Among his many ingenious devices and inventions, the mirror-comparator for comparing and the tracing-machine for dividing standard measures, his deep-sea thermometer, used in the exploration of the Gulf Stream by the U. S. Coast Survey, his self-registering tide-gauge, and his immersed hydrometer, deserve especial mention. D. at Washington, D. C., Oct. 26, 1873.

Revised by R. H. THURSTON.

Saxton, RUFUS: soldier; b. at Deerfield, Mass., Oct. 19, 1824; graduated at the U. S. Military Academy July 1, 1849, as brevet second lieutenant of artillery; from 1855 to 1859 was on coast-survey duty, and for a year was assistant instructor of artillery tactics at West Point. On the outbreak of the civil war he was stationed at St. Louis, and participated in dispersing the Confederate force at Camp Jackson, May 10, 1861; appointed assistant quartermaster U. S. army May 13, 1861, he served on the staff of Gen. Lyon as chief quartermaster until transferred in July to the staff of Gen. McClellan in West Virginia. In September he accompanied the expedition to Port Royal, S. C.; appointed brigadier-general U. S. volunteers in Apr., 1862, he commanded at Harper's Ferry when threatened by Jackson; assigned to duty as military governor of the department of the South July, 1862, where he was engaged in organizing Negro laborers and troops, and as commissioner of the Freedmen's Bureau until Jan., 1866, when he was mustered out of the volunteer service; brevet major, lieutenant-colonel, colonel, and brigadier-general. In 1872 he became deputy quartermaster-general U. S. army, with rank of lieutenant-colonel; in 1882 assistant quartermaster-general, with rank of colonel; retired Oct. 19, 1888. Revised by JAMES MERCUR.

Say, JEAN BAPTISTE: economist; b. in Lyons, France, Jan. 5, 1767; was educated for a commercial career, and spent a part of his youth in England; found employment on his return to Paris on Mirabeau's paper, *Courrier de Provence*, and afterward as secretary to Clavière, Minister of Finance; edited from 1794 to 1800 *La Décade*; became a member of the tribunate in 1799; published his celebrated *Traité d'Economie politique* in 1803, and enjoyed a great reputation when his thorough disagreement with Napoleon's policy compelled him to retire into private life. He established a large spinning-mill, and published in 1815 *Catéchisme*

de l'économie politique and in 1810 *De l'Angleterre et des Américains*. After the fall of Napoleon he again took an active part in public life, and was appointed professor at the Ecole des Arts et Métiers in 1816, and at the Collège de France in 1822. D. in Paris, Nov. 15, 1833. He was the first writer to popularize the doctrines of Adam Smith on the Continent. His lectures were published 1828-30 under the title *Cours complet d'économie politique*.

SAY, JEAN BARTHELEMY (Léon); economist; b. in Paris, June 6, 1793; grandson of Jean B. Say; studied political economy; took an active part in conducting the *Journal des Débats*; was appointed prefect of the department of the Seine in 1821, and elected a member of the Legislative Assembly; was Minister of Finance in 1823, 1825, and 1827, minister to England in 1829, and in the same year president of his nation; and published *Théorie des changes étrangers* (translated from the English), *Histoire de la Cour de Commerce*, *Les Villes de Paris et de l'Orléans*, *Examen critique de la situation financière de la Ville de Paris*, etc.

SAY, THOMAS; zoologist; b. in Philadelphia, Pa., July 27, 1817; was one of the founders, and the first curator, of the Philadelphia Academy of Natural Sciences; accompanied Moore, Pease, and Ord in their scientific exploration of Georgia and Florida 1842; was zoologist to Maj. Long's expeditions to the Rocky Mountains 1849-50, and to St. Pierre 1850; published *Vocabularies of Indian Languages* (Philadelphia, 1822); issued his principal work, *American Zoology*, in 3 vols. (Philadelphia, 1824-28); removed with Haver and Owen to New Harmony, Ind., 1826, as one of the founders of that socialist experiment; remained there after the separation of his associates; published 7 numbers of a great work on *American Conchology* (1830-32) with colored plates. D. at New Harmony, Oct. 10, 1834. His *Complete Writings on Conchology* was edited by William G. Barron (New York, 1850), and his *Complete Zoology on Zoology* was issued by Le Conte (New York, 1850). Say must be regarded as the father of American systematic zoology. His work, mostly on invertebrates, was of the highest character.

Revised by J. S. KIRSTEY.

SAYCE, ALBERTUS HENRY, J. D. D.; philologist; b. at Shrewsbury, England, Sept. 28, 1846; graduated at Oxford in 1869, where he became a fellow of Queen's College; was appointed Deputy Professor of Comparative Philology at Oxford in 1870, which office he resigned in 1890. He has worked in a great variety of fields, classic, biblical, Assyrian, Hittite, Persian, Egyptian, and has published a number of books and essays. Among these are *Introduction to the Science of Language* (3 vols., 1890); *The Ancient Empires of the East* (1891); *The Hittite Language* for 1887 (on the religion of the ancient Babylonians); and *The Records of the Past* (2 vols., 1898-99).

D. G. LYON.

SAYRE, LEWIS ALBERT, M. D.; surgeon; b. at Madison, N. J., Feb. 29, 1820; graduated at the University of Pennsylvania in 1837. Having selected the medical profession, in 1839 he joined the office of Dr. David Green in New York; in 1842 took the degree of M. D. in the College of Physicians and Surgeons; was appointed resident physician of Bellevue Hospital, New York, in 1850, and soon after was elected Professor of Orthopedic Surgery in the Bellevue Hospital Medical College. In 1846 he advocated free incision for the treatment of suppurative diseases of the joints; and in 1852 he amputated the head of the os femoris and portion of the os pubis with success—an operation he has performed since probably more than the whole profession besides. He inaugurated important steps in the treatment of hip-joint disease and various of the osteitis, lecturing on these subjects at the U. S. and Europe, and may be said to be the founder of orthopedic surgery as a specialty. Dr. Sayre is the author of several monographs on orthopedic surgery. In 1872 the King of Sweden appointed him a Knight of the Order of Vasa.

Revised by S. T. ARMSTRONG.

Scab, a disease of sheep much resembling the itch which sometimes affects the human species. Like that disease, it is caused by the presence of a minute scarus or spider-like mite. Sulphur treatment, arsenical washes, tobacco-water, and mercurial ointments are all useful, and the disease can generally be cured without difficulty. It may be suspected when the sheep rub themselves much or have bare and scurfy patches upon the skin.

Scab on man, the popular name of several diseases, characterized by a roughening of the surface of the affected

part. **Apple-scab** is a disease in which the fruit becomes more or less covered with black scab-like spots, varying from mere specks a millimeter in diameter to blotches nearly or quite an inch in diameter. It is caused by a minute hyphomycetous fungus (*Phoma pomorum*).

Apple-scab is a disease in which the fruit becomes more or less covered with black scab-like spots, varying from mere specks a millimeter in diameter to blotches nearly or quite an inch in diameter. It is caused by a minute hyphomycetous fungus (*Phoma pomorum*), which grows upon the surface and in the superficial cells of the leaves and fruit. According to Prof. Scribner, whose figures we reproduce, the loss in some States from the apple-scab amounts to one-half the crop. Spraying the trees in the spring with potassium solutions (iron or copper sulphate) is beneficial. **Cherry-scab** is a similar affection of the pear, caused by the same or a very nearly related fungus known as *P. pyracanthæ*. **Grape-scab**, or more properly anthracnose, occurs upon the leaves, twigs, and berries of the grape, forming brownish or grayish scales with darker margins. It is one of the most destructive of the grape diseases and is caused by a minute melanconicaceous fungus (*Uromyces ampelophagum*, or, according to de Bary, *Sphaeria ampelophagum*) which attacks the superficial cells of the affected parts. The application of potassium solutions by spraying has been found beneficial. **Potato-scab** is a disease of the tubers of common potatoes in which the surface becomes more or less covered with rough warty scales, greatly injuring their appearance and value. Careful investigations by Prof. Bolley show that it is caused by bacteria which invade and destroy the outer cells. As a consequence, the tuber develops masses of cork-like cells to close the wounds resulting from the action of the bacteria. Soaking the potatoes before planting for an hour and a half in a solution of corrosive sublimate in water (1 to 1,000) will destroy the bacteria. The planting should be upon ground free from contamination. **Beet-scab** is a disease of sugar-beets similar to the potato-scab, and, as shown by Prof. Bolley, caused by the same species of bacteria. The scabby patches occur upon the upper portion of the bedroot, and greatly disfigure it. It is therefore necessary in growing sugar-beets to avoid the use of fields in which scabby potatoes have been grown. **Wheat-scab** is a disease of the heads of wheat in which they turn pale yellow, wholly or in part, the kernels shriveling and drying up. The chaff also becomes coated over with a sticky growth, which the microscope shows to be a hyphomycetous fungus, probably *Fusarium tritici*. Early sowing upon well-prepared soil tends to decrease this disease. See F. L. Scribner's *Fungus Diseases of the Grape* (U. S. Dept. Agric., 1886); *Fungus Diseases of the Grape and other Plants* (1890); J. C. Arthur, *Wheat Scab* (Bull. Purdue Univ. Expt. Station, 1891); H. L. Bolley, *Potato Scab and Beet Scab* (Bull. N. Dak. Expt. Station, 1891).

CHARLES E. BRISSET.

Scabhard-fish: the *Lepidopus argenteus*, a species of the family *Trachinotidae*, distinguished by the elongated, ribbon-like body, pointed head, formidably armed mouth, elongated dorsal and anal, and well-developed and forked caudal fin. The species is an open-sea fish, and rather rare on the coasts of Europe.

Scabies, or **Itch** [*sabies* is Mod. Lat., from Lat. *scabies*, scurf, mange, itch]; a parasitic disease of the skin. It affects chiefly the hands, more especially the webs of the fingers, their inner surfaces, and the back of the hand. Less frequently it extends to the arms, and rarely the feet, legs, and abdomen are affected. The scalp may be invaded, but the face is exempt. This disorder infests children, the peculiar insect being transmitted from person to person by contact at school or play, and its lodgment being facilitated by neglect to wash perspiration and dirt from the hands. Persistent and annoying itching is experienced; careful inspection detects small red elevations, points of irritation, papular at first; soon these become vesicular or watery at the tip, and often from scratching are rendered pustular, and later scaly. Closer inspection discloses small red lines connecting these vesicles or branching from them into adjacent healthy skin. These red lines are subcutaneous channels,

Apple-scab: a, an affected apple, reduced; b, a section showing the parasites, much enlarged.

produced by the burrowing of the itch-insect beneath the cuticle or scurf-skin, and the vesicles are the result of inflammation to which its presence and irritation have given rise. The insect will not be found in the fluid or cavity of the vesicle, but by laying open the diverging canals with a fine needle may often be found at its end. This parasitic insect is known as the *Acarus scabiei*, or *Sarcoptes hominis*. It is a whitish insect, from $\frac{1}{16}$ th to $\frac{1}{8}$ th of an inch long. The male is migratory in his habits, and small. His head is provided with two mandibular organs and four palpi or bristles; the adult male has eight legs. The female is sedentary in habits, and more easily found, especially at the ends of channels, where she lays her eggs. The acarus makes its progress beneath the epidermis by means of suckers or disks upon its legs, and by aid of bristles upon its back, directed backward. Hahne-mann ascribed itch to a supposititious cause, a subtle humor, which he termed *psora*, and which he regarded as the cause of multitudinous ailments of all kinds; but the microscope has established the parasitic nature of the disease. The treatment of scabies consists in killing the parasites. Remedies producing this end are termed parasiticides. Chief among these is sulphur, in ointment, powder, or vapor. Sulphurous acid is a convenient application. Carbolic acid, kerosene, petroleum, strong alkalies, and solution of corrosive sublimate are also efficacious. Even when cured as a specific disease, the redness and vesicles may linger, a chronic condition of irritation. Soothing ointments are then indicated.

Revised by W. PEPPER.

Scad: the *Trachurus trachurus*, a fish of the family *Carangidae*, distinguished by its elongated, fusiform body, completely plated lateral line, and silvery color. When fresh it is scarcely edible, but it takes salt well, and when pickled is very good. Immense quantities are taken in the British seas. The name has been extended to congeneric species, as well as to species of like form belonging to the genera *Trachurops* and *Decapterus*.

Scævola, sev'ô-lă: a cognomen common among the members of the plebeian family of the Mucii in ancient Rome. The two most prominent members of the family were QUINTUS MUCIUS SCÆVOLA, THE AUGUR, and QUINTUS MUCIUS SCÆVOLA, THE PONTIFEX, both celebrated as jurists, and nearly contemporary. The former was tribune of the people in 128 B. C., prætor in 121, consul in 117, and died soon after the outbreak of the war between Marius and Sulla. Cicero, who was born in 106 B. C., states that after assuming the garb of manhood (*toga virilis*) he was taken by his father to Scævola to be instructed in law, and that he remained in close attendance upon him until his death. The Pontifex Scævola was tribune in 106 B. C., and consul in 95. He was proscribed and put to death by the party of Marius in the year 82. Cicero, who, after the death of Scævola the Augur, attached himself to the Pontifex, characterizes him with the epigrammatic phrase that of juriconsults he was the most eloquent, and of orators the most deeply versed in the law.

Revised by G. L. HENDRICKSON.

Scagliola, skāl-yô-lă [from Ital. *scagliuo'la*, liter., dimin. of *scaglia*, scale]: an imitation of marble, made by mixing ground gypsum with glue, coloring it, applying it to the surface to be marbleized, and setting into the soft mass, if it be desired, bits of various ornamental stones. When hard the surface is smoothed and polished. It is an admirable imitation of the more costly marbles, but is not durable, especially in damp places.

Scala, skaal'ă (Lat. *Scaligeri*): the name of a celebrated Italian family which reigned in Verona from 1260 to 1387. After a long series of internal disturbances, tyranny alternating with anarchy, Mastino della Scala succeeded in 1260 in making himself master of the city. He ruled with firmness and wisdom; the city prospered, and, although he was assassinated in 1277, the power continued in his family for more than a century. Under Cangrande (1311-29) the fortune of the family culminated. He was confirmed in his possessions, to which were added Vicenza, Padua, Treviso, etc., by the Emperor Henry VII. At his court lived Dante, and many of the most magnificent architectural monuments of the city were erected during his reign. Most of his successors, Cangrande II., Paolo Alboino, and others, were worthless and infamous tyrants, and in 1387 Galeazzo Visconti of Milan expelled Antonio della Scala. The male line of the family, which flourished in Bavaria under the name of Scaligeri, became extinct in 1598; the female is still flourishing in the families of Dietrichstein and Lamberg.

Scala Nova (anc. *Nedrolis*): town; in Asia Minor, vilayet of Aidin; 7 miles S. W. from the ruins of Ephesus (see map of Turkey, ref. 5-D). It has a good and sheltered harbor, and is the main port of the towns in the valley of the Meander. Pop. 7,500, almost all Greeks. E. A. G.

Scald: See BURNS AND SCALDS.

Scaldhead: See FAVUS.

Scale [from Lat. *sca'la*, flight of steps, for **scadla*, deriv. of *scan'dere*, climb]: a mathematical instrument used in plotting and in other branches of applied geometry. It consists of a slip of wood or other material divided into parts in accordance with some mathematical law. The common ivory ruler of the instrument-maker has a great variety of scales stamped on its faces, of which the *scale of equal parts* and the *scale of chords* are of most frequent use.

Scale of Equal Parts.—This consists of a number of inches, or aliquot parts of an inch, laid off along a line. The representative fraction gives the ratio between the scale and the object it represents. Thus if the scale is of 1 inch to 8 miles the representative fraction is 1:506,880. The first part, counting from the left, is subdivided into ten equal parts, the 0 of the scale being at the beginning of the second part. The *principal divisions* are numbered from the 0 toward the right, and the *subdivisions* toward the left. This scale is used, in connection with a pair of dividers, for laying off and measuring the lines of a drawing. The diagonal scale is used to further divide the subdivisions. If the division is into tenths, ten parallel lines at equal distances are drawn above the simple scale, and the perpendiculars are erected at the ends of the division. Then from the points of subdivision on the uppermost line parallel lines are drawn to the corresponding points one subdivision to the right on the base line. The intercepts of these diagonals on the lines parallel to the base determine the length of the farther subdivision.

Scale of Chords.—This scale is used for laying off and for measuring the angles of a drawing. It is constructed by laying off from the left-hand extremity of a given line the chords of all the arcs from 0° up to 90°, corresponding to some assumed radius. The extremity of each chord is marked by a corresponding number; the origin of the scale and the extremity of the chord of 60°, which is equal to the radius, are marked in a more conspicuous manner than the other divisions. To lay off an angle, the vertex and one side being given, take the chord of 60° as a radius, and from the vertex of the angle as a center describe an arc cutting the given side; then from the point in which this arc cuts the side as a center, with a radius equal to the chord of the arc corresponding to the given angle, describe a second arc cutting the first; join this point of intersection with the given vertex; the last line will make the required angle with the given side. The method of measuring an angle by means of the scale is obvious.

Scale: in music, the regular series of sounds, or degrees on the stave, which form the gamut. The scale in its simplest form consists of seven steps or degrees, counted upward in regular order from a root or prime, to which series the eighth is added to complete the octave. By reverse motion the same notes form the descending scale; and by the addition of other notes above or below in a continuous order the scale may be extended to seven, eight, or more octaves. The *diatonic* scale is that which consists of the tones and semitones of the octave in their natural order and relation; as, for example, A, B, C, D, E, F, G, A. (For the origin of this scale, see the article GAMUT.) Of the diatonic scale, only two varieties are in use in modern music—viz., the *major* and the *minor*. The chief characteristic interval in both these scales is the *third*, which is one semitone greater in the major than in the minor. In ancient music several other diatonic scales were in use as described under the head of MODE (*q. v.*). The word scale means also the entire range or compass of sounds producible by any given instrument, as the scale of the violin, flute, organ, or piano. It is also applied by organ-builders to a graduated rule, plan, or scheme showing the lengths and diameters of the various pipes comprised in any stop. In like manner the length and thickness of the strings of a piano are regulated by a carefully graduated scheme called the *scale*; hence the terms new or improved scale refer to changes adopted by manufacturers in regard to the length and thickness of the strings.

Scaldis (cf. *Rubus*): See *ANACARDIUM*, *DISPARANETTES* (*Murder-net* species).

Scaliger, JESSE (former classical scholar); tenth child and third son of JESSE (classical scholar); b. at Agon, Guyenne, France, Aug. 8, 1640. He was carefully educated by his father and studied in Heidelberg and Paris under TURNERUS (1658), and was professor in Witten 1672-74. The succeeding twenty years were spent in travel and on the coast of America, in the Netherlands. In 1698 he accepted a call to the University of Leiden, where he remained till his death Aug. 11, 1699, by inadvertent poisoning of the fumes of burning incense offered by the numerous attacks upon his character which SCALIGER (q. v.) hurled against him in the *Neuburg Hypobolismus* (1697). *Scaliger* has been justly styled the "most richly stored intellect that ever spent itself in acquiring knowledge." He insisted on fewer than fifteen languages, and his acquisitions in mathematics and the sciences generally were profound, and his acquaintance with ancient antiquity all-embracing. He opened new regions of research for the classical scholar, being virtually the founder of epigraphy, numismatics, and chronology as sciences. His critical talent was of the highest order, and none is so sure as an ancient author whom he has not been misled by *Scaliger's* genius, although he has said of himself: "Natus modestus quam remedia novimus." His most important works are *Expositio* (1675); *Caesars*, *Tibullus*, *Propertius* (1677), a work unfortunately marred by a wanton disregard of MS. tradition; twenty-four indexes to *Varro's Thesaurus*, *Isidorus*, *Latinitas* (1691), a colossal and epoch-making achievement; *De emendatione Temporis* (1686) and *Thesaurus Temporis* (1696), immortal masterpieces and the basis of all subsequent chronological research; the restoration of the last portions of the *Chronicon* of Eusebius being perhaps the greatest triumph of his critical skill on record, for when the missing parts were discovered in an Armenian translation they were found identical with *Scaliger's* reconstruction. See JACOB BARNES, *Joseph Justus Scaliger* (Berlin, 1855), pp. 370 (list of his works, pp. 207-208); L. MULLER, *Geschichte der class. Philologie in den Niederlanden*, pp. 222-227; M. PATISSON, *The Lives of the Two Scaligers*, in *Essays*, vol. I, pp. 196-216.

ALFRED GUDEMAN.

Scaliger, JESSE (former classical scholar); b. at Riva, near Genoa, Italy, Apr. 24, 1640; the son of Benedetto Barnes, a miniature-painter of Padua. The latter assumed or assumed the name Della Scala (de l'Escale) from the street where he lived, for the genealogy by which his descent from the noble family of the Della Scala was made out is a pure fabrication, though obstinately upheld by his illustrators. The elder *Scaliger*, according to the account given in his son, served as a page under Maximilian I., and as a soldier of fortune in the armies of François de Valois. He studied medicine, and after living for some time at Poissy served JESSE at Agon, France, in 1629, as physician in the hospital of the diocese. D. Oct. 21, 1695. He was a man of great learning and a versatile Latin poet, but of a very enervate and pugnacious nature. His best-known works are *Commentarii* (1661), commentaries on Hippocrates, *De insomniis* (1658); Aristotle, *De somno*; *Thesaurus*, *De causis plantarum* (1696); and a monumental work, *De assis Lingue Latine* (1640). His attack on Erasmus (*Prologus pro Oratione contra Erasmus*, 1600) is characterized by a most virulent invective, remarkable even for an age so tolerant of personal vituperation. See JACOB BARNES, *De virtutibus et splendore gentis Scaligeri* (1697); *Scaligeri vita* (Leyden, 1691); JACOB BARNES, *Vita JESSE Scaligeri* (1694); A. MAGN, *Documenta de JESSE Scaligeri et de familia* (1880).

ALFRED GUDEMAN.

Scallops (from O. Fr. *escalope*, a shell; of Dutch *schelp*): a common name for mollusks of the family *Pectinidae*. The word, the two valves of which are usually unequal, is circular or oval, the straight hinge having ear-like lobes at one end. There are many species, most of them being used for food. The Eastern markets of the U. S. are supplied by the *Pecten irradians*, which abounds on the south shore of Cape Cod and southward. Only the muscle which forms the shell is good for food. A scallop-shell was formerly worn by pilgrims to show that they had been to the holy land.

J. S. KINGSLEY.

Scalp, the outer covering of the top of the human head, consisting of the hairy integument, the flattened tendon of the occipito-frontal muscle, and subcutaneous cellular tissue.

Wounds of the scalp are peculiarly liable to take on an upward kind of inflammation, and their treatment requires great care. The removal of the scalp of a dead (or even a living) enemy as a token of triumph is one of the customs of many tribes of North American Indians.

Scaly Ant-eater: See *MANIDIA*.

Scamander (in Gr. *Σκαμάνδρ*): a stream in the plain of Troy. Homer says that it was called *Xanthos* by the Greeks, but *Scamander* by men; it is probable, however, that it received the name *Xanthos* from the yellow or brownish color of its water, which was believed to have the power of dyeing the wool of sheep which drank of it. According to Homer, it arose from two sources, one of hot, and the other of cold water. To-day, at all events, the waters of the stream of *Scamander* do not differ in temperature. The river is still called *Menderes* by the Turks.

J. R. S. S.

Scammony (via O. Fr. from Lat. *scammonia*, *scammonium* = Gr. *σκάμνη*): a cathartic drug obtained from the *Convolvulus scammonia*, a twining plant of the family *Convolvaceae*, indigenous in Greece, Syria, Anatolia, and Southern Russia. The root of this convolvulus contains a milky juice which, collected from the cut surface of a fresh root, dries into a slate-colored lump, hard and brittle, and constitutes the drug in question. At the time of collection the juice is much adulterated, so that scammony varies greatly in purity. The purest quality is called virgin scammony. The active principle of scammony is a resin which may be used in medicine instead of the crude drug. Scammony has been known from a remote period. It is a powerful drastic cathartic, and in overdose is capable of exciting dangerous inflammation. Its principal advantage is the fact that an emulsion of the drug is nearly tasteless, but it is very seldom used except in combination with other purgatives. Resin of scammony is an ingredient of the U. S. compound extract of colocynth, and therefore of the compound cathartic pill.

Revised by B. A. HARK.

Scamozzi, *skā-mōt-sō*, VINCENZO: architect; b. at Vicenza, Italy, in 1532. His father, also an architect, grounded him in his art. He then studied at Venice with Palladio and Sansovino, and in 1579 he went to Rome to study ancient monuments. In 1583 he returned to Venice to establish himself, and was commissioned by Marc Antonio Barbaro to erect a monument to his family in the Church of the Carità. This work was so much approved of that Scamozzi immediately was appointed to finish the library of St. Mark's. The Cornaro Palace on the Grand Canal, Venice, is his work, also the Trisino Palace at Vicenza. The second or uppermost story was added to the Palazzo Strozzi, at Florence, by Scamozzi, and he built the Ravascheri Palace at Genoa. His designs were in request all over Europe, for he was acknowledged to be one of Italy's best architects. He published several works, and had completed six parts of his *Ideas of Universal Architecture*, when he died in Venice, Aug. 7, 1616.

W. J. STILLMAN.

Scam'derberg: soldier and patriot; b. 1404. His real name was George Castriotes, and he was fourth son of John Castriotes, despot of Northern Albania. The four brothers were given as hostages to Murad II. in 1423, when he invaded Albania. The three elder died from poison, but the beauty and brightness of George rendered him a favorite of the sultan, who made him a janissary and gave him the title of Iskender (Alexander) Bey; hence his popular name of Scanderbeg. He gained great distinction in the Ottoman campaigns in Asia, but when his father died in 1432 the sultan incorporated Albania as a province. Scanderbeg was offended and indignant, but bided an opportunity for freedom and revenge. In 1443 he was sent as second in command of a large army into Hungary. He so maneuvered as to give the victory to the Hungarian Hunyadi, and fled with a few followers to Croia. Previously he had compelled the sultan's secretary to sign an order, bidding the Ottoman commander of Croia to give up his office to the bearer of the order, and had then killed the secretary to prevent discovery. He thus obtained possession of the chief Albanian fortress, Adjuring Island; he called upon his countrymen to rise against their Mussulman masters. The country responded; even the rival, semi-independent Albanian chiefs forgot their jealousies and agreed to pay him tribute. During seventeen years Scanderbeg successfully resisted the whole power of the Ottoman empire, fifteen times defeating armies always far more numerous than his own, commanded by the ablest generals and often by Murad II. or his successor, Mohammed

II., in person. In 1461 the sultan, hopeless of victory, acknowledged the independence of Albania and Epirus. Persuaded by the pope to violate the treaty and attack the Ottomans, Scanderbeg won eight splendid victories, the last, with 24,000 men, over Mohammed II., who had 100,000. He died at Alessio, Jan. 17, 1468, and was buried at Scutari in Albania. When in 1477 the Ottomans captured Scutari, they broke open his tomb, divided his bones into fragments as precious relics, had them set in gold and silver, and wore them around their necks as talismans to give intrepidity and success. Despite his ferocity and lack of faith, Scanderbeg is deservedly honored and revered as the "hero of Albania."

E. A. GROSVENOR.

Scandina'via: a name applied by the Romans to a supposed great island N. of Germany, probably the southern point of Sweden, extended by moderns as a geographic name for the peninsula between the Baltic Sea and Gulf of Bothnia on the one hand, and the North Sea and Atlantic Ocean on the other. It includes Norway, Sweden, and part of Finland. The name is sometimes used in an ethnographic sense, when it also includes Denmark. See NORWAY, SWEDEN, DENMARK, FINLAND, and LAPLAND. M. W. H.

Scandinavian Languages: the name applied collectively to the Teutonic languages of the Scandinavian north, inclusive of settlements from Scandinavia, notably Iceland and the Faeroes. With Gothic and West Germanic Scandinavian forms the Teutonic branch of the Indo-European family of languages. An earlier classification made Scandinavian and Gothic East Germanic as opposed to West Germanic, but, although coincidences in some points exist, no other relationship than the one at present assumed is probable. The linguistic territory of Scandinavian is Norway, Sweden, including parts of Finland and Esthonia, Denmark, including the adjoining northern parts of Schleswig and the Danish dependencies of the Faeroes, Iceland, and Greenland. At an earlier period Scandinavian was, at least for a time, the language of conquered territory elsewhere—viz., in Swedish settlements in Russia from the ninth to the eleventh century; in Norwegian settlements in the Orkneys and Shetlands from 800 to 1800; in the Hebrides, Northern Scotland, and the Isle of Man from 800 into the fifteenth century; and in Ireland from 800 to 1800; in Danish settlements in England from the ninth into the eleventh century; and in Danish and Norwegian settlements in Normandy from 900 until after 1000. From the Shetlands, Ireland, Scotland, England, Normandy, and Russia there is, however, no extant monument from ancient times.

In its historical development Scandinavian falls chronologically into several periods. Common Norse, the first, extends from the earliest time down to the beginning of the Viking age in 700. It is the homogeneous parent language of the north before it shows traces of dialectic differences. The second period is coincident with the so-called Viking age, from 700 to 1050. Instead of a single language, three dialects appear—Old Norwegian, Old Danish, and Old Swedish, including the sharply defined dialect of the island of Gotland, Old Gutnic, to which was added after the settlement of Iceland, principally from Western Norway, in the ninth century, a fourth, Old Icelandic. This dialectic separation, furthermore, proceeded in such a way that two groups were formed—an eastern, made up of Old Danish and Old Swedish, together, accordingly, called East Norse, and a western, comprising Old Norwegian and Old Icelandic, together called West Norse. At the end of the Viking age these dialects again had differentiated into languages, properly so called, whose early or "old" period extends to the Reformation, or about the year 1530, at which time the modern or "new" period begins. The whole development of the Scandinavian languages down to the Reformation is commonly included under the one term Old Norse. In Scandinavia itself, in the Viking age and later, *dǫnsk tunga*, Danish language, was applied to the language of the entire north; in the same signification *norðrǫn mál*, Norwegian language, also occurs in Norway and Iceland, but it is usually limited specifically to West Norse.

Common Norse is only scantily preserved in Scandinavian loan-words adopted by the neighboring Lapps and Finns in the early centuries of the Christian era, and in something over a hundred runic inscriptions in the earlier Germanic alphabet of twenty-four characters, the oldest of which date from about the year 500. Of the Teutonic dialects Common Norse even more than Gothic stands nearest in essential points to Common Teutonic. Important differences be-

tween Scandinavian and Gothic observable in the earliest time are: Norse retention of final *a*, *i*, *u* of stem in substantives, syncopated in Gothic; Norse *a*-stems end genit. sing. -*as*, dat. sing. -*e*, Goth. -*ia*, -*a*; *an*-stems end genit. and dat. sing. -*an*, Goth. -*ina*, -*in*; *u*-stems end dat. sing. -*iu*, Goth. -*au*; *r*-stems end nom. pl. -*iR* (*R* palatal liquid), Goth. -*jus*; 1 sing. pret. of weak verbs ends -*o*, Goth. -*a*. The most important points of coincidence with Gothic are the development of Teutonic *jj* to Gothic *ddj*, Norse *ggj*; Teutonic *uv* to Gothic *ggu*, Norse *ggu*; Teutonic *z* to Gothic *s*, Norse *k*.

During the Viking age (700-1050) it is possible to obtain for the first time a tolerably complete view of the language. The sources of information are, as in the earlier period, loan-words, and not only in Finnish-Lappish, but in Keltic, Russian, and Anglo-Saxon. Runic inscriptions, besides, occur in great numbers over the whole Scandinavian north, written after the middle of the ninth century exclusively in the shorter or Old Norse alphabet of sixteen characters. To these, after the end of the ninth century, is to be added a literature consisting of the oldest Eddic lays and early Skaldic poetry cited in Icelandic MSS. of the thirteenth century, until then orally transmitted and still preserving an archaic form. The Viking age was not only pre-eminently a period of rapid organic change, but local differentiations occur also at an early period, as has already been noted, in two well-defined groups, and after the introduction of Christianity, which marks the end of the period, there are four languages instead of the one at its beginning. After the middle of the twelfth century a native literature begins in Icelandic-Norwegian, soon abundant enough to show comprehensively the facts of the language. The alphabet used is essentially the Latin. From the runic alphabet *f*, thorn, was retained, and the Anglo-Saxon *ð* was borrowed. To indicate new vowel-conditions the MSS. use, but inconsistently, various digraphs and modified forms. Vowel-length in the oldest MSS. is indicated by accent.

Old Norse in the literary period exhibited the following phonetic conditions:

A. Sonants:

Vowels: Palatal. Short: *i*, *j*, *e* (*ę*), *y*, *ø*. Long: *ī*, *ē*, *ǣ*, *ý*, *ē*.
Guttural. Short: *a*, *o*, *u*, *ʊ*, *q*. Long: *ā*, *ō*, *ū*, *q̄*, *ē*.

In the function of sonants (only in unstressed syllables):

Nasals: *m*, *n*.

Liquids: —, *l*, *r*.

Diphthongs: *ei*, *au*, *øy* (*ey*); *ja*, *jo*, *jō*, *ju*, *jā*, *jō*, *jē*, *jū*; *va*, *ve* (*vę*), *vi*, *vq*, *vā*, *vē*, *vā*, *vī*, *vq̄*.

All vowels and diphthongs may be nasalized. *e* has a twofold value: close Teutonic *e*, whose corresponding long form is *ē*; open *e*, by umlaut from *a*, whose long form is *ā*. The two values fall together in most MSS. *ø* has a twofold value: short close *ø* from close *e* or *o*, the long form *ē*; or short open *ø* from open *e* or *q*, the long form lacking *ē*, which is used in most printed texts, was borrowed from German in the sixteenth century.

B. Consonants:

CLASSES OF CONSONANTS.	Labials.	Interdentals.	Dentals.	Palatals and gutturals.
Explosives: voiced....	<i>b</i>	—	<i>d</i>	<i>g</i>
voiceless..	<i>p</i>	—	<i>t</i>	<i>k</i>
Spirants: voiced.....	<i>f</i> , <i>v</i>	<i>ð</i>	—	<i>ǰ</i> (i. e. <i>z</i>)
voiceless....	<i>f</i>	<i>þ</i>	<i>s</i>	<i>h</i> , <i>g</i>
Nasals.....	<i>m</i>	—	<i>n</i>	<i>ɲ</i> (i. e. <i>ɲ</i>)
Liquids.....	—	—	<i>l</i> , <i>r</i>	—
In the function of consonants.....	<i>u</i> , <i>v</i> , (<i>w</i>)	—	—	<i>i</i> , <i>j</i>

There was, in addition, breath (laryngeal) *h*; *ts* is represented by *z*; *ks* by *x*.

The consonants occur long (geminated), with the exception of the spirants where *s* is the only one lengthened. *ff* occurs in loan-words. Common Norse palatal (dorsal) *R* (Teutonic *z*) is merged in Old Norse *r*.

Of the Common Teutonic vowels Old Norse maintained, under circumstances, in direct continuity: Short: *a*, *e*, *i*, *o*, *u*. Long: *ā*, *ē*, *ī*, *ō*, *ū*. Diphthong *au*. Teutonic *ā* is represented throughout by Old Norse *ā*, by *i*, *R*-umlaut *ē*. Teutonic *ai* by Old Norse *ā*, by *i*, *R*-umlaut *ē*; by *i*-umlaut *ei*, which in its turn as final is contracted to *ē*, and sporadically to

corresponding active form, which then ends in *-k*, *-sk*, *-zk*. These endings were supplanted early in the thirteenth century by *-z* or *-s*, which somewhat later became *-zt* or *-zst*. Modern Icelandic has *-st*; Swedish and Danish have *-s*.

The Use of the Definite Article.—The definite article *enn* (*inn*) stands before an adjective, but after a substantive, to which it is suffixed with (original) declension of both substantive and article. That it was originally free in the same position is shown by instances in the Old Icelandic Stockholm Book of Homilies, so called, from early in the thirteenth century.

For the history of the individual Scandinavian languages, see DANISH LANGUAGE, ICELANDIC LANGUAGE, NORWEGIAN LANGUAGE, and SWEDISH LANGUAGE.

BIBLIOGRAPHY.—Adolf Noreen, *Allisländische und Altnorwegische Grammatik unter Berücksichtigung des Urnordischen* (Halle, 1884); Paul, *Grundriss der Germanischen Philologie* (vol. i., Strassburg, 1891), in the chapters *Geschichte der Nordischen Sprachen* by Adolf Noreen and *Skandinavische Mundarten* by J. A. Lundell, which contain an exhaustive treatment of the language; Old Norse is also considered in Brugmann, *Elements of the Comparative Grammar of the Indo-Germanic Languages* (vols. i.-iii., 1888-92); Cleasby-Vigfusson, *An Icelandic-English Dictionary* (Oxford, 1874); J. WILLIAM H. CARPENTER.

Scandinavian Literature: the literary monuments of the Scandinavian language or languages. See SCANDINAVIAN LANGUAGE, DANISH LITERATURE, ICELANDIC LITERATURE, NORWEGIAN LITERATURE, and SWEDISH LITERATURE.

Scandinavian Mythology: the system of myths pertaining to the Scandinavian peoples. It is frequently called Norse or Northern mythology, but might more properly be denominated Teutonic mythology, since its chief deities were worshiped not only in Iceland, Norway, Sweden, and Denmark, but also in Germany and England—in short, by every branch of the Germanic or Teutonic race.

Original Sources.—Some information in regard to this mythology is to be gleaned from the old runic inscriptions found on monumental stones throughout the lands inhabited by Teutonic races, but mainly in the Scandinavian countries. Heathen Germany supplies a few ancient laws and glossaries containing mythological words. Formulas are also preserved by which converts to Christianity renounced the old gods and in which names of heathen divinities accordingly occur. Richer veins of information are such German heroic poems as the *Nibelungen Lied*, the *Gudrun*, the Saxon *Heliand*, and the Anglo-Saxon *Beowulf*. Cæsar, in his *De Bello Gallico*, gives us glimpses of the manner in which the Teutonic Druids preserved their mythological songs and epics, and with Cæsar Tacitus ranks as a source of information. Next after Cæsar and Tacitus come the Christians who wrote in Latin down through the Middle Ages, but they are, as a rule, very silent on the subject of the heathen religion. Among this class of writers Denmark furnishes a remarkable exception in Saxo Grammaticus. The first eight books of his *Historia Danica* contain an outline of Scandinavian mythology, the deities being presented as kings and potentates of early times. Mythological fragments must also be looked for in the customs, habits, speech, traditions, proverbs, ballads, folk-lore tales, and in the usages of the Christian Church throughout Teutonic lands. The chief sources of Scandinavian mythology are to be found in Iceland, and in Icelandic literature the most important documents are the *Elder* and the *Younger Edda*. (See EDDA and ICELANDIC LITERATURE.) The *Younger Edda* gives in prose a succinct account of the Odinic religion. It also contains some poetic quotations not found in the *Elder Edda*.

Interpretations.—Modern Authorities.—Both Snorre and Saxo Grammaticus present the euhemeristic interpretation of the myths, and this view prevailed until late in the eighteenth century. Euhemerism was finally superseded by the so-called physical interpretation making the divinities represent the various forces and phenomena of nature. This theory was most elaborately developed by the Icelandic

Finn Magnusson in his *Eddalæren og dens Oprindelse* (Copenhagen, 1824-26). More recently an ethical has been combined with the physical interpretation—that is, while accepting the phenomena and forces of nature as the basis of the myths, the scholar seeks to establish its deeper, philosophic, poetic, and moral value to its votaries.

The most prominent writers on Scandinavian mythology of the nineteenth century are Finn Magnusson, *Lexicon Mythologicum* (Copenhagen, 1828); Jacob Grimm, *Deutsche Mythologie* (4th ed. 1875; an Eng. trans. by Stallybrass, London, 1880); Karl Simrock, *Deutsche Mythologie* (several editions); Wilhelm Mannhardt, *Germanische Mythen* (1858); P. A. Munch, *Nordmændenes Gudelære i Hedenold* (Christiania, 1847); R. Keyser, *Nordmændenes Religionsforfatning i Hedenommen* (Christiania, 1847); N. F. S. Grundtvig, *Nordens Mythologi* (Copenhagen, 1808-32); N. M. Petersen, *Nordisk Mythologi* (Copenhagen, 1849); Benjamin Thorpe, *Northern Mythology* (London, 1851); Rasmus B. Anderson, *Norse Mythology* (5th ed. Chicago, 1891). Finally, special attention should be called to the elaborate investigations made since 1880 by the Norwegian linguist Sophus Bugge (*Studier over de nordiske gude- og helle-sagns Oprindelse*, Christiania, 1890) and by the Swedish scholar Viktor Rydberg (*Undersökningar i germanisk mythologi* (Göteborg, 1886-90). Bugge attempts to show the influence of classical mythology and early Christianity upon Scandinavian myths, while Rydberg, in opposition to Bugge, vindicates the exclusive Teutonic origin, and seeks to establish the harmonious connection between the various myths as parts of an all-embracing mythological epic. In his conflict with Bugge he is ably supported by the German scholar Müllenhoff (*Deutsche Alterthumskunde*, vol. v., 1881). An English translation of Rydberg's work by R. B. Anderson appeared in London in 1889, and bears the title *Teutonic Mythology*.

General Features.—The various forces and phenomena of nature—heat and cold, night and day, the seasons, thunder and lightning, life and death—led the old Teutons to speculate on the rise, development, and fall of all living things. The Scandinavian myths are inferior to the Greek in point of beauty, but, on the other hand, they outrank them in deep significance and wealth of thought. The Greek gods live a happy life, free from care. The life of the old vikings was characterized by constant struggle and warfare, and so their gods too are engaged in an unending conflict with the powers of evil which they never wholly overcome. A peculiar feature of the *asa-faith* is its eschatology, by which it presents in the clearest manner the idea that the present world must perish and give place to a new and better one. The gods themselves know that they are in common with all other beings are sinful and contaminated by evil. They are conscious that they can not escape death and destruction, but they seek in every way to ward off that terrible catastrophe as long as possible. They also know that after the destruction of this world and out of its fragments there are to rise a new heaven and a new earth which are to be more beautiful than the present universe and free from sin and sorrow and care. In the regenerated world gods and virtuous men shall enjoy eternal happiness. The Scandinavian myths form a drama, in which every detail leads up to Ragnarok, the twilight of the gods, which constitutes the final act.

The Creation.—In the beginning (the prechaotic period) there were two worlds, Niflheim to the N. and Muspelheim to the S., and between them was Ginnungagap, the wide abyss. In Niflheim were the well Hvergelmir, from which flowed twelve ice-cold streams, called the Elivoggs, into Ginnungagap. Muspelheim, on the other hand, was intensely bright and hot, and in the midst of it sat Surt guarding its borders with a flaming sword in his hand. The Elivogs flowed far into Ginnungagap, where the venom they carried with them became ice. Vapors rose and froze to rime, and in this way were formed many layers of congelation. Meanwhile sparks flew from Muspelheim, and when the heated blasts came in contact with the frozen vapor it melted into large drops, and by the might of him (Surt) who sent the heat these drops quickened into life and took the form of an immense giant named Ymer and of a great cow named Audhumbla (chaos). Ymer was nourished by the cow's milk, and the cow fed herself by licking the salt rime on the stones, and by this licking she produced in the course of three days a man named Bure. Bure begot a son, named Bor, by the giantess Bestla, daughter of the giant R. Bor became the father of three sons, Odin (spirit),

Ygg (earth) and Yggdrasil (tree). These three herithers slew the giant Ymer, and from his dead body they created the present world, heaven, earth, and sea. Of his body they made the earth, of his blood the ocean, of his bones the rocks, of his hair the forests of the world the wooded sky, and of his brains the clouds. In the flat, round earth they built a high wall about Midgard as a protection to the abode of man against the giants. Outside of this wall was Jotunheim, the home of the giants who descended from Ymer. Above Midgard was Asgard, the home of the gods. The rains, which were not of the same race as the seas, originally dwelt in Asgard, but after a prolonged warfare peace was declared and seas and rains were united into one family of deities, the earth and rocks dwell the dwarfs. The elves lived in Asgard, and the inhabitants of the lower world and the dwellers in Asgard and Nifheim. Dwarfs, elves, and men were created by the gods, were subject to their protection, and owed them obedience and service. The giants and the dwellers in the upper world were the enemies of the gods and men. One day three gods, Odin, Hoenir, and Loken, found two trees by the water, an ash and an elm. Of them they made the first human pair, Ask and Embla, and gave them such as their dwelling place.

The Golden Age, the Norns, and the Conflict between the Good and Evil Powers.—Immediately after the creation of the world there was a golden age. The gods met on the slopes of Ida, where they built temples and altars of gold, of bones, of stones, and implements were made of gold. They played with golden tablets, and their happiness was complete. This condition lasted until there came three maidens from Jotunheim. They were the so-called Norns, Frigg (the past), Verdande (the present), and Skuld the future. They were the rulers of fate, and time and the gods were subject to their decrees. With the advent of the Norns the active life of the gods began. Henceforth their lives were full of care and trouble. With the Norns came strife, strife, and warfare into the world. From that time on there is constant activity and conflict between all powers until the world shall fall dead. The movement of the cosmic world consists in a ceaseless strife between the good and the evil powers, neither side gaining advantage over the other. The gods gain temporary advantage and subdue the giants for a time, but the powers of evil gradually increase in strength, the world grows in decrepitude until the final day comes when all perish in an enormous flood in Ragnarok, a catastrophe which is most fully described in the *Eddas*.

Yggdrasil.—One of the most poetic and significant myths in Scandinavian mythology is that of the world ash-tree Yggdrasil, which symbolizes the whole universe. It has three main branches: one into Nifheim, a second into Jotunheim, and a third into Asgard. The branches of Yggdrasil grow over the whole world and aspire above heaven itself. Yggdrasil is the house of Odin, and the *Elder Edda* says Odin hung nine nights on this tree and sacrificed himself to himself. While hanging there he discovered the runes.

The Principal Deities.—The *Eddas* call the Scandinavian gods *ases* (as, pl. *asir*) and the goddesses *asynjas*. The chief god is Odin (9: 1). As Alfather he is active in every part of the world created by him and his brothers Vili and Ve. No one knows better than he the fate of the world, and hence he is more interested than he in warding off as long as possible the Ragnarok doom. This can be done by enlisting all the forces possible on his side. He is accordingly the god of war who sends forth his mailed warriors, the valkyries, to gather the faithful heroes slain in every battle-field and to conduct them as sinners to Valhalla, where they are to dwell with Odin, and whence they will follow him to the Ragnarok battle-field. Other prominent gods were Thor, Balder, Hoenir, Tyr, Krage, Heimdal, Ullr, Vali, Ull, Vane, and Forsete. Njord and Frey were originally *ases*, but were adopted by the *ases*. Loke, though of giant race both by father and mother, early became a sworn brotherhood with Odin, and he too unfortunately was adopted by the *ases*. While the most of these *ases* are of war, still some of them also have other functions. Thus Frey is the god of song and eloquence, and is the god of the sea, presides over fishing and commerce. Frey is a *vanir*, and rules over harvests and the fertility of the earth. Heimdal represents eternal vigilance, he is the god of the rainbow bridge and proclaims the coming of danger to the gods with blasts from his trumpet *gullinbursti*. Forsete was worshiped as the god of

justice. Thor (Thursday—*i. e.* Thor's day—is named after him) is the god of thunder, and he is foremost in the conflict with the giants. The *Eddas* contain elaborate accounts of his conflicts with the giants Hrungnir, Gialfred, Thrym, and others. Balder is the representative of moral purity, wisdom, peace, and good will. While he lived the power of the *ases* was secure, but when Balder, at the instigation of Loke, was slain the fall of creation could not be prevented. Thus the death of Balder, which is told very fully and with great pathos in the *Eddas*, forms the turning-point in the great drama. Loke is the Mephistopheles of Scandinavian mythology. He is the personification of evil, though he constantly assumes the guise of virtue; but when he has accomplished the slaying of the good Balder he throws off the disguise by which he gained the favor and confidence of the gods. He is then put in chains, but finally gains his liberty, and in Ragnarok is the leader of the hosts of Hel that rally forth to the Vigrid plains.

Of goddesses there are in all twenty-six, and chief among them is Frigg, the wife of Odin. Several goddesses of lower rank serve her in her magnificent hall called Fensal. Thor's wife is Sif, and Balder's is the graceful Nanna. Frey's wife is Idun, who possesses the apples of eternal youth. Freya (Friday is named after her) is also called Menglad. She is the goddess of love, the Norse Venus. Njord married Skade, and Frey's wife was the giantess Gerd, for whom he gave his trusted sword.

The Giants.—Next in importance to the gods are the giants and giantesses. They are countless in number and are the chief foes of the gods. They bring about the destruction of the world. Loke, himself a giant, because the parent of three terrible children in Jotunheim. These are (1) the Fenriswolf, (2) the Midgard-serpent, and (3) Hel, the goddess of death. The gods knew that these terrible monsters were growing up and would some day cause them great mischief. They therefore bound the Fenriswolf on a barren island and put a sword in his open-stretched mouth, but for this the god Tyr had to sacrifice his right hand. They cast the Midgard-serpent into the ocean, where he encircles the whole earth and bites his own tail. Hel was thrown into Nifheim, and Odin commanded that all who die from sickness or old age should go to her. The giants were older than the gods, and hence surpassed them in knowledge. The wisest one among them is Mimir, who presides over the fountain of wisdom. Many of the giants are represented as good-natured, and fond of gold and silver and other riches. Egi, the giant of the sea, is the wealthiest of all, and he once entertained all the gods in his magnificent hall in grand style.

LITERATURE.—J. Grimm's *Deutsche Mythologie* (Eng. trans. by Stallybrass); G. Vigfusson's *Corpus Poeticum Boreale*; Laing's *Heimskringla* (new ed. by R. B. Anderson, 1889); N. M. Petersen's *Nordiske Mythologi* (1849); P. A. Munch's *Normandens gamle Gude- og Helte-saga* (1854; new ed. 1890); Mannhardt's *Germanische Mythen* (Berlin, 1888); and R. B. Anderson's *Norse Mythology* (5th ed. 1891).

KARSTEN B. ANDERSEN.

Scanzo's [Mod. Lat., *liter.*, climbers, from Lat. *scandere*, *scandere*, climb]: a name applied by Illiger, in 1811, to a group of birds containing those having the toes two before and two behind. The group was purely artificial, containing such dissimilar forms as the cuckoo, toucan, woodpecker, and parrot, and its members are now distributed among several orders.

F. A. L.

Scanzoni, skantzō-ni, FRIEDRICH WILHELM, von, M. D.: obstetrician and gynecologist; b. at Prague, Bohemia, Dec. 21, 1821; graduated M. D. from the University of Prague in 1844; after a tour abroad he returned to Prague, and was appointed assistant obstetrician to the Imperial Royal Lying-in Hospital; later he was appointed assistant to the chair of Obstetrics in the university; in 1850 he was appointed Professor of Obstetrics and Gynecology in the University of Würzburg, resigning this chair in 1888 to retire to private life. He was a voluminous writer, his better-known works being *Lehrbuch der Geburtshilfe* (Vienna, 1849), a work that passed through many editions and was translated into nearly all the European languages; *Lehrbuch der Krankheiten der weiblichen Sexualorgane* (Vienna, 1857). D. June 12, 1891.

S. T. LEMSTRONG.

Scaphiopus [from Gr. *scaphos*, *scaphos*, spade + *pus*, foot]: a genus of toad-like animals belonging to the family *Pelobatidae*; externally recognizable by having teeth in the upper jaw, the fingers and toes without sucking-disks, and

the heel with a flat-edged spur. The spade-foot toads burrow by day and feed at night. In the breeding season they frequent temporary pools, and at this period their voices are very loud. The allied genera belong, with one exception, to the Old World.

Scaph'oid, or Navic'ular Bone [*scaphoid* is from Gr. *σκαφον*, boat + *ειδης*, appearance, form, likeness; *navicular* is from Lat. *navicula*, dimin. of *navis*, boat]: a name applied to one of the bones of the wrist, and another of the foot, on account of their fancied resemblance to a boat in shape.

Scaphop'oda: See MOLLUSCA.

Scap'ula [Mod. Lat., from Lat. *scapula* (plur.; sing. not used), shoulder-blades, back]: the shoulder-blade, a bone of the anterior or upper extremity, forming part of the shoulder. It is regarded as a pleurapophysis of the occipital (fourth cephalic) vertebra. In man and nearly all mammals it is normally firmly united to the coracoid bone, which is regarded as a process of the scapula, though representing a hæmapophysis of the occipital vertebra. The dorsum of the scapula is marked by a prominent keel or spine. The scapula is developed from seven centers, and is in man not fully ossified till the twenty-fifth year of life.

Scap'ular [from Late Lat. *scapula*, shoulder, formed as sing. to Lat. *scapula*, shoulder-blades]: (1) a garment worn by lay brethren and professed monastics of various Roman Catholic orders. It is a long piece of serge, one end of which falls in front and behind the wearer. Its size, color, and proportions vary. (2) A small concealed emblem worn by many Roman Catholics, who bind themselves to a certain round of religious exercises called the Devotion of the Scapular. There are several scapulars, as that of the Passion and that of the Seven Sorrows of Mary, but the original one, that of Our Lady of Mt. Carmel, was, it is claimed, revealed by the Virgin to the Blessed Simon Stock, an English Carmelite and general of that order, who died in 1265.

Scar'ab, or Scarabe'us: a black or metallic-colored dung-beetle (*Scarabæus ægyptiorum* or *Ateuchus sacer*) found in tropical countries, particularly in Egypt, where it was regarded as the symbol of the god KHEPER (*q. v.*), and the emblem of the revivification of the body and the immortality of the soul. This was by virtue of the solar significance of the object, whose Egyptian name (*kheper*) signified to be or exist and also to roll, as of the sun. The daily revolution and re-appearance of the sun typified the return of the soul to life. The beetle places its eggs in a mass of ox-dung which it rolls into a ball. The ball is propelled by the beetle with its hind legs. According to Horapollo and early Greek and Syrian writers, the female did not exist, and hence, as procreated by the male only, the scarab was held to be a symbol of the self-begetting and of the immortal, while in the hermetic literature it was regarded as the type of the "only-begotten," of "generation," of "father," of "man," and of the "world." It is evident, however, that these latter ideas are for the most part foreign to the original Egyptian conception.

The Egyptian figures of the scarab were made of gold, silver, precious stones, granite, basalt, steatite, faience, and paste, and, in the Roman period, of glass. Those in stone, faience, and paste were usually glazed blue or green. They were inscribed with religious or historical texts, with names of gods, kings, and other persons, and with magical legends and devices which are impossible of clear explanation. It is doubtful whether they were ever intended to be read. They may most conveniently be classified, according to their purpose, as funereal, ornamental, and historical. Funereal scarabs were placed on the fingers or over the heart of the dead, and in the latter case the RITUAL OF THE DEAD (*q. v.*) prescribed that certain words should be inscribed on a scarab of green jasper and put in the place of the heart. When buried with the mummy they bore a variety of names or of magical emblems that were to serve for the protection of the dead. Ornamental scarabs were an adoption by the living of the trappings of the dead, and were apparently employed principally as charms. They were strung together lengthwise as necklaces, or used singly as rings or seals, and were inscribed with the name of the reigning sovereign, or some national hero, or with magical or ornamental designs. Historical scarabs comprise all those bearing royal names or historical texts or data. The number of the former is very great, and nearly every king from Menes, the first Egyptian king, to the Roman Antoninus is represented in extant specimens. The favorite names, if frequency and number may

form the test, were those of Thothmes III., Amenophis III., and Ramses II. Curiously enough a large proportion of these scarabs date from periods other than that of the Pharaoh in question. From the reign of Amenophis III. come four scarabs which contain actual historical texts, relating to his prowess as a lion-hunter, to the limits of his kingdom (from Nubia to Mesopotamia), to the arrival of his Semitic bride, and to the construction of a sacred lake in his eleventh year, which has intimate connection with the introduction of the solar monotheism of the "heretic" king of the succeeding reign, Amenophis IV., or Khunaten. When Egyptian influence extended to the East, the Phœnicians and others borrowed this design and produced objects to which the name *scaraboids* is usually applied. The design, and in part the symbolism, were also adopted by the Gnostics, and upon their gems they inscribed appropriate legends. The manufacture of forged scarabs is pursued to a large extent in Egypt, to meet the demand of travelers, some of the specimens being made with such skill as to deceive the unwary or even experts. See Birch, *Catalogue of Egyptian Antiquities at Alnwick Castle* (London, 1880); Loftie, *Essay of Scarabs* (London, 1884); Budge, *Catalogue of the Egyptian Collection of the Harrow School Museum* (Harrow, 1887); *The Mummy* (pp. 281 ff., London, 1893), and *Catalogue of the Fitzwilliam Collection* (London, 1894); Murray and Smith, *Catalogue of Gems* (London, 1888); Petrie, *Historical Scarabs* (London, 1889), and his various works, such as *Illahun* (London, 1891), *Hawara* (1899), and *Kahun* (1890); Meyer, *Scarabs* (New York, 1894). CHARLES R. GILLET.

Scarborough [O. Eng. *Skardeburge*, fortified hill]: town; in Yorkshire, England; 43 miles N. E. of York and 54 miles N. of Hull (see map of England, ref. 5-J). It rises like an amphitheater from a sandy bay, and is protected on the N. by a promontory which is crowned by an historical castle dating from 1136 and rebuilt by Henry II. Scarborough is one of the principal watering-places of England; it has an aquarium, a museum, a market-hall, a spa, with mineral springs discovered in 1820, and a promenade three quarters of a mile long opened in 1890. The harbor is inclosed by three piers, and has a floating dock and a lighthouse. Jet is manufactured and there is a considerable fishing-trade. Scarborough returns one member to Parliament. Pop. (1891) 38,776. R. A. R.

Scar'f-skin: See EPIDERMIS.

Scar'ridæ [Mod. Lat., named from *Scar'rus*, the typical genus, from Lat. *scar'rus* = Gr. *σκαρρος*, a kind of sea-fish (*S. cretensis*): a family of teleocephalous fishes known as parrot-fishes, from some resemblance of their mandibles to the bill of a parrot. The body is oblong and compressed; the scales large and cycloid; the jaws well exposed, and with the teeth soldered to them, so that they form a cutting edge, but with imbricated series of older worn teeth; dorsal single, with a longer anterior spinous part (containing nine spines), and a shorter posterior portion (with ten articulated rays); anal fin corresponding to the posterior half of the dorsal, and provided with two spines and eight soft rays; pectorals with branched rays; ventrals thoracic, with one spine and five soft rays; the lower pharyngeal bones are ossified together in a solid mass. The species are confined to the tropical regions, and in these latitudes are everywhere to be found on coral-reefs and among the groves of coral. They are reported to browse upon the coral, which they cut by means of their strong trenchant jaws, in order to obtain the living polyps.

A species of the family (*Scarus cretensis*) was known to the Greeks and Romans, and was the subject of several fables. In the reign of Claudius, according to Pliny, Optatus Porcius introduced it into the Italian sea between Ostia and Campania, where it became abundant. It was regarded, at least for a time, as being the very first of fishes.

Revised by F. A. LUCAS.

Scarlati'na, or Scarlet Fever [*scarlatina* is Mod. Lat. from Ital. *scarlattina*, liter., dimin. of *scarlatto*, scarlet]: one of the acute eruptive or exanthematous fevers. It is chiefly a disease of childhood, with immunity for adults, increasing as the period beyond puberty lengthens. It is an infectious disease, propagated often by close aggregation of children, as in schools, asylums, or at play; but the contagion retains vitality with great persistence, and may be conveyed by clothing, letters, food, etc. The disease occurs sometimes as local epidemics; at other times with a graver type and great mortality, involving whole communities. In different individual cases, as well as different seasons and epidemics, it

medium variable degree, from a trivial disorder to a malignant and hemiplegic one. Physicians recognize three clinical varieties: (A) *Scarlatina angulosa*, simple scarlet fever, in which the rash as eruption is fairly developed, the patient comfortable, and complications do not exist; (B) *S. angulosa*, where are unusual soreness of the throat, with formation of pseudomembranes resembling that of diphtheria, is present; (C) *S. latens* or *mitigata*, a latent form, where the eruption does not appear or is doubtful, but grave injury is done by the secreted poison in the blood to the nerve-centers or the kidneys. Like other contagious diseases, scarlatina has degrees of assimilation or development: first to six days after exposure between exposure and the consequent attack. The fever develops suddenly, and without prodromata, or more often in connection with vomiting, nervous excitement, convulsions, or exhaustion indicative of a powerful reaction on the nerve-centers. The temperature may be 104° or 107° F. higher in fatal cases. The throat is usually found and tender, the tongue studded with sensitive red papillae. At the end of twenty-four hours of fever the eruption appears—an efflorescence composed of first of small red points upon a flushed surface, and later of a uniform, vesicular form. It develops upon the body and neck before the face, but the face, arms, and lower extremities are less involved, and the outline, destroyed by the high temperature of the surface, may begin to fall by the fifth day. This process of desquamation varies. In mild cases, when sponging or bathing has been employed in allay fever, no flaking or peeling of the cuticle is seen. In others it may slowly separate in shreds and patches. Still again, the cuticle covering fingers and toes may exfoliate intact, in the form of scales. During and following this desquamation danger is greatest of acute inflammation of the kidneys, the desquamation symptoms constituting the most serious complication of scarlet fever. The mortality is very variable, from 1 in 5 to 1 in 20, according to class of patients and type of epidemic. The chief causes of death are early convulsions, severe throat complications, and uraemic poison and dropsy, from complication of the kidneys. Deafness often results from severe attacks of *S. angulosa*.

Treatment is chiefly directed (1) to confining the temperature within limits by the use of acetate, diaphoretic drinks, leeching, frequent sponging, or even the wet pack; in very marked cases the use of a cool bath is absolutely essential, but may completely modify the nature of the disease, as is done also with typhoid fever; (2) to favoring the action of the kidneys by digitalis and effluents alkaline drinks, as Ringer's and soda; the friction of lard, practiced by the Germans, and of butter of cacao, protects the skin and guards the kidneys from congestion; (3) to maintaining the patient's strength and counteracting the poison of the disease. Quinine and tincture of iron are chiefly indicated, in the wet frequent doses. The patient should have liberal liquid diet throughout, and mild alcoholic stimulus when indicated. Local antiseptic and antiseptic applications to the throat are useful to prevent the anginous form of the disease from developing and to prevent spread of the inflammation to adjoining mucous surfaces. Secondary kidney disease—dropsy and scanty urine—calls for dry cups over the kidneys, the hot-air bath, eluterium as a purge, digitalis, and alkaline diuretics. Revised by WILLIAM PERREN.

Scarlatti, Alessandro, composer; b. at Trapani, Sicily, in 1685; composed his first opera in 1690 in Rome, in the house of Queen Christina of Sweden; lived afterward alternately in Rome and Naples as chapel-master; composed 115 operas, of which only the titles of twenty are known, 200 songs, nine oratorios, more than 500 cantatas, and thousands of minor pieces. D. in Naples, Oct. 24, 1757. He was the originator of the *opera buffa*, and the first composer who gave to musical accompaniment an air of separate design. His son, Domenico Scarlatti, b. 1685, d. 1757, was considered the greatest pianist of his time, held positions in Madrid and Lisbon as court-pianist, and composed operas and many pieces for the piano and harpsichord.

Revised by DUDLEY RUCK.

Scarlatti, Pietro, see SCARLATINI.

Scarpa, Francesco, anatomist; b. at Castello-Motta, Friuli, Nov. 19, 1741; studied medicine at Padua; traveled extensively; was appointed Professor of Anatomy at Padua in 1772, and in 1793 at Pavia, where he died Oct. 31, 1807. He was one of the greatest anatomists of his time, and wrote a number of works: *Anatomica Disquisitiones de Arteria Offensa* (1780); *Tubula Neurologica ad Illu-*

strandam Historiam Cerebrum Nervorum (1794); *De Anatomia et Pathologia Thalami* (1807); *Sull' Anatomia* (1804); and *Sull' Nerve* (1807).

Scarpanto, or Car'pathos, island; one of the Sporades, belonging to Turkey, nearly equidistant between Rhodes and Crete; a mass of naked rocks, some of which rise nearly 4,000 feet; the reputed birthplace of the mythologic Tithonus. Pop. 2,500. K. A. G.

Scarron, Jean-Paul, writer of burlesque; b. in Paris, France, in 1610; was destined for the Church, but spent his youth in the grossest dissipation, and was in 1637 overtaken by paralysis, which deprived him of the use of his legs. He then took up literature as a means of subsistence, and developed a brilliant talent for burlesque, which owed largely to him the vogue it enjoyed in France in the middle of the seventeenth century. His comedies and poems are forgotten, but his *L'Enfide Truculent* (1648), *Mucrocinade* (1649), which during the war of the Fronde he wrote in opposition to the powerful minister Mazarin, and which cost him the person Anne of Austria had bestowed upon him, and especially his *Roman comique* (1651), translated into English by Oliver Goldsmith (1775), became literary types, and are still read with interest. In 1652 he married Françoise d'Aubigné, afterward Madame de Maintenon, and she, as well as the irresistible humor of her husband, made their home a rendezvous for all the Parisian wits. D. in Paris in 1660. A complete edition of his works, in 10 vols., was published by Bruzen de la Martinière (1737).

Revised by A. G. CLESTER.

Season: another name for ebullientness. See LAMBE METEOR.

Scepter (via O. Fr. from Lat. *scipitru* = Gr. *σκήπτρον*, staff, scepter, deriv. of *σκέπτεσθαι*, prop. against, lean on); a rod or truncheon borne by kings and other magnates as an emblem of authority. It has been employed as part of the regalia of almost all monarchies of which there is any record. The English scepter now in use dates from Charles II.'s time; it is cruciform. The scepter for Scotland dates from the time of James V.

Scepticism, or Skepticism [from Gr. *σέπτεσις*, the Sceptical, a school of philosophers, liter., plur. of *σέπτεσις*, thoughtful, inquiring, deriv. of *σέπτεσθαι*, consider]; the doctrine which sets up, as its highest principle, doubt or suspense of judgment in view of the contradictory nature of phenomena. It endeavors to establish the subjectivity of all cognitions, and to show their incompatibility with each other; it infers, as a consequence, the impossibility of knowing truth, and takes its stand simply and solely upon its own individuality. Scepticism therefore deepens and intensifies mental independence, and is regarded as a necessary clearing up preparatory to philosophic thinking. At least since the time of Descartes this has been the case, and some writers—as Herbert, for example—insist upon the point that all beginning in philosophy is sceptical, and, on the other hand, that all scepticism is elementary philosophy. It is most important to note that all scepticism is based upon the observation of method, and in this respect is a higher activity of the mind than the mere dogmatism which it attacks. All modern philosophy is a struggle to found itself upon method, and thus to place its structure above the assaults arising from scepticism. Sceptical arguments emanate neither from the stage of sense-perception nor from that of simple reflection—i. e. neither from the first nor second intention of the mind, so called, but from a third, or rather a fourth, intention, a perception not of external objects, nor of species or genera, but a perception of the activity or process of reflection itself. Hence simple common sense, alike with the deepest speculative insight, may be attacked and undermined by scepticism, but sceptical arguments can have no weight except for those minds that abandon other points of view and give attention to the method of cognition.

The ancient scepticism is directed against sense-perception, and usually counts Pyrrho of Elis as its founder. Gorgias, the Sophist, had reached the doctrine of nihilism; nothing exists; nothing can be known if it does exist. Socrates had asserted that he knew only that he knew nothing. The Megarian Stilpo had shown the contradictions in sense-perception involved in predication universals of individual objects. The scepticism of the second and third schools of the Middle Academy, founded respectively by Arcesilaus and Carneades, was of a modified type. But Pyrrho, who seems to have learned much from Stilpo, de-

veloped scepticism as a system of philosophy, and made universal doubt the highest principle, and *εὔρεσις* (suspension of judgment) and *ἡρεσεία* (tranquillity of mind, imperturbability) the practical objects to be attained. With Pyrrho, Timon the Sillograph and Ænesidemus are reckoned as the representatives of the old sceptics. The last named collected Pyrrho's arguments in the form of ten tropes, as follows: Knowledge of truth is uncertain, because of the difference (1) in the organization in animals resulting in different modes of knowledge (how can we decide?); (2) in the human constitution in tastes, feelings, desires, capacities, etc.; (3) in the structure of the organs of sense, the same object being white to the eye, sweet to the taste, rough to the touch, etc.; (4) in the mental and physical conditions at different times; (5) in the position, distances, and intervals of objects; (6) in the appearance of objects by reason of their complication with each other; (7) in the appearance of objects owing to their variation in quantity, size of parts, etc.; (8) in objects on account of the general relativity of things known; (9) in the frequency with which objects are observed; (10) in regard to education, all customs, habits, laws, ideas, faith, and theories being derived from it. The later school of sceptics includes Agrippa, Favorinus, Sextus Empiricus, and others. Agrippa reduced the tropes to five: (1) The discordance of opinions renders all uncertain; (2) every proof rests upon grounds which again need proof, and so *ad infinitum*; (3) all our ideas are relative; (4) all systems rest upon hypotheses; (5) the vicious circle, demonstrating the grounds on which the proof rests by that which is proved by them. Sextus Empiricus has left us a complete account of ancient scepticism, and himself sums up the whole as follows: Nothing is certain in itself, as is proved by the diversity of opinion, and nothing can be made certain by proof, since it derives no certainty from itself, and, if based on other proof, leads us either to the *regressus ad infinitum* or to a vicious circle.

Among famous sceptics of later times are Algazel the Arabian, Duns Scotus the Schoolman, Agrippa of Nettesheim, Glanvill, Nicolaus Cusanus, and Hirnhaym, who reject science in the interest of faith. Montaigne, Charron, Sanchez, and Le Vayer revive the ancient scepticism. Hume is the greatest modern sceptic. He saps all dogmatism by making habit or "invariable sequence" the origin of the idea of causality, and thus occasions by way of reaction the rise of the Kantian system and its derived schools, which "criticise the faculty of cognition" and build their structures upon insight into method, and thus eliminate scepticism by making its partial view (of method) a complete one.

WILLIAM T. HARRIS.

Scerodite: See SINTERS.

Schabzieger Cheese: See CHEESE.

Schack, shaak, ADOLF FRIEDRICH, Graf von: poet; b. at Schwerin, Mecklenburg, Germany, Aug. 2, 1815; studied law at Bonn, Heidelberg, and Berlin, devoting much of his time to the study of Oriental and European languages; traveled in Italy, Egypt, Syria, Turkey, Greece, and Spain, where he made extensive researches into the history of the Spanish drama; was called to Munich by King Maximilian of Bavaria where he resided up to the time of his death, Apr. 14, 1894. He published *Epische Dichtungen aus dem Persischen des Firdusi* (1853); *Stimmen vom Ganges* (1856); *Gedichte* (1866); *Nächte des Orients* (1874); *Weihgesänge* (1878); *Lotusblätter* (1883); *Memnon* (1885); and a number of epic and dramatic poems. Like Rückert, with whom he may be compared in many respects, he was a master of the poetic form, not only in his translations from Oriental literatures, but also in his original productions, which, moreover, are distinguished by their deep philosophic thought.

JULIUS GOEBEL.

Scha'dow, FRIEDRICH WILHELM, von: painter; b. in Berlin, Sept. 6, 1789. He was a son of J. G. Schadow, the sculptor, and was thoroughly taught. In 1810 he went to Rome with his brother Rudolph, the sculptor, and there was influenced by Cornelius and Overbeck; became a Roman Catholic and a member of the religious and somewhat mystical school which those painters had brought together. In 1819 he returned from Italy to Berlin, and was made professor in the Academy of Fine Arts. In 1826 he was made director of the Düsseldorf Academy. D. at Düsseldorf, Mar. 19, 1862. In the Berlin National Gallery are his picture *Christ at Emmaus* and a *Portrait Group* of his father and brother with the sculptor Thorwaldsen. At the Stadel Institute at Frankfurt is the picture of the *Wise and Fool-*

ish Virgins; at the old Pinakothek at Munich is a *Holy Family*; and at the Cathedral of Anspach is a *Christ*. His last work was an allegorical painting founded upon Dante's *Divina Commedia*.

RUSSELL STURGIS.

Schadow, JOHANN GOTTFRIED: sculptor; b. in Berlin, May 20, 1764; studied drawing and sculpture in his native city and at Rome 1785-87, and was appointed professor at the Academy of Art in Berlin in 1788. His life was spent chiefly at Berlin from this time on, but he traveled much, especially in Italy. His style is founded upon classical traditions. His principal works are statues of Frederick the Great, in Stettin; Leopold of Dessau, in Zietzen, and the Count de la Marck, in Berlin; Luther, in Wittenberg; the monument of Marshal Blücher, at Rostock; and a number of busts, some of which are in the Walhalla on the Danube near Ratisbon, etc. He also modeled the quadriga over the Brandenburg gate of Berlin, and a frieze on the outside of the mint in that city. D. in Berlin, Jan. 27, 1850.

Revised by RUSSELL STURGIS.

Schadow, RUDOLPH, called also Zeno Ridolfo: sculptor; b. in Rome, July 9, 1786; was the oldest son of Johann G. Schadow. He studied with Thorwaldsen and Canova, and became famous at an early age. He was much employed, and perhaps too constant application caused his early death, at Rome, Jan. 31, 1822. Among his works are the bas-reliefs of the *Daughters of Leucippe, Socrates and Theodora*, and that of the tomb of the Marquis of Lansdowne; the statues of St. John the Baptist, Diana, and a Bacchus; a group of the Virgin and Child; and his last work, *Achilles defending the Body of Penthesilea*.

RUSSELL STURGIS.

Schaeffer, shä'fer, CHARLES FREDERICK, D. D.: theologian; b. at Germantown, Pa., Sept. 8, 1807; graduated at the University of Pennsylvania; studied theology privately; pastor at Carlisle, Pa., Hagerstown, Md., Lancaster, O., Red Hook, N. Y., and Easton, Pa.; professor of theology, Columbus, O., 1840-45, Gettysburg, Pa., 1857-64, and Philadelphia, Pa., 1864-79. D. in Philadelphia, Pa., Nov. 24, 1879. Among his more important works are the translation of *Lechler on Arts* in the English edition of Lange's *Commentary*, the translation of Kurtz's *Sacred History*, a revised translation of Arndt's *True Christianity*, and a *Commentary on Matthew*. Dr. Schaeffer was a prominent advocate of confessional Lutheranism, and his articles in *The Evangelical Review* of Gettysburg contributed powerfully to the movement that resulted in the establishment of the General Council.

H. E. JACOBS.

Schaeffer, CHARLES WILLIAM, D. D., LL. D.: theologian; nephew of Rev. Charles Frederick Schaeffer; b. at Hagerstown, Md., May 5, 1813; graduated at University of Pennsylvania, and Theological Seminary at Gettysburg, Pa.; pastor at Barren Hill, Pa., 1835-40, Harrisburg, Pa., 1840-49, Germantown, Pa., 1849-74; professor in the Lutheran Theological Seminary, Philadelphia, 1864-94, when, on his resignation of the chair of Church History, he was elected professor emeritus. Dr. Schaeffer was for many years president of the Lutheran Ministerium of Pennsylvania, has been president of the General Synod and the General Council, and has served the University of Pennsylvania as a trustee since 1850. He has published *Early History of the Lutheran Church in America* (1857), *Family Prayers*, and one volume of a translation of the *Halle Reports* (Reading, Pa., 1882).

H. E. JACOBS.

Schaeffer, DAVID FREDERICK, D. D.: Lutheran pastor and theologian; b. at Carlisle, Pa., July 22, 1787; graduated at the University of Pennsylvania 1807; studied theology privately; pastor at Frederick, Md., 1808, until within a year or two before his death. He conducted a private theological seminary, and directed the studies of a number of most useful pastors. He was one of the most active founders of the Theological Seminary at Gettysburg, and of the General Synod, of which body he was secretary for a number of years from its founding. He edited *The Lutheran Intelligencer*, the first English periodical in the Lutheran Church of America. D. at Frederick, Md., May 5, 1837. H. E. JACOBS.

Schaff, PHILIP, S. T. D., LL. D.: b. at Coire, Switzerland, Jan. 1, 1819; studied at Coire, Stuttgart, Tübingen, Halle, and Berlin; took the degree of B. D. and passed the examination for a professorship in Berlin 1841; traveled as tutor of a Prussian nobleman through several European countries; returned to Berlin and lectured in the university on exegesis and church history 1842-44; was called to a professorship in the theological seminary of the German Reformed Church

of the U. S. at Harrisburg, Pa. He moved to New York during the next year, Dec., 1891, was secretary of the New York Sabbath school committee 1904-09, and delivered lectures on sacred history in theological seminaries at Andover, Hartford, and New York. He was Professor of Sacred Literature in Union Theological Seminary, New York, from 1870 to 1887, when he became Professor of Church History. He received the honorary degree of D. D. from the University of Berlin, 1884, the University of St. Andrews 1887, and the University of the City of New York 1893; the degree of LL. D. from Amherst College, 1876; was elected member of the Leipzig Historical, the Netherlands, and other literary societies in Europe and America. He was one of the founders and honorary secretaries of the American branch of the Evangelical Alliance, and was sent in 1869, 1872, and 1876 as representative to Europe to make arrangements for the general conference of the Alliance, which, after a second postponement in consequence of the Franco-German war, was held in New York City, 1875. He was also one of the Alliance delegates to the Emperor of Russia in 1871, to interfere with him in behalf of the religious liberty of his subjects in the Baltic provinces. He took part in the founding of the Presbyterian Alliance in London 1876, and was prominent in the first Presbytery council at Edinburgh 1877, in the second at Philadelphia 1880, in the third at Belfast 1884, and in the fourth in London 1888. He visited Bible lands in 1877. He was president of the American Bible revision committee, which he organized in 1871 at the request of the English committee, and he went to England in 1875 to negotiate with the British scholars and university press about the terms of co-operation and publication of the Anglo-American revision, and attended repeatedly the meetings of the English revisers in December Chamber (the last time in 1884). He was also sent as delegate to the fifth centennial of the University of Basel 1886, and to the eighth centennial of the University of Bologna 1889. In 1892 he celebrated the semi-centennial of his professorship. See *Berlin 1892 to New York 1897*; *Semecentennial of Philip Schaff*, privately printed New York, 1900. He died in New York, Oct. 20, 1893.

His Schaff's books are mostly historical and exegetical. He wrote *History of the Apostolic Church* (New York, 1853; Edinburgh, 1855; Leipzig, 1904, etc.); *History of the Christian Church* (English and German; New York and Leipzig, 1857; revised more than doubled, New York and Edinburgh, 2d ed. 1889-93, 7 vols.); *Creeds of Christendom* (New York and London, 1876, in 3 vols.; 4th ed., rev. and enlarged, 1885). He edited the Anglo-American reproduction and selection of Lange's *Critical, Theological, and Dogmatical Commentary on the Bible* (1864-80, 25 vols.); an *International Reading Commentary*, with illustrations and maps (New York and Edinburgh, 1879-80, 4 vols.); a *German Encyclopedia*, based on Herzog (New York and Newburgh, 1880-81, 11 vols.; 3d ed., rev., 1891, 4 vols., including *Encyclopedia of Living Divines* and the *Nine and Five Names Library of the Fathers* (New York and Oxford, 1888, etc.). In addition he wrote a great number of minor treatises, including *The Principles of Pneumatology* (1845); *Practical Edition of the Heidelberg Catechism*, with its history to the tercentenary celebration (1863; rev. ed. 1866); *John Bunyan* (New York, 1875); *Literature and Poetry* (1879). His last work was *Theological Propædæa: a General Introduction to the Study of Theology, Exegetical, Historical, Systematic, and Practical* (New York, 1893). Several of his works have been republished in Germany, England, and Scotland, and translated into French, Italian, Dutch, Greek, Hungarian, Arabic, Chinese, Hindustani, and Japanese.

Revised by S. M. JACKSON.

Schaffhausen, shaf-haw-sen: the northernmost canton of Switzerland, bounded N. by the grand duchy of Baden and S. by the Rhine, Area, 114 sq. miles. It consists mostly of a number of valleys, which slope toward the Rhine and are very fertile. Wheat and other kinds of grain, fruit and wine of superior quality, hemp and flax are extensively cultivated; the rearing of cattle and the manufacture of wool and silk are important. Pop. (1888) 37,788.

Schaffhausen: capital of the canton of Schaffhausen, Switzerland; on the Rhine, 8 miles above the celebrated fall (see map of Switzerland, ref. 2-G). It is an old, curious little town, with some manufactures of ironware and silk goods. Pop. (1888) 12,402.

Scharf, shärf: ARNOLD EUGENIUS FAIRBANKS: political economist; b. at Nuremberg, Württemberg, Feb. 24, 1811; studied theology at Tübingen, where he became Professor

of Political Economy in 1861. He took an active part in politics, sitting in the Württemberg Landtag from 1862 to 1868, and holding the office of Minister of Commerce in Austria for a short time in 1871. On the downfall of the ministry in the same year he went back to Stuttgart, and devoted himself to economic studies. His works prove him to belong to the historical school of economists who have broken with the traditions of Adam Smith and the exponents of laissez faire. His chief writings are *Die Nationalökonomie* (1861), 2d ed., published under the title *Das gesellschaftliche System der menschlichen Wirtschaft* (1872); *Kapitalismus und Sozialismus* (1876); *Ursprung des Sozialismus* (1874; Eng. trans. 1900); and *Die Ausbeutung der Sozialdemokratie* (1902). F. M. COLBY.

Schamyl, sham'il, warrior and prophet of the tribes of the Caucasus; of Tartar origin; b. in Daghestan in 1797. From 1824 to 1831 he took an ardent part in the holy war which Kadi Mullah proclaimed against Russia. A self, he claimed to be the messiah, or elect envoy of God. Twice coming to life when apparently dead, exceedingly safe and thoroughly sincere, he made the Circassians recognize his pretensions. So from 1837, during twenty-two years, he was their sagacious and generally successful leader in their resistance to Russia. In 1859, hemmed in on all sides and cut off from escape, he was made prisoner and carried to Russia. There he remained ten years, being treated with great honor and kindness. In 1870 he went on a pilgrimage to Mecca, and died at Medina in 1871. A marvellously handsome man, daring, eloquent, always master of himself, an economical and judicious administrator, he maintained an absolute supremacy over his lawless followers, who feared him as a wizard and revered him as a saint. K. A. G.

Schandorph, shän'dörf, SOREN KRISTIAN FREDERIK: poet and novelist; b. at Ringsted, Denmark, May 8, 1804. Originally an idealist, he soon adopted the literary methods of the new school. As a delineator of the life of the Danish peasantry and lower middle class, he is, perhaps, without an equal. To great power of observation he adds a keen humor, which sometimes borders on cynicism. His most ambitious work is a novel dealing with Danish peasant conditions, *Thomas Frø's Historie* (two parts, 1851). Among his other publications may be mentioned *Fru Proceus*, *Førstefinger og Skæder* (From the Provinces, Tales and Sketches, 1877); *Uden midtpunkt* (Without Center, 1878); *Skræfede Børn* (The Forester's Children, 1884); *Det gamle Apotek* (The Old Drugstore, 1885); *Fra Isle de France og fra Sørd Amt* (From L'Isle de France and from Sørd District, four tales, 1888); *Stillebejv-Folk* (Quiet Folk, 1889); *Past og Junker* (Past and Cavalier, 1902). D. K. D.

Scharnhorst, GERHARD JOHANN DAVID VON: general; the organizer of the Prussian military service; b. at Herdman, Hanover, Nov. 12, 1756; entered the Hanoverian army in 1776; became a lieutenant of artillery in 1780, and soon afterward teacher in the school of artillery in Hanover. He served with the allies in the Netherlands 1793-95. Having attracted much attention by his military writings, he was invited to enter the Prussian service, and became in 1801 director of the military academy of Berlin. His lectures here became quite celebrated, but his ideas called forth a strong opposition from the older military men, and in 1803 he was removed to the staff, where he advanced to the rank of general. After the Peace of Tilsit, in 1807, he took charge of the whole administration of military affairs in Prussia until 1810, when he was compelled to retire at the request of Napoleon. He continued to exercise a decided influence, and it was chiefly due to his energy and his ideas that Prussia in 1813 was able to place a large and effective army in the field. He was wounded at Grouchy'schen, and died at Prague June 28, 1815, on his way to Vienna to persuade Austria to join the allies against Napoleon. See *Life*, by Lehmann (Leipzig, 1898-97), and von Boyen's *Erinnerungen* (1891). F. M. COLBY.

Scharwenka, shäer-ren'ka, PHILIP: composer and teacher; b. at Samter, Posen, Prussia, Feb. 16, 1847. In 1865 his family moved to Berlin, and Philip began study in Kullak's New Academy, and on completing his studies he remained with the academy as a teacher. He is a fine pianist, and has composed largely for his instrument. D. E. H.

Scharwenka, XATRA: composer and teacher; a younger brother of Philip Scharwenka; b. at Samter, Prussia, Jan. 6, 1850; also studied at Kullak's New Academy. He made his first appearance in Berlin as a pianist in 1869, and re-

mained there as a teacher till 1873. In 1877 he produced his first piano concerto. Since then he has composed largely for the piano and for orchestra, and also has written an opera, *Mataswintha*. In 1890 he visited the U. S. on a concert tour, and the next year he settled in New York, where he established a conservatory of music. D. E. H.

Schauffler, showf'fler, WILLIAM GOTTLIEB, D. D., LL. D.: missionary; b. at Stuttgart, Germany, Aug. 22, 1798; resided in Russia during his youth; studied theology, and went to Turkey as an independent missionary 1825, but having soon convinced himself that he needed more thorough training, removed to the U. S. in 1827; graduated at Andover Theological Seminary 1830; was ordained Nov. 14, 1831; was missionary to the Jews in Constantinople, Turkey, 1831-55, and after that to the Moslems; he translated the entire Bible into Hebrew-Spanish and into Turkish, the New Testament, the Pentateuch, and Isaiah in the latter language having been printed in Germany under his supervision; and published an *Essay on the Right Use of Property* (1832). He was also author of a work entitled *Meditations on the Last Days of Christ*. D. in New York, Jan. 26, 1883.

Schaumburg-Lippe, showm'boorch-lip'pe: a principality and state of the German empire, between Hanover and Westphalia. Area, 131 sq. miles; pop. (1890) 39,183. The southern part is hilly and well wooded; the northern is flat, and here is found lake Steinhudermeer, occupying an area of 22,000 acres. The actual revenue in 1892-93 was 1,096,516 marks; the public debt in 1891 was 510,000 marks. Capital, Bückeburg; pop. (1890) 5,186.

Schedone, skā-dō'nā, BARTOLOMEO (called also SCHIDONE): painter; b. at Modena, Italy, in the latter part of the sixteenth century. He was supposed to have been a pupil of the Caracci, but his paintings seem to show a deep study of Correggio and Raphael. He worked in the palace and in the cathedral of his native city. His chief works are a *Madonna di Field*, at the Academy of Parma, the *Birth of Christ*, and a *Madonna*, at Loreto. His pictures at Capo di Monte, Naples, were painted for his generous patron, Duke Ranuccio of Parma. He is also well represented in the Louvre. He distinguished himself as a portrait-painter. He died at Parma in 1615 of grief at having lost a large sum of money through gambling. W. J. STILLMAN.

Scheele, shā'le, KARL WILHELM: chemist; b. at Stralsund, Pomerania, at that time a Swedish possession, Dec. 19, 1742; studied chemistry in Stockholm and Upsala, and settled in 1777 as apothecary at Köping, near Stockholm, where he died May 21, 1786. By his comprehensive chemical analyses he discovered tartaric acid, manganese, chlorine, baryta, glycerin, the pigment called Scheele's green, and the coloring-matter of Prussian blue. His papers were collected and published in French, English, German, and Latin (*Mémoires de Chimie*, 2 vols., Paris, 1785-88). In his *Chemical Observations and Experiments on Air and Fire* (Leipzig, 1777; translated into English, London, 1780) he described oxygen, unaware of its previous discovery by Priestley.

Scheele, KNUT HENNING GEZELIUS, von, D. D.: bishop; b. at Stockholm, Sweden, May 31, 1838; educated at Upsala, where he became Professor of Theology in 1879, whence he was appointed Bishop of Gotland, with residence at Visby, in 1885. He visited the U. S. in 1893 as special representative of the King of Sweden at the tercentenary of the Decree of Upsala, celebrated by the Swedish Augustana Synod. Among the more important of Bishop von Scheele's works is a work on symbolics, published in both Swedish and German, and an outline of the same subject in Zöckler's *Handbuch der Theologischen Wissenschaften*. H. E. J.

Scheele's (sheelz) Green, or **Swedish Green**: name given to the arsenite of copper. Scheele prepared it by slowly pouring a hot solution of 11 parts of arsenious oxide in 32 of potash into a hot solution of 32 parts of blue vitriol, with constant stirring. Sharples says the best results are obtained when a solution of 2 parts arsenious oxide and 8 parts cryst. carb. soda is mixed with a solution of 6 parts blue vitriol. The product is a yellowish-green powder, consisting essentially, according to Sharples, of $\text{Cu}_2\text{As}_2\text{O}_5 \cdot 2\text{H}_2\text{O}$, or CuO , 51.49; As_2O_3 , 41.93; H_2O , 7.93. It may or may not contain basic sulphate and carbonate of copper, according to the proportions and degree of dilution of the materials. *Parrot green*, *pickel green*, and many varieties of *Brunswick*, *Newwed*, and *mineral green* and *blue*, consist of Scheele's

green with more or less hydrate, basic sulphate, or basic carbonate of copper, and sometimes considerable gypsum. Scheele's green is little used in the U. S., being replaced by the more brilliant SCHWEINFURTH GREEN (q. v.).

Revised by IRA REMSEN.

Scheffel, JOSEPH VIKTOR, von: poet and novelist; b. at Karlsruhe, Germany, Feb. 16, 1826; studied law and German philology at the Universities of Heidelberg, Munich, and Berlin; practiced law for several years; traveled in Italy; and after his return, devoted himself entirely to literary pursuits. In 1854 he published his famous *Trompeter von Säckingen*, an epic poem of great poetic charm, and in 1858 his great historical novel *Ekkehard*, a story of the tenth century. Both of these works were little noticed at first, until the great events of contemporary German history and the subsequent establishment of the empire gave rise to a renaissance of German antiquity. Scheffel's artistic description of German life of the past, his delightful humor, and true patriotic feeling, then led to his being imitated by a host of followers, and for a long time the historical novel was the literary fashion of Germany. He became equally popular as a lyric poet, especially by his *Gaudeamus* (1868), a collection of lyrics of quaint and exquisite humor, many of which became favorite student songs. His *Bergpalmen* (1870), a later collection of poems, is less popular, though it probably contains his best lyric productions. D. Apr. 9, 1886. JULIUS GOEBEL.

Scheffer, ARY: historical and portrait painter; b. at Dordrecht, Holland, Feb. 10, 1797; son of Johann Baptist Scheffer, historical painter (1773-1809); pupil of Guérin in Paris; officer Legion of Honor 1825. He was not in sympathy with either the academic or classic style of painting taught by his master, nor with that of the new school of romanticists led by Delacroix and Géricault, and he formed a style of his own, more sentimental than vigorous and healthy. He was a devoted adherent of the Orleans family, and accompanied the Duc d'Orléans to the siege of Antwerp. After returning to Paris, he painted pictures of military scenes for the Versailles Museum, and when the Revolution of 1848 broke out he assisted the king and his family to escape from Paris, and retired to Holland. He went to England later, and returned to Paris after the *coup d'état* of 1851, but kept aloof from politics. D. at Argenteuil, France, June 15, 1858. One of his most noted pictures, *The Sultane Woman* (1827), is in the Louvre. Other works are in the museums at Versailles, Nantes, Marseilles, Montpellier, and Amsterdam, and in the National Galleries in London and Berlin. WILLIAM A. COFFIN.

Scheldt, skelt (anc. *Scaldia*, Fr. *Escaut*): the most important river of Belgium. It has its rise in a small lake in the department of Aisne, France, and by a circuitous passage enters Belgium near Tournay; thence flows N. N. W. past Tournay, province of Hainault, at Hérisson becomes the boundary of this province and East Flanders, and at Escamaffles becomes the common boundary between West and East Flanders; thence N. N. E., past Oudenarde to Ghent, where it receives the Lys on the left; thence E. S. E. to Dendermonde and N. N. E. to Antwerp, at which point it becomes a noble stream, with a fine harbor sufficient for the largest ships. Leaving Antwerp, its course is N. W. The island of South Beveland divides it into two arms; the left, or south, known as The Hond or West Scheldt, and the most important, enters the North Sea near Flushing. The right, or north, called the East Scheldt arm, is divided again by the island of North Beveland before it flows into the sea. It has an entire length of 210 miles, and is navigable to Condé, near its source. Among its numerous affluents, the Scarpe, Lys, and Darne, from the left, and the Dender and Rupel, from the right, are the most important. A system of canals connects this stream with the principal cities of Belgium. The entrance to the river is rendered somewhat difficult for large vessels by sandbanks which form at its mouths. These mouths are almost opposite that of the Thames, thus increasing its commercial and naval importance. Revised by M. W. HARRINGTON.

Schelling, shelling, FRIEDRICH WILHELM JOSEPH, von: philosopher; b. at Leonberg, a village near Stuttgart, Württemberg, Jan. 27, 1775; d. at the baths of Ragatz, Switzerland, Aug. 20, 1854. His father, distinguished as an Orientalist, was a country clergyman who became prelate at Maulbronn; he directed his son's education. In his sixteenth year young Schelling entered the theological seminary at Tübingen, and studied theology in connection with philosophy and

philosophy. In his seventeenth year (1792) he wrote a thesis on the degree of matter of philosophy, taking as his theme the origin of evil as set forth in Gen. III. As early as 1799, he has come to an ethical historical sense, and philosophizes of antiquity, whose mission it appears to outline his own important theory, developed to later life. In the spring of 1799 he went to Leipzig, and there remained for two years. He had already published his essay *On the Age as Transition of Philosophy*, in which he had repudiated the Kantian doctrine, and pointed out the common source of the two main theoretical and practical, subjective and objective, as well as the theory of a faculty of knowing which could grasp the unconditional ground of these two sides—a faculty or activity which he called "intellectual intuition." At Leipzig he pursued studies in mathematics and natural science, and paid special attention to medicine. His attitude toward Fichte's system was at first that of an expectant, afterwards that of a critic. He put forth his ideas in the *Philosophy of Nature* (1797) and *Concerning the World Soul* (1799), indicating his departure from his standpoint. The *Science of Knowledge*, by Fichte, had made the ego all in all and nature a mere subordinate affair. Consciousness being regarded as the essential principle, and the end as the highest, ethical science was the sole outcome, and the natural sciences, as well as all partially unconscious activity of man as displayed in art, religion, poetry, and the metaphysics, was ignored. Schelling's function was to call attention to this unconscious evolution of Reason—the side of the absolute ego which Fichte had slighted. Schelling, however, went so far in this new direction as to make Nature a perpetual pole of the absolute, with Mind as the other, apparently influenced in this by Spinoza, who had made "thought and extension" the two poles of his "substance." Accordingly, the union of the ideal with the real, of mind with matter, was the ultimate principle with Schelling's system. In whatever art this union was to be found. The beautiful is the highest realization of the Absolute, and the "history" which the whole creation moves." This standpoint was criticised subsequently by Hegel, who reduced the supernatural realization of the highest principle to the human soul as above its mere incarnation, which then sinks into a subordinate phase of spiritual life as a mere preliminary stage thereof, a step in its progressive development. If the beautiful is the highest principle, human life, a soul divorced from body, becomes a mere abstraction, and with this God, as supernatural, loses consciousness and perfection. Schelling remained almost entirely silent from 1802 to 1803, during the period of the activity of Hegel, whose system was that of Schelling, with the essential modification of substituting religion for art as the highest activity, and indeed preferring conscious thought as based on theology or speculative philosophy to all other forms. He seems to have felt this defect in his system, and after the death of Hegel (1831) to have developed his system from this amended basis. He calls, therefore, his earlier system, which lays so much emphasis on nature-philosophy and art, his negative system, and his later one, in which he endeavored to make freedom the highest ideal, his positive system. From Leipzig he was called to Jena (1799), partly through the interest of Goethe, who was attracted toward the philosophy of nature. At this time he came into contact with and exercised a powerful influence upon the romantic school, becoming intimate with the Schlegels, Novalis, Pries, and others.

If Fichte may be regarded as building his system chiefly on Kant's *Critique of Practical Reason*, Schelling certainly builds upon the *Critique of Judgment* and the *Metaphysical Principles of Natural Science*. Kant's use of the forces of attraction and repulsion for the construction of matter suggested an entire system of philosophy in his fertile mind. Matter became the principle of matter and of mind as well. In 1804-05 he edited *The Journal of Speculative Science*, and set forth the doctrines of this fundamental conception, showing how the giant mind of the world descends from its sleep in nature to consciousness in man. In 1806 appeared his dialogue, *Demos*, or *On the Natural and Human Principles of Things*, in which the theory of freedom and divine providence in the style of the Platonic *Timaeus*. In the same year he associated himself with Hegel for the publication of *The Critical Journal of Philosophy* (Tübingen, 1806-08), the latter furnishing the greater part of the material for it. In his *Lectures on the Method of Academic Study*, delivered in 1802 and published the next year, he gave the outline of his entire system in a popular form.

The tendency toward mysticism here makes its appearance, and is quite marked in his works written during the next few years. In his *Philosophy and Religion* (1804) he makes substance and materiality to be the result of a lapse from the Absolute, to recover from which lapse is the object and goal of human history. Theosophical doctrines appear in his essays *On the Philosophy of Nature* (1806) and *On the Relation of the Human Arts to Nature* (1807). The influence of Franz Baader upon Schelling belongs to this period, and is manifested in the noteworthy treatise, *Philosophical Inquiry into the Nature of Human Freedom* (1809), in which he seems to follow Jacob Böhm in his theological distinctions. In this treatise also, which does not strictly accord with his system of transcendental idealism already given, the stress that he lays upon freedom and personality indicates the first appearance of his latest system, which he called his "positive philosophy." He defended his system against the charges of naturalism, Spinozism, and atheism in a controversial work against Jacobi in 1812. In 1808 he had gone to Munich as secretary of the Academy of Arts and Design. When in 1826 the University of Munich was founded, after the removal of that at Landshut, Schelling became professor, and for a time formed the chief attraction of the university. At Erlangen in 1820 he wrote the *Philosophy of Mythology* and the *Philosophy of Revelation*, mythology, according to his view, being an imperfect revelation. In 1834, upon the occasion of the publication of Hubert Decker's translation of Cousin's estimate of French and German philosophy, Schelling wrote a preface for it, and criticized the Hegelian philosophy as being merely negative, and as substituting logical abstractions for the living and real. The dialectic of Hegel he regarded as a fiction of hypostatization, whereby self-movement is ascribed to the idea. In his lectures on the history of modern philosophy, delivered at Munich, he unfolded this critical view more fully. Ten years after Hegel's death, Schelling became his successor at the University of Berlin, and in his opening lecture (1841) endeavored to unite his earlier and later systems, pronouncing the system of Identity to be the necessary negative phase of his entire philosophy, and needing only to be supplemented by his philosophy of mythology and revelation, which he regarded as the positive phase. The publication (1842) of the substance of his lectures at Berlin, from notes taken by Paulus and Fraunstaedt, showed very clearly that the work on freedom already mentioned lay at the basis of his later views. He distinguished in God, after the fashion of Böhm, (1) a blindly necessary or unpremeditated Being—the primordial "abyss" of the divine nature; (2) the three potencies of the essence of God; (3) unconscious will, the cause *materialis* of creation; (4) conscious will, the cause *efficiens*; (5) *causa finalis*, the union of the two—that by which all things are made that are made; (6) the three Persons, who proceed from the three potencies by overcoming the first or unconscious phase by means of the theogenic process. These Persons are the Father, Son, and Spirit—the possibility, the power, and the completed deed of overcoming that "primordial abyss of unconsciousness." In nature only potencies are at work; in man, personalities. Both Schelling and Fichte laid great stress on the distinction between Pauline and Johannine Christianity. Schelling makes three periods of Christianity: (a) Petrine, or Catholicism; (b) Pauline, or Protestantism; (c) Johannine, or the Church of the future.

The two sons of Schelling (Karl, P. A. and Hermann) published a complete collection of his writings (Stuttgart and Augsburg, 1856-61) in 14 vols., of which the first division, in 10 vols., contains the works published during his life, arranged in their chronological order, while the second division, in 4 vols., gives what had remained unpublished, and is chiefly the exposition of his later system. Schelling's works have not been, to any great extent, translated into other languages. His introductions to the *Sketch of a System of Nature-Philosophy* and to the *System of Transcendental Idealism* (1799), and the famous *Method of Academic Study*, however, have been translated and published in *The Journal of Speculative Philosophy*. His *Life* was written by Phil G. vols. 1867-71). WILLIAM T. HARRIS.

Scheltopu'sie, or **Scheltopu'sik**: a lizard (*Pseudopus palasi*) inhabiting Sicily and parts of Southern Europe, devoid of external limbs and clothed, except for a space on either side of the body, in a complete armor of small bony plates. It reaches a length of nearly 3 feet, and feeds on insects, birds, and small quadrupeds. F. A. L.

Schem, shem, ALEXANDER JACOB: author; b. at Wiedenbrück, Germany, Mar. 16, 1826; studied at the gymnasium of Paderborn 1839-43; at the university of Bonn 1843-45, and at that of Tübingen 1845-46; edited Westphalian newspapers 1849-51; removed to the U. S. 1851; was Professor of Hebrew and of Modern Languages at Dickinson College, Carlisle, Pa., 1854-60, after which he devoted himself to literature in New York, chiefly in the departments of geography and statistics; edited ecclesiastical almanacs for 1860 and 1868-69; wrote for religious and political newspapers; aided Rev. George R. Crooks in the preparation of his *Latin-English School Lexicon*; was one of the editors of *The Methodist* and of *The Methodist Quarterly Review*; was a contributor to Appletons', McClintock & Strong's, and Johnson's *Cyclopedias*, and prepared a revised American edition of a *Conversations-Lexicon* in the German language (12 vols., 1869, seq.). D. at West Hoboken, N. J., May 21, 1881.

Revised by A. OSBORN.

Schemnitz, shem'nits: a large mining-town in Hont county, Northern Hungary; on the Schemnitz; 65 miles N. by W. of Budapest, at an elevation of 1,300 feet above the sea (see map of Austria-Hungary, ref. 5-G). It has a celebrated mining-school with chemical laboratories and a fine collection of minerals. The mines, which yield gold, silver, copper, and iron, extend below the city. Pop. 15,265.

Schenck, skenk, ROBERT CUMMING: diplomat; b. at Franklin, O., Oct. 7, 1809; graduated at Miami University in 1827; studied law and was admitted to the bar, beginning practice at Dayton; member of State Legislature 1841 and 1842, and member of Congress 1843-51; U. S. minister to Brazil, and employed on diplomatic missions to Buenos Ayres, Montevideo, and Paraguay 1851-54. Appointed brigadier-general of volunteers on the outbreak of the civil war in the U. S., he commanded a brigade at the battle of Bull Run July 21, subsequently in Western and Northern Virginia; engaged at the battle of Cross Keys Apr., 1862. At the second battle of Bull Run he was severely wounded and incapacitated until December, when, having meanwhile been promoted to be major-general from Aug. 30, he was placed in command of the Eighth Army-corps and Middle department. He resigned from the army Dec., 1863, and resumed his seat in Congress, having been re-elected, serving at the head of the committee on military affairs and that of ways and means; appointed minister to Great Britain Dec. 22, 1870; resigned 1876, and resumed the practice of law in Washington, D. C., where he died Mar. 23, 1890.

Schenck, WILLIAM EDWARD, D. D.: clergyman; b. at Princeton, N. J., Mar. 29, 1819; was educated at Princeton College and Seminary with one year in the study of law between the two courses; pastor at Manchester, N. J., 1842-45; Hammond Street church, New York, 1845-48; First church, Princeton, N. J., 1848-52; superintendent of church extension in the Presbytery of Philadelphia 1852-54; secretary, 1854-86, and editor, 1862-70, of the Presbyterian board of publication; permanent clerk of the General Assembly (Old School) 1862-70; and vice-president of the American Colonization Society since 1877. Dr. Schenck has published many minor works and several books, including *Children in Heaven*; *Historical Account of the First Presbyterian Church of Princeton, N. J.* (Princeton, 1851); *God our Guide*; *The Fountain for Sin* (1867-68; translated into German); *Church Extension in Cities*; *General Catalogue of Princeton Theological Seminary* (1881); and *Necrological Reports of Princeton Theological Seminary* (1874-84).

C. K. HORT.

Schenectady: city; capital of Schenectady co., N. Y.; on the Mohawk river, the Del. and Hudson and the N. Y. Cent. and Hud. River railways, and the Erie Canal; 17 miles W. of Albany (for location, see map of New York, ref. 4-J). It has connection with the West Shore Railroad at South Schenectady and with the Fitchburg at Scotia, on the opposite side of the river, and local roads connect it with Saratoga and Troy. The city is located in one of the most beautiful portions of the renowned Mohawk valley. The older parts are along the river-bank, the modern are on the heights which surround the valley here. The supply of water is by the Holly system. The city has gas and electric lights and an electric street-railway.

Public Buildings.—Among the notable public buildings are the Ellis Hospital, Children's Home, Home of the Friendless, Free Public Library, the Van Curler opera-house, and a State armory.

Churches and Schools.—Schenectady has 21 churches and

4 missions, the former divided as follows: Methodist Episcopal, 3; Roman Catholic, 3; Baptist, German, Presbyterian, Protestant Episcopal, and Reformed, each 2; and African, Congregational, English Lutheran, German Lutheran, and Jewish, each 1. There is a Y. M. C. A., with a commodious building. The city is the seat of UNION COLLEGE (q. v.), the academical department of Union University, and of Union Classical Institute, a preparatory school. The public-school system comprises graded schools, occupying six modern buildings, having about 2,500 pupils, and costing annually about \$41,000. There are two parochial schools, a business college, and several private schools.

Finances and Banking.—The city receipts for the year ending Feb. 28, 1894, were \$444,114, and expenditures \$415,977; the debt was \$470,569, and the property valuation \$9,399,186. In 1895 there were two national banks with combined capital of \$200,000, a State bank with capital of \$100,000, and a savings-bank with deposits of \$1,500,000.

Business Interests.—The manufacturing industries are numerous and extensive, and include the main plant of the Edison General Electric Company, the Schenectady Locomotive-works, Westinghouse Agricultural Works, car-works, copper and sheet-iron works, foundries, 3 knitting-mills, mica-insulator works, shawl-factory, women's underwear mill, shirt-factory, planing-mills, boat-yards, and carriage, varnish, and sash and blind factories. There are 3 dailies and 4 weekly newspapers.

History.—Schenectady is one of the oldest cities in the State. It was settled by Arent Van Curler in 1661; patented in 1684; burned by the French and Indians, who massacred all but sixty of its inhabitants in 1690; created a borough in 1765; incorporated as a city in 1798; and had almost its entire business portion burned in 1819. Pop. (1880) 13,655; (1890) 19,902; (1895) estimated, 24,000.

EDITOR OF "DAILY GAZETTE."

Schenkel, DANIEL: theologian; b. at Dögerlin, Zurich, Switzerland, Dec. 21, 1813; studied theology in Basel under de Wette and Hagenbach, afterward in Göttingen; was appointed pastor at Schaffhausen in 1841; Professor of Theology at Basel in 1849, and in 1851 at Heidelberg. He became professor emeritus in 1884. He edited *Allgemeine Kirchenzeitung* (1852-59) and *Allgemeine Kirchliche Zeitschrift* (1859-72), and *Bibel-Lexicon* (1869-75, 5 vols.); wrote *Das Wesen des Protestantismus aus den Quellen des Reformationszeitalters beleuchtet* (3 vols., 1846-51; 2d ed. 1 vol., 1862), which defended the thesis that Protestantism had for its end rather to found a new community of believers than a new theology or polity. This idea he again developed in his *Das Prinzip des Protestantismus* (1852). Up to this time he was orthodox, but with his *Christliche Dogmatik vom Standpunkte des Gewissens* (2 vols., 1858-59) he came out on the liberal side, and this altered position is yet more plain in his *Das Charakterbild Jesu* (1864; translated into English by W. H. Furness, 1866), which represents Jesus as a mere man without miraculous power. He was the founder of the German Protestant Union. D. at Heidelberg, May 21, 1885.

Schenckendorf, MAX, von: poet; b. at Tilsit, Germany, Dec. 11, 1783; studied law at the University of Königsberg; practiced his profession until the breaking out of the wars of liberation in 1813, when he entered the Prussian army. Though unable to fight on the battle-field, on account of the lameness of his right arm, he inspired his comrades by his excellent war-songs. Many of these songs, which appeared in the collection of his *Gedichte* (1815), possess the true ring of popular poetry, and, like the war lyrics of Körner and Arndt, they were a powerful help in arousing German patriotism against the tyranny of Napoleon. See A. Hagen, *M. von Schenckendorf* (1863). JULIUS GOEBEL.

Scherer, she-rär, EDMOND HENRI ADOLPHE: critic; b. at Paris, Apr. 8, 1815; was educated in the Collège Bourbon, Paris; studied theology at Oxford, England, and Strasbourg, and was in 1845 appointed Professor of Exegesis at Geneva. His views of the inspiration of the Bible having undergone some modification, he resigned his chair in 1852 and settled in Paris, where he became one of the leaders of the liberal movement within the Protestant Church. For many years he wrote literary and political articles for *Le Temps*. Elected a member of the Legislative Assembly in 1871, he took an active part in politics. D. at Versailles, Mar. 16, 1889. His principal theological works are *De l'état actuel de l'Eglise Réformée en France* (1844); *La Critique et la Foi* (1850); *Alexandre Vinet, sa vie et ses*

Amis (1892); *Mélanges de littérature religieuse* (1899), often reprinted. He also published *Études religieuses ant. et hist.* (1899) (London, 1900).

Schayer, Isidor (WILHELM); philologist; b. at Hildesheim, August 26, 1841; studied Germanic philology at Vienna under Franz Pfeiffer, and later at Berlin under Jacob Grimm and Karl Brüllhoff; was Professor of German Language and Literature at Vienna 1868-72, at Bonn 1872-77, at Berlin 1877-96, D. Aug. 6, 1896. While a student he was made by Müllenhoff coeditor of the famous *Deutsch-amerikanische Prosa- und Poesie aus den VIII.-XII. Jahrhunderten*, and by his masterly treatment of the difficult questions of text criticism and philological interpretation in this work he at once attracted the attention of German philologists. In 1868 he published *Zur Geschichte der deutschen Sprache*, in which he made use of the results of comparative philology far more extensively and successfully than had hitherto been done in this field, and opened new fields for numerous researches by the application of advanced methods borrowed from the natural sciences. A number of studies in the history of German literature, *Deutsche Studien* (1870), *Monumente der D. Dichtung im 11 und 12 Jahrhundert* (1875), *Wissenschaftliche Studien der deutschen Gegenwart* (1875), *Die Anfänge des Romanismus* (1877), *Das Goethes Erbe* (1879), etc., gave evidence of the thoroughness with which he applied himself also to the investigation of the history of German literature. The results of these studies he embodied in his famous *Geschichte der deutschen Literatur* (1880), a masterpiece which has been translated into English. His essays on Goethe were published under the title *Aufsätze zum Goethe* (1890), and his minor writings were collected in the *Goethe-Schriften* (1896), with an excellent preface by Rudolf Dittber. See W. Dittber, *W. Schayer in Deutsche Literaturgesch.* (1880); Johannes Schmidt, *Goethe-Jahrbuch* (1887); W. Schayer (1887); L. Schmidt, *Goethe-Jahrbuch* (1888); *Lehrbuch der deutschen Literatur* (1887). J. G.

Schere, Johannes; historian; b. at Hohenhausen, Württemberg, Dec. 2, 1817; studied philosophy and history at Tübingen; was appointed Professor of History at the Polytechnische School at Zurich in 1860. He was a very precise writer, who indulged in strange oddities of diction and style, and as a critic was for a time very influential in German literature. His principal works are *Geschichte der deutschen Literatur* (3d ed., Leipzig, 1854); *Geschichte der englischen Literatur* (Leipzig, 1854; 3d ed. 1883); *Schiller und seine Zeit* (Leipzig, 1859, several editions); *Geschichte der deutschen Prosa* (Leipzig, 1860; 4th ed. 2 vols., 1874); *Wörter, ihre Art und sein Leben* (Leipzig, 3 vols., 1860-65); 4th ed. 1867. D. Nov. 21, 1886.

Revised by J. GOSCHL.

Schörrer, Johann, Karl, von; sailor and traveler; b. at Vienna, Austria, May 1, 1821. In company with Dr. Rudolf Wagner he made a scientific journey through North and Central America and the West Indies 1852-55, and on his return published (with Wagner) *Reisen in Nordamerika* (Leipzig, 1856), *Die Republik Costarica, and Wanderungen durch die Mittelamerikanischen Freistaaten*. He was one of the members of the Novara expedition round the world 1857-59, and wrote the narrative *Beschreibender Theil der Reise der österreichischen Fregatte Novara* (3 vols., 1861-62, and numerous editions) and *Naturlich-kommerzieller Theil der Novara-Expedition*. From green-leaves which he brought from America was first prepared. Schörrer was knighted and was commissioned to edit the commercial statistics of the Austrian empire. In 1869-70 he was chief of an Austrian scientific expedition to Eastern Asia, of which he published a narrative. Besides the works mentioned he is the author of many scientific papers, and a volume of commercial statistics, *Wirtschaftsstatistik* (1880). He edited (in German) *Novara's history of Guatemala*. H. H. S.

Schepareff, Aleksandr (ALEXANDER VIKTOROVICH); astronomer; b. at Navigliano, Piedmont, Italy, Mar. 4, 1835; studied at Turin, Berlin, and Pulkova; became director of the observatory at Milan, 1869, and is best known for his remarkable discovery of the relation between the orbits of comets and meteors. His observations on the surface of the planets Mars are also of much note, as well as his conclusions, not yet fully established, that the planets Venus and Mars, in their relation around the sun, always present the same face to it, as the moon does to the earth. He is the author of *Astronomical Theory of Shooting Stars* (1867). *The Phenomena of Copernicus in Antiquity*; and of numerous scientific works. S. NEWCOMB.

Schiedon, Bartholomew; See SCHIEDON, BARTHOLOMEW.

Schiedam, schied-dam; town of the Netherlands, province of South Holland, on the Scheldt, 24 miles W. of Rotterdam (see map of Holland and Belgium, vol. 6-12). It is a neat and well-built place, and has fine buildings, among which the town-hall and exchange are the most remarkable. Its principal industry is gin-manufacturing, for which it has many distilleries and malt-works. Large herds of cattle and swine are fed from the refuse of the distilleries, and an extensive trade is carried on. Pop. (1891) 25,960.

Schiff, Moyses, M. D.; professor of physiology; b. at Frankfurt-on-the-Main, Germany, Jan. 28, 1833; educated in the same city; demonstrator of ornithology in the University of Frankfurt till 1852; Professor of Comparative Anatomy in the University of Bern 1852-62; Professor of Zoology in the Instituto di Perfezionamento at Florence 1862-70; Professor of Physiology in same institute 1870-78; then took the chair of Physiology in the University of Geneva. His principal works are *Muskel und Nervensystem* (Leipzig, 1856); *Untersuchungen zur Physiologie des Nervensystems* (Frankfurt, 1858); *Untersuchungen über Zerkleinerung* (Würzburg, 1860); *Lezioni di Fisiologia sperimentale* (Florence, 1865; 2d ed. 1870); *Leçons sur la Physiologie de la Digestion* (2 vols., Turin, 1867); besides various papers on physiology, translated into French (5 vols., vol. 5, 1890).

Schiller, Hermann, Ph. D.; professor of pedagogy; b. at Weithelm, Baden, Nov. 7, 1829; studied at gymnasium, Weithelm, and at the Universities of Heidelberg and Kelten; gymnasial professor at Weithelm, 1852-68; Karlsruhe 1868-72; gymnasial director at Constant 1872-76; director of gymnasium and of the seminary, and professor in the university, Giessen, since 1876. Schiller ranks among the foremost leaders of the new educational movements in Germany. His pedagogical writings and the practical application of his theories in his training-school, connected with the Giessen gymnasium, have been largely instrumental in shaping the methods for the professional preparation of teachers for the higher schools of Prussia. In literary activity and in devotion to the solution of problems pertaining to the secondary schools he may be classed with Dr. G. Frick (d. at Halle, 1893); to these two practical school-men are due in large measure the new life and scientific spirit of the German gymnasia. His principal works are: 1. Historical, *Geschichte des christlichen Kaiserreichs unter der Regierung des Nero* (1872); *Geschichte des röm. Kaiserreichs* (2 vols., 1880-88); *Handbuch der röm. Staats u. Kriegsalterthümer* (2d ed. 1892); *Lehrbuch des griech. u. röm. Geschichte* (1891). 2. Pedagogical, *Didaktischen Vermächtnis des Herodot* (3d ed. 1892); *Handbuch der praktischen Pädagogik* (3d ed. 1894); *Lehrbuch der Geschichte der Pädagogik* (3d ed. 1894); *Die einheitliche Gestaltung u. Vereinfachung des Gymnasialunterrichts* (1890); *Pädagogische Seminarium für das höhere Lehramt* (1890); *Haushalt und Schularbeit* (1891); *Vorträge über Schulgesundheitspflege* (1893). Since 1870 Schiller has been a frequent contributor to the leading educational journals. J. E. RUSSSEL.

Schiller, Johann Christoph Friedrich, von; poet; b. in the town of Marbach, in Württemberg, Germany, Nov. 10, 1759. His father was a military surgeon, who was made captain in the army for his services in the Netherlands and Bohemia. His mother, Elizabeth Kodweis, was a baker's daughter, with some natural taste for music. As a boy, Schiller exhibited signs of a highly imaginative and spiritual nature, and his ambition was to become a clergyman. But Duke Karl of Württemberg insisted, against the wish of the parents, on having the boy educated in a new academy—the Karl's School—which he had founded according to the most approved plan of military discipline. Theology was not taught in this academy; Schiller, therefore, entering at the age of fourteen, first selected law, but afterward changed to medicine, in which branch he graduated in his twenty-first year. There can be no doubt that the rigid, soulless discipline to which he was subjected for seven years was one cause of the reckless, rebellious spirit which breathes through his earliest works. Even before leaving the academy he had written his play of *The Robbers*, and after his graduation and appointment as military surgeon to a regiment in Stuttgart, he published it at his own expense. The impression it made was immediate and universal; the time was ripe for a revolt in literature against the French classicism which had governed the intellectual tastes of Europe for a century. Baron Dürberg, then di-

rector of the theater at Mannheim, announced *The Robbers* for representation on the stage, and Schiller, being refused leave of absence, went to Mannheim without it, and witnessed the first successful performance of the play Jan. 18, 1783. On his return to Stuttgart he was arrested and temporarily imprisoned; the duke endeavored to exact a pledge from him that he would write no more poetry, and the probability of sterner measures being taken induced Schiller to take refuge in flight. In September of the same year, under an assumed name, in company with a musician named Streicher, he left Stuttgart, and for nearly a year afterward remained in concealment on an estate belonging to the noble family of Wolzogen, near Meiningen. During this time he completed his plays of *Fiesco* and *Intrigue and Love*. The first of these, rejected by Dalberg, was finally produced at Mannheim, and became so popular that the author was offered the post of dramatic poet to the theater there, with a meager salary. He accepted the position, undertook also the editing of a new dramatic periodical, *Thalia*, and remained in Mannheim until the spring of 1785, when an invitation from Körner (the father of the famous poet, Theodore Körner) drew him to Leipzig. Soon afterward he followed Körner to Dresden, and was supported in the most generous manner by that faithful friend during two years while writing his tragedy of *Don Carlos*, his historical sketch *The Revolt of the Netherlands*, the romantic fragment *The Ghost-seer*, and a number of lyrical poems. In the summer of 1787 Schiller visited Weimar for the first time, and made the acquaintance of the authors Wieland and Herder. He also met his future wife, Charlotte von Lengefeld, whom he returned to see the following summer, and in the garden of the Lengefeld family at Rudolstadt first met Goethe. The interview has a special interest from the fact that these poets, destined to be such friends and collaborators, disliked each other at first sight. Nevertheless, it was through Goethe's influence that Schiller early in 1789 was offered the place of Professor of History at the University of Jena. He at first hesitated to accept on account of want of preparation, but he was tired of his homeless life, and saw in the appointment the possibility of marriage. His opening lectures were remarkably popular. He married Charlotte von Lengefeld early in 1790, and devoted himself to a life of study and creative activity. But during the following year he was brought to the verge of the grave by an inflammation of the lungs; the report of his death was circulated, and he was already so well known beyond the boundaries of Germany that two Danish noblemen, the Prince of Augustenburg and Count von Schimmelmarmann, sent him the sum of 1,000 thalers annually for three years, in order that he might rest and recover his strength. His *History of the Thirty Years' War* was published in 1793, and in the autumn of that year he returned to Würtemberg, with his family, and remained until the following spring, his visit being wisely ignored by the duke. Through consultation with the publisher Cotta a literary periodical called *The Hours* was projected, and this led to the most important crisis of his life. Goethe's co-operation was too important to be overlooked; the two poets discovered unexpected points of sympathy, and soon became united in a personal and literary friendship as noble as it is rare in history. Schiller soon freed himself from the influence of Kant, which had for a time interrupted his poetical activity, but which had also been of great influence on his artistic development; stimulated by Goethe, he wrote his finest ballads and lyrics, and was greatly encouraged by the success of his periodical, *The Hours*. His plan for a great drama based on the history of Wallenstein was resumed, and the completion of the work as a trilogy or triple drama in the year 1799 placed him at once in the first rank of authors. His ill health, however, made it more and more difficult for him to discharge the duties of his professorship at Jena; a closer intercourse with Goethe became an intellectual necessity, and in the year 1800, after the grant of a liberal pension by the duke, Karl August, he removed to Weimar. His friendship with Goethe drew upon both the bitter hostility of most of the secondary authors of Germany, and many attempts were made to estrange the two great friends. The splendid rhythm, rhetoric, and artistic completeness of form of Schiller's *Song of the Bell*, *The Diver*, and his classical ballads bore down all narrow criticism, and secured his fame as a poet in the universal judgment of the German people. His *Wallenstein* was a great success upon the stage; not less so his *Maria Stuart*, which appeared in 1800, and the *The Maid of Orleans*, in 1801. In the year 1802

Schiller was ennobled by the emperor, Francis II. His next work, *The Bride of Messina* (1803), was an attempt to unite the stately formalism of the antique Greek chorus with the free romantic element of modern dramatic art. Notwithstanding passages of rare lyrical beauty, the experiment can not be considered successful, although the play is occasionally given on the German boards. *William Tell*, which appeared in 1804, although poetically inferior to *Wallenstein*, was Schiller's greatest dramatic success. He visited Leipzig and Berlin when it was produced, and was received with the greatest popular enthusiasm. There was a chance of his obtaining the post of director of the royal theater in Berlin, but the duke doubled his pension in order to retain him, and Schiller was also unwilling to relinquish his intercourse with Goethe. He began a new play, *Demetrius*, and was well advanced in the work when, in the spring of 1805, his failing vital power reached its limit. A simple cold apparently turned the balance, and on May 9, he died. A dissection showed that under no circumstances could his life have been prolonged for more than six months more. His remains were exhumed in 1826, placed in a granite sarcophagus, and transferred to the vault of the grand ducal family, where they now repose beside those of Goethe. While as a poet Schiller holds one of the most prominent places in German literature, ranking next to Goethe, his influence as a philosopher and critic must not be overlooked. Quite early in his literary career we discover a pronounced talent for philosophy, a talent which he afterward, by the careful study of Kant's system, developed to so great an extent that he ranks among Germany's greatest thinkers. His philosophic studies were, however, not directed to the logical operations of the human mind, but rather to ethics and aesthetics, and a number of essays (*Ueber Anmuth und Würde*, 1793; *Ueber das Erhabene*, 1793; *Briefe über die ästhetische Erziehung des Menschen*, 1795, etc.) give evidence of the profoundness with which Schiller grasped and solved the most difficult problems. In these brilliantly written essays the rigidity of Kant's ethics and the one-sidedness of his aesthetics are overcome, and the innermost thoughts of the great classical period of German literature, which culminate in the advancing of a modern ideal of humanity superior to that of the Greeks, find their powerful philosophic expression. The results of his philosophic studies Schiller with a remarkable skill undertook to turn into poetry in his famous philosophic poems (*Das Glück*, *Der Genius*, *Das Ideal und das Leben*, etc.), the like of which no other literature possesses. The influence of philosophy on Schiller's critical activity is also quite evident. He stands next to Lessing as a critic of German literature. While the former carefully established the subtle formal distinctions between the various branches of poetry, and laid down the laws which govern poetic production accordingly, Schiller discusses chiefly the nature of poetry and its different branches, inquiring besides into the psychological operations of the poet's mind. To him we owe the best critical estimate of Goethe's genius (*Correspondence with Goethe*), and his famous essay on *Nature and Sentimental Poetry* has influenced literary criticism to the present time.

In Schiller the interest belonging to individual character is associated with his genius, and lends to it the magnetism which accompanies universal popularity. On the hundredth anniversary of his birth, in 1859, a "Schiller fund," amounting to several hundred thousand dollars, was created in Germany, and the annual income is devoted to the assistance of needy authors, some fifteen or twenty of whom are now wholly or partially supported from this source. All the principal cities of Germany have erected statues in his honor. The unselfish devotion of his life to his art is recognized with a fervor which takes no note of his early irregularities; and without ever having made the slightest profession of democracy he is everywhere celebrated in Germany as the poet of the people. The explanation of this fact must be sought for in the sincerity of his nature, no less than in the persecution of which he was temporarily the object. Carlyle finely says of him: "He was a high ministering servant at truth's altar, and bore him worthily in the office he held."

Schilling, Johannes sculptor; b. at Mittweida, Saxony, June 22, 1839; studied sculpture in Dresden, Berlin, and Rome; settled in 1856 at Dresden, and was appointed professor of the academy in 1868. The first work which attracted attention was *Amor and Psyche*. Among his later works are the Schiller monument in Vienna, the war monument in Hamburg, the monument of the Archduke Maximilian at Trieste and the great national monument on the site of the Niederwald overlooking the Rhine, which was erected by Emperor William I. in 1893.

Schisma (v. fr. from Lat. *schisma* = fr. *exigere*, a pull, schism, dovry of *exister*, to split): a division in the Church on points of worship and discipline. A schismatic is one who separates himself, or improperly cuts off others from the Church. The New Testament word refers to differences rather than divisions. Some of the chief divisions, either voluntary or forced, are the Eusebians (second and third centuries), Novatian (251 A. D.), Millenian (386), Donatists (411), Arian (first under Damasus 353; second under Marcellus 361), Nestorian (431), Monophysites (453). The great schism between the East and West (about 884) arose from sacerdotal rivalry, the conflict concerning courts of appeal between Pope Nicholas I. and Photius, Patriarch of Constantinople, limits of jurisdiction, doctrines, and rites. Their mutual excommunication dates 1054. The papal schisms concerning the election of popes were 963, 1159, 1164, 1169, 1271, and the great schism, with rival courts at Rome and Avignon, 1378-1429. With discussions and eruptions for and against, some fanatical, some reforming, but in their separation from the Church differences of doctrine were unbridled, and generally they were called heretics.

Stethopoda (Gr. *stethos*, with chest; *poda*, claws, and a foot, *stethi*, foot); an order of crustaceans (see Malacostraca), the members of which are small and shrimp-like, and differ from the true shrimps (Decapoda) in having six pairs of locomotor appendages, and, besides, two pairs of accessory jaws which are pediform. All these feet are two-segmented. The present tendency is to dismember the group, distributing its members between the mysids and the euphausiidae forms. The species of *Mysis* are remarkable, from the fact that the auditory organs are in the tail. On the sides of the body and abdomen of the euphausiids are series of eye-like organs, which have recently been shown to be photophorescent. The species, nearly a hundred in number, are almost entirely marine, but one species has been found in the lakes of Sweden as well as in Lakes Michigan and Huron.

Schlagintweit, also **Schlagintweit**: the name of several travelers and authors: **HARNO HERMANN VON Schlagintweit**, b. Mar. 14, 1826, d. at Munich, Jan. 19, 1882; **ALBOL**, b. Jan. 4, 1828, studied at Kachgar, Turkestan, Aug. 26, 1857; **HONERT**, b. Mar. 10, 1831, d. at Gießen, June 6, 1885. They were the sons of an oculist in Munich; were early distinguished by their enthusiastic study of physical science, especially geology. Twice they explored the Alps, and communicated the results of their researches in *Untersuchungen über die physikalische Geographie der Alpen* (1850) and *Neue Untersuchungen* (1854), which attracted general attention. From 1851 to 1858 they undertook, supported by the King of Prussia and the British East India Company, comprehensive explorations of the Himalayas, Tibet, Hindustan, and Siam, the results of which were communicated in *Reise in die Himalaya, Nippon, in India und High Asia*, with an atlas of panoramas, views, and maps (1860-64), and *Reisen in Siam und Cochinchina* (1869-80), written by Hermann alone. Hebert also traveled extensively in North America, and wrote in 1870 *Die Pacific-Eisenbahn in Nordamerika*.

born in 1971 *Californicum, Land and Leuts*, and *The Miramones* (2d ed. 1979). —HARRISON, In 1924 received the honorary citizenship of SAKU, OREGON, because of his ascent of the Klamath Mountains. —A fourth brother, EARL, b. July 7, 1863, studied first law at Berlin, afterward Oriental languages and history, and published *Buddhismus in Tibet* (1903). —*Die Kulturgeschichte der Indier* (1906); *Die Könige von Tibet* (1906). —A fifth brother, KENNETH, b. Mar. 23, 1864, entered the Bavarian army, and fell in the battle of Königsberg, July 20, 1905. He published *Der Spanisch-mexikanische Krieg* (1905).

Schlegel, AUGUST WILHELM (1792; studied philology under the famous Chr. G. Heyne at Göttingen; was private tutor at Amsterdam; lectured at Jena 1796-98; was appointed professor at Jena in 1798; went to Berlin in 1801, where he lectured on art and literature. He traveled for several years with Madame de Staël; was private secretary of the Crown Prince of Sweden during the wars of liberation. In 1810 he joined Madame de Staël at Paris, and remained with her until her death in 1817. In 1818 he was appointed Professor of Art and Literature at the University of Bonn, where he died May 12, 1845. Schlegel began his literary career as a critic and translator of English, Spanish, and Italian poets. Some of his reviews, as those on Schiller's *Königler* and Goethe's *Bernard and Dorothea*, may still be considered classic specimens of literary criticism. His translation of Shakespeare, which he began to publish in 1797, and which was continued and finished by L. Tieck and Wolf Haselstein, made the great English poet one of the German classics. In 1798 he founded with his brother Friedrich the *Athenäum*, a periodical which became the chief organ of the romantic school, the new literary movement started by a number of young writers in opposition to the extreme classicism of Goethe and Schiller. Though Schlegel was one of the principal leaders of this new movement, he never participated in the eccentricities of his brother in advocating the return to Catholicism and medieval feudalism. He was the representative of the sound elements in romanticism, and as such he exerted a great influence upon the development of the mental life in Germany. While his own poetic attempts, though perfect in regard to form, lack the true poetic spirit, his name is to be mentioned among the founders of the study of German antiquities, of Sanskrit and comparative philology. His best work, besides his masterly translations, is his *Vorlesungen über dramatische Kunst und Literatur* (1809), a book which places Schlegel as a critic very near to Lessing. See Haym, *Die Romantische Schule* (1870); Retzlir, *Die Romantische Schule* (1879); Bernays, *Zur Entstehungsgeschichte des Schlegelschen Shakespeares* (1872); L. Minor, *A. W. Schlegels Vorlesungen über schöne Literatur und Kunst* (1884); D. Fr. Strauss, *Kleine Schriften*.

Schlegel, FRIEDRICH, von: poet and critic; b. at Hanover, Germany, Mar. 10, 1772; studied philology at Göttingen and Leipzig; lived in Berlin and Jena; lectured in Jena 1801, in Paris 1802; studied Oriental languages, and especially Sanskrit, in Paris; joined, with his wife, the Roman Catholic Church at Cologne in 1808; settled finally in Vienna, where he lived, lecturing and writing, to the end of his life. D. on a lecturing tour at Dresden, Jan. 11, 1829. In his early writings—*Ueber das Studium der griechischen Poesie* (1798); *Die Griechen und Römer* (1796)—Schlegel is still influenced by the critical writings of Schiller, especially by the latter's essay on *Nature and Sentimental Poetry*. He points to Greek art as the model of artistic perfection, and praises Goethe as the "dawn of true art and beauty." Soon afterward he became the chief theorist and organizer of the romantic school, which aimed at an entire reformation of German literature. For this purpose he founded and edited, with his brother August Wilhelm, the *Atenäum* (1798-1800), in which he advocated most zealously the doctrine of romanticism. As illustrations of his critical principles he wrote the drama *Atena* (1802), the indecent novel *Lucinde* (1799) and a great many poems, interesting documents for the study of romanticism, but without poetical value. He exerted far greater influence on the science of linguistics and the history of literature. His book *Ueber die Sprache und Wissenschaft der Indier* (1808) opened the way for the study of Sanskrit in Germany, and his *Vorlesungen über die Geschichte der alten und neuen Literatur* (1815) marks the beginning of the science of the history of literature in Germany. Like his brother he directed the attention

of his contemporaries to the beauties of Old Germanic poetry, and by his letters on art in the *Europa*, a periodical which he edited while in Paris, he caused a revival in the plastic arts of Germany. But he is also, especially during the last period of his life, the chief representative of the pernicious elements of romanticism. He advocated the re-establishment not only of the papal hierarchy, but also of mediæval feudalism, and the injurious effects of his and his associates' influence in this direction were only gradually overcome. See R. Haym, *Die romantische Schule* (1870); W. Dilthey, *Schleiermacher* (1870); I. Minor, *Fr. Schlegels prosaische Jugendschriften* (1882). JULIUS GOEBEL.

Schleicher, shli'cher, AUGUST: comparative philologist; b. at Meiningen, Germany, Feb. 19, 1821; studied theology and comparative philology at Leipzig, Tübingen, and Bonn 1840-46; privat docent in science of language at Bonn 1846-48; newspaper correspondent in Austria 1848-50; appointed Assistant Professor of Comparative Philology at Prague 1850; Professor of Science of Language and Teutonic Philology at Jena from 1857; died at Jena, Dec. 6, 1868. His residence at Prague directed his interest toward the Slavic languages, which, with the related Baltic languages, became from that time central in his scientific work and interest. Though his favorite thesis, that the science of language is to be classed among the natural sciences, has not been maintained, the influence of his views has been powerfully felt in checking arbitrary empiricism and establishing stricter methods of investigation. Chief works: *Die Sprachen Europas* (Bonn, 1850); *Formenlehre der kirchenslav. Sprache* (1853); *Handbuch der litauischen Sprache* (2 vols., Prague, 1856-67); *Die deutsche Sprache* (Stuttgart, 1860); *Compendium der vergl. Grammatik* (Weimar, 1862; 4th ed. 1876); *Laut- und Formenlehre der polabischen Sprache* (St. Petersburg, 1871). BENJ. IDE WHEELER.

Schleiden, MATTHIAS JAKOB: botanist; b. in Hamburg, Germany, Apr. 5, 1804; first studied law at Heidelberg, then medicine at Göttingen, and finally botany at Jena, where he was appointed professor in 1839. In 1862 he resigned his office, and after a short stay at Dorpat (1863-64) as Professor of Vegetable Chemistry, he settled at Dresden. His principal works are *Grundzüge der wissenschaftlichen Botanik* (2 vols., 1842-49), which attracted much attention and gave rise to many controversies; it was translated into English by Dr. Lankester (1849); *Die Pflanze und ihr Leben*, translated into English by Prof. Hentfrey (1848); *Baum und Wald* (1870); *Die Rose* (1873). D. at Frankfurt-on-the-Main, June 23, 1881.

Schleiermacher, shli'er-maäh-er, FRIEDRICH ERNST DANIEL: theologian and philosopher; b. at Breslau, Germany, Nov. 21, 1768; the son of a Reformed clergyman; was brought up in the community of Moravian Brethren, receiving a profound religious impulse from them. From 1783 to 1787 he attended the pædagogium at Niesky and the seminary of the United Brethren at Barby. He completed his theological course at Halle, and after filling the positions of private tutor, assistant preacher, etc., became in 1796 the chaplain of the Charity Hospital at Berlin; in 1802 court chaplain at Stolpe, and in 1804 Professor (*extraordinarius*) of Theology and Philosophy at Halle. In 1809 he preached at the Trinity church in Berlin, and the following year received appointment as Professor (*ordinarius*) of Theology at the new University of Berlin, which position he retained till his death. During the ten years previous to going to Berlin he had studied and criticised the Kantian philosophy, and was greatly attracted by Jacobi's exposition of Spinoza. He subsequently studied and translated Plato, and did much by his lectures to encourage the study of the remains of the early Greek philosophy. His activity knew no limits. He labored to effect a union of the Lutheran and Reformed Churches on the broad basis that demanded unity in the spirit of Protestantism and allowed diversity as to doctrines and modes of worship. His failure in this led to a misunderstanding with Minister von Altenstein, which lasted for some years. D. in Berlin, Feb. 12, 1834.

The fundamental point of view of Schleiermacher's system is this: Religion is not a knowing nor a doing, but a feeling—a feeling of the universal life of the Infinite, and of the dependence of the Ego upon it. Hence, with him, religion begins with the feeling of dependence. Reflection upon this feeling gives rise to descriptions of it, and hence the statement of religious principles and dogmas. All religions are historic and positive. Among these Christianity holds a unique place, inasmuch as in it is found the recon-

ciliation with the Infinite, hence the very essence of religion itself. Upon the same framework of antithetic ideas of the universal and particular (infinite and finite, common and special, God and the Ego) he builds his system of ethics. The organizing activity of reason in the realm of the common or universal, securing identity of common usage, is the first province of ethical action—that of interchange among men. The second is that of organization in the realm of particular individuality, the province of inalienable personality. The third and fourth provinces of ethical action are not those of organization, but of "symbolism," the third being that of symbolism with identity in the realm of thought and language, and the fourth the symbolism with individuality in the realm of feeling. Corresponding to these four provinces are the four institutions: (a) State, in which each is for the whole; (b) civil society, organized for the benefit of the individual; (c) school (college, etc.), for community of culture; (d) church, "for individual symbolic activity." The most important of Schleiermacher's writings are: (1) *Discourses on Religion* (Berlin, 1799); (2) *Monologues* (1800); (3) *Confidential Letters on F. Schlegel's Lucinde* (1800); (4-7) *Four Collections of Sermons* (1801-20); (8) *Outlines of a Critique of Previous Systems of Ethics* (1803); (9) *Translation of Plato's Works* (1804-28); (10) *The Christian Faith according to the Principles of the Evangelical Church* (1821-22); (11) *Theological Encyclopædia* (1811). After his death were published (1835) lectures on the history of philosophy, dialectics, psychology, ethics, politics, and pedagogics. The lectures on the life of Jesus, which appeared in 1864, made an epoch when first delivered. According to the authority of Zeller, Schleiermacher is the greatest theologian of the Protestant Church since the period of the Reformation—"a churchman whose liberal ideas will yet prevail in regard to the union of Protestant confessions, the constitution of the Church, and the rights of conscience and individuality in religion"—"a deep-working religious teacher, who formed the heart by the understanding and the understanding by the heart—a philosopher who scattered fruitful seeds, who introduced a new era in the knowledge of Greek philosophy, and who assisted in Germany's political regeneration." He investigated the nature of religion more profoundly than any before him. Physically, he was small of stature, slightly deformed, quick and animated in his movements, his countenance kind and sympathetic. His *Autobiography* (covering only the first twenty-six years of his life) was published in 1851. His *Correspondence with J. C. Gass* appeared the following year in 4 vols. His *Biography* has been written by K. Schwartz, D. Schenkel, W. Dilthey, and others. WILLIAM T. HARRIS.

Schleitz, shli:ts: town of Reuss (younger branch), Thuringia, Germany, and residence of the reigning family; 24 miles S. S. W. of Gera, terminus of a branch railroad from Schönberg; elevation, 1,407 feet (see map of German Empire, ref. 5-F). It is well kept, has beautiful streets, tanneries, a foundry, factories of lamps, whips, and lace; also a college and schools for teachers, for deaf mutes, and for wood-carving. Near by is the château of Heinrichsruh. Pop. (1890) 4,928. M. W. H.

Schleswig, shles'wich (i. e. Bay of the Schlei): district and town of the southern part of the Danish peninsula (see map of German Empire, ref. 2-E). The district was a Danish province until 1864, when it was taken by Prussia by conquest and united two years later with Holstein to form the province called Schleswig-Holstein. The town is at the end of a slender arm of the Baltic Sea, which penetrates nearly half-way across the peninsula and is called the Schlei. Schleswig is an ancient town, was known to the Arabian geographers, and by 800 was a place of considerable commercial importance. This continued during the Middle Ages, but eventually the removal of the ducal residence, the rivalry of Lübeck and Kiel, and the silting up of the mouth of the Schlei caused its trade to decline, and it remained only of strategic interest, which, however, was lost as a result of the war of 1864. Southwest from the town are the traces of the Danewerk, a line of intrenchments connecting the Schlei with the Treene, which flows westward and empties into the North Sea. It was thrown up in the ninth century, or earlier, and was intended for the defense of the peninsula. It was used for this purpose for ten centuries, and was repeatedly renewed and strengthened until it was abandoned in 1864 by the Danish army under Gen. de Mera without striking a blow. Pop. of town of Schleswig (1890), 15,123. MARK W. HARRINGTON.

Schleswig-Holstein, province of Prussia; bounded N. by Denmark, E. by the Elbe, which separates it from Hanover, S. by the Baltic, and W. by the North Sea. Area, 14,737 sq. miles. Several islands—Römö, Sylt, Föhr and others—in the North Sea. Towns and Flensburg in the Baltic—belong to the province. A slightly elevated ridge stretches through the center of the province, sandy, gravelly, and covered with heath in Schleswig—swampy, marshy, and covered with forests in Holstein. To the E. of this ridge the surface is dominated by hills, and the coast much indented by long, narrow bays. The soil affords excellent arable land, and forests of oak and beech are numerous. To the W. the surface is perfectly level, and the ground so low that in many places it must be protected against the North Sea by high dikes; but the soil is rich and affords excellent pasture. The chief occupations are agriculture in the eastern part, and cattle-breeding in the western. Wheat, hops and fruit are raised in great quantities and thousands of swine are annually sold in Hamburg and Lunden. The fisheries in the North Sea are considerable. The province is of great importance to Prussia, partly on account of the harbor of Kiel, the best, if not the only one available for naval purposes, on the coast of Germany, and partly because of the Prussia of the mountains for maritime occupations. Pop. (1890) 1,219,523. In Schleswig about 150,000 of the inhabitants speak Danish; the Frisian language is spoken in the western districts and on the islands of the North Sea; the rest of the inhabitants speak the Low German dialect.

Revised by M. W. HANSEN.

Schley, WILHELM A. SCHLEY: naval officer; b. in Frederick, Md., Oct. 9, 1850; midshipman Sept. 30, 1866. Was in all the engagements from May 16 to July 9, 1898, which led up to the capture of Port Arthur, Mar. 21, 1894, ordered to command the newly built ship, *Thetis*, Dec. 1, 1894, the ship having been generously presented for the purpose by the Danish Government, and accepted by the President in behalf of the people. The *Thetis* was by the fleet, and followed several days later by the *Albatross*, sailed from New York May 1, bound Greely and the remains of his party at Cape Sabine June 22, took them on board, and returning, reached Portsmouth N. H., Aug. 1. Author, with Prof. James R. Selig, of *The Rescue of Greely* (New York, 1899).

Schliemann, HENRIK, HENRIK, Ph. D., D. C. L.; archaeologist; b. at Neumark, Mecklenburg-Schwerin, Germany, Jan. 8, 1822. His enthusiasm for classical antiquity manifested itself at a very early age, and when only ten years of age he wrote a Latin essay on the Trojan war, with the idea of which his name was destined to become indelibly associated. Family misfortunes compelled him to leave the gymnasium, and after a five years' apprenticeship as a grocer's clerk in the village of Bütenberg he walked to Rostock, where he embarked as a cabin-boy on a vessel bound for Venezuela (Nov. 28, 1841). The ship was wrecked on the Dutch coast, but Schliemann was saved. He then went to Amsterdam and became an office-boy in a commercial house, where he acquired a knowledge of the principal modern languages. In 1846 his employers sent him as their agent to St. Petersburg. In the following year he founded a firm of his own. In 1850, during a trip to California, he accidentally became a citizen of the U. S., having been present on July 4 of that year, when California was received into the Union. In 1852 he founded a branch establishment at Moscow, and by 1858 had amassed a great fortune. He had acquired a knowledge of Greek in Russia, and after traversing over the European continent and around the world (1860), he settled in Paris, giving himself up entirely to archaeological study. He began his excavations in the Troia in Apr., 1870, on the hill of Hissarlik, which he believed to be the site of Troy (q. v.). These excavations were continued with interruptions till 1892, and brought to a close by Dr. Dörpfeld in 1892. Schliemann's childish credulity in the historical reality of the Homeric epic had to a certain extent been validated, although many of his inferences regarding details had to be abandoned or modified. These excavations were followed up by excavations at Mt. Athos (1876), at Mycenae (1876-88), Ithaca (1878), Tiryns and Mycenae (1880-81). The discoveries at Mycenae, in particular, were not only of great intrinsic value, but they substantiated the prevalent ideas of the prehistoric civilisation of Mycenae and threw a flood of light upon the rise and development of Greek art. The results of Schliemann's excavations were described in numerous works. His Trojan excavations, he commenced in Berlin, which honored him with

the freedom of the city. He died at Naples, Dec. 20, 1890, and is buried at Athens, near the Ilissos. The best survey of his achievements, together with an admirable topographical sketch, is to be found in Dr. C. Schuchard's *Schliemann's Excavations in Archaeological and Historical Study* (translated, with an introduction of W. Leaf, by Eugene Sellers, London, 1891).

ALFRED GIVENS.

Schlösser, FRIEDRICH CHRISTOPH: historian; b. at Dorpat, Oldenburg, Nov. 17, 1779; studied theology and philosophy at Göttingen; spent several years as a private tutor in various families and as librarian to the city of Frankfurt, and was appointed in 1810 Professor of History at the University of Heidelberg, where he died Sept. 22, 1861. His principal writings are *Geschichte des 16. Jahrhunderts* (1802), often reprinted, and translated into English by Davidson, London, 1848-50; *Weltgeschichte in zusammenhängender Erzählung* (1817-24); *Naturhistorische Übersicht der Geschichte der alten Welt und ihrer Kultur* (1826-34). Written rather from the ethical than from the scientific point of view, the works of Schlösser have taken a strong hold on the popular mind, and have been especially favored by the middle classes.

F. M. COLAR.

Schlözer, AUGUST LUDWIG, von: historical writer; b. at Gaggard, Wittenberg, July 3, 1763; studied theology at Wittenberg and Göttingen; lived from 1789 to 1799 at Stockholm as private tutor, and wrote here, in the Swedish language, a history of commerce; went to Russia in 1791 with the Russian court-historiographer, Müller, and was appointed Professor of Political Science in 1794 at Göttingen, where he died Sept. 9, 1808. His principal works are his *Allgemeine nordische Geschichte* (2 vols., 1772) and his translation of Neider's *Russian Chronicle* (3 vols., 1803-09).

Schlyter, KARL JONAS: legal writer; b. at Karlskrona, Sweden, Jan. 20, 1796. He became doctor in law at the University of Lund 1816, but in 1820 moved to Stockholm, and two years later was chosen, together with H. S. Collin, to bring out a complete critical edition of the ancient laws of Sweden. After visiting the principal libraries of Sweden and Denmark Schlyter entered upon his work in 1822, which after the death of his colleague in 1838 he performed alone. Some idea of the magnitude of the undertaking may be formed from the statement that about 800 separate MSS. were examined in connection with it, the text of each collection being based upon the oldest codex. The different parts appeared as follows: *Fästgötalagen* (1827); *Östgötalagen* (1829); *Uppländalagen* (1834); *Södermanstalagen* (1835); *Västmanstalagen* (1841); *Hälsingalagen*, etc. (1844); *Gästlandalagen* (1852); *Västby stadslagen* (1853); *Skånelagen* (1859); *Könung Magnus Erikssons landslag* (1862); *Oluf stadslagen* (1863); *Könung Kristoffers landslag* (1869); and finally *Ord-bok till samlingen af Sveriges gamla lagar* (1877), not the least valuable portion of the work. D. at Lund, Dec. 26, 1895.

D. K. DORR.

Schmal'kalden, or **Smal'cald**: town; in the province of Hesse-Nassau, Prussia; at the confluence of the Schmal'kalden and Sille; 19 miles S. W. of Gotha (see map of German Empire, ref. 5-8). It has salt-works, iron-forges and steel-forges, and manufactures of white lead and paper. The famous league of the German Protestant princes was formed here in 1531. Pop. (1890) 7,316.

Schmank, SHIMON, THEODORE EMANUEL; author; b. at Lancaster, Pa., May 30, 1860; graduated at University of Pennsylvania and the Theological Seminary in Philadelphia; pastor Lebanon, Pa., since 1884; literary editor of *The Lutheran*, Philadelphia, since 1889, and a frequent contributor to *The Sunday-school Times*. His chief work is on *The Negative Criticism* (Lebanon, 1894).

H. E. J.

Schmid, SHMIT, HANSZON: theologian; b. at Harburg, Bavaria, July 31, 1811; studied at Halle, Berlin, and Erlangen; professor extraordinary at Erlangen 1848; ordinary professor 1854-81. D. at Erlangen, Nov. 17, 1885. His chief distinction was as a successful compiler. He is best known by his *Dogmatik*, a compilation of the definitions of Lutheran dogmatists of the sixteenth and seventeenth centuries, first published at Erlangen in 1843, sixth edition at Frankfurt-on-the-Main in 1876, and translated into English by Hay and Jacobs, first edition, Philadelphia, 1875; second, 1899. He also published *Geschichte der synkretistischen Streitigkeiten* (1846); *Lehrbuch der Dogmengeschichte* (Nördlingen, 1890; 4th ed. 1897); *Geschichte des Protestantismus* (1890); and a *Handbuch der Kirchengeschichte* (2 vols., Erlangen, 1890-91).

H. E. JACOB.

Schmid, LEOPOLD: cleric; b. at Zurich, June 9, 1808; studied theology at Tübingen and Munich; became professor in the priest seminary at Limburg 1831, and Professor of Theology in 1839 at Giessen. Although a strict adherent of the Roman Catholic Church, his broader and more liberal views, acquired by an extensive study of philosophy, brought him into collision with the ultramontane party. In 1849 his election as Bishop of Mentz was not confirmed by Pope Pius IX., who, however, dared not place his book, *Der Geist des Katholicismus oder Grundlegung der christlichen Irenik* (2 vols., Giessen, 1848-50), in the *Index*. The papal action led him to leave the theological and enter the philosophical faculty at Giessen. His little pamphlet *Ultramontan oder katholisch?* (1867) indicated his renunciation of the Roman Catholic Church. D. at Giessen, Dec. 20, 1869.

Schmidt, schmit, FREDERICK AUGUSTUS: theologian; b. at Leutenberg, Thuringia, Jan. 3, 1837; emigrated to the U. S. in 1841; educated in Concordia College and Seminary, St. Louis, Mo.; pastor Erie co., N. Y., and St. Peter's English church, Baltimore, Md.; entered the service of the Norwegian Synod in 1861; professor at Decorah, Ia., 1862-73; professor in Theological Seminary, St. Louis, Mo., 1872-76, at Madison, Wis., 1876-86, Northfield, Minn., 1886-90, Minneapolis since 1890. Dr. Schmidt was a chief opponent of Dr. Walther in the controversy on the subject of predestination that agitated the Synodical Conference, establishing and editing for this purpose the *Altes und Neues* (1880-85). H. E. JACOBS.

Schmidt, HEINRICH JULIAN: journalist and author; b. at Marienwerder, Prussia, Mar. 17, 1818; studied philology and history at the University of Königsberg; settled in 1847 at Leipzig as editor, afterward in connection with Gustav Freytag as proprietor of the *Grenzboten*, which supported the Prussian interest in Germany; removed in 1861 to Berlin and edited the *Berliner Allgemeine Zeitung* 1861-63; d. in Berlin, Mar. 26, 1886. Author of *Geschichte der Romantik im Zeitalter der Reformation und Revolution* (2 vols., 1850); *Geschichte der deutschen Literatur seit Lessings Tod* (3 vols., 1858); *Geschichte des geistigen Lebens in Deutschland von Leibniz bis auf Lessings Tod* (2 vols., 1860-64); *Bilder aus dem geistigen Leben unserer Zeit* (1870); *Geschichte der deutschen Literatur von Leibniz bis auf unsere Zeit* (1886). He was a much-dreaded critic, hostile to morbid romantic tendencies, and advocated healthy realism in poetry. See G. Freytag's *Erinnerungen aus meinem Leben* (1886). J. G.

Schmidt, HENRY IMMANUEL, S. T. D.: educator; b. at Nazareth, Pa., Dec. 21, 1806, where he was educated, and afterward taught 1826-29; Lutheran pastor, Bergen co., N. J., 1831-33, Boston, Mass., 1836-38, Montgomery co., Pa., 1844; professor at Hartwick Seminary, New York, 1833-36, Pennsylvania College and Theological Seminary, Gettysburg, Pa., 1838-43; principal of Hartwick Seminary 1845-47; Professor of German Language and Literature in Columbia College, New York, 1848-80. D. in New York, Feb. 11, 1889. He published *History of Education* (New York, 1842); *The Lutheran Doctrine of the Lord's Supper* (1852); *Course of Ancient Geography* (1860). H. E. JACOBS.

Schmidt, JOHANNES: comparative philologist; b. at Prenzlau, Prussia, July 29, 1843; educated at the Marienstifts Gymnasium in Stettin and at the Universities of Bonn and Jena; docent in Comparative Philology at Bonn 1868; assistant professor in Bonn 1873; autumn of same year professor in Graz; since 1876 Professor of Comparative Philology in Berlin; member of the Royal Prussian Academy. Author of *Zur Geschichte des indogerm. Vocalismus* (1871-75); *Die Verwandtschaftsverhältnisse der indogerm. Sprachen* (1872); *Die Pluralbildungen der indogerm. Neutra* (1889); *Die Urheimath der Indogermanen und das europäische Zahlssystem* (1890); also important articles in *Kuhn's Zeitschrift für vergleichende Sprachforschung*, of which since 1875 he has been coeditor with E. Kuhn. In wide and accurate scientific acquaintance with the details of the grammatical structure of the Indo-European languages he is unexcelled by any living scholar. BENJ. IDE WHEELER.

Schmidt-Rimpler, HERMANN, M. D.: ophthalmologist; b. in Berlin, Prussia, Dec. 30, 1838; graduated M. D. at the University of Berlin in 1861; was a military surgeon for some years, and after 1871 was brigade-surgeon at the Frederick William Institute; at that time he was appointed Extraordinary and in 1873 Ordinary Professor of Ophthalmology at the University of Marburg; in 1891 he accepted

the same chair at the University of Göttingen. His chief work, *Augenheilkunde und Ophthalmoskopie für Aerzte und Studierende* (Brunswick, 1885), has passed through several editions and has been translated into several European languages. S. T. ARMSTRONG.

Schmucker, BEALE MELANCHTHON, D. D.: clergyman and author; son of Samuel S. Schmucker; b. at Gettysburg, Pa., Aug. 26, 1827; graduated at Pennsylvania College and Theological Seminary, Gettysburg, Pa.; pastor at Martinsburg, Va., 1845-51, Allentown, Pa., 1852-62, Easton 1862-67, Reading 1867-81, Pottstown 1881-88. D. at Pottstown, Oct. 18, 1888. He was especially distinguished as a liturgical scholar and writer, being unexcelled in this department in the U. S. *The Church Book* (1867, 1892) of the General Council and *The Common Service* (1888) of all English-speaking Lutherans owe more to his indefatigable labor and investigations than to any one else. The American edition of the *Hallesche Nachrichten* was edited by him, with Dr. Mann and Dr. Germann, and furnished with exhaustive historical notes. He was secretary of the General Council's committee on foreign missions 1869-88, and secretary of the board of directors of the Theological Seminary, Philadelphia, from its founding in 1864 until his death. H. E. JACOBS.

Schmucker, SAMUEL SIMON, D. D.: theologian; b. at Hagerstown, Md., Feb. 28, 1799; educated at the University of Pennsylvania and Princeton Theological Seminary; pastor at New Market, Va., 1820-26; professor in Theological Seminary, Gettysburg, Pa., 1826-64. D. at Gettysburg, Pa., July 26, 1873. Schmucker represented the American Lutheran type of theology, as he termed it, which was characterized by indifference to the distinctive doctrines of the Lutheran Church. He advocated this tendency in his *Elements of Popular Theology*, first published in 1834; *American Lutheran Church* (1851); *Lutheran Manual* (1855); *Lutheran Symbols, or American Lutheranism Vindicated* (1856); *Church of the Redeemer* (1867), besides in numerous articles in the reviews and church papers. He wrote *The Definite Synodical Platform* (1856), as an American recension of the Augsburg Confession to be adopted by the synods of the General Synod, in which the Lutheran doctrines of original sin and the sacraments were greatly modified. He also labored in the cause of Church union, and was one of the founders in 1846 of the Evangelical Alliance. H. E. J.

Schneider, JOHANN GOTTLIEB: classical scholar; b. at Collmen, near Wurzen, Saxony, Jan. 18, 1750; began his philological studies at Schulpforta, which he continued at Leipzig, and at Göttingen under Heyne, who recommended him to Brunnck at Strassburg to aid the latter in his edition of the Greek poets. Here he added to his classical studies that extensive and thorough acquaintance with anatomy, botany, and zoölogy which gave so great value to his editions of the ancient authors who treat of those subjects. In 1776 he was appointed Professor of Ancient Languages and Eloquence in the University of Frankfurt-on-the-Oder. When, in 1811, the university was removed to Breslau, he accompanied it, holding the same office, which he resigned in 1816 on his appointment as chief librarian. Of the many valuable editions published by him may be mentioned: *Scriptores Rei Rusticæ* (4 vols., 1794-95); *Vitruvius* (3 vols., 1807-08); *Aristotle's Historia de Animalibus* (4 vols., 1812); *Works of Theophrastus* (5 vols., 1818-21); *Ælian, De naturali animalium*; *Nicander's Alexipharmaca and Theriaca*; and *Orpheus's Argonautica*. On his large *Griechisch-Deutsches Wörterbuch* (2 vols., 1797-98; 3d ed., with supplement, 1819-21) Passow based his lexicon. D. at Breslau, Jan. 12, 1822. Revised by A. GUDEMANN.

Schneider, KARL ERNST CHRISTOPH: classical scholar; b. at Wiehe, Prussian Saxony, Nov. 16, 1786; studied theology and philology at the University of Leipzig; in 1816 appointed Professor of Ancient Literature in the University of Breslau; published *De Originibus Tragædiæ* (1818); edited, with a critical commentary, *Plato's Republic* (3 vols., 1830-33; supplement, 1854); German translation of same (*Platon's Staat*), of the *Timæus* (1847), and an edition of Proclus's *Commentarius in Platonis Timæum* (1851); *Cæsar's Commentarii de Bello Gallico* (2 vols., 1840-55), with elaborate commentary; edited a portion of the *Plato in Didot's Bibliotheca Græca* (Paris, 1846-53). D. at Breslau, May 16, 1856. Revised by A. GUDEMANN.

Schneidewin, FRIEDRICH WILHELM: classical scholar; b. at Helmstedt, Brunswick, June 6, 1810; entered the Uni-

University of Göttingen, 1800; appointed in 1801 teacher in the gymnasium at Brunswick; in 1806 instructor in the University of Göttingen; in 1807 professor extraordinary, and, in 1810, regular professor. His literary activity was very great. He published *Recherches Critiques sur Platon* (Paris, 1800); *Disquisitiones Philosophicae* (1800-05); *Martinii Regimen*, with critical commentary (2 vols., 1842); *Platonis Propædia* (2 vols., 1843, and frequently reissued since); *Platonis Agrippa*; *Simondini's Ciceronis Rhetorica* (1825); *Plinius* (2d ed., 1803); *Robinus* (3d ed., 1803); *Thomassin's Géométrie* (2 vols., 1800-01, in conjunction with Lacroix); and founded the *Philologus*, the well-known classical quarterly. D. at Göttingen, Jan. 10, 1856.

Revised by A. GUDMAN.

Schmidt, JEAN VICTOR, painter; b. at Versailles, France, May 13, 1787; studied painting under David, Regnault, and Gérard, and in Italy; began to exhibit in 1810; was director of the French Academy in Rome 1840-60. D. in Paris, Mar. 11, 1870. His most celebrated pictures are *The Gypsy and the Little Child* (1800); *The Smiling of Rome* (1813); *Christ and the Little Children* (1855); *The Capuchin Preaching* (1857).

Schmidler, EDUARD: See ENCYCLOPEDIA.

Schnorr von Carolsfeld, JEROME, painter; b. at Leipzig, Germany, Mar. 26, 1794; studied painting under his father, who was a painter himself, in Vienna and Italy; was appointed professor at the Academy of Munich in 1827, and director of the picture gallery at Dresden in 1840. D. at Dresden, May 24, 1879. His principal works are his pictures in the palace in Munich illustrating the *Nibelungen* and the history of Charlemagne, Barbarossa, and Rudolf of Habsburg; his *Luther at the Diet of Worms*, and *Bibel in children's collection of wood-cuts* giving the Bible history. 340 plates, with text. His celebrated *Nibelungen* pictures are in the Königsbau, a part of the royal palace. His *Luther at the Diet of Worms* has often been reproduced in the engraver's and photographer's arts and spread all over Europe.

Revised by ROBERT STUBBS.

Schulze, GEORGE HENRY, Ph. D.; educator; b. at Allentown, Pa., Apr. 10, 1851; graduated at Capital University, Columbus, O., 1873; studied theology at Columbus, O., Tillamook, and Leipzig; pastor Canal Winchester and Martin's Ferry, O.; professor in Capital University since 1880. He has published a translation of the *Book of Enoch* from the Coptic (London, 1882); has been on the editorial staff of *The Lutheran Standard* (Columbus, O.), and is a frequent contributor to *The Bibliotheca Sacra*, *The Independent*, etc. H. E. J.

Schulze, FR. JEAN, shôl'shâr, Vicenza; legislator and philosopher; b. in Paris, July 21, 1804; began early to take an active part in political discussion as a republican; resided in 1829, 1830, and 1840 in Mexico, the U. S., East and West Indies, Africa, and devoted himself to exposing the conditions of slavery in the works *De l'Esclavage des noirs et de la législation coloniale* (1833); *Abolition de l'esclavage* (1840); *Les Colonies françaises* (1842); *Les Colonies étrangères et Haiti* (1843); *Égypte en 1846* (1846); *Le problème de l'esclavage pendant les deux dernières années* (2 vols., 1847). He was a member of the Constituent and Legislative Assemblies 1848-51, where he championed the cause of emancipation; during the empire he lived in Geneva, where he published violent attacks against it; also a *Life of Handel* (1857); after the downfall of Napoleon III. he returned to Paris, and represented Martinique in the Legislative Assembly. In 1875 he was chosen senator for life. D. in Paris, Dec. 26, 1885.

Schofield, JOHN McALLISTER, soldier; b. in Chautauque Co., N. Y., Sept. 28, 1831; graduated at the U. S. Military Academy, and attained brevet second lieutenant of artillery Jan. 1, 1855; captain May 14, 1861. From 1855 to 1860 he was Assistant Professor of Natural and Experimental Philosophy at West Point, and at the outbreak of the civil war was Acting chair of Physics in Washington University, St. Louis, Mo. Appointed major First Missouri Volunteers Aug. 26, 1861, he served with Gen. Lyon as chief of staff in the operations in Missouri, participating in the battles of Lexington and Wilson's Creek. Commissioned brigadier-general of U. S. volunteers and of Missouri militia Nov., 1861, he commanded the State troops and the district of St. Louis, and in Dec., 1862, was placed in command of the Army of the Frontier, promoted to be major-general U. S. volunteers Nov. 20, 1863, he commanded the district and Department of Missouri until Jan., 1864, when appointed to

command the Army of the Ohio; was in immediate command of the Twenty-third Corps in Sherman's Georgia campaign, participating in the almost constant severe fighting ending with the capture of Atlanta Sept. 2, 1864. In Nov., 1864, he was placed in command of the forces detached from Gen. Sherman's army to strengthen Gen. Thomas at Nashville, being constantly engaged with Hood's army invading Tennessee, and defeated it at the battle of Franklin Nov. 30, 1864; joined Gen. Thomas the next day, and commanded the Twenty-third Corps at the battle of Nashville and subsequent pursuit of Hood's army. For his services at Franklin he was appointed brigadier-general in the regular army. Transferred with his command to North Carolina and placed in command of that department Feb. 9, 1865, he occupied Wilmington Feb. 22, fought the battle of Kinston Mar. 8-10, and joined Gen. Sherman at Goldsboro May 23, 1865. Upon the surrender of Gen. Johnston's army (Apr. 9) he was appointed to execute the terms of the convention; in command of the Department of North Carolina until June, 1865. He was on special duty in Europe from 1863 to Aug., 1866; in command of the first military district of Virginia 1866-67; Secretary of War *ad interim* May, 1869-Mar., 1869, when he was promoted to be major-general U. S. army, and assigned to command of department of Missouri. In May, 1870, he assumed command of the division of the Pacific; became superintendent of U. S. Military Academy at West Point July, 1870; in command of the military division of the Pacific 1880-82; of division of the Missouri 1882-86; of division of the Atlantic 1886-88; of army 1889. In Feb., 1893, he was appointed lieutenant-general, that grade having been revived.

Revised by JAMES MANION.

Scholasticism [from Lat. *scholasticismus*, scholasticism, deriv. of *scholasticus* = Gr. *σχολαστικός*, pertaining to leisure or school, deriv. of *σχολή* (whence Lat. *schola*, school, hearing, school): in a large sense, the science of Christian theology and philosophy as presented in the schools and universities of the Middle Ages, notably those of the thirteenth and subsequent centuries. Strictly speaking, it does not mean a doctrine, nor even a system, but a method, a style, a manner of handling certain truths, which contrasts strongly with their treatment in times previous or posterior to the period in which scholasticism flourished. This method is highly technical, dialectic, analytic, implying a severe and exact use of the reasoning faculties. It is strictly syllogistic, and tends to present the doctrines of Christian theology and philosophy in a complete methodical system, in which an even balance and a due proportion shall be everywhere observed. The modern emotional element, the "personal equation," and the individualistic tendency are utterly foreign to the nature of this method, which is constructive, architectonic, unitive in its spirit, and is as tangible an expression of the large unity of the life and ideals of the Middle Ages as their cathedrals, laws, and literatures.

Aristotelianism.—It has been made a reproach to the scholastic period that it examined with excessive subtlety, and was marked by an arid formalism, infinite prolixity of treatment, barbarous terminology, etc. The excess of subtlety in the mental investigations of medieval scholars is not to be laid at the door of their method or their system, whose chief element is the employment of philosophy or trained human reason in the service of religion. It was only in the decay of scholasticism that such refinements of doubt appeared, and even then they awoke the ire of all sensible theologians, to use the words of Melchior Canus. It is not entirely true that all the scholastics are distinguished by cold formalism of style. The style of Abelard and John of Salisbury is easy, familiar, and agreeable. Dante, one of the princes of scholasticism, is the glory of Italian literature, and the preaching of the Middle Ages, the hymns, sequences, and masses, are the products of men formed in the schools, and broken by hard dialectic exercise to exact, clear thought, and a certain power of terse and rugged expression. The scholastic style in St. Thomas and St. Bonaventure has somewhat of the severe charm of the early Gothic, where the lines, proportion, and balance of all alone awake admiration. The masters of medieval philosophy had a great task—viz., to endow with noble ideals, intelligible, tangible, and familiar, a generation just issued from barbarism, and for this end the categorical explication of principles and truths was the best means; it was left to future generations and to spontaneous action to present the same in a more charming garb. For them it was enough that they made known to the best of their ability truth, duty, life, nature, man, and God, as they were in themselves and

relatively to one another. It would be unjust to tax them with their shortcomings in history and the natural sciences; those elements of human learning they borrowed from their predecessors, and they were too busy as pioneers of a mighty intellectual movement, as the schoolmasters of the young nations, to devote attention to special and minor departments of the world of knowledge, even if their value were as clear to them as to us. To one of these schoolmen, Vincent of Beauvais, we owe the famous *Speculum*, forerunner of our modern encyclopædias, in which the divisions of human science and their respective claims are justly observed and recognized. Withal, Albert the Great and Roger Bacon recognized fully the bearings of the study of nature, and the great moral poem of Dante is a study in social and political questions of the highest order. The annalists, chroniclers, and historians of the time, themselves schoolmen or trained in the schools, show an ever-widening interest in human affairs, much shrewdness, a large extent of observation, and a well-developed political sense. It may also be noted that even in the schools during the latter half of the twelfth and in the thirteenth century the technical and oratorical styles were in a constant struggle for the mastery, a phase of this movement which is well illustrated by the contemporary Alexander of Hales and William of Paris, the former representing the didactic and the latter the larger, more rhetorical manner. A glance at the weighty philosophical problems which constantly attracted the attention of the schoolmen is sufficient to impress a frank, intelligent mind with respect. They were the relations of faith and reason; the nature and means of knowledge; the reality of observations, phenomena, experience; the personality of man; the nature of the universe, immortality, the future life; the rights and duties of the factors of society, the forms and functions of government, etc. And all this, not in a loose, inconsistent, contradictory manner, but with logical coherency, and a consciousness that they were contributing in a systematic way to the creation of a great whole in which faith and reason have each the share that is demanded by the peculiar nature and office of each. The most perfect specimen of this philosophic spirit is St. Thomas Aquinas, and the most admirable of the scholastic works is the *Summa Theologica* of that stupendous genius—"a vast encyclopædia of the moral sciences, in which whatever could be known of God and man and their relations was set down; a monument severely harmonious, magnificent in design, but yet unfinished, like so many other of the great mediæval undertakings." (*Ozanam*.)

Sources of Scholasticism.—Inasmuch as this term implies a rounded and consistent body of doctrines, it sums up all previous knowledge of a higher order, and draws upon all the fountains of human learning then known. In theology the written word of God, the decisions of councils and popes, the writings of the Fathers, Church history, canon law, the liturgy, and popular religious custom and feeling, furnish the materials of the scholastic writings. In philosophy Aristotle, as known to the Middle Ages, with Boethius and the pseudo-Areopagite, form the sources of their logic and metaphysics. The schoolmen accepted without question the teachings of the Church, and proceeded to co-ordinate them by means chiefly of the Aristotelian method and principles, to illustrate, explain, and defend, to reduce the propositions of theology to formal theses, against which they marshaled all possible objections, which were answered briefly and in order, but not before the theological truth in question had been defined and proved. Thus theology grew under their hands into a perfect science, with the aid of the dialectic method, and all the teachings of the Catholic Church were built up as into a vast edifice, which had its vestibule or preparation in natural theology, its framework in the revealed and defined truths of religion, its roof or completion in their orderly presentation by the schoolmen, and its decoration in the countless services rendered by human reason to the entire process.

The Processes of Scholasticism.—The doctors of the schools wrote usually on two distinct lines. Sometimes they composed independent, original writings, and thus arose their sums of theology, their controverted and so-called quodlibetal questions. Again, they wrote commentaries on some favorite work, like the Bible, the pseudo-Areopagite, Boethius, Peter Lombard, or Aristotle. In either case they usually divided their subject-matter into parts, which were in turn subdivided into questions and articles—the bulk of the doctrine being always given in the latter, and the outlines furnished by the titles or theses placed at the head of each division and subdivision. Each article opened with a series

of formal objections, after which the doctrine, theological or philosophical, was stated, and the sufficient grounds for it assigned, whereupon the answers to the objections followed. Clear statement, compressed sentences, close dialectic reasoning, frequent fine distinction, and a sharp insistence upon the point at issue mark these brief treatises of theology, which were as pleasing to the mediæval mind as the dialogue was to that of the Greek. There is in the writings of the best of the schoolmen a magnificent play of reason, which recoils before no difficulty, reminding us often of certain wonderful feats of skill that the contemporary architects successfully attempted. Before them there had been theologians without number, and scarcely a point in theology had been left untouched. But they created the science of theology; they impressed the most rational of philosophies into its service; they mapped out all the multiplex relations between God and man, and in all this they preserved a certain free and speculative spirit, with minds turned habitually toward investigation, and, within certain limits, filled with an insatiable curiosity.

History of Scholasticism.—The origins of this method or system are not to be found in a sudden discovery and adaptation of the philosophy of Aristotle; they are as old and as deep as those of other great phenomena of the time. The philosophy of Aristotle had been handed down through Boethius, and that of Plato through the pseudo-Areopagite. Ecclesiastical science had found numberless exponents, from Bede and Isidore of Seville down to the meager annalists and collectors of canons in the darkest years of the tenth century. The rational and scientific presentation of those logical truths had been happily performed by many writers long previous to the rise of what is known as scholasticism. Usually, however, its history is said to begin with St. Anselm of Canterbury (1033–1109), in whose *Monologium* the outlines of the scholastic dialectic method are distinctly visible. Abelard, William of Champeaux, Roscelin, Peter Lombard, the Blessed Albert the Great, St. Thomas Aquinas, St. Bonaventure, and Duns Scotus mark its progress to the end of the thirteenth century, which was its true apogee, and in which its highest exponents were the Blessed Albert the Great, St. Thomas, and St. Bonaventure. Their theological systems are at once complete and grand, and awaken forever the astonishment of dispassionate students, for the keen, searching analysis of details, the regular proportions of the parts, and the successful boldness with which they are fitted together, and resist all antagonizing forces. Other great doctors of this brilliant period were Alanus of Lisle, Alexander of Hales, Henry of Gant, Richard Middleton, Peter of Poitiers, William of Paris, etc. From an early date, however, divergent currents and tendencies, arising from various sources, made themselves visible. Thus the Dominicans and Franciscans represented opposing views in theology and philosophy, and again within each great body there were fresh clefts. The second period of scholasticism covers the fourteenth and fifteenth centuries, and is marked by a tendency on the one hand to free philosophy and the other sciences from their ancillary dependence on theology, and on the other to gather from the latter all possible benefit for the practical, ascetic, spiritual needs of the soul, as opposed to the purely scientific satisfaction of the intellect. Thus the differentiation of the sciences (Roger Bacon, Raymond Lull) and the growth of mystical theology as a specific branch (Master Eckhart, Tauler, Suso, Ruysbroeck, Thomas à Kempis, the "German Theology") divide with theology proper the interest of students in this second age. It was inevitable that the succession of men like St. Thomas and St. Bonaventure should fall upon weaker shoulders, and several other circumstances combined to hasten the decline of the great intellectual movement of the thirteenth century. The Western Schism, the Franciscan controversies, and the political changes drew men's minds more to practical immediate interests, and the cultivation of dogmatic philosophy and theology was neglected for moral and legal questions. It is the age of the moralists and jurists, of the commentators on the law of the Church, and the civil law. Durandus, Occam, Pierre d'Ailly, Gerson, Capreolus, Denys le Chartreux, Gabriel Biel, and Thomas of Strassburg represent this later and weaker stage of scholasticism, previous to the Reformation.

Neo-scholasticism.—As the theology and philosophy of the mediæval schools were not a sudden and foreign importation, but the natural outgrowth of the previous literary movement, so the true Catholic theology and philosophy of

today are the legitimate heirs of the best thinkers of the scholastic period, and represent, both in spirit and in method, what was most durable and efficient in the great productions of the scholastics. The basis of positive science and the external administration of the schools and universities of the Catholic world brought about deviations, changes, and modifications more or less novel and alien to the old tradition. But during the nineteenth century there has been a steady return to the father on the part of Catholic theologians and philosophers, culminating in the encyclical letter of Leo XIII., *Æternæ Patris*. This is known as *neoscholasticism*; and that it is different from the scholasticism that it takes account of all new and stable modern progress, and combines it with the fundamental and general teachings, and with the spirit, methods, and principles of the old scholasticism, as personified in St. Thomas Aquinas, the "angel of the schools." Its influence is felt daily more and more in all Catholic universities and schools, in textbooks, sermons, and newspapers, and in the great issues of political and social life, and it certainly stands for much in the improvement of the mutual relations between the Church and modern society. There are several associations and societies, notably at Rome and Louvain, devoted to the work of popularizing this movement, in which Leo XIII. has manifested more, perhaps, than any pope in the last six hundred years, and whose intellectual possibilities are visible in his own personal character, as well as in his energetic and polemical activity.

LITERATURE.—The entire works of the scholastics are not to be had in any complete collection. The most accessible is St. Thomas's scholastic works can be procured in many cheap and portable editions. Consult in general the histories of philosophy, and in particular Houtou, *Histoire de la Scholastique*; Schmidt, *Aristoteles und die Scholastik*; Talamon, *Le scholasticisme nella Scolastica*; Cousin, *Cours de l'Histoire de la Philosophie*; Stöckl, *Philosophie des Mittelalters*; Bracht, *Die Universitäten des Mittelalters*; Vaughan, *Life of St. Thomas Aquinas*; Goussier, *Haute et la Philosophie Catholique*; Weiser and Walin, *Kirchenscholastik*, art. *Scholastik*; Leo XIII., encyclical, *Æternæ Patris* (1879).

J. J. KEANE.

SCHÖLL, MAXIMILIEN JACQUES FRIEDRICH: historical writer; b. at Maastricht, Hesse-Nassau, May 5, 1796; studied at Bonn; travelled as tutor with a literary family (1788-90, in Italy, France, and Russia; attempted different occupations until in 1814 he received employment in the Prussian consular corps; was employed as secretary at various legations and congresses. D. in Paris, Aug. 6, 1853. His literary activity was very comprehensive; the most remarkable of his works are *Ouvrage d'Histoire* (46 vols., 1801-30); *Éléments politiques ou diplomatiques* (3 vols., 1818); *Pièces choisies des Chanciers de Vienne* (6 vols., 1816); *Pièces officielles destinées à déterminer les Français, etc.* (9 vols., 1814); *Œuvres de la Litt. grecque* (6 vols., 1824-25); *Hist. de la Litt. moderne* (4 vols., 1815).

SCHÖLLER, WILHELM JAV HENDRIK, D. D.: theologian; b. at Utrecht, near Utrecht, Netherlands, Aug. 17, 1811; studied theology and philosophy at the University of Utrecht; appointed Professor of Theology in 1843 at the University of Groningen, and became the founder and leader of a liberal movement in Dutch theology called "the modern theology," which attracted much attention, not only in the Netherlands, but also in Germany and France. It was briefly extreme rationalism. The supernatural was entirely rejected and Christ was considered a mere man. He retired on a pension in 1861, and died at Leyden, Apr. 19, 1885. His principal writings, mostly translated into German and French, are: *De het oer beginsel der kerk in hare grondbeginselen* (2 vols., 1849-50; 3d ed., 1861); *Geschiedenis der Godsdienst en wetenschappen* (1861); *De erfenis van Christus* (1862); *Het evangelie naar Johannes* (1864); *De oudste geschiedenis van de christenheid de schriften des Nieuwen Testaments* (1866); *Afhandeling van de oorsprong van het christendom* (1868), his retiring address, in which he presents his theological views; *Historisch-erfelijk Bijdragen aan de afleiding van de afzake Hypothese oorsprong van den Christus der eer Hoofdbeginselen* (1862).

SCHÖMANN, GISELA PARASKEVI: Greek scholar; b. at Constantinople, January, June 28, 1750; professor and librarian at the University of Göttingen from 1823 till his death there in 1879. His chief works are *Der attische Prozess* (2 vols., revised by Lipsius, 1865) and the *Griechische Altertümer* (3 vols.; 3d ed., 1870, translated into English by E. G.

Hardy and F. S. Marz, London, 1890, and into French by L. Goussier, 1892), both standard works on the subject; *Die Lehre von den Hethen bei den Alten* (1860); and editions of Iliad; Pictarch's *Agia et Chionensis*; Cicero, *De natura deorum*; Herodotus's *Thucydides*. His minor writings, distinguished no less for their brilliant Latin style than for their intrinsic value, are collected in his *Opera* (4 vols., 1871). See Houtou's *Biographisches Jahrbuch*, ix, pp. 7 ff. ALFRED GRIMMAN.

SCHÖNBURG, FREDERICK HERMAN, Duke of: soldier; b. at Heidelberg, Germany, about 1618; served in the army of the United Provinces, afterward in the French army, where he acquired a great reputation as a strategist and tactician; held important commands in Portugal during the war of liberation, and compelled Spain to recognize the independence of that country under the dynasty of Braganza (1668), for which he was made a grandee and received a handsome pension. He was again in the French service in Catalonia 1679, where he won the grade of marshal; was at Maastricht (1678) and Charleroi (1677); left France on the revocation of the Edict of Nantes 1685; and after rendering his services for a short time to the Elector of Brandenburg was appointed by William, Prince of Orange, his second in command in the expedition to England 1689; was made Duke of Schönburg in the English peerage, Knight of the Garter, and master of the ordnance 1693; received from Parliament a grant of £100,000; took a leading part in the expedition against Ireland, and was killed at the battle of the Boyne, July 12, 1690. His brother and son succeeded in his honors and estates, but the title became extinct in 1718.

P. M. CURRY.

SCHÖNBURG, SIR HENRY HERMAN, Ph. D.: traveler; b. at Prilburg-on-the-Neckar, Prussia, June 3, 1804; resided, engaged in mercantile pursuits, at Leipzig 1823, afterward in Virginia as partner in a tobacco-factory, in which business he experienced pecuniary losses; settled on the island of St. Thomas in the West Indies 1829, devoted himself to botany and natural history; made a scientific examination of Anguilla, one of the Virgin islands, 1830, on which he prepared a report which procured him the patronage of the Royal Geographical Society; spent four years in the exploration of British Guiana, where he discovered the great water-lily named by him *Victoria regia*; published a *Description of British Guiana, Geographical and Statistical* (1840), a series of *Vues de l'intérieur de Guiana* (1840), *Recherches en Guyane* (1840), and several reports to the Royal Geographical Society, for which he received the gold medal of that body 1850, and which were translated into German by his brother Otto, and published at Berlin with a preface by A. Humboldt (1841); was at the head of the commission for surveying the frontier between British Guiana and Brazil 1841-44; published the *Natural History of the Fishes of Guiana* (2 vols., 1841-43); was knighted 1845; published a *History of Barbados* (1847) and *The Discovery of the Empire of Guiana by Sir Walter Raleigh* (1848); was British consul and chargé d'affaires in the Dominican Republic 1848-57, and consul-general in Spain 1857-64. D. at Schönburg, near Berlin, Mar. 11, 1865.—His brother, MORITZ RICHARD, took part in the second exploration of Guiana, of which he published an account in German (3 vols., 1847-48); translated some of the works of Sir Robert into German; went to Australia 1849; and has been since 1865 director of the botanical garden at Adelaide. Revised by M. W. HARRINGTON.

SCHÖNBEIN, CHRISTIAN FRIEDRICH: chemist; b. at Metzingen, Württemberg, Oct. 15, 1799; studied natural sciences at Tübingen and Erlangen; was appointed Professor of Chemistry at Basel in 1828; discovered osmium in 1829; invented gunotton in 1845. D. at Baden-Baden, Aug. 29, 1868. His principal works are *Das Verhalten des Eisens zum Sauerstoff* (1807); *Beiträge zur physikalischen Chemie* (1844); *Ueber die Erzeugung des Ozons* (1844); *Ueber die langsame und rasche Verbrennung der Körper in atmosphärischer Luft* (1845). Hagenbach wrote his *Life* (1869).

Revised by IAN KENNEDY.

SCHÖNBUNN: an imperial palace situated a few miles from Vienna, on the river Wien, built in 1744 by Maria Theresa. It contains 1,441 rooms, among which are several magnificent state-rooms, and is surrounded with a large park, containing a botanical garden, a menagerie, etc. The palace is generally inhabited by the imperial family during parts of the summer. The Peace of Vienna was signed here Oct. 14, 1809.

Schönebeck: town; in the province of Saxony, Prussia; on the Elbe; 9 miles by rail S. of Magdeburg (see map of German Empire, ref. 4-F). It has large salt-works, breweries, and distilleries, and manufactures of powder, chemicals, soap, white lead, and vinegar. It suffered much from an inundation in Feb., 1876. Pop. (1890) 14,189.

Schönfeld, Edward: astronomer; b. at Hillburghausen, Saxe-Meiningen, Germany, Dec. 22, 1828; became an assistant to Argelander at the University of Bonn, where he took an active part in cataloguing all the stars of the northern hemisphere, down to the ninth magnitude. In 1875 he succeeded Argelander as director of the Bonn Observatory and Professor of Astronomy. In 1889 he received the Watson medal from the National Academy of Sciences at Washington for his work in cataloguing the stars. D. at Bonn, May 1, 1891. S. N.

Schoolcraft, Henry Rowe, LL. D.: ethnologist; b. at Watervliet (now Guilderland), N. Y., Mar. 28, 1793; studied at Union and Middlebury Colleges; devoted himself to a scientific study of the art of glass-making, his father being a manager of extensive glass-works; began the publication at Utica in 1817 of a work on *Vitreology*, which was left incomplete through lack of patronage; made a journey through the mineral regions of Southern Missouri and Arkansas in 1817-18, of which he published an account, *A View of the Lead-mines of Missouri* (New York, 1819); obtained from Secretary Calhoun in 1820 an appointment as geologist to an exploring expedition sent to the upper Mississippi and Lake Superior copper region, and published a *Journal* (1821); was in 1822 appointed Indian agent for the tribes of Lake Superior; was the principal founder of the Michigan Historical Society (1828) and of the Algic Society of Detroit (1831), an association for the investigation of Indian antiquities; was at the head of a scientific expedition which in 1832 explored for the first time Lake Itasca and the sources of the Mississippi; negotiated in 1836 a treaty by which the U. S. purchased from the Chippewas a tract of 16,000,000 acres on the upper lakes, after which he became superintendent of Indian affairs for the northern department, and in 1839 chief disbursing agent for the same department; published *Algic Researches* (2 vols., 1839), a collection of Indian tales and legends; removed to New York 1841; issued the prospectus of an *Indian Cyclopædia* (1842), afterward carried into effect in another form; superintended at Washington the publication of a series of reports on all the Indian tribes of the U. S. (6 vols., illustrated, Philadelphia, 1851-57), containing material of great value, but unsatisfactory as a whole from lack of systematic arrangement and from unwarranted theorizing. D. at Washington, D. C., Dec. 10, 1864. Among his numerous publications were a *Narrative of an Expedition to Itasca Lake, the Actual Source of the Mississippi* (1834; reissued in 1853, along with the account of the earlier exploration of 1820); *Oneota, or Characteristics of the Red Race of America* (New York, 1844); *Notes on the Iroquois* (Albany, 1848); *Personal Memoirs of a Residence of Thirty Years with the Indian Tribes* (Philadelphia, 1851); and *Scenes and Adventures in the Semi-Alpine Regions of the Ozark Mountains* (1853).

Revised by J. W. POWELL.

Schoolmen: those philosophers of the Middle Ages whose labors were directed chiefly to adjusting the relations of the Christian religion to philosophy. See **PHILOSOPHY** (*History of Philosophy*), **NOMINALISTS**, **REALISM**, and **SCHOLASTICISM**.

Schools: collections of persons brought together and duly organized for the purpose of imparting and receiving instruction. The word school is commonly applied to an organization intended to provide elementary, secondary, or professional instruction, and not to an institution designed to offer exclusively non-professional studies of college or university grade. Thus we have elementary schools, secondary schools, normal schools, trade schools, theological schools, law schools, and medical schools, each group of which is treated below. See also **AGRICULTURAL COLLEGE**, **COLLEGE**, **COMMON SCHOOLS**, **KINDERGARTEN**, **MANUAL TRAINING**, **MILITARY ACADEMIES**, **UNIVERSITY**, etc.

I. HISTORICAL DEVELOPMENT OF SCHOOLS.

The Orient.—In India schools for the instruction of boys have existed from time immemorial. These were held in the open country, under the shade of trees, or, in case of bad weather, under primitive roofs. Exercises were first performed on the sand, then on palm-leaves with a stylus, and finally with ink. Among the Israelites great care was taken to instruct

the children, but until the Christian era, so far as is known, such instruction was limited to the family. In the year 64 A. D., however, the high priest Gamala decreed that each town should support a school under pain of excommunication. As given in the Talmud, if the number of children did not exceed 25, the school should be conducted by one teacher; if more than 25 and less than 40, there should be an assistant; if more than 40, there should be two masters. The Talmud describes in detail the duties of the teacher and the obligations of the pupil, showing conclusively that great reliance was placed by the Jews upon the effects of the training effected by the schools. Corporal punishment was inflicted only for children above the age of eleven. "After the age of six receive the child and load him like an ox." "Children should be punished with one hand and caressed with two." In case of disobedience the pupil might be deprived of food and even "struck with a strap of shoe-leather." In China the necessity of the most thorough provision for schools was inculcated by Confucius. The philosophy of the country demanded the most complete knowledge possible of the methods and characteristics of the fathers. To this end the provisions for education were systematic and universal. Huc, the famous missionary and traveler, declares that of all countries it is in China that primary instruction is most widely diffused, and another missionary asserts that "there is not a village so miserable, nor a hamlet so unpretending, as not to be provided with a school." When Japan adopted Chinese civilization, it adopted the Chinese school system, which continued until the opening of the country to European and American influences. In 1872 a law was passed providing for an elementary school for every 600 of the population. This law has been very generally carried out, and the benefits derived from it have been very great. In Egypt intellectual culture reached a very high point, but education was confined almost exclusively to the priestly caste, which guarded jealously all the sources of knowledge. Here, therefore, as in the other contemporaneous nations, schools were only imperfectly developed.

Greece.—The necessity of education in the most comprehensive sense was universally recognized among the Greeks, but schools were private and not subject to governmental supervision. The Athenian lad was put under a pedagogue (a conductor of boys, usually a slave), who took him at an early age to a *palestra* or primary school. Here the boy was taught gymnastics, reading, writing, mythology, and especially music. Homer was universally the boy's reading-book. From the *palestra* the pedagogue took his pupil to the gymnasium or secondary school. Here, as in the *palestra*, special attention was given to music, as a means of inspiring the soul with a love of harmony and order. Grammar and rhetoric were also taught. From the gymnasium the pupil either betook himself to their several vocations or, in case of special ambitions, continued their studies in the schools of the sophists or under personal private instruction. It was to such pupils that Socrates, Plato, and Aristotle gave instruction. In the *Republic* and the *Laws* of Plato and the *Politics* of Aristotle the Greek ideas of education are set forth. The prevailing thought was the harmonious development of all the powers of the pupil, physical, mental, and moral. In Sparta education was regarded as equally important, but here special stress was placed upon the training of men physically for military duty.

Rome.—With the Romans education manifested two somewhat distinct types. During the republic it inclined to the Spartan, during the empire to the Athenian. Before the second Punic war no provision was made for schools, but education was limited to the care of the family. Under the empire a severe family discipline, coupled with the Roman ideals as to the civic and military virtues, succeeded in developing a remarkable race of men. With the introduction of a taste for Greek arts and literature in the third century B. C. the era of severe simplicity gradually gave way to new ideals. Schools of philosophers and rhetoricians came into existence, and the younger children were intrusted, as at Athens, to the care of pedagogues. But even under the empire education was not taken up as an affair of the state; each teacher followed his own method. Varro wrote of grammar, rhetoric, history, and geometry, and his works had much influence for several generations. Of more importance were the *Institutes of Oratory* by Quintilian, who gives a detailed account of the ideal education of an orator from the earliest childhood to manhood.

Middle Ages.—During the period of the invasions the [re-

railing turbulence made the establishment of schools impossible. Even the Christian Fathers were divided in their opinions as to the influence of a comprehensive education. Tertullian rejected all pagan learning, and St. Augustine, after his conversion, renounced his taste for classical poetry and eloquence. St. Basil, on the other hand, recommended that young Christians become familiar with the orators, poets, and historians of antiquity; and St. Jerome wrote a treatise on the education of girls which has elicited warm commendation. But the ideas of the time were monastic in their nature, and early monasticism was unfavorable to the establishment of schools of any kind. Here and there groups of young Christians, aspiring to the priesthood, gathered around the priest for instruction, but these were scarcely worthy the name of schools. Sidonius Apollinaris, writing in the fifth century, says: "Teachers no longer have pupils, and learning languishes and dies." It was not till the age of Charlemagne that an attempt was made to provide for systematic instruction. This great ruler not only established a kind of itinerant school, which followed the king on his travels, with Alcuin at its head, but he decreed the establishment of schools in various parts of his domain. Nothing gives a more depressing picture of the intellectual feebleness of the time than the description of the methods of instruction contained in Einhard's *Vita Caroli Magni*. (See Guizot, *History of Civilization in France*, lect. xxii.) Thus, notwithstanding the enlightened efforts of Alcuin, who has aptly been called the first minister of education in France, neither the clergy nor the people by their intelligence or their appreciation responded to the efforts that were put forth. No one of Charlemagne's successors took up his thought, and the Council of Aix-la-Chapelle, in 817, decided that no more day-pupils should be admitted to the conventual schools. It was not till the twelfth century that SCHOLASTICISM (*q. v.*), by the introduction of the Aristotelian processes of reasoning, awakened some intellectual activity. But even this was chiefly a mental gymnastic, and gave distorted views of all the affairs and relations of life. The fact that Abelard by the renown of his eloquence could gather about him in Paris thousands of students shows that there was an interest in learning, which, under wise, inspiring, and systematic guidance, might perhaps have accomplished important results. But no such guidance was at hand. It is not till that general awakening called the Renaissance that schools of any considerable importance were established. There were, it is true, ecclesiastical schools for the education of priests, but their methods were crude and their results narrow and distorted. In 1363 choirs and benches were forbidden, because they encouraged pride. The rod was freely used. "Day and night," wrote an abbot to Anselm, "we do not cease to chastise the children, but they grow worse and worse." "In the fifteenth century," says Montei, in describing the schools, "the rods are twice as long as those in the fourteenth." But it would be erroneous to suppose that the conditions generally prevalent in Europe were universal. On the contrary, after the rise of Mohammedanism in the seventh century, schools were established in all the principal cities in the East as well as in the West. The most celebrated were at Bagdad, Damascus, Cordova, Salamanca, and Toledo. Here grammar, philosophy, chemistry, medicine, and the various branches of mathematics were studied with great success. They gave algebra and trigonometry their modern forms, determined the size of the earth by measuring a degree, made a catalogue of stars, invented the pendulum clock, and discovered alcohol, as well as nitric and sulphuric acids. Their schools were largely attended by the most enterprising and aspiring youth of the other countries of Europe, and their influence was considerable in awakening the thought which led to the Renaissance.

The Revival of Learning.—It is of importance to note that the first general intellectual movement of modern Europe was through the universities. Cambridge, Oxford, Bologna, Salerno, Naples, Paris, Prague, Vienna, and Heidelberg were established before the beginning of the fifteenth century. The moral and intellectual tone of the universities was low, but their influence in behalf of learning soon made itself felt. Students had special halls or colleges in which they lodged and boarded under official superintendence. At first the universities were free associations, but they were soon recognized as elements of power by the Church and the rulers, and soon received special privileges. Before the end of the twelfth century contemporary authorities assert that at the University of Bologna there were 12,000 students and

a little later that at Paris there were 20,000. These were grouped into four faculties—those of theology, philosophy, law, and medicine, the classification which is still prevalent in Germany. During this period schools were greatly assisted by the writings of the most enlightened teachers. Besides Abelard (1079–1142), Gerson, chancellor of the University of Paris (1363–1429), Vittorino da Feltre of Padua (1379–1446), and Æneas Silvius, afterward Pope Pius II. (1458–64), contributed greatly to improve the methods and spirit of instruction. In the secondary schools, which were mostly conventual, "the seven liberal arts"—viz., Latin, grammar, dialectics, rhetoric, music, arithmetic, geometry, and astronomy—were regularly, though not very efficiently, taught.

The Reformation.—The great religious upheaval of the sixteenth century was heralded by a number of eminent teachers and patrons of learning. Manuel Chrysoloras collected a vast number of Greek MSS. and introduced them into Italy. Pope Nicholas V. founded the Vatican Library and made Rome the center of learning. Agricola not only transplanted the spirit of letters from Italy to Germany, but gave most valuable advice to those engaged in establishing schools. To the authorities at Antwerp inquiring for a head master, he wrote: "Take neither a theologian nor a rhetorician, but one who knows how to teach, to speak, and to act at the same time. If you know such a man get him at any price." Reuchlin created great enthusiasm for the study of Hebrew, and Erasmus performed a still higher service in behalf of Greek and of polite learning in general. The impulse thus given was carried on by Luther, whose doctrine of justification by faith alone transferred from the Church to the individual the responsibility of saving knowledge. The logical result was a great movement in behalf of the means by which individual knowledge could be increased. Luther not only advocated the establishment of schools everywhere, but he gave important advice in regard to their organization and improvement. His teachings wrought a veritable revolution. He pushed forward the art of giving instruction, and provided for special instruction of the best scholars to fit them for the work of teachers. While he put great stress on the study of theology, and gave a very prominent place to studies in Greek, Latin, and Hebrew, he recommended mathematics and history. He made the support of the schools a charge upon the public treasury, and placed upon the parents the moral obligation to send their children to school. Perhaps the most important of all was the fact that he insisted upon an absolute emancipation from the old spirit of exclusiveness, for it was in this emancipation that the revolution really consisted. The gist of his teachings in this respect was contained in these words: "The monks have imprisoned young men like birds in a cage. It is dangerous to isolate the young. It is necessary, on the contrary, to allow young people to hear, see, and learn all sorts of things, while all the time observing the restraints and the rules of honor." This new spirit became the fundamental idea of education in Germany, and it exerted a vast influence in giving German schools of all grades the pre-eminence they have ever since maintained. These fundamental propositions were given definiteness of form two generations later by the great father of educational organization, Comenius. Michelet calls him "the first evangelist of modern pedagogy—Pestalozzi being the second." His particular service was in giving exactness to different grades of instruction, in defining the most important laws in the art of teaching, in determining how elementary instruction should be conducted, and in applying to all grades of teaching the laws of modern logic. The classification of studies outlined in his different works, of which there were twenty volumes, was essentially the same as that generally adopted at the present day by the best schools of Europe and America. While the work of Comenius was going on in Germany, England, and Sweden, other efforts were put forth in different parts of Europe. In Geneva the ecclesiastical policy of Calvin provided for the establishment of schools and teachers. Melancthon drew up the "Saxony plan," which was long the basis of organization in many parts of Germany. In Strassburg the school of John Sturm became so famous that it was sought by pupils from all parts of Europe. In all Roman Catholic countries schools were organized in the most thorough manner under the direction of the Jesuits. The foundation of all the Jesuit schools was the study of the classics, but they taught also philosophy, ethics, mathematics, and history. At the beginning

of the eighteenth century the fame of the Jesuits as teachers had become so great that they had been called upon to establish schools in every part of the world. In 1710 they were reported to have 612 colleges, 157 schools for the education of teachers, and twenty-four universities. The system proposed by Loyola in 1588, with the exception of some slight modification made in 1832, has remained unchanged to the present day. Thus far the organization of schools since the Reformation has been largely shaped either by individual teachers or by general religious considerations.

Germany.—From the time of Comenius until the nineteenth century the schools of Germany were multiplied, but there was no very radical change in the plan of organization. In 1715 A. H. Francke founded the first *Pedagogium*, or normal school for the training of teachers, and his organizing and inspiring power was such as to bring together more than 4,000 teachers and pupils in the institutions under his control. Methods were still further improved by Basedow and Rochow, and both Frederick the Great and Maria Theresa gave practical encouragement to the schools by declaring them entitled to the protection and care of the state. Even the eccentric Frederick William I. of Prussia published an edict of compulsory education. But notwithstanding all these efforts, the elementary schools remained in wretched condition throughout the eighteenth century. It was not till after the Napoleonic wars had shattered Prussia (see NAPOLEON I., *Jena Campaign*) that thoroughgoing reform took place. The methods recommended by PESTALOZZI and FROEBEL (q. v.) were then generally applied in the elementary schools, and all grades of instruction were subjected to the most systematic and rigid revision, as well as state control and state superintendence. In a most solemn address to the German people, Frederick William III. recognized the great part that education must play if the nation was to be developed in internal power and splendor. Educational affairs of all grades were intrusted to a department of education, consisting of four of the most eminent professors of Germany, at the head of whom was Wilhelm von Humboldt. Order was soon evolved out of the chaotic conditions that formerly prevailed. After tentative orders in 1811 and 1812, a general statute was promulgated in 1816 constituting the fundamental school law of Prussia. Although this great ordinance was in some of its parts modified by the Prussian Code of 1854, and again by the Falk Laws of 1872, its general characteristics were those which have made the schools of Prussia the most famous in the world during nearly the whole of the nineteenth century. The organization may be briefly described as follows: Schools were classified in four general groups—primary schools, secondary schools, universities, and technical schools. In the fourth class the normal schools were to occupy the place of foremost importance. No teacher was to be employed who had not, after a severe course of pedagogical training, passed a rigid examination, not only in the matter to be taught, but also in the art of giving instruction. Pensions were provided for teachers honorably retired. The hours of instruction for pupils in the lowest grades are twenty-two per week; in the highest, thirty-two. In the elementary and secondary schools the work is strictly prescribed; in the universities there is absolute freedom. By the Falk Law of 1872 the middle school was specially adapted to commercial requirements. In Prussia, which may be regarded as the model, all the schools are under the immediate supervision of thirty-six district boards or committees. The laws compel an attendance of pupils from six to fourteen years of age, and in case of deficiency even a longer time. In Prussia, Saxony, and Bavaria, small fees may be exacted of each pupil, but in the other states elementary instruction is free. In all the German states the laws requiring compulsory attendance are enforced with rigor, and consequently the percentage of illiteracy is everywhere very small. The proportion of pupils who advance to the higher grades is very large. In Berlin, during the decade from 1881 to 1891, of the average of about 160,000 scholars in the public schools, about 9,000 were in the gymnasias, about 5,600 in the realschools of the first class, about 10,000 in the various trade and technical schools, and about 133,000 in the common schools. In Saxony, of 600,000 pupils, more than 11,000 were in schools of gymnasium grade. In all the states of Germany trade schools (see below) and schools of agriculture (see AGRICULTURAL COLLEGE) occupy a prominent place, and are generously supported.

France.—Before the Revolution the schools of France

were for the most part under the direct or indirect control of the clergy. Napoleon saw the necessity of thorough and comprehensive reorganization. His method (see *Reforms during the Consulate* under NAPOLEON I.) was not fortunate. The organization of an educational hierarchy with the university at Paris as its head proved to be so unwieldy that the primary and secondary schools never acquired life or efficiency. While the Germans were demonstrating the success of local boards of control acting under a wisely framed general law, the French, on the contrary, were showing the inherent weakness of a system that took all power out of the hands of those who were most interested in success. The war of 1870 proved even to the French themselves the superiority of the German system. The law of 1881 provided for a thorough reorganization. The schools were classified under the terms superior, secondary, and primary, and all were placed under the supervision of a Minister of Instruction. Professors in the universities are paid by the state, as are also in part those of the *lycées*. The *collèges* are supported by departments or municipalities, with occasional endowment of chairs by the Government. The normal schools are mainly supported by the central Government, the primary schools mainly by local taxation; but in case of necessity a "supplementary subsidy" is furnished by the general Government for the better payment of teachers. In all the public schools primary education is gratuitous. Of the 4,520,928 children in school in 1891, 3,453,071 were in public schools, and 1,067,857 in schools under private management, but subject to governmental inspection. The system of technical and trade schools is very elaborate, and extends to nearly every vocation. Since 1881 the system of schools of all grades has been made one of the most thorough in Europe, though the French methods of instruction have not yet become equal to those of Germany.

Great Britain.—The schools of Great Britain have had a peculiar history. Before the Reformation there were few schools except those connected with monasteries and cathedrals. At the beginning of the sixteenth century sixteen grammar schools had been founded, and this number was increased by as many more during the reign of Henry VII., by 63 during the reign of Henry VIII., by 138 in the time of Elizabeth, and by 142 in the reign of the Stuarts. These schools, established under private endowments, were not subject to general governmental control. In the eighteenth century a considerable number of charity schools were founded, largely for the purpose of giving religious instruction. While the charity schools were open to both boys and girls, the grammar schools were open to boys alone. The wretched condition of the English schools in the eighteenth century is amply revealed by the writings of Joseph Lancaster and Andrew Bell. In 1808 the Royal Lancasterian Society and in 1811 the British and Foreign School Society were organized, but they accomplished little except to demonstrate the need of governmental assistance. In 1816 a select committee on the condition of schools was appointed, with Henry Brougham at its head; but its achievements were mostly limited to the dissemination of knowledge. It was not till 1832 that Parliament made its first appropriation of £20,000 for the erection of school-buildings. In 1835 and 1838 committees of inquiry were appointed, and in 1839 a committee of the privy council on education was established. The first fruits of this committee were the establishment of model schools and the appointment of inspectors of all aided schools. The system thus entered upon was rapidly developed, and in 1858, when the annual grants amounted to £830,000, a member of the privy council was raised virtually to the position of minister of education. The result was a revised code in 1862, which swept away many of the worst features and made the distribution of funds depend on the efficiency and standing of individual schools. In 1867 the royal commissioners reported that of 3,000 endowed schools, 782 had been designated in the articles of endowment as grammar schools and the others as charity schools. This law was violently opposed as too radical, but it was followed by the much more radical Education Acts of 1870 and 1871, with which the name of the Right Hon. William E. Forster is inseparably connected.

These memorable acts, which may be regarded as the corner-stone of the present English system of elementary education, may be summarized under the following heads: (1) That either by voluntary organization and effort, or by the compulsory establishment of school boards, the supply of elementary schools should be made sufficient for all the school districts in the kingdom. (2) That every such ele-

master should be taught by properly qualified teachers, should conform to the general school laws, and should be subject to official inspection. (3) That in all public elementary schools whatever religious instruction is given must be either at the beginning or at the end of school time, so that the secular instruction may be uninterrupted. (4) That a free-table seating forth the books at which instruction is to be given in each subject shall be displayed in each classroom. (5) That in schools managed by public boards no sectarian or other denominational creed shall be taught. (6) That the governmental inspectors are to inspect and report on all the schools receiving governmental aid.

Some of the most eminent of English men of letters have occupied the position of inspectors, and their reports are of great educational value.

In the period of the Reformation John Knox advocated in Scotland a school for every parish, a college in every county town, and the establishment of three universities. The outcome of the movement then begun was a school law in 1580 which, with those men following it, was the last of the system of parish schools that prevailed in Scotland until the law of 1870-71 was applied in Scotland in 1871. The parish schools were generally taught by schoolmaster and were among the most efficient schools in the kingdom, taking the pupils from the most elementary stages through those necessary for admission to the university. In 1873 the parish schools became board schools, and subject to inspection as such.

In the other states of Europe the methods of Germany, France, and Great Britain have generally prevailed, with more or less important modifications.

The United States.—Education in the U. S. had its beginning in New England. Harvard College was founded in 1636, and in 1647 a school law was enacted by Massachusetts which provided for the systematic establishment of primary and secondary schools. This earliest example of provision for education at public expense was soon imitated in other colonies. The Huguenots, the Dutch, the Cavaliers as well as the Puritans, each in their own way, made provision for the education of their children. The first public school was established in New Amsterdam in 1614, followed in 1674. During the colonial period schools were everywhere developed by the individual colonies, and, accordingly, when the Federal Constitution came to be adopted in 1789 the care of educational affairs was retained by the individual State governments. Massachusetts, in its constitution of 1780, proclaimed it as the "duty of magistrates and legislators to cherish the interests of public schools, common schools, colleges, and universities," and the establishment, even before the adoption of the Federal Constitution, was very generally imitated by other States. When in 1803 the ordinance for the organization of the Northwest Territory was adopted it contained the injunction, "Religion, morality, and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall forever be encouraged." Though the general Government under the Constitution is not charged with the care of education, Congress has uniformly been actuated by the sentiment embodied in this declaration. In 1787 provision was made for giving each State the sixteenth section (1 sq. mile) of every township for common-school purposes, and two sections (32 sq. miles) for the purposes of a university. In 1861, in 1861 sixteen of the newer States received each 30,000 acres of land for education; and in 1848 the thirty-sixth section was added to the sixteenth for common schools. In 1820, 1830, and 1840 large tracts of the public domains, amounting to 82,428,415 acres, were given to Alabama, Arkansas, California, Florida, Illinois, Indiana, Iowa, Louisiana, Michigan, Minnesota, Mississippi, Missouri, Ohio, and Wisconsin. In 1862 Congress gave to each State 30,000 acres for each of its members of Congress for the purpose of promoting industrial education, and supplementary acts were passed in 1869 and 1890. The amount of land given by Congress for educational purposes has amounted to about 150,000,000 acres.

While Congress has thus encouraged education with a cash grant, the details of educational organization and management have been provided for by the individual States. They are in every method, though there is general similarity. In New York a board of regents was established in 1784 to have general superintendence of the educational interests of the State, but until the adoption of the constitution of 1846 the efficiency of the board was crippled in various

ways. In most of the States there is a superintendent of public instruction, whose duties are more or less comprehensive as defined by constitutional or legislative provisions. In all the States a tax is levied for the support of the elementary schools. In some of the States a portion of the fund so received goes to the free high schools, but in all cases it is distributed in proportion either to the number of pupils in attendance, or to the number attending provisionally.

The following table furnishes the most important statistics of public, private, and parochial schools in 1890:

SCHOOL STATISTICS IN THE UNITED STATES AND TERRITORIES, AS GATHERED BY THE CENSUS OF 1890.

STATE, TERRITORY, OR POSSESSION	Number of schools	Number of pupils	Number of teachers	Value of school property	Value of school furniture
U. S.	1890	1890	1890	1890	1890
The United States	10,728,480	750,940	127,182	30,325	10,842
North Atlantic Division	4,679,253	319,000	52,000	11,071	30,351
Maine	140,000	8,000	1,000	21,123	20,244
New Brunswick	70,000	4,000	500	10,000	10,000
New Hampshire	70,000	4,000	500	10,000	10,000
Vermont	80,000	4,000	500	10,000	10,000
Massachusetts	200,000	10,000	1,000	10,000	10,000
Rhode Island	20,000	1,000	100	10,000	10,000
Connecticut	170,000	8,000	1,000	10,000	10,000
New York	1,040,000	50,000	6,000	10,000	10,000
New Jersey	200,000	10,000	1,000	10,000	10,000
Pennsylvania	970,000	47,000	5,000	10,000	10,000
South Atlantic Division	1,700,000	100,000	15,000	10,000	10,000
Delaware	10,000	1,000	100	10,000	10,000

South Carolina	100,000	5,000	500	10,000	10,000
Georgia	100,000	5,000	500	10,000	10,000
Florida	10,000	1,000	100	10,000	10,000
North Central Division	3,000,000	150,000	20,000	10,000	10,000
Ohio	1,000,000	50,000	6,000	10,000	10,000
Indiana	1,000,000	50,000	6,000	10,000	10,000
Illinois	1,000,000	50,000	6,000	10,000	10,000
Michigan	1,000,000	50,000	6,000	10,000	10,000
Wisconsin	1,000,000	50,000	6,000	10,000	10,000
Minnesota	1,000,000	50,000	6,000	10,000	10,000
Iowa	1,000,000	50,000	6,000	10,000	10,000
Missouri	1,000,000	50,000	6,000	10,000	10,000
North Dakota	10,000	1,000	100	10,000	10,000
South Dakota	10,000	1,000	100	10,000	10,000
Nebraska	10,000	1,000	100	10,000	10,000
Kansas	10,000	1,000	100	10,000	10,000
South Central Division	2,000,000	100,000	15,000	10,000	10,000
Kentucky	100,000	5,000	500	10,000	10,000
Tennessee	100,000	5,000	500	10,000	10,000
Alabama	100,000	5,000	500	10,000	10,000
Mississippi	100,000	5,000	500	10,000	10,000
Louisiana	100,000	5,000	500	10,000	10,000
Texas	100,000	5,000	500	10,000	10,000
Oklahoma	10,000	1,000	100	10,000	10,000
Arkansas	10,000	1,000	100	10,000	10,000
Western Division	1,000,000	50,000	6,000	10,000	10,000
Montana	10,000	1,000	100	10,000	10,000
Wyoming	10,000	1,000	100	10,000	10,000
Colorado	10,000	1,000	100	10,000	10,000
New Mexico	10,000	1,000	100	10,000	10,000
Arizona	10,000	1,000	100	10,000	10,000
Utah	10,000	1,000	100	10,000	10,000
Nevada	10,000	1,000	100	10,000	10,000
Idaho	10,000	1,000	100	10,000	10,000
Alaska	10,000	1,000	100	10,000	10,000
Washington	10,000	1,000	100	10,000	10,000
Oregon	10,000	1,000	100	10,000	10,000
California	10,000	1,000	100	10,000	10,000

The most noteworthy feature of the above table is the fact that in all the older States the percentage of attendance in 1890 was considerably less than it had been in 1880. While in the older States of the East and North this tendency seems generally manifest, in the South, on the other hand, there has been a marked improvement.

II. PRIMARY SCHOOLS.

This term is here applied to those schools which are planned to furnish the elementary education necessary for citizenship and for the ordinary duties of life. Such schools are now almost universally supported by the state. In point of time, they occupy the children from about the sixth to the fourteenth year, or during the first eight years of a course of study, the kindergarten not being included. Where schools are graded this period is frequently divided in the U. S. into primary, intermediate, and grammar departments. The obligation of the state to provide instruction for all its children is a modern conception. In ante-Christian society education was largely a state concern, but it was confined exclusively to the more wealthy classes. From the time of Christ practically to the beginning of the nineteenth century, all elementary education was controlled by the Church. Occasionally the state intervened when a ruler more enlightened than his fellows took some step in advance. But the great achievements in this field have all been accomplished in the nineteenth century.

In Great Britain.—Until well into the nineteenth century primary or elementary education in England was practically left entirely to the care of the clergy of the Established Church. Parliament in 1832 for the first time voted money to aid in the building of schools. In 1846 money was first given for increasing the salaries of teachers; in 1853 grants began to be made according to the number of pupils in attendance; while in 1862 these grants were made to depend on the successful passing of examinations. The Elementary Education Act of 1870 as subsequently amended regulates elementary education in England and Wales, while the act of 1872 extended the system to Scotland. The central authority is a committee of council on education, the acting chief being the vice-president, who is a member of the cabinet. The local administrative unit is the district, to form which boroughs and parishes are grouped together. Each district has a school board, which may compel parents to send their children to school. Under this law, sufficient school accommodations must be provided in every district for all children between the ages of five and fourteen. The obligatory subjects of instruction are reading, writing, arithmetic, drawing for boys, and needlework for girls. Optional subjects are singing, geography, sciences, algebra, modern languages, cookery, and some others. Religious instruction is given. There are seven grades, and each pupil should pass one grade each year. After passing the fourth grade, the children may, if twelve years of age, leave school. This education became practically free only in 1891. The system of paying for results, or, in other words, giving grants in proportion to the number of examinations passed, still prevails, and with all its faults seems to have a strong hold. The schools are local or denominational institutions. The state aids them, but does not manage them. The managers of any schools may cut loose from the governmental connection at any time, the state's rights to supervision being based solely on its contributions to financial resources. The business of inspectors is solely to ascertain and report on the efficiency of the schools. Probably in no country is there so large local independence and power to adapt the school to the needs of the country as in Great Britain.

The schools of Scotland have long been famous. Here from 1695 to 1872 elementary education was regulated by the act of James VI., which ordained that every parish should have a school supported by revenues derived from the land, the teachers being appointed by the heritors and the presbytery of the Established Church. By the Elementary Education Act of 1872 the Scotch education department was instituted, and each borough and parish, or group of parishes, was required to have a school board to administer both elementary and secondary education and to enforce the attendance of children from five to fourteen years of age. In Ireland, since 1845, elementary education has been under the superintendence of the commissioners of national education in Ireland. Of these national schools

there were in 1893 8,459, having on their rolls 832,545 of the 939,694 children of school age.

In Germany.—The school laws of Prussia are, with slight modifications, the standard in all the German states. Thorough organization of the school system dates from the prostration of Prussia after her crushing defeat by Napoleon. The reform in education undertaken under the leadership of von Humboldt began first with the university, then extended to the secondary schools, and presently primary schools felt the same impulse. Since 1816 Prussian common schools have been usually considered the best in the world. The attendance on the schools is compulsory. The law of 1888 provided for making instruction free. About 18 per cent. of the cost of the schools is borne by the state and the rest by the community. The minister of ecclesiastical, educational, and medical affairs, a member of the cabinet, is the head of all the educational institutions of the kingdom. The course of study is prescribed in general outlines by the central Government, and the appointment of teachers must be approved by the Government. The course of study in the elementary schools includes religion, reading, writing, arithmetic, geography, singing, drawing, natural history, and history of man. Needlework and household economy is taught to the girls. Instruction in natural history, natural science, and history of man is entirely oral. Physical exercises are prescribed, and every school is provided with suitable apparatus. Industrial education for girls consists of knitting, crocheting, embroidering, sewing, darning, cutting, fitting, and patching, and is found in every school. The study of arithmetic is less extensive than in the U. S. Vocal music is continued through the entire course. The school hours are usually six a day. Schoolrooms are apt to be small and overcrowded. The school year consists of forty-five weeks, with six or seven weeks of vacation. Legal holidays are more frequent than in the U. S. Lessons usually last from forty to fifty minutes. Examinations are comparatively rare, are usually oral, and are conducted in the presence of parents and friends. In Germany, students who are to take a secondary course, as a rule leave the common schools and enter the secondary schools at the age of nine or ten.

In France.—The educational reorganization of France dates from the Franco-German war. School management is completely centralized. This was done originally by Napoleon in constituting the University of France. Since 1850 the central school organization has not been officially called university, though in common usage it still is. Previous to 1870 only one important effort had been made looking toward the education of the people. This was the passage in 1833 of Guizot's laws which imposed upon the commune the obligation of establishing primary schools. The law was not well executed. Jules Simon declared that it was the German schoolmaster that conquered at Sedan. As in Prussia after Jena, so in France in 1871 it began to be felt that the school was to be the instrument of national regeneration. The law of 1878 created a fund of 23,000,000 francs for the purpose of establishing necessary schoolhouses. The law of June 16, 1881, made instruction obligatory, that of Mar. 28, 1882, made it gratuitous, and that of Oct. 30, 1886, reorganized education, and declared that within a certain period all public schools should be under the charge of laymen. In 1857 France devoted to primary instruction the sum of 16,523,969 francs; in 1891, 173,372,524 francs, and in no modern country has the advancement in educational lines been so great and so rapid. The course of study for primary schools prescribed by the law of Mar., 1882, comprises moral and civic instruction, reading, writing, the elements of arithmetic and the metric system, history and geography, especially of France, object-lessons and the first notions of science, elements of design, of singing, manual work, needlework in the school for girls, gymnastic exercises, and in the school for boys military training. In the superior primary schools this course is much extended.

In the United States.—The school organization of the U. S. shows a general adherence to a certain type, with infinite variety in details. The great local differences work more to the disadvantage of the pupil than they would in Europe, since the people of the U. S. are proverbially migratory, and change of schools, with consequent loss of time, is very common. The success of primary schools is determined by (a) the intensity of public interest, (b) the thoroughness and comprehensiveness of organization and supervision, and (c) the aptitude and training of teachers. There is a general disposition on the part of the people to appro-

could mobilize freely for the support of the common schools. The instruction is everywhere gratuitous, the teachers are salaried or rewarded, and progress is making in the direction of compulsory attendance; more or less satisfactory laws of this character already exist in over half the States and Territories, the most common one for required attendance being from eight to fourteen. Fairly successful efforts have been put forth, especially in the West, to introduce science teaching in the elementary schools. Opportunities for professional training for teachers are still sadly inadequate. Superintendents and administrative officers are political in their nature, seeking frequent change in office in most localities. There are also, as a rule, too few supervisory officers. Many experienced observers are of the opinion that the children in the schools of the U. S. are in attainments behind those of the same age in the leading countries of Europe. A comparison of the school work in Great Britain, France, and Germany, as given above, with the system in the U. S. will show where lie the differences. As the general government leaves control over the schools, the U. S. Bureau of Education being charged solely with the function of collecting and disseminating information, the school system of each State must be studied by itself. The differences that appear in such a study are very great.

C. H. TURNER.

III. SECONDARY SCHOOLS.

Meaning.—In the U. S., what is known as secondary instruction technically means the ninth to the twelfth years of the course of study, inclusive, or from about the fourteenth to the eighteenth years of life. The classification into primary, secondary, and higher education has been distinctly recognized only in the nineteenth century, but as early as 500 B. C. the Greeks had divisions in the education of their youth which corresponded fairly well to the three classes of modern times. As a term of general application, then, secondary education covers the intermediate of the three periods in the complete educational plan. In the countries of the Old World the range has been fixed with tolerable definiteness, but in the U. S. the limits look of higher and of primary education are constantly shifting, thus making the secondary school rather indefinite. The U. S. Bureau of Education has selected from the forty or more studies taught in different secondary schools in the U. S. the following as typical secondary-school studies: Latin, Greek, French, German, Spanish, geometry, trigonometry, physics, chemistry, history, science, etc. (U. S.), history, English literature, and geology.

In Germany.—With the exception of Great Britain, and in almost every France, all the European countries have modeled their course largely after the German pattern. The typical German institution of secondary education is the gymnasium. This name came into use as early as the sixteenth century, and in 1810 a ministerial decree ordered that all school institutions, such as the lyceum, pedagogium, collegium, Latin schools, etc., should henceforth be called by that name. It has properly six classes, counted upward from the sixth, the lowest, and called sexta, quinta, quarta, tertia, secunda, and prima. In each of the three lower classes the course is one year; in each of the three upper it covers two years, making the entire course nine years. There are two terms, or semesters, and generally two corresponding sections in each class, one section comprising the scholars who enter at Easter, and the other those who enter at Michaelmas. The class-system, as opposed to the system of instruction in each subject by specialists (*Fachlehrer*), prevails generally. The course is thorough, and the attainments of the students at graduation correspond in a general way to the attainments of American students at the beginning of the junior year in the best colleges. In 1902 a new programme was adopted for these schools, which is here given:

PROGRAMME OF GERMAN GYMNASIUM.

Subject/Year	1st	2d	3d	4th	5th	6th	7th	8th	9th	10th	11th	12th
1. German (continuous)	2	2	2	2	2	2	2	2	2	2	2	2

Total	10	10	10	10	10	10	10	10	10	10	10	10

Attention is called to the provision for religious instruction in Germany, and to the great number of periods—thirty in the upper classes—required of students. Side by side with the gymnasium exist the realgymnasium and real-school, the former having Latin and no Greek, and the latter neither Greek nor Latin. These three institutions are equal in plan and purpose fairly well in the classical, Latin-scientific, and English courses which are found in the U. S. side by side in the same high school. The way to any high position in the army, in the Government service, and in all professional lines in Prussia is through some one of the higher schools. The right to one year voluntary military service, instead of the three years required of the conscripted, is one which belongs to every German youth who completes six years of the course in any one of the three higher schools. Graduates of the gymnasium are admitted to the universities, and to the study of any of the liberal professions, as well as to the practice of teaching in all its branches. Graduates of the realgymnasium are excluded from the liberal professions, and may study only with the philosophical faculty of the university, and may become teachers only in mathematics and modern languages, and are then eligible for positions only in realschools. The realschools qualify for admission to the technical high schools. Teachers in the gymnasium must be graduates of a gymnasium, who have attended a university three years, passed a severe Government examination, and taught then on trial for two years. There is an ascending salary-scale for length of service. At the age of sixty-five, teachers are entitled to a pension.

In France.—In France the system of education has been entirely reorganized since the disaster of 1870-71. Secondary education is cared for by the *lycees* and communal colleges. Of these the representative establishments are the *lycees*. Pupils enter at eight years of age, and are expected to spend a year in each class, completing their course at eighteen. The discipline is rigid and rather mechanical. Both communal colleges and *lycees* have boarding-departments. The scope of the instruction given is not materially different from the German standard.

In Great Britain.—In Great Britain there is no secondary education at the expense of the state, and for the great mass of children who go through the elementary schools there is no further opportunity, except in the numerous grammar schools and academies, both endowed and private, which are found there, but over which the Government has no direct control. The great public schools of England correspond to the best and most expensive private endowed schools in the U. S. All are boarding-schools, with their own traditions and customs. Nine of these schools have been distinguished by special recognition as particularly the public schools, although there are forty or more. Two of these nine are day schools. The others, which are incontestably public schools, are, with the dates of their foundation—Winchester, 1087; Eton, 1440; Shrewsbury, 1551; Westminster, 1560; Rugby, 1567; Harrow, 1571; Charterhouse, 1609. These schools are for the most part well endowed. Eton, for example, has an annual income of some £70,000.

In the United States.—The earliest representative of the secondary schools in the U. S. was the academy, which flourished in New England and New York. At the close of the eighteenth century New York had nineteen of these schools and Massachusetts about an equal number. They were to be found in almost every State, and were the characteristic educational agency of the period. Their course, not planned solely with reference to preparing for college, was frequently followed by a college education, but more often not. Of these schools the Boston Latin School, founded in 1635, was the earliest. Other notable ones are the Hopkins Grammar Schools at Hartford and New Haven, Conn., 1657; Germantown Academy, Germantown, Pa., 1760; Dunbar School, Byfield, Mass., 1763; Phillips Academy, Andover, Mass., 1778; Phillips, Exeter, N. H., 1781; and Flatbush Academy, New York, 1781. There soon developed two distinct types of secondary schools—public high schools and the private endowed schools or academies. The public high schools seem to have succeeded in large measure to the work of the old New England academies, which sought not so much to train for college as to give the best possible education for life to those who came within their influence. The academies which sprang up in connection with the early colleges as preparatory departments in the same have, in the Eastern States at least, nearly disappeared and been succeeded by the private endowed schools, which aim mainly to fit their

pupils for the different colleges, though they are managed in entire independence of these colleges. In Massachusetts, as early as 1797, the academies were virtually incorporated into the system of public schools by receiving endowments of land from the State. In 1834, by an act of the New York Legislature, the regents of the university were required to apply the surplus income of the literature fund beyond the sum of \$12,000 to the education of common-school teachers by distributing it to such academies as should undertake their instruction. Philadelphia organized a high school in 1837, the first of the kind in the U. S. outside of Massachusetts. Baltimore followed in 1839, Cincinnati in 1850, Chicago in 1856. The New York Free Academy was organized in 1849. Courses of study in the different high schools vary, as the schools themselves are subject to local influences. Private endowed schools also have different courses shaped mainly by the influence of the college to which the majority of their graduates are sent. Most public high schools receive and educate both sexes in the same class-rooms and under the same teachers. In a very few of the larger cities there are separate high schools for girls and boys. The following statistics on secondary education in the U. S. as to students and teachers in public high schools and private academies are taken from the report of the commissioner of education for 1890-91:

PUPILS, ETC.	Public high schools.	Private academies.	Total.
Students	211,000	99,000	310,000
Preparing for college	25,058	20,907	45,965
Sex—male	85,000	51,000	136,000
female	126,000	48,000	174,000
Teachers *	8,270	6,281	14,551
Male	3,745	3,041	6,786
Female	4,525	3,180	7,715

* Incomplete; there are probably at least 20,000 teachers in secondary schools in the U. S.

The constitutions of at least twenty-two States specify high schools as the object of legislative and general interest. The newer States universally recognize the high schools as part of the State system of education. In the East, Massachusetts has gone so far as to compel the offering of high-

school advantages to all her children. As high schools can not be established within easy reach of every one, the State pays for carrying children from sparsely settled districts to the nearest village or city high school. The public high schools are relatively best and strongest in the Western States; the private and endowed academies in the Eastern States. The question of introducing military drill and tactics in public schools is beginning to be agitated. In most high schools participation in military drill is yet optional.

Provisions for the preparation of secondary teachers are meager as compared with such provisions in the foremost European countries. The best secondary teachers are college graduates, who, however, rarely have been able to obtain any special professional training. Colleges and universities are beginning to establish chairs in pedagogy to supply this professional training in some measure. A unique contrivance to meet a special want is the summer school for teachers, a feature in many leading universities. These schools are attended largely by secondary teachers, who find opportunity not only for studying their own specialties, but also in most cases for taking work in psychology and pedagogy.

No account of secondary schools would be complete without mention of the work of the committee on secondary-school studies appointed by the National Educational Association July 9, 1892. This committee consisted of ten prominent educators. It appointed nine sub-committees or conferences, each numbering ten, on the various subjects comprising the secondary curriculum. These sub-committees met in Dec., 1892, and prepared elaborate reports, which were transmitted to the central committee as material for their work. The report of the main committee, with the reports of the conferences as an appendix, was published by the U. S. Bureau of Education in Jan., 1894, and has since been the center of educational discussion in the U. S. The committee prepared four model programmes for secondary schools, which are inserted below. No school is known to be actually following any one of these; but since the report appeared a number of schools have modified their programmes to conform closely to these model programmes, and it is certain they will form for some years to come the standard toward which a large number of schools will more and more closely approach.

* In any school in which Greek can be better taught than a modern language, or in which local public opinion or the history of the school makes it desirable to teach Greek in an ample way, Greek may be substituted for German or French in the second year of the classical programme.

IV. Normal Schools.

A normal school is an institution for the training of teachers, and is usually supported by the state. As a general rule such schools confer their honors on the preparation of teachers for the elementary schools. There are in France two normal universities, the Superior Normal School at Paris (created 1808) for women, and that at St. Cloud for men. These schools devote themselves to the preparation of the teachers for the lower normal schools. Nothing of this kind exists in the U. S. or Germany, though the State Normal School at Albany, N. Y., gives a higher grade of professional instruction than that found in other schools. It is designed for those who have completed college or ordinary normal school courses. By the common practice of the world, therefore, the scope of the normal school is confined to the training of elementary teachers. Beyond the indispensable purpose of training teachers for the elementary schools the function of the normal school has not been accurately defined in the U. S., the work of each school being adjusted local or according local needs and conditions. In the early years of their development in the U. S. it was held to be the chief purpose of these schools to furnish a limited amount of scientific academic instruction to candidates for the teaching certificate. In some schools this is still the sole idea. Later it was held to be their chief function to furnish only professional instruction in methods of teaching and school management, the domain of scientific instruction to be borne by the secondary or high schools. Nor has it always been clear that normal schools have any inherent right to exist. There may be an abundance of incidental grounds of expediency for their existence, such as the absence of sufficient scientific instruction in high schools, or the scarcity of well-trained teachers, or the great cost of their services, without there being any peculiar function for the normal school to perform. Were there college-bred teachers enough to supply the needs of the schools and at prices within the reach of the financial abilities of the community, would there be any need of normal schools? Would there be any need of those could the academic and high schools furnish enough teachers well trained in academic branches? If these questions are not to be answered in the negative and there is any real inherent function for the normal school, it must be different from those two types of culture.

The university and college rightly pride themselves upon the breadth and depth of the knowledge they impart and upon the rigorous scientific character of the methods they pursue. But rigorous scientific method for adults is the best unfolding of relatively perfect systems of completed knowledge, or is a difficult extension into new realms of hitherto unexplored. The young, however, are most susceptible of perceiving either of these processes successfully. The logical unfolding of a department of acquired and systematic knowledge is not a proper guide for instructing it to children, since this course does not coincide with the psychological laws of learning in the young. The first of apprehension demand that new knowledge shall be imparted in view of the interpreting experience that the child has already acquired. University knowledge is therefore of scant account until it has been analyzed and readjusted in accordance with the psychological principles governing the child's mental assimilation. On the other hand, schools in academic and high schools acquire in an elementary, noncollective manner the knowledge imparted. They are so much engrossed in absorbing that they are unconscious of the manner of assimilation, nor do they pursue the higher studies long enough to see their interpreting value for the more elementary knowledge. It is evident that to a still greater degree there must here be a lack of psychological insight as to the proper way to select, arrange, and impart knowledge, since there is a lack both of the knowledge that the necessity exists and the broad liberalizing outlook that is requisite.

The function of the normal school, therefore, is to pass the whole light of knowledge, whether acquired in the high school alone or in that and the college combined, through the prism of that psychology which reveals the elementary processes of learning. The machinery of the best normal schools is all adjusted to this end. Academic knowledge is imparted not in the rigid scientific method of the university, or in the half-conscious manner of the academy, but rather according to methods that reflect the psychological conditions under which it can be imparted to children so as to secure their greatest interest and promote their most rapid

understanding. The purpose of the practice or training school, in which normal-school students do practice teaching, is a practical device for securing still greater conformity to the psychological adjustment of the matter of education to the mind of the child. The strictly professional aspect of normal schools pertains to theoretical instruction on psychology and the general theory of the educative processes. There are, therefore, in most normal schools these three factors: (1) Academic knowledge from the teacher's standpoint; (2) professional instruction in psychology and theory of teaching; (3) training-schools where candidates for teaching may impart knowledge to children in accordance with the educational doctrine they have learned.

Rise and Growth.—Normal schools had their beginning in the eighteenth century in France and Germany, but their development as important factors in public education is confined to the nineteenth century.

In Germany the beginnings of normal-school instruction were instituted by August Hermann Franke in connection with his orphan school at Halle in 1697. In 1704 he founded his *Seminarium Præparandum*, or teachers' seminary, which a little later grew into the *Pädagogium*, or normal school, and is still in active operation. A state normal school was founded at Stettin in 1735, one in Potsdam in 1748, and one at Breslau in 1765. After this time the establishment and maintenance of normal schools were greatly stimulated by the demand for popular education incident to the period of the French Revolution and the educational reforms brought about through such men as Pestalozzi. The cause was especially promoted by the effort to free Germany from the rule of Napoleon through the development of the intelligence of the people. The Revolution of 1848 was followed by a reaction in which the normal schools suffered greatly, not so much in diminution of numbers as from the control of the clergy. The three noted Prussian regulations of 1804 crushed all effort to develop independence of character, reducing instruction mostly to memoriter exercises and the inculcation of religious dogma. At the close of the Franco-German war these regulations were repealed, and the number of scholars increased until practically the whole demand for elementary teachers could be supplied from them. Prussia alone has 116 of these schools, 106 being for men and 10 for women. Austria-Hungary has 70 and Switzerland 37 normal schools. Great Britain sustains 44 training-colleges for teachers, the Government paying 58 per cent. of the cost, which amounts to \$867,498. Nearly all civilized nations now support normal schools in some form or other.

After the establishment of the "seminary for lay teachers" by La Salle in 1684, the first permanent normal school in France was founded by local authorities at Strasbourg in 1810. Between 1820 and 1822, when the state took charge of the matter, fifteen were founded. The course was usually two years in length, most of the schools being supplied with training-departments. The fundamental law of 1879 organized the normal schools upon their present basis. In 1889 there were 82 schools for the training of male, and 60 for the training of female teachers. All were released from the control of the clergy. Most of them are now installed in new and enlarged buildings, and are well equipped with the needed material and teaching facilities. The students in 1889 numbered 4,754 male and 3,647 female, and as a rule resided in the schools. Nearly all French normal schools now have practice schools connected with them.

The first normal school in the U. S. was established at Lexington, Mass., in 1839. During the same year a similar school was established at Barre (now at Westfield) and in 1840 at Bridgewater, both in the same State. During the period from 1840 to 1860 twelve others were founded, located for the most part in the Eastern and Middle States. Normal schools began at this time to multiply rapidly, forty of them having been established from 1860 to 1870, seven of which were in New York, and most of the remainder in the States of the northern Mississippi valley. In 1890 there were 135 public normal schools in the U. S.

Organization of German and U. S. Normal Schools.—In order to understand the points of difference between German and U. S. schools for the training of teachers the following facts must be borne in mind: (1) Of the 116 Prussian normal schools but 10 are for women, thus indicating that but little more than 84 per cent. of the elementary teachers in that country are women. Normal schools in the U. S. are coeducational, but the number of women attending them is 18,000 and the number of men only 9,000. In Germany

most persons who prepare for teaching follow that business for life, so that the number of new teachers that must be supplied each year is comparatively small, but little over 5 per cent., the average length of service for Prussian teachers during the last 50 years being 16.9 years, while in the U. S. about 30 per cent. must be renewed each year. This fact greatly enhances the cost and labor of preparing teachers in the latter country. To supply trained teachers for all schools it would take—e. g. in the single State of Illinois alone—142 normal schools, each having 100 students (the usual number in a German normal school), a three years' course of study, and graduating 33 students annually. Illinois has in reality two State normal schools, each graduating from 25 to 50 persons every year—that is, instead of furnishing the 4,000 or 5,000 new teachers needed, the normal schools of that State furnish less than 100 annually. (2) The attendance in German normal schools is unbroken save by accident, so that each year there are nearly as many graduating as entering students; but in the U. S. the attendance is so irregular that rarely more than a fourth or a third as many students graduate as enter. This irregularity of attendance causes discontinuity in study, and explains the fragmentary nature of the instruction in the average normal school. (3) As a rule, the preparation enjoyed by students of German normal schools is of uniform amount and excellence, being special instruction in public or private schools for three years after the close of the Volks-school course at the age of fourteen, and concluded by a public examination before school commissioners. The preparation for entrance to normal schools in the U. S. varies much, ranging from that given in the poorest country school to that furnished by the best city high schools. Under such conditions the German method of training teachers can be much more effective in every way than can that in the U. S., with its broken attendance and great variety in preparation. (4) The supply of learned and skillful teachers in Germany being practically unlimited, and the direction of the normal schools being in the hands of state officials and educational experts, it naturally follows that these schools are supplied with thoroughly efficient corps of instructors; whereas in the U. S., in which no such body of trained teachers exists, and where the administration of the normal schools is intrusted to State boards who concern themselves with business rather than with educational affairs, it is not surprising to find a teaching corps in the normal school which varies as much in preparation and fitness to teach as the student body itself does in scholarship and ability.

The normal schools of the U. S. and Germany are practically agreed as to the need of training-schools in which the students may have an opportunity to observe and practice teaching under criticism and direction. The training department usually covers the field of elementary instruction, sometimes including on the one hand the kindergarten and on the other the high school. In Germany it is common to have one class to represent the ordinary country school. In general the student teacher prepares more trial lessons and teaches less in the practice school than is customary in the U. S. Thus there is in Prussia one trial lesson a week for each student during the second and third years, whereas class-teaching in the training-school is reserved for the last year. In the normal schools of the U. S. it is usual to give the actual conduct of a class in the early part of the second year, but it is less common to have repeated trial lessons under searching criticism, followed by thorough discussion on the part of teachers and students.

The following table exhibits the amount and distribution of professional and academic work that is accomplished in the German normal schools, and will furnish a basis for further comparisons:

SUBJECTS.	HOURS PER WEEK EACH YEAR.			Per cent. of whole.

XII. FRENCH (optional).....	3	3	2	

It can be seen from the foregoing table that no subject is pursued for less than one year, while many subjects, such as history, geography, drawing, gymnastics, and certain branches of music, are studied throughout the entire three years. Many other subjects are pursued continuously for two years. It is curious to notice that the number of hours per week assigned to any given subject does not exceed two, except for arithmetic and algebra, biblical history, and teaching in the training-school. On the other hand, the normal schools of the U. S. usually pursue whatever subjects they have in hand for four or five recitation periods of forty-five or fifty minutes each per week.

There has been a decided movement in many States of the U. S. for the abolition of all academic instruction in normal schools, the argument being that the State should not have to pay for this, since the academies and high schools profess to impart academic knowledge. It is declared that the high schools should teach the *what* and normal schools the *how*. This movement has resulted in securing perhaps a higher grade of academic instruction, but it has nowhere driven it out of institutions for the training of teachers.

The conditions of admission to normal schools in the U. S. do not greatly vary in the different States, and may be summarized as follows: (1) The candidate must be not less than sixteen years of age; (2) must possess sound health and a good moral character; (3) must be able to pass a satisfactory examination in reading, spelling, writing, arithmetic, and the elements of English grammar, or be a graduate of an accredited high school; (4) must sign a declaration of intention to teach for a certain specified time, usually two or three years, in the common schools of the State. In city normal schools it is often customary to require graduation from the high school as a condition of admission. That the actual instruction in normal schools is not, or at least need not be, so elementary as might be inferred from a study of the curriculum that follows, becomes evident when the age of the average normal student is considered. Answers from twenty-four representative State normal schools show that the average age at graduation is twenty-two years. Since, however, their courses do not exceed three years in length, it is clear that the average entrance age

a seven sixteen and nineteen years. This is the age for beginning serious instruction. The schools just mentioned report that 82 per cent of their students are graduates of high schools, or have had an equivalent preparation.

The State Normal School at Normal, Ill., founded in 1857, may perhaps be regarded as a typical normal school. Its educational aims and methods of work were a direct inheritance from the old Bridgewater, Mass., normal school, and the leaders in the early conduct of the Western school were direct from the Bridgewater normal. The faculty consists of twenty-one persons, twelve men and nine women. The president, John W. Cook, A. M., LL. D., is a graduate of the school. Of the professors, ten are college or university graduates, and two have taken degrees at German universities; of the whole number, ten are graduates of the school itself. The scholarship represented in this faculty is considerably above the average for normal schools in the U. S. One of the weaknesses of these institutions comes to light when it is stated that these twenty-one persons must do all the teaching for 446 normal and 122 high school students, besides spending considerable time with the 382 pupils of the model or training school. This makes an average of seventy students in one instructor; in good colleges and universities there are usually only from ten to twelve students to each teacher.

The training-department of this school consists in reality of three groups of pupils—a grammar school with 165, an intermediate school with 99, and a primary school with 121 pupils each of these schools being in charge of an assistant training teacher. There is, besides, a model high school, in which pupils may prepare for college or study ancient and modern languages, but in which students do not teach to any considerable extent. The academic year is divided into three nearly equal terms, and each normal-school student who completes the course is required to teach under inspection at least four terms in the training-school, giving during the year four total lessons in the presence of instructors and of students in the senior class. In many normal schools there is a different organization of the pupil teaching. Some so arrange the matter that a student may do his practice-teaching for a short period at a time, being in charge, it may be, of all the pupils in a given department for a few weeks.

The curriculum of study is not very different from that of most normal schools in the U. S. having a three years' course. It is as follows, the numerals 1, 2 and 3 indicating the time terms of the year respectively:

STUDIES.	First year.	Second year.	Third year.
Elements of pedagogy	1		
Psychology	2, 3		
Elementary psychology		1	
Practical pedagogy		2, 3	2, 3
Life psychology and flower-plant			1, 2, 3
Didactic teaching			1, 2, 3
Second course of history (2 weeks)			3
Reading and orthography	1, 2

Practical	2		
Practical	1, 2		
Practical	3		
Practical		1	
Practical		2	
Practical		3	
Practical			1, 2
Practical			3

In addition to this table a number of optional studies, the Latin, Greek, German, astronomy, advanced mathematics, economics, and science, are offered, but the required work so much fills the programme that there is little time for them. The regular number of periods per week for each study is four and a half and five, elements of pedagogy, drawing, penmanship, and vocal music alone having but two each. This is in sharp contrast with the programme of the German normal schools given above. On the other hand, it will be seen that the amount of time

given to many important studies is sadly inadequate for anything more than the most superficial knowledge. Thus chemistry, botany, physiology, zoology, to say nothing of other branches, receive but one term each. Lack of teaching force prevents any specialization on the sciences. It is difficult to see how much more time can be given to the individual subjects unless their number is reduced, or unless the amount of attention given to the common branches is considerably abridged.

The sharpest contrast between the schools of Germany and the U. S. is in uniformity of excellence. The German system of training teachers insures for every school in the land a high minimum of excellence, since every teacher must demonstrate by examination that he has adequate academic knowledge, and has subjected himself to at least three years of professional preparation. In the U. S. this is by no means the case, for only a small per cent of the teachers have any professional training whatever, while their academic knowledge is gauged by constantly varying standards. The results obtained in Germany from the universal training of teachers should therefore be an ever-present stimulant for educators in the U. S. to extend and perfect their normal schools. CHARLES DE GARMON.

V. THEOLOGICAL SCHOOLS.

Their Rise.—As forms of worship developed, divine oracles required interpretation, or holy men attracted disciples, schools of theology grew up in all civilized nations of antiquity. Thus Egypt had her priestly colleges at Heliopolis, Memphis, Thebes, and Sais; Assyria her prophetic schools at Arslah and Nineveh; Babylonia her seats of sacred learning at Uruk, Kutha, Babel, and Borsippa. The prophetic unions of Hama and Gibeah can scarcely be called schools, but the disciples of Isaiah were students, and the canonizing of religious writings made the *bet ha-midrash*, or "house of instruction," a necessity. The Magi imparted particular instruction in the rites and tenets of Manichæism. The cult of Eleusis called for training, and the Orphic revelation for special study; young men were drawn to Pythagoras and Socrates. Plato, Aristotle, and Zeno largely by their religious interest; the best theology of Greece was expounded in the academy, the lyceum, and the stoæ; and Plotinus, Porphyry, and Proclus made the school of Alexandria a theological seminary.

Like John the Baptist, Jesus gathered about himself disciples whom he taught the way of life and the manner of the kingdom. From his personality, his teaching, and his death the mightiest impulses to theological study, as well as to religious life, have gone forth; but he founded no school of theology. Paul recognized the need of apostles, prophets, and teachers, and chose for his companions young men fit to continue his work; but he established no seminary. The charismatic organization of the Church supplied her for some time with an order of apostolic teachers. As tradition grew in importance, the cult developed, and the ministry of the word was added to the episcopal function, the house of the bishop became a home of Christian training. But it was the maiden efforts of Hellenistic philosophy in the service of the Christian faith that resulted, in the second century, in the first regular schools of Christian theology. Such were the schools of Valentinus in Rome, Carpocrates in Alexandria, Saturninus in Antioch, and Bardesanes in Edessa. A maturer fruit of the same tendency was the school of the catechists at Alexandria, founded by Pantenus in 190 and brought to its highest efficiency by Clement and Origen, where candidates for the ministry as well as catechumens received instruction. In 231 Origen opened a school in Caesarea. Of greater importance was the school of Antioch established by Lucian about 300, where Chrysostom and Theodoret of Mopsoesta taught. From 363 to 489 the school of the Persians at Edessa was the great center of Christian learning, and there was a flourishing school at Nisibis in the sixth century. The clergy of the Occident, as a rule, studied in the schools of the rhetoricians, so highly praised by Augustine. Besides the ordinary catechetical instruction, ministerial candidates often enjoyed special episcopal training. After Constantine's conversion the school of the Patriarchium at Rome attracted many students. The closing of the University of Athens in 529 really signified the inability of the pagan schools to furnish any longer the culture needed for theological study. In the same year Benedict of Nursia opened his monastery on Monte Cassino, and in 535 Cassiodorus introduced *trivium*, *quadrivium*, and theology in a cloister school at Vivaria.

Monastic schools had already been established by Cassian

at Marseilles, by Martin at Marmontier, and by Honoratus on the Leryns, about 400. The schools of Armagh, Aran, and Clonard in Ireland, Whithorne, Lantwit, and Llan Elwy in England, may have been founded in the fifth century, and the school of theology at Constantinople owed its origin in the seventh to an independent movement; but it was the Benedictine order and discipline that gave lasting fame to the foundations of Columban at Luxeuil, St.-Gall, and Bobbio, and efficiency to the great schools of Bangor, Iona, Lindisfarne, Canterbury, and York. The *regula* of Chrodegang of Metz (754), made binding on the entire Church in Aachen in 814, provided for an episcopal school at each cathedral. Both episcopal and monastic schools received enthusiastic support by Charlemagne. His palace school, where Alcuin and Erigena taught, set an example followed not only by Tours and Fulda, Corvey and Ferrières, but also by the cathedral schools of Orleans and Rheims. The tenth century marks the ascendancy of Liège, the eleventh that of Le Bec. In this Norman cloister Lanfranc and Anselm laid the foundations of scholasticism, and their influence was quickly felt in Chartres and Rouen, in Glastonbury and Oxford. The mendicant friars brought the heritage of Le Bec to the new centers of learning.

University Schools.—From the thirteenth century theological schools began to be connected with the universities. The *studium generale* rarely had its origin in an episcopal school, never in a monastery. Of the forty-six universities founded before 1400, twenty-eight had at the outset no theological faculty, having generally grown out of city schools, medical schools, or law schools. Among the other eighteen many were new creations and some sprang from private schools like that of Abelard. But the Franciscans and the Dominicans, besides founding their own colleges, gradually secured generous representation on the theological faculties. Probably no other school of theology ever enjoyed the prestige of the Collège de Sorbonne. The theological course at Paris (twelfth century) was open only to masters of arts and covered ten years, five for the baccalaureate and five for the licentiate. The student began with a biblical course familiarizing him with the literal, tropical, allegorical, and anagogic interpretations. This was followed by dogmatics based on Lombard's sentences. Instruction was given by lectures, repetitions in the colleges, and disputations. Substantially the same rules prevailed in all mediæval universities. In advance of Cambridge (twelfth century), and next to Paris in importance, was Oxford (twelfth century). Toulouse was founded in 1229, Coimbra in 1291, Salamanca in 1355, and Valladolid in 1418. Bologna had no theological faculty until 1362; but Rome (1303), Pisa (1343), Florence (1349), and Padua (1363) taught theology at the beginning. Prague (1347) was the first German university. Then followed Vienna (1365), Erfurt (1379), Heidelberg (1385), Cologne (1388), Leipzig (1409), Rostock (1419), Freiburg (1457), Tübingen (1477), and Mayence (1477). Geneva had a university in 1368 and Basel in 1460, Upsala in 1477 and Copenhagen in 1479. Famous Louvain (1431) reflected the wisdom of the *fratres docti*.

Modern Catholic Schools.—The Renaissance inaugurated a new era. Classical antiquity returned, the Semitic world drew nearer, the physical universe expanded and attracted minds emancipated by nominalism, and the religious life demanded greater earnestness and freedom. The intellectual forces of the modern world began to operate. But the renaissance influence has been felt in varying degrees in different parts of Christendom. While the Romance and Teutonic nations claimed the heritage of Byzantium, the Slavs, so long under her tutelage, had not yet reached their majority. But the Orthodox Church, by nurturing national life and letters, has proved a faithful tutor in Russia, Servia, and Bulgaria, not less than in Roumania and Greece, and these nations are making rapid progress. The religious academies of St. Petersburg, Moscow, Kiev, and Kasan may not be consciously affected by Occidental thought, but they are flourishing institutions, and especially devote praiseworthy attention to non-Christian religions and to missionary history. The universities of Bucharest (1869) and Czernowitz (1876), as well as that of Athens (1837), have theological faculties.

The Roman Catholic Church owes it largely to a new order of theological schools that her influence, still so marked in the Romance nations, has survived the Renaissance. By the establishment of colleges, at the universities or independently, embodying Sturm's humanistic and their own religious principles, Loyola and his successors sought

to meet the demands of the age for spiritual earnestness, classical learning, and biblical erudition. Few schools have attained the efficiency of the Collegium Romanum (1550). The *studia superiora* comprised four years of philosophy, three years of positive or biblical theology and dogmatics based on Thomas Aquinas, and three years of casuistry. Other famous colleges were the Germanicum (1552), the Anglicanum (1580), the Claramontanum at Paris (1562), and those of Pont à Mousson (1572) and Dijon (1581). Clerical seminaries were also established at Rome (1585), at Milan (1572), and elsewhere by Borromeo, and subsequently in every Roman Catholic country. Had the searching criticisms of the Port Royalists been heeded, the Society of Jesus might have been saved from spiritual decay and loss of power. When, in 1773, Clement XIV. dissolved the order, it had 669 colleges and 176 seminaries, and controlled 80 theological faculties; but its moral influence was so shattered that not even the restoration of 1814 could rehabilitate it. Its system of education still survives, but scarcely to the profit of the Church. To this day Italy depends upon her 217 seminaries, no Italian university having a theological faculty. Spain is equally dependent, and though Coimbra teaches theology Portugal has many seminaries. France is better provided, with her Roman Catholic faculties at Paris, Lille, Lyon, and Toulouse. At Vienna, Salzburg, Budapest, Cracow, Innsbruck, Agram, and Gratz Roman Catholic theology is taught, and Prague has both a Czech and a German faculty, but there are forty-three seminaries besides in Austria. Freiburg (1457), Munich (1826), Münster (1773), Würzburg (1582), Bonn (1818), Breslau (1702), and Tübingen have Roman Catholic faculties. Besides Louvain, Belgium has sixteen seminaries. Since 1854 Ireland has had a Roman Catholic university at Dublin. England has twenty-seven Roman Catholic seminaries.

German Protestant Schools.—In the independent Teutonic churches the Renaissance bore richer fruits. The influence of Luther was strongly felt in the universities already leavened with humanism, and there the study of Lutheran theology remained in touch with other departments of learning. Luther's suggestions were nobly carried out by Melancthon. Under his presidency Wittenberg (1522) became a great center, and other universities modeled their instruction after it, as Marburg (1529), Tübingen (1536), Leipzig (1539), Königsberg (1544), Greifswald (1545), Rostock (1563), Heidelberg (1551), and Jena (1558). The change involved an extension of the biblical course, interpretation of the Hebrew and Greek texts of the Scriptures, and greater attention to Augustine. The theological faculty became an arbiter in doctrinal matters. In the period of orthodoxy occasioned by this arrangement, Giessen was founded in 1607 and Kiel in 1665. Metaphysics had crowded Bible study and personal piety into the background, when Spener and Francke made their plea for faithful exegesis and living experience, and embodied their ideas in the University of Halle (1694) and the *seminarium ministerii ecclesiastici* (1714). The indifference of pietism to theology as a science undermined orthodoxy and paved the way for rationalism. In the opposition against supernaturalism Göttingen (1737) became a leader. Kant's *Critique* made this conflict meaningless by a higher synthesis, but the new theological development started with Schleiermacher's and Hegel's teaching at Berlin (1810). To their influence the still dominant tendencies emanating from Baur in Tübingen, Reuss in Strassburg, and Ritschl in Bonn are largely traceable. Scientific methods prevail in the biblical departments and find increasing application in Church history, dogmatics, and practical theology. The professors in the seventeen evangelical faculties are free to present their own views and to modify them as research demands. Their lectures are the prominent feature. Disputations are seldom held. Seminars and theses try the student's strength. A triennium leads to the doctorate in philosophy, three additional years suffice for the licentiate. The doctorate in theology is conferred either *rite* or *honoris causa*, the recipient recognizing the honor by dedicating a work to the faculty. The annual average of doctors of divinity made in all Germany is forty.

Other European Schools.—The Universities of Upsala and Lund (1668), Christiania (1813), Copenhagen, Helsingfors (1827), and Dorpat (1832) supply the clerical needs of Sweden, Norway, Denmark, Finland, and Lutheran Russia. Preachers' seminaries have also been established by the Moravians at Gnadefeld and Nisky, the Baptists at Hamburg and Stockholm, the Methodists at Frankfort and Upsala, and the Congregationalists at Christinehamn. In

relationship between the state schools, these seminaries emphasize more strongly personal piety.

France was a humorist, Deza brought the new learning to Lausanne (1529), and Calvin had studied with Sturm in regular lecture founding at Geneva his college (1568) and theological academy (1606). Calvin's new theology and scholarly example made the academy a center of French Protestantism. Like Lausanne it has maintained itself through the centuries, while Nemišal and Fribourg are of modern growth. A reaction against these ideas has called forth theological schools unsupported by the state in Lyons, Louviers, and Nemišal. Similarly Basel, Bern (1628), and Zurich (1802) have theological faculties, and each says also a free seminary. French Protestant seminaries were established at Nîmes (1691), Nismes (1699), Montauban (1700), and Sedan (1704), but the expatriation of the Huguenots left only Montauban, which has been connected with the Academy of Toulouse. In 1877 the seminar of Nismes (1802) was removed to Paris and incorporated in the university. All these schools are open to bachelors of arts who may graduate as bachelors of divinity after three years and as licentiates after four, upon presenting an *opuscule* and a thesis. *L'École des Hautes Études* (1888) also has a section for theology with excellent equipment for the study of comparative religion. In Holland Leyden (1575) became the representative of Arminianism, which in 1614 and Utrecht (1634) expounded Calvinism. Rationalism in the eighteenth century destroyed these landmarks, and Groningen, Utrecht, and Amsterdam (1877) are now making valuable contributions to theological science. The Dutch universities of St. Andrews (1411), Aberdeen (1494), and Glasgow (1511) have remained more faithful to Calvinism, while Edinburgh (1858) is at present liberal. Each has four divinity professors. Masters of arts may gain the bachelor's degree in three years. Six theses and a thesis are required. At St. Andrews bachelors of divinity may obtain the doctorate after eighteen months, presenting a thesis; elsewhere it is conferred three years' lecture. The Free Church has three divinity seats at Edinburgh, Aberdeen, and Glasgow, and the United Presbyterian one each at Edinburgh. Four years' attendance is required, but the course is identical with that at the universities.

In the English universities Cambridge was first affected by the humanism, and under the influence of Puritanism, Calvinism, and rationalism, has steadily advanced, while conservative Oxford was aroused from long lethargy by the Oxford movement. At present both offer excellent opportunities for theological study. Masters of arts may become bachelors of divinity in three years and doctors after two additional years. Durham (1852) admits bachelors of arts and others to theological study. Besides these, the Church of England has 21 theological schools, the Methodists have 10, the Congregationalists 11, the Baptists 8, the Presbyterians 2, the Unitarians 1, and the Jews 1. Two are independent.

Schools in North America.—Canada long depended upon the mother country, but in the nineteenth century the immigrants have established 2 theological schools at Toronto the Presbyterians 2 at Montreal, Toronto, and Quebec the Methodists 2 at Montreal and Toronto, the Baptists 1 at Toronto and the Congregationalists 1 at Montreal.

The English, Dutch, Swedish, and French colonies in America in the seventeenth century were at first served by ministers educated at Cambridge or Utrecht, Upsala or Bologna. New England began to supply her own needs by establishing Harvard (1636) with a professorship of divinity. William and Mary (1693) probably did similar service for Virginia. In 1740 a professor of divinity was appointed at Yale (1701), but the Dutch Reformed Church owned the first theological school, at New Brunswick, N. J. (1784). The example was followed by the Roman Catholics at Baltimore (1791), the United Presbyterians at Xenia, O. (1792), the Methodists at Bethlehem, Pa. (1807), the Congregationalists at Andover (1807), the Presbyterians at Princeton (1811), the Lutherans at Hartwick (1815), the Unitarians at Cambridge (1817), and the Baptists at Hamilton (1819). Since 1820 36 seminaries had been established. After the Civil War the emancipated race and the settled West caused much activity. The commissioners report 161 theological schools; 25 of these have scarcely any existence, 25 are in training, 19 are Roman Catholic seminaries, and 1 is a Jewish school. The remainder 74 belong to 10 Protestant denominations, the most prominent being Baptist: Colgate

(1819), Newton (1823), Rochester (1831), Louisville (1836), Chicago (1867), Oberlin (1869), Congregationalist: Andover (1809), Bangor (1816), Yale (1822), Hartford (1834), Union (1863), Chicago (1868), Pacific (1869); Episcopalian: New York (1820), Virginia (1820), Berkeley (1854), Philadelphia (1897), Cambridge (1897); Lutheran: Gettysburg (1820), Concordia (1826), Augustana (1860), Philadelphia (1864), Methodist: Boston (1847), Hartford (1867), Drew (1867), Vanderbilt (1871); Presbyterian: Princeton (1812), Auburn (1820), Union, Va. (1824), Columbia, S. C. (1828), Lane (1832), Union (1833), Chicago (1839), Dutch Reformed: New Brunswick (1834), German Reformed: Lancaster (1825) and Heidelberg (1831); Unitarian: Harvard (1817) and Mountville (1846); Universalist: Tufts (1860). Sixteen states have no theological school. No state university teaches theology; of the ten leading ecclesiastical universities Harvard, Yale, Princeton, Colgate, and Northwestern have theological faculties; of the privately endowed, Boston, Vanderbilt, and Chicago. These and many independent schools admit only bachelors of arts to the regular course, and confer the bachelors of divinity after a triennium. The anomaly exists that over 300 institutions, not universities and without a theological faculty, can confer degrees of divinity, while only a few theological schools have the right even of nomination. No American theologian has formed a school of thought, but the conservatism of Princeton, the "new theology" of Andover, and the more advanced position of Harvard have exerted a wide influence. The revival of Scriptural learning, the introduction of scientific methods, the decline of sectarian teaching, the missionary zeal, the close contact with Church life, the high moral tone and the warm piety characterizing the North American schools give promise of rich and independent work in theology.

NATHANIEL SCHMIDT.

VI. MEDICAL SCHOOLS.

1. *In the United States.*—In the earlier history of North America physicians generally received their medical training from preceptors, in whose offices they served an apprenticeship of seven years in the practical branches, receiving at the same time instruction as students and studying such cases of disease as developed in the daily practice of their preceptors. In rare instances these studies were supplemented by a trip to Edinburgh, London, or Paris, and less frequently to Holland or Italy. In some country districts the physician was also the churchman. Frequently he was engaged in tilling the soil.

Dr. Thomas Cadwallader, of Philadelphia, who had studied anatomy under Cheselden, gave anatomical demonstrations

to the physicians of Philadelphia prior to 1751, and Dr. Hunter, of Newport, R. I., gave anatomical demonstrations in 1754-56. Dr. William Shippen, Jr., of Philadelphia, gave a course in anatomy to twelve students in 1762. These were all private enterprises. The first regularly organized school of medicine was the College of Philadelphia, which was founded by Dr. William Shippen, Jr., and Dr. John Morgan at the suggestion of Dr. John Fothergill, of London, in 1765. Dr. Morgan was appointed to the chair of Medicine in May, 1765, and Dr. Shippen to the chair of Surgery in September of the same year. The first course of lectures was given in Nov., 1765, and continued annually thereafter. The College of Philadelphia subsequently became the University of Pennsylvania.

The requirements for the degree of bachelor of medicine were: (1) A satisfactory knowledge of Latin, mathematics, natural and experimental philosophy; (2) one course of lectures in anatomy, materia medica, chemistry, theory and practice of physic and clinical lectures, and one year's attendance on the practice of the Pennsylvania Hospital and a public examination; (3) apprenticeship to a reputable physician.

The requirements for the degree of M. D. were: The candidate, being twenty-four years of age, and a bachelor of medicine of three years' standing, must present and defend an original thesis. The degree of M. B. was first conferred in 1768, and of M. D. in 1771.

The second medical school in North America was founded in New York in 1787 in connection with King's (now Columbia) College by Dr. Samuel Bard and Dr. Peter Middleton. The degree of M. B. was first conferred in 1769, and of M. D. in 1770. It was broken up by the Revolutionary war, but was reorganized in 1792 and merged with the College of Physicians and Surgeons in 1807. The third medical school was founded in connection with Harvard College in 1783, the fourth in connection with Dartmouth College in 1798, the fifth was the Maryland College of Medicine in Baltimore (now the University of Maryland), founded in 1807, and the sixth at Yale College in 1813.

From this date the growth of medical colleges was rapid, until almost every large city possessed one or more. Many, like those at Castleton, Vt., Berkshire, Mass., and Fairfield, N. Y., were established in small country towns independently of any institutions of learning or hospital facilities, and gave purely theoretical instruction by lectures, the effect being to lower the standard of medical education. In some schools a single course of lectures was exacted prior to graduation; in others two courses of four months each; in the vast majority two courses of not more than six months each; and in comparatively few colleges three courses of lectures. Since 1890 a movement to lengthen the number of courses to three, and in some cases to four, has gained strength, to the great advantage of medical education.

Requirements for Admission to Medical Colleges.—Prior to 1892 no uniform requirements for admission to medical colleges existed in the U. S. In 1892 the Association of American Medical Colleges established the following standard: (1) Ability to write an English composition of not less than 200 words. (2) To translate simple Latin prose. (3) A knowledge of algebra or higher arithmetic. (4) Elementary physics.

The regents in the State of New York require that all applicants for admission to medical schools must file a certificate showing:

(A) That they hold a degree of bachelor or master of arts, of bachelor or master of science, or of bachelor or doctor of philosophy; or, (B) That during or prior to the student's first year of medical study he has passed an examination conducted under the regents of the University of the State of New York, or by the faculty of a medical school or college in accordance with the standard and rules of the said regents, in arithmetic, grammar, geography, orthography, American history, English composition, and the elements of natural philosophy; or, (C) That he possesses one or more of the following equivalents:

(a) A certificate of having successfully completed a full year's course of study in any college or university under the supervision of the regents of the university, or registered by them as maintaining a satisfactory standard. (b) A certificate of having satisfactorily completed a three years' course in any institution subject to the visitation of the regents, or registered by them as maintaining a satisfactory academic standard. (c) A certificate of having passed the examination preliminary to the study of medicine, required

by the present medical act of Canada. (d) A certificate of having passed the matriculation examinations of any university in Great Britain or Ireland. (e) A regent's diploma. (f) Regents' pass-cards for any twenty counts not including reading and writing.

Many medical colleges in the South and West do not exact even these modest requirements.

A few medical schools require more, e. g. the University of Michigan, which requires an elementary knowledge of English, mathematics, including arithmetic, algebra and plain geometry, physics, botany, zoölogy, physiology, history, and Latin prose.

The requirements of Harvard Medical School are: English, Latin, physics, chemistry, and any one of the following: French, German, algebra, plane geometry, or botany.

The Johns Hopkins Medical School, at Baltimore, Md., requires: (1) An ability to pass the matriculation examination to enter any undergraduate course at the Johns Hopkins University; (2) a reading knowledge of French and German; (3) a knowledge of minor courses in physics (at least five class-room exercises and three hours' laboratory work each week for one year constituting a minor course), chemistry (five class-room exercises and five hours' laboratory work each week for one year), and biology (five class-room exercises and five hours' laboratory work each week for one year, or the degree of A. B. in the chemical-biological course of the university).

Courses of Study.—The best medical courses are graded and cover a period of four years. In the most advanced schools the first two years are spent in the study of anatomy, embryology, physiology, histology, bacteriology, pathology, physiological chemistry, and pharmacology; the third year is devoted to the study of medicine, surgery, gynecology, and obstetrics, and the fourth year to clinical work and special branches of medical practice. In the first two years laboratory work occupies a prominent place, and recitations and seminary conferences are held rather than formal didactic lectures.

Many schools have three courses of lectures which practically cover identical subjects, but this method of instruction is no longer popular, and laboratory work and graded recitations are fast taking the place of didactic lectures.

Medical educators differ as to the advisability of requiring a degree in arts or sciences preliminary to the study of medicine, and many are of the opinion that the majority of young men can not afford to sacrifice the time needed to secure a degree before commencing a course of medical study proper, extending over a period of at least four years. They prefer the arrangement of studies existing at Cambridge, England, whereby the last two years of study for the degree of B. A. constitute the first two years of medical study leading up to the degree of M. D. at the end of three years thereafter, thus practically giving a medical course of five years.

Requirements for Degree of M. D.—The requirements for this degree vary materially. In some schools in the U. S. the degree is conferred after three years of medical study and an attendance upon two courses of lectures. The majority of the medical schools since 1892 have required three courses of lectures. The leading schools require four courses of lectures and practical work in laboratories.

Number of Schools.—In 1891 there were 95 regular, 9 eclectic, 14 homœopathic, 2 physio-medical colleges, and 9 post-graduate schools of medicine, with 18,160 students and 4,931 graduates receiving the degree of M. D.

II. **Canada.**—There are 12 medical schools in Canada. The requirements for admission are English, arithmetic, algebra, geometry, Latin, and Greek, French, German, or natural philosophy.

Courses of study extend over four years. During the first and second years, anatomy, physiology, histology, chemical physics, general chemistry, materia medica and therapeutics, toxicology, and botany. During the third and fourth years, theory and practice of medicine, including medical pathology; principles and practice of surgery, including surgical pathology; clinical medicine, clinical surgery, midwifery, diseases of women and children, medical jurisprudence, and sanitary science.

In Quebec the requirements for admission to the medical schools are nearly equal to the medium requirements for admission to the schools of Great Britain.

III. **Great Britain.**—**Requirements for Admission.**—**Minimum.**—English, Latin, mathematics, including algebra and geometry, elementary mechanics, and one of the following optional subjects: Greek, French, German, Italian, or

any modern language, logic, botany, zoology, elementary geometry.

Subjects.—Latin, Greek, French, German, Sanskrit or Latin, English language, history and geography, mathematics, mechanics, sciences—some of the following: chemistry, heat and light, magnetism and electricity, botany.

Matriculation.—Latin, translation of selected and non-selected authors, grammar, and short passages to be translated into Latin; Roman history; Greek grammar and translation from a selected author; English language, composition, literature and history; French or German grammar, and translation into English; mathematics—arithmetic, algebra in the theory of indices and logarithms; geometry, plane and solid, with the elements of co-ordinate geometry; trigonometry. This is equivalent to the examination for the B. A. degree in Oxford, Cambridge, and London.

The courses of study occupy at least five years. After leaving the regular courses the students spend several years in the London hospitals.

U. Germany.—The applicant for admission must present a certificate of having successfully passed the final examination of two gymnasial courses. Eight semesters must be devoted to medical study. The first four are devoted exclusively to physics, chemistry, zoology, botany, mineralogy, anatomy, and physiology. The purely medical studies begin with the fifth semester, and must be pursued for two years.

France.—The applicant for admission must possess the "diplôme de bachelier de lettres" and the "diplôme de docteur de sciences naturelles," which are equivalent to B. Sc. of London University, with considerable knowledge of chemistry, zoology, botany, geology, and astronomy added.

Courses of Study.—These must be pursued at one of the six medical faculties of France, viz., Paris, Montpellier, Nancy, Lille, Lyons, and Bordeaux, and must cover four years.

First year: Physics, chemistry, anatomy and dissection, natural history, physiology, and histology; second year, anatomy and dissection, histology, general pathology, surgical pathology and clinical physiology, medical pathology; third year, dissection, surgical pathology and clinical, medical pathology and clinical, operations and apparatus, gynecology; fourth year, dissection, surgical pathology and surgery, medical propædæutics, pathological anatomy, materia medica and therapeutics, hygiene, and gynecology.

VI. Italy.—Requirements for Admission.—Latin, mathematics including algebra, geometry, plane trigonometry and mensurations, mechanics, elementary physics, chemistry, and natural history.

Courses of Study.—Medical studies are to be pursued at various of the twenty universities of Italy. The course is six years. There are no rules as to sequence of studies, but the following order is generally observed: First year, zoology, botany, inorganic chemistry; second year, physics, organic chemistry, comparative anatomy; third year, anatomy, physiology; fourth year, general pathology and pathological anatomy; fifth year, special pathology and surgery and clinical, topographical anatomy, operative surgery; sixth year, medical and surgical clinic, hygiene and medical jurisprudence, ophthalmology, electricity.

VII. Sweden.—The applicant for admission must present a *Maturitetscertifikat* from the gymnasium. The courses of study must be pursued at Upsala or Lund, or the Medical Academy of Stockholm. The period of study is ten years. The first three years are spent in preliminary studies. Three years are then spent in the study of anatomy, physiology, physiological chemistry, general pathology, pathological anatomy, and pharmacology. Two years are spent in the study of practical medicine, practical surgery, ophthalmology, dermatology, and forensic medicine. In addition there are eight months in a medical and surgical clinic, four months in an obstetrical clinic, and two months in a psychiatric clinic.

Number of Schools.—The following is a summary of the medical schools of Europe: Belgium, 4; Denmark, 1; Germany, 20; France, 6; Great Britain, Scotland, and Ireland, 20; Italy, 20; Netherlands, 4; Austria-Hungary, 6; Norway and Sweden, 4; Portugal, 1; Russia, 7; Switzerland, 5; Spain, 1—total, 117.

HENRY M. HURN.

VIII. LAW SCHOOLS.

A Continental Europe.—With the revival of interest in Roman law, students flocked to the medieval universities, mainly in Bologna and Paris; and in countries where the spirit of law is essentially Roman the tradition of obtain-

ing one's legal education at a university is still maintained. Indeed, upon the continent of Europe a university law school is the only avenue to the legal profession. In Germany, for example, the course for one aiming at a legal career is plainly defined. He must first complete the curriculum of a gymnasium; he must then study law for three years at a university and pass an examination at the end of the course; after this theoretical study he must, if he means to be a judge or an advocate, give three years to the "service of practical preparation." Then, upon passing a second state examination, he may expect an appointment as an inferior judge when a vacancy occurs, or, if he prefers to practice, he may be admitted to the body of advocates. One wishing to be a law-professor dispenses with the three years of practical work, and seeks first, by passing a special examination, the position of privat docent. His subsequent promotion to assistant professor and professor will depend wholly upon his ability and success as a private lecturer, for the ranks of the law-professors are recruited, not from judges and successful practitioners, but exclusively from those who have won their spurs as younger teachers. What is true of Germany is, in the main, true of the other continental countries.

In England.—The history of legal education in England has been widely different. The English law was not Romanized and English lawyers were not bred at Oxford or Cambridge. Since the fourteenth century legal education has been in the hands of the four Inns of Court, Lincoln's Inn, Gray's Inn, the Inner Temple, and the Middle Temple. These, with the ten dependent Chancery Inns, have been called by Fortescue and Coke a legal university. In the days of these writers the term was not inapt. The membership of the Inns of Court was made up of students, barristers, readers, and benchers. A student after eight years was admitted to the degree of barrister. From the barristers of longest standing were chosen annually two readers, each of whom was to give a dozen readings or lectures to the members of the Inn, and to preside at meetings. The readers after performing these duties became benchers or governors of the Inn. The two courses of readings were delivered in vacation, and each reading with the discussion that followed between the reader and some of the barristers occupied the morning hours. In term-time the members of the Inns would naturally be engaged in the forenoon in court. Both in term-time and vacation much time was given after dinner and after supper to bolting, i. e. conversational arguments upon cases put to the students by a bencher and two barristers sitting as judges in private, and to meetings, which were public arguments by barristers before the benchers. This continued discussion of points of law could not fail to develop legal acumen and the art of ready speaking. But the readings and the discussions came in time to be regarded as too great a burden. They were at first shortened and finally, in the latter half of the seventeenth century, given up altogether. Membership in an Inn of Court for three years became the sole requisite for a call to the bar. A legal education being no longer obtainable in the Inns of Court, students of law turned to private reading, supplemented at first by experience in attorneys' offices; but after Lord Mansfield's time the chambers of special pleaders, conveyancers, or equity draughtsmen were resorted to instead of attorneys' offices. Since the middle of the nineteenth century attempts have been made to convert the Inns of Court into a genuine law school, but thus far with very little success. Annual courses of lectures on five subjects have been introduced, upon four of which students must pass examinations before being called to the bar. The attendance at these lectures is not large. At Oxford and Cambridge there are courses both in Roman and English law, but the attendance is small. Another generation may see the establishment of a true law school, but private study and the attendance at the chambers of a barrister are still the normal mode of learning law in England.

In the United States.—This same method was naturally adopted so far as practicable by the English colonists in North America; but the English distinction between the upper and the lower branches of the legal profession was not followed, the law-work of the barrister and the business of the attorney being united in the same person. For this reason the office of a lawyer in the U. S., regarded as a place for legal training, was distinctly inferior to the chambers of the English barrister. It is doubtless a source of the inadequacy of a law office to give a satisfactory legal education that is due the early origin and later widespread success of the

American law school. It is claimed that the earliest law school in the U. S. was at the College of William and Mary in Virginia. Chancellor Wythe was certainly appointed Professor of Law in that college in 1779; but it may be doubted if a law school, in the proper sense of the term, existed there at that time. Be this as it may, the famous school at Litchfield, Conn., may justly be regarded as the parent of law schools in the U. S. This school was established by the Hon. Tapping Reeve in 1782. The Hon. James Gould was associated with him in 1798, and after Judge Reeve's retirement in 1820 remained in charge of the school until its discontinuance in 1833. This school was eminently successful in attracting a high class of students from all parts of the U. S., the average attendance being about twenty-five a year. The course, with two months' vacation, occupied fourteen months. The instruction was by lectures, thrown into the form of legal treatises, specimens of which may still be seen in *Reeve's Domestic Relations* and *Gould's Pleading*.

Mention should be made of sporadic and ephemeral courses of lectures delivered by Judge James Wilson at the College of Philadelphia in 1791 and 1792, by James Kent, Esq., afterward Chancellor Kent, at Columbia College, New York, in 1797, and by Prof. Stearns at Harvard College from 1815 to 1817. But it is still true that the Litchfield school was for many years without a rival, the Harvard Law School, the oldest of all existing law schools, not being established until 1817. The first dozen years of this new school were full of discouragement. Most of those who desired a law-school education still resorted to Litchfield, or, during the years 1823-29, to another successful private school at Northampton, Mass., conducted by Judge Samuel Howe and John Hooker Ashmun. The prosperity of the Harvard school dates from its reorganization in 1829 when Judge Story and Mr. Ashmun were appointed professors. In 1833, when the Litchfield school was given up, there were law schools at Harvard, University of Maryland, Yale, University of Virginia, Cincinnati College, and at Transylvania University, Kentucky, with less than 150 students in all. There were two new schools in the next decade, at Dickinson College, Pennsylvania, and at the University of Indiana. Five more were established between the years 1846 and 1850. In 1860 the number of law schools had risen to twenty-two, with a total attendance in that year of about 1,000 students. The following table gives the law schools existing in the U. S., with the date of their foundation, the length of the course, and the number of students in the academic year 1893-94:

NAME OF LAW SCHOOLS.	Date of establishment.	Length of course, years.	Number of students in 1893-94.

* Prior to 1895-96 the course was two years.

Fifty-three law schools have been organized since the civil war—seventeen in the period 1890-95. There were 3,806 students in law schools in 1888-89, and 7,804 in 1893-94. This shows the rapidly growing conviction that a legal education is best acquired in a law school. It is noticeable also that at only eight of the seventy-five schools is the course limited to a single year. In eleven the course extends over two years. It is highly probable that in a few years a majority of the schools will have the three years' course. Furthermore, but seven of the seventy-five schools are university schools. The significant feature of legal education in the U. S. will be seen, is the wide departure from English traditions in favor of study with a practicing lawyer and the closer approximation to the continental principle of university legal training. This result has been reached not by imitation of continental methods, but by an independent development. There are still important differences. Upon the continent of Europe the student's attendance at the university law school is compulsory, while in the U. S. it is optional. In continental countries a collegiate education is a prerequisite to admission to the law school. In the U. S. the great majority of law students have no academic degree, and the standard of admission requirements is lamentably low, although gradually rising. The Harvard Law School, indeed, after the academic year 1895-96 will, with rare exceptions, give the degree of LL. B. only to college graduates.

Methods of Instruction.—There is, as yet, no consensus of opinion as to the best mode of teaching law in a law school. In the European universities the professors teach almost wholly by lectures, but the *seminar* courses, in which the students and the professor discuss the original authorities, are growing in favor. In American law schools, also, in early days the instruction was generally given in the form of lectures, but since the multiplication of legal treatises the lecture method has been largely superseded by the recitation method. The student reads a certain number of pages of a given text-book, upon which he is catechised in the classroom by the professor, who also expounds and criticises the treatise. In 1870 the inductive and genetic method, which is almost universally adopted in the teaching of other sciences, was for the first time used in the teaching of law. To Prof. Langdell, dean of the Harvard Law School, belongs the honor of this innovation. The chief merit of the new system lies in its development of the habit of intellectual self-reliance. The text-books used contain, instead of treatise or commentary upon the original sources, but the original sources themselves, being collections of cases and arranged as to show the historical development of legal principles.

case. These cases are subjected to the classroom in a theoretical and systematic way to the students, who are made what is so far as possible, that they and the instructor are both made subject to the common pursuit of scientific truth. In a word, the students apply to the questions concerned arising in the orderly development of a branch of science the same method which is employed by a successful scientist in solving the heterogeneous questions arising in professional life. The inductive method, as we all know, is not infrequently called, the case method, of which it has been adopted by all of Dean Langdell's disciples at the Harvard Law School. It is also the exclusive prevailing mode of instruction at the law schools of Columbia College, Northwestern University, Western Reserve University, and at the Metropolitan Law School, and has also been adopted in one or more courses at the following law schools: Cornell, Leland Stanford Junior, University of Illinois, Columbia, University of Iowa, University of Wisconsin, University of Minnesota, St. Louis, University of New York, University of Pennsylvania, University of Kentucky, University of Tennessee.

JAMES HARRIS.

VIII. Technical Schools.

Into this class must be included polytechnic institutes, schools of technology, schools of technology, schools of agriculture, mining schools, all schools, in fact, in which the sciences are taught with a view to their practical application to the promotion of the material interests of man. They will necessarily be included also technical departments of colleges and universities, some of which have distinct and separate organization as to facilities of instruction, and often a distinctive name, although controlled by the same corporate body as other departments, while others are different than technical or professional courses of study, which instruction is given by the college or university professors.

It is difficult to point out the exact beginnings of technical education, when considered in a general sense as education, usually planned to prepare young men for the positions in which they are likely to be engaged during active lives. Perhaps the earliest authentic records of any system of training are those of the ancient Persians. The curriculum, like many in more modern times, was tripartite. It included riding, shooting with the bow, and raising the truth. The first two accomplishments may easily be considered as technical in their character, being closely related to the probable future occupation of the young men being educated. That speaking the truth is the counterpart of sufficient importance to form an essential element of this training is extremely interesting, especially as it appears to have furnished about all three of the moral intellectual side of the educational discipline. The purely intellectual found its earliest pronounced development among the Greeks, and technical education became recognized at that time. It is true that Aristotle solved and taught an elaborate system of natural philosophy, but when it is remembered that it was founded on two principles, namely, the principle of generation and the principle of corruption, it is easy to admit that the growth of science was seriously retarded during the nearly 2,000 years which the influence of Aristotle was dominant. Sometime, another Greek, living a century later, was the founder of applied science, the great forerunner of the noble art of agriculture which has brought the forces of nature to submission for the benefit of man. He was the first to possess some knowledge of the fundamental principles of science. Out of a clear insight into the doctrine of equilibrium he created the science of statics, one of the two sciences which the best part of engineering rests. He accomplished two accomplishments, even now necessary and all the while to the production of a successful engineer. He had the skill and instincts of a mechanic, and he was a profound mathematician.

It was of the life and work of Archimedes, the influence of which remained paramount for many centuries, and throughout all Europe; but a new era began with the appearance of Galileo, who was especially fitted for the task which seems to have awaited his coming. Possessed of many accomplishments, music, painting, eloquence, with unusual success, he was at the same time bold and courageous. At the age of thirteen he began his career as an experimental philosopher by making a discovery which the world will never forget, and which was the beginning of a

series resulting in a few years in the establishment of an experimental basis of the fundamental principles of dynamics. These had been beyond the grasp of Archimedes, but the work of the Italian furnished the other pillar upon which, through a system of rational mechanics, the science and art of engineering might now rest. For the first time it came to be recognized that whenever possible every dictum of the science of philosophy should be subjected to the final tests of trial and experiment before acceptance, and the reign of authority was ended, although not without a struggle.

It would seem that the time was ripe for this development, for contemporaneous with Galileo were two Englishmen, Dr. William Gilbert and Lord Bacon, who took a prominent part in the work. The work of Gilbert, although relatively very narrow and restricted, was on the same high plane of originality as that of the Italian, and furnished one of the earliest and very best examples of the purely experimental method of discovering truth. That of Bacon, while generally overestimated, was valuable as a formulated expression of the principles of the new philosophy, and a masterly analysis of the methods of inductive reasoning. The labor of these men resulted in the destruction of the method of antiquity. They were followed by Kepler, Newton, and a host of others, who, by creating science, made applied science possible.

Much time elapsed, however, before experimental science was admitted to the sacred precincts of the college curriculum. Brilliant scholars had made beautiful discoveries concerning the interpretation of natural phenomena, the exposition of which at once charmed the cultivated and delighted the ignorant. Practical applications of these discoveries were made from time to time, by means of which the comforts of life were enormously multiplied and woe, disease and anxiety enormously lessened; but all of these originated in more or less irregular and sporadic examples of scientific activity. Science had, it is true, found its way into many institutions of learning before the beginning of the nineteenth century, but the methods of instruction in vogue were those then, and until recently, in use in teaching mathematics, language, philosophy, and history. Such experimental studies and research as were carried on were mostly the private work of the professor; students continued to learn from books only, as they were accustomed to do in other subjects, and independent thinking was not encouraged. As early as the beginning of the nineteenth century, however, the importance of a systematic study of the applications of scientific discovery to the practical affairs of everyday life was felt by more than one man, and the possibility of an organized effort to encourage experimental research and the pursuit of applied science was recognized. The establishment of the Royal Institution in London by Count Rumford was an epoch in the history of science. He unquestionably had in his mind a technical school or college of the modern type. He founded the institution that it might serve for "the general diffusion of the knowledge of all new and useful improvements, and teaching the application of scientific discoveries to the improvement of arts and manufactures, and to the increase of domestic comfort and convenience." It originally contained a workshop for blacksmiths, with a forge and bellows, all sorts of models of machinery, and at one time a score of young mechanics were housed and lodged in the house. But, fortunately indeed for the world at large, it was not destined to continue as an example of what its founder evidently intended it to be, and what has been so abundantly realized in other more recent institutions. One of the first men to begin the work of the Royal Institution was Davy, and he quickly inaugurated for it a career on a distinctly higher plane. By a rapid evolution it became the most famous laboratory of research in the world, and even its founder would be compelled to admit that by its devotion to pure science and seeming neglect of the practical it has been infinitely more useful to those whom it was originally planned to benefit than if it had been held closely to the lines at first laid down. The splendid and continuous series of epoch-making discoveries by Thomas Young, Davy, Faraday, Tyndall, and Rayleigh constitute an everlasting monument to the founder of the institution.

Indeed it may be safely affirmed that during the first half of the nineteenth century the time was not yet ripe for the establishment of the technical school as it now exists. A science must come to be more or less of an exact science, and it must have accumulated a tolerably well-di-

gested and compact body of facts and principles before its application to practical problems can be undertaken with assurance of success. The splendid researches carried out by a generation of scholars now passed away were essential to successful development of the school of technology, and in a still greater degree were the methods of scientific investigation necessary to that development. Observation and experiment came to the front, and for the first time in the history of education began to be esteemed at something like their full value. It came to be understood that the path to success was not alone through the study of books, but that the study of things was more important. What is known as the "laboratory method" of instruction began to be adopted in the most progressive institutions of learning, and soon proved itself to be vitalizing and powerful. All other departments of learning were forced to become the imitators of science in the use of this method, and the "new education" resulted. Many feared the effect upon the courses of study tending to produce what was long erroneously called a "liberal education," but it was soon found that if the simple "culture effect" be considered alone, the new education asks no odds of the old, while in the production of sound thinking and a virile intellectuality it is far and away ahead.

All of this was a necessary forerunner to the perfectly organized school of technology, but as a matter of fact the development of the latter was in a large measure contemporaneous with the evolution of the new education as outlined above. A class of professional schools has existed, indeed, almost as long as education itself, namely, those organized and maintained for the training of clergyman, lawyers, and physicians. Military schools have also long been in existence, and out of these latter came the beginnings of technical instruction.

In Europe this beginning is to be found in the creation of the celebrated École Polytechnique in France, in the third year of the Convention (1794). It was primarily for the training of young men in mathematics and drawing, to fit them for the Engineer and Artillery Corps of the French army. It owes much of its excellence to the labors of Carnot, who strove to give it a secure and proper foundation. The number admitted to its classes was limited, and only the best of the candidates were selected. Some of the most celebrated military and civil engineers of France have received their training there, and it has numbered among the members of its faculty such famous men as Lagrange, Laplace, Berthollet, Poisson, etc. It continues to adhere with considerable conservatism to the principal methods of its early history, and, in spite of innumerable competitors that have sprung up since its foundation, its rank is among the highest.

The famous School of Mines at Freiberg, earlier in its establishment by many years, has enjoyed a long and illustrious career, and is an excellent type of a technical school differing very decidedly from the École Polytechnique. In its early development, amid the rich mining resources and industries of Saxony, it illustrates the general principle that nearly every one of the first technical schools owes its origin to the demands of the leading industry in its immediate vicinity, by which also the character of its instruction was largely determined. Influenced largely by this principle, schools of technology became very numerous throughout continental Europe during the first half of the nineteenth century. Most of them have kept pace with the extraordinary development of science and scientific methods which has taken place during the last half of the century; their facilities for instruction have increased, and their courses of study have become largely professional. The polytechnic school has begun to assume its proper place in European schemes of education as something quite distinct from the earlier trade schools, from which, however, it was in many instances evolved. Besides France and Germany, Austria, Sweden, Switzerland, and Russia have maintained technical schools of high repute. Indeed, the U. S. is indebted to Russia more than to any other nation for some of the most important and valuable features of the modern school of technology. It was at two famous Russian schools, the Imperial Technical School, at Moscow, and the Institute of Technology, at St. Petersburg, that the experiment was first made of combining in the engineering courses the study of text-books, lectures, and other exercises long known to form a necessary part of scholastic training, with practical exercises in workshops in which the student was made familiar with machines, their construction and use, and the

nature of the materials upon which they worked. Many of the older and more conservative schools in Europe have been reluctant to follow the example of the Russians, but the numerous and great advantages of the method have been recognized in England and in a still greater degree in the U. S., where nearly every school of technology has adopted the Russian plan in a greater or less degree.

Great Britain, although contributing more largely, perhaps, than any other nation to those scientific discoveries upon which all technology is based, was slow to realize the necessity for technical education. It was not until it became evident that France, Germany, and other nations of continental Europe were likely, through their encouragement of technical schools and colleges, to deprive the United Kingdom of the prestige of first place in engineering and manufacturing skill, that the British began to develop this side of their educational system. Much interest was suddenly created, royal commissions were appointed, the work of foreign countries was examined and reported upon, and organized efforts resulted in the rapid advancement of the interests of technology. One organization, extensive in scope and comprehensive in plan, deserves more extended notice, even in a brief treatment of the subject. It is the City and Guilds of London Institute for the Advancement of Technical Education. The Prince of Wales is the president of the institute, and among its vice-presidents are the lord mayor of London, the president of the Royal Society, the president of the Institute of Civil Engineers, and many other of the most eminent men of Great Britain. The operations of the institute include the management of three London colleges and the system of technological examinations. The three colleges are the City and Guilds Central Technical College, which is "a college for higher technical instruction in mechanics and mathematics, civil, mechanical, and electrical engineering, and chemistry," the City and Guilds Technical College at Finsbury, and the London Technical Art School. The scheme of technological examinations is very elaborate and ambitious. Examinations are conducted once every year at various centers in the United Kingdom, upon a wide variety of technical subjects, more than sixty in number. Prizes and honors are awarded, and in some cases grants of funds are made. The object is to encourage local development of technical education, and the results are commensurate with the magnitude of the undertaking.

In the U. S. the earliest foundation for technical education was that of the Rensselaer Polytechnic Institute at Troy, N. Y. It was established in 1824 by Stephen van Rensselaer as a School of Theoretical and Applied Science. In the early years of the republic it was the necessary custom to employ learned and skilled foreigners in various public works, and most of the engineers at first engaged on the construction of canals and roads came from France. Many young men were sent there from the U. S. to be educated, and the Rensselaer School evidently owed its origin to a desire on the part of its founder to create an institution capable of supplying this demand. Its work has been mostly confined to the education of civil engineers, in which it has had a long and successful career.

About the middle of the century the importance of the sciences of chemistry, physics, geology, etc., had become so evident that several of the more important colleges established special departments for scientific work. The old education still held sway, and was at most only willing to admit the new as a sort of annex, but carefully avoiding responsibility in most cases by providing quite a distinct organization for the scientific school. The Sheffield Scientific School of Yale University was the earliest of these, having been founded in 1847. It was followed by the Lawrence Scientific School of Harvard University in 1848, and the Chandler Scientific School of Dartmouth College in 1852. The first two were for a long time schools of science rather than its applications, although they have latterly taken more of the character of schools of technology with thorough courses in several branches of engineering. The school at Dartmouth College has confined its work largely to civil engineering. All have done work of a high order.

Technical education in the U. S. received its greatest impetus, however, during the later years of the civil war and those first following its close. This must be attributed to two causes: First, the passage of the Morrill Act by which large land grants were made to the several States for the purpose of enabling them to establish institutions for giving instruction in agriculture and mechanics; second, the very

pressure, endowment of schools of technology during those years by private institutions. At this time the great industrial resources of the country began to receive the attention they deserved; the civil war had demonstrated the great need of technical knowledge and skill, and by the rapid rise in the value of real estate near cities and towns, and the consequent enormous expenditure of the Government in supplies during the period of the war, many men had themselves amassed of larger fortunes than they had been used to possess. Some of them were wise enough to turn a part share of their accumulations to the people through educational endowments.

From these two sources came a number of technical colleges, which usually divide themselves into two great classes: the best are founded principally through schools owing their origin to the national land grant and a few others, including some of the early schools already mentioned, all of which are departments or schools or colleges belonging to a university or college organization. Probably half of the institutions growing out of the land grant fund have departments in the various branches of engineering and the technical sciences. Among those best known for the length of the technical courses may be mentioned Cornell University, at Ithaca, N. Y.; Purdue University, at Lafayette, Ind.; the University of Wisconsin, of California, the Ohio State University, at Columbus, and the Illinois Institute of Technology. To these should be added, as among somewhat important technical schools attached to colleges or universities now founded or supported by the land grant, the Sheffield, Lawrence, and Chandler Scientific schools mentioned above, the Thayer School of Civil Engineering, also connected with Dartmouth College, the School of Engineering of the Washington University at St. Louis organized in 1870, and the School of Mines connected with Columbia College, New York.

In the second class are found schools of technology on an independent and separate foundation, and mostly the outcome of private endowment. The earliest of these was the Lowell Polytechnic Institute, already referred to. The year in order of time and one of the foremost in the number is the Massachusetts Institute of Technology, at Boston. First mentioned in a report prepared by Prof. William B. Ewing, entitled *Objects and Plan for an Institute of Technology, embracing a Society of Arts, a Museum of Arts, and a School of Industrial Sciences*. It was chartered in 1826, and opened to students in 1829. The school of industrial sciences has grown to be the foremost feature of the institute, although the other features are still retained. Even at the date of its incorporation is the Lowell Polytechnic Institute, at Worcester, Mass. It was incorporated in 1826, and its first building opened to students in 1827. It was the first school of technology in America to add a workshop to its equipment for the instruction of mechanical engineers and systematically to provide workshop practice as a part of the course of study. In its class should also be included Lehigh University, at Bethlehem, Pa., incorporated in 1866. Although using the same university, and providing courses of study in general literature as well as in technical subjects, the location of the school in the heart of a region rich in mineral resources has given it such a bent in the direction of applied science that it may not unjustly be regarded as a school of technology. In 1871 the Stevens Institute of Technology was established through the munificent liberality of Edwin A. Stevens, himself a noted engineer. The School of Applied Science was opened in Cleveland, Ohio, in 1870, and the Rose Polytechnic Institute, at Terre Haute, Ind., in 1880. All of the schools named as belonging to the first class owe their origin to private endowment. The Massachusetts Institute of Technology receives a share of the congressional aid in land grant colleges.

The course of study in the schools of technology in the United States through four years in nearly every instance. Students are not usually admitted under sixteen years of age, and the requirements for admission are not, in general, less than those of other institutions of college rank, and in some instances they are higher. Modern languages are usually required for admission instead of Latin and Greek. The course of study generally includes, besides mathematics, the more purely technical subjects and sciences, languages, history, and political economy, differing in this respect from many of the European technical schools. They are usually as to the range of their technical courses, a few making themselves almost exclusively to civil engi-

neering, or in some cases to mining engineering, while the greater number include civil, mechanical, and electrical engineering and chemistry, in which in a few instances are added mining engineering, sanitary engineering, architecture, and general scientific courses. The instruction is largely of a practical character, extensive use being made of laboratories, workshops, etc. Considerable difference exists in the character and amount of workshop practice as a part of the course in mechanical engineering. In some schools this is largely restricted to hand and bench work, little or no attention being given to construction. In others, the use of machine tools and experience in the actual construction of machines, and the assembling of their parts, is regarded as of paramount importance to the engineer. In all schools of technology worthy of the name the methods of instruction are such as tend to create independence of thinking and personal responsibility in judgment. With properly managed courses of study they are not deficient in the production of that intellectual discipline and culture which constitute a liberal education. While not organized for original research, their methods naturally tend to it, and in the U. S. they have probably during the period of their existence contributed more to the advancement of science than have educational institutions non-technical in character. They represent one of the most important achievements of an age whose chief glory is found in the increase and diffusion of science and its applications.

T. C. Mendenhall.

IX. TRADE SCHOOLS.

The inception and growth of the trade-school idea is, strictly speaking, confined to the nineteenth century. As an institution the trade school is purely a logical outgrowth of the changes in industrial methods which have taken place since the invention of the steam-engine. In the days of the guilds, when all production was in the hands of the master workman and his corps of journeymen, the youth seeking a trade found his natural place in the household of his master, where during the long years of his indenture he was initiated into all the secrets of the craft. With the introduction of machinery, however, a great change began in industrial methods. The economic advantage of quantity production, coupled with the division of labor, appeared, and the master, no longer simply the master craftsman, has gradually developed into the directive head of an industrial establishment. No longer working with his own hands, he uses his brain to direct more effectively the hands of many. Under these conditions the natural relation between the apprentice and his master has ceased, and without any provision for systematic training the apprentice, except in rare instances, is left to pick up the practice of his trade by observation and to such opportunities as chance and the good nature of his fellow workmen afford. Under such conditions a large amount of time is inevitably wasted and the training obtained liable to be one-sided and lacking in thoroughness.

Object of the Trade School.—The trade school represents an attempt to provide a modern substitute for the apprenticeship system better suited to these changed conditions. Before discussing the institutions engaged in such instruction it will be necessary to make clear certain distinctions in purpose and methods existing among the present schools. The trade school proper, with which this article is immediately concerned, is an institution designed to prepare handicraftsmen for practical work at a trade. Such a school may or may not include instruction other than manual, but its primary object is manual dexterity. Such schools are represented by the *Fachschulen* of Germany and Austria and the trade schools of the U. S. A technical school is an institution in which, in addition to practical instruction in the methods of a craft, the scientific principles upon which it is founded are thoroughly explained and their bearing upon the operations of the trade clearly demonstrated. Such schools may prepare superior craftsmen, fitted to become foremen or superintendents, or they may produce designers. The Pennsylvania School of Industrial Art and the weaving-school at Crefeld, Germany, are typical examples of such schools.

Schools in Continental Europe.—On the continent of Europe a large amount of study and experiment has been given to the problem of industrial training, and trade and technical schools have there reached a high point of organization and efficiency. This is particularly true of Germany, Austria, Belgium, and France. In Germany and Austria the system of trade schools is very thorough and much special-

ized. General industrial schools, in which a number of trades are taught, are found throughout the two empires, while special trade schools, in which one particular branch is dealt with, are distributed according to local needs. Thus there are special trade schools for silk-weaving, linen-weaving, watch-making, wood-working, mason-work, machine-work, brewing, etc. Courses in these schools are generally from three to five years in length, and embrace, besides practical trade-training, instruction in mechanical and free-hand drawing, geography, business forms, mathematics, book-keeping, and science. From the nature and extent of the instruction many of these schools should more properly be classified as technical schools, and even when the object is merely to combine the elements of a general education with the training of a handicraftsman the large amount of time required prevents their benefits being very generally reaped by the artisan class. The actual effect of these schools is in consequence rather to prepare a limited number of graduates fitted for superior workmen and foremen than to supply a means of training the great mass of artisans.

The aim of the Belgian schools approaches more nearly to that of a true trade school than those of the schools just described. Trade proficiency rather than an all around education is the end sought. Mental instruction is indeed generally provided, but its character is limited to such branches as have a direct bearing upon the trade. Besides a number of institutions supported by guilds and trade-unions, as well as several parochial schools in which practical trade-training is furnished, two very comprehensive trade schools exist at Tournay and Ghent. In these schools the pupil upon entering selects a special trade, which he pursues for a course of three years. Instruction is given in these schools in drawing, mathematics, science, and industrial economy.

In no country is the character of trade and technical instruction more differentiated than in France. In each of the French schools the grade of product aimed at, whether it be artisan, foreman, superintendent, or engineer, is accurately defined. Of the first mentioned class are the manual apprenticeship schools, into which boys are admitted at twelve or thirteen years of age. These schools are municipal institutions receiving state aid. They are in fact elementary trade schools which devote the greater part of a three years' course to practical manual work. The aim is not to turn out full-fledged workmen, but rather to shorten the period of apprenticeship. Mental instruction to the extent of three or four hours a day is given throughout the course. There are schools of this character in Paris for the mechanical trades, for bookmaking, and for furniture-making. Other schools exist at Havre, St.-Etienne, Rheims, Nantes, and St.-Chamond. Besides these municipal schools there exists a system of national apprenticeship schools, which are divided into primary and secondary grades. The primary schools are similar in character to the municipal schools, but afford somewhat more advanced instruction. In the three secondary schools at Châlons, Angers, and Aix, the instruction in both theoretical and practical branches is very thorough, and is such as to fit the graduates to become superintendents and masters of industrial establishments. The course is three years in length, and pupils must be between fifteen and seventeen years at entrance.

Great Britain.—In Great Britain trade schools (with one or two possible exceptions) do not exist. There are a large number of technical schools representing a great variety of aims and methods in which workshop instruction plays a part, but the principle almost universally obtains that a trade can only be properly acquired in a regular shop.

The United States.—Practical trade-school work in the U. S. began with the foundation of the New York trade schools in 1881. At first the work of these schools was confined entirely to evening classes. From the beginning the aim has been to train beginners for practical work at the trades. It is not designed, however, to reach the expertness of the finished mechanic, but rather to give a thorough grounding in the science and practice of the trade, leaving speed and experience to be acquired in after-practice at the trade. These schools have been pre-eminently successful. Starting with thirty-three pupils in 1881, the attendance has steadily grown, until in 1893 it reached 556. Manual instruction is supplemented in all classes by instruction upon the nature of materials and the scientific principles involved in the trade. Schools of like nature have been established by the Philadelphia Master Builders' Exchange and by the Pratt Institute of Brooklyn. In all of these institutions the principle obtains of confining the instruction given in the

schools to an essentially practical preparation for the trade and to pupils of sufficient age to learn rapidly, leaving the general education to be gained in the common schools previous to entering.

This system has received the endorsement of the National Association of Master Builders, who at their meeting of 1888 at Cincinnati passed resolutions recommending that a man who wished to enter the building trades should go at first to a trade school to learn the science and practice of his trade. When the trade-school course is finished and he has proved by an examination held by a committee of master mechanics that he has profited by it, he is to enter a workshop as a "junior." When old enough and able to do a full day's work he is to apply for a second examination, which if passed entitles him to be considered a journeyman.

This system seems well suited in its essentials to the needs and genius of the people of the U. S. and destined to develop throughout the country. One great obstacle to progress, however, is the attitude of the labor-unions, who oppose the entrance of trade-school graduates into the trade upon the same ground that they seek to limit the number of apprentices. In order to secure a full and free development of the trade-school movement in the U. S., a recognition of the trade-school graduate by the organization of the journeymen as well as by organizations of masters is necessary, and his establishment with a definite place and a definite economic value in the industrial world. C. R. RICHARDS.

Schooner: a vessel with two or more masts and fore-and-aft rigged; or, if the foremast have a square topsail, the vessel is called a topsail schooner. When sailing by the wind, schooners have an advantage over square-rigged vessels, and they are easily handled by a small crew.

Schoonmaker, AUGUSTUS: lawyer; b. at Rochester, Ulster co., N. Y., Mar. 2, 1828; was educated in the public schools of his native town; 1848-50 taught in the district schools of the county; in 1851 began the study of law, and was admitted to practice in 1853. He was elected county judge in 1863; re-elected in 1867; in 1875 was elected to the State Senate, where he drafted a bill to provide for uniformity of text-books in the common schools, which embodied the principle of the one which finally became a law of the State. In 1877 he was elected attorney-general of the State, and during his term of office (1877-79) had to deal with the questions relating to the release of William M. Tweed, the complications of the Erie Railway, the new apportionment under the census of 1875, and the constitutionality of that portion of the New York city charter creating a board of estimate and apportionment. In 1883 he was appointed one of the civil-service commissioners of New York. In 1887 he became an interstate commerce commissioner. D. at Kingston, N. Y., Apr. 10, 1894.

Revised by F. STURGES ALLEN.

Schopenhauer, shō'pen-how-er, ARTHUR: philosopher; b. in Dantzic, Prussia, Feb. 22, 1788. His father was a banker; his mother, Johanna, a writer of novels and books of travels. He entered the University of Göttingen in 1806, studied philosophy under Schulze the skeptic, and gave especial attention to Kant and Plato; in 1811 heard the lectures of Fichte at Berlin; wrote his famous essay, *On the Fourfold Root of the Principle of Sufficient Reason*, for his degree at Jena in 1813; adopted Goethe's theory of colors, and wrote in 1816 an essay *On Seeing and Color*. His principal work, *The World as Will and Representation*, was composed in Dresden and published in 1819. After a visit to Italy he settled at Berlin University as docent, and remained there in this capacity until 1831, with the exception of some intervals spent in Italy. Want of success as a lecturer caused his withdrawal from Berlin in 1831 to Frankfort-on-the-Main, where he spent the rest of his life in seclusion, and died Sept. 21, 1860. His characteristic doctrine is pessimism. The world is the worst of possible worlds. We can alleviate our lot in it by sympathizing with the suffering, and in a still more effectual way by an asceticism which destroys our will to live. This view of the world he connects with his doctrine of the Will, but not in a very obvious manner. According to him the Will is the only substantial essence in the universe; it is Kant's "thing in itself." The intellect, consciousness, our entire theoretical activity, is simply a result of the Will in its higher forms. The Will constantly energizes toward life, and the stadia of nature are simply the instrumentalities of the Will created on its way to life. Mere matter, as the product of forces, is the lowest

stage, the realm of blind Will; in chemical action, where there is conscious extension to activity, the Will is manifest on a higher stage; finally, the Will abstracts itself as a regulative, which do not depend upon externally exerting causes for their activity, but work from internal motives, and select likewise their own field, and hence need intelligences to further blind exerting impulses into qualities. The universe thus exhibits a brain in which the Will manifests its highest objectivation. With the brain, and intelligence which is its function, there arises simultaneously, as result, the world as representation with all its forms: subject and object, space and time, causality, etc. The brain with its intelligence is therefore only the tool or instrument of the will to live. He adheres to the Oriental idea of annihilation, and sometimes the Christian idea of immortality a delusion, hence "the highest moment of life is the complete transcendence of self in sleep, and the worst death is the most selfish and conscious." The world presents a continued rebirth before us, in which eternal justice becomes visible as the Nemesis which refuses to nullify again the individuals which have arisen like bubbles upon the surface of the eternal Will. Hence the highest act of morality is resignation, renunciation. Enjoyment of art is the only permissible pleasure, because that is cognition devoid of Will, the attainment of the Buddhists is the ultimate desideratum as the aim of Schopenhauer. In this world, which was the worst possible, the worst features in it, to Schopenhauer, was the contemporary philosophers, Fichte, Schelling, Hegel, and their followers, who achieved popularity and success, while he failed. He estimated his ingenuity in inventing speculations suitable for these "professors of philosophy"; but the dependence of his own views upon contemporary systems is quite obvious, especially upon those of Fichte and Schelling. Optimism might as well have been the logical consequence of his theory that the energy of the Will determines the intellect as its tool; for the world as representation must be then regarded as the ultimate final product of the Will, and any pessimistic amendment thereof as retrogression to a less complete standpoint. It was therefore illogical to adopt Buddhism as a consequence of his system. Consistent elaboration would have developed a philosophy much resembling the earlier system of Schelling, besides the three works already named, the following are noteworthy: *Upon the Will in Nature* (1836); *The Freedom of the Human Will* (1860); *The Basis of Morals* (1841). *The Parerga and Paralipomena* (1851) contains his views in a fragmentary form, and is the most popular of his works. The following of his works have appeared in English translations: (a) *The World as Will and Idea*; (b) *The Fourfold Root of the Principle of Sufficient Reason*; (c) *On the Will in Nature* (London); selections from his *Parerga and Paralipomena*; (d) *On the Theory of Life*, etc. (Milwaukee); (e) *The History of Philosophy*, etc.; (f) *Religion*, etc. (London). See his *Life*, by Helen Zimmern (1876), and by Wallace Stone *Writers Series*, 1886. Julius Frauenstädt has edited his works, and done much to make known his doctrines. Alfred von Hartmann, in his *Philosophy of the Unconscious*, presents in a modified form the philosophy of Schopenhauer.

THE PISCOPAL.

WILLIAM T. HARRIS.

Schopp, ROBERT DEO SCOPPIUS.

Schouler, JAMES, A. B., LL. D.; lawyer and historian; b. at Arlington, Mass., Mar. 20, 1829; graduated at Harvard (1850); served in the civil war; practiced law in Boston and Washington, D. C.; author of legal text-books on *Domestic Relations*, *Personal Property*, *Real Estate*, *Wills, Executors and Administrators*. He is more widely known as the author of *History of the United States under the Constitution* (6 vols., 1890-91).

C. H. T.

Schooten, also known as, WILLEM CORNELIS; navigator; b. at Breda, Holland, about 1567. He was long employed by the Dutch East India Company, but resigned in 1610, and engaged with the merchant Isaac Lemaire to find a new route to the W. Indies. Leaving the Texel June 14, 1611, he passed by the Strait of Magellan, discovered the passage named by him Lemaire Strait, was the first to double Cape Horn and reached the Indies in safety. There he was arrested, but was subsequently acquitted, re-entered the service of the Dutch East India Company, and died on the coast of Balambangan in 1663. The Cape Horn route was speedily adopted as preferable to the Strait of Magellan; it is still used by the sailing vessels.

H. H. S.

Schuyvaloff, another spelling of the name SCHUYALOV

Schrader, KENNETH; Orientalist; b. at Brunswick, Germany, Jan. 5, 1866; studied at the gymnasium in Brunswick and the University of Göttingen; Professor of Hebrew and Semitic Languages successively at Zurich, Göttingen, Jena, and since 1876 professor and member of the Royal Academy at Berlin; author of *Die Sprache der Äthiopier aus cognatis Sprachen* (Leipzig, 1890); *Studien zur Kritik und Erklärung des biblischen Urgeschichte* (1890); *Einführung in das alte Testament* (with de Wette, 8th ed., 1899); *Die vorderasiatischen Keilschriften* (Leipzig, 1874); *The Keilschriften und das alte Testament* (Göttingen, 1872); 2d ed., 1883; Eng. trans., *The Cuneiform Inscriptions and the Old Testament* 2 vols., London, 1885-86); *Die Hittitische Sprache* (1874); *Keilschriften und Hittitische Sprache* (Göttingen, 1876). Editor of *Keilschriftliche Bibliothek* (1869, seq.).

Revised by W. W. W.

Schrader, JAMES FRANKLIN; painter; b. in Berlin, Prussia, June 19, 1815; studied painting at the academy of the native city, at Düsseldorf 1837-45, and in Rome 1845-47, and was appointed professor at the Academy of Berlin in 1851. His most celebrated pictures are *The Death of Leonardo da Vinci* (1851); the great fresco in the New Museum at Berlin, *The Conversion of the Church of St. Sophia in Constantinople* (1860); *Robert before Alexander* (1866), and a number of portraits.

Schrader, OTTO; comparative philologist; b. at Weimar, Germany, Mar. 28, 1856; educated at the gymnasium in Weimar, and at the Universities of Jena, Leipzig, and Berlin; teacher in the gymnasium at Jena, and assistant professor in the University of Jena; author of *Langensprachliche Forschungen zur Handbuchgeschichte und Wortkunde* (1886); *Sprachvergleichung und Urgeschichte* (1881); 2d ed., 1890; Eng. trans., *Prehistoric Antiquities of the Aryan Peoples*, 1890; *Völker und Sprachen* (1891); edited the 6th (revised) edition of Hahn's *Kulturpflanzen und Haustiere* (1894). He is an eminent authority in linguistic archaeology.

W. L. W.

Schreyer, ADOLF; animal-painter; b. at Frankfurt-on-the-Main, May 9, 1828; studied at the Städels Institute, Frankfurt; medals, Paris Salons, 1854, 1855, and 1867; medals at Brussels Exhibition 1863 and Munich 1876; Order of Leopold of Belgium. He has traveled and painted in Egypt and Algiers, and lived in Paris until 1870, when he removed to Kronberg, near Frankfurt. His pictures of horses and Arabs are very popular in the U. S., and many of his works are in private collections in New York and other cities. Studies in Paris and at Kronberg.

W. A. C.

Schriver, ENRIQUE; soldier; b. at York, Pa., Sept. 16, 1812; graduated at U. S. Military Academy, and promoted brevet second lieutenant of artillery July 1, 1830, captain 1842; resigned July 31, 1846, having served as captain of staff and assistant adjutant-general almost continuously from 1838 to 1846. In Apr., 1861, he accepted an appointment on the staff of Gov. Morgan of New York, with the rank of colonel and A. D. C., and May 14 was appointed lieutenant-colonel of the Eleventh Infantry U. S. army; colonel and A. A. D. C. May, 1862, and served as chief of staff to Gen. McDowell and Gen. Fremont (third corps); appointed inspector-general U. S. army (rank of colonel) Mar., 1863, and assigned to the Army of the Potomac; was engaged at Chancellorsville and Gettysburg 1863, and in the Richmond campaign of 1864, up to the investment of Petersburg. He was breveted brigadier-general in 1864 and major-general in 1865; was inspector of the Military Academy 1866-71; retired 1881.

Revised by JAMES MAURIN.

Schröder, FERDINAND LUDWIG; actor; b. at Schwerin, Germany, Nov. 3, 1744; was abandoned, while still a boy, by his parents, who were strolling actors, at Königsberg; found his parents in 1759 in Salsburg, where he was trained to become a dancer; joined them finally in Hamburg in 1764; undertook in 1771 the management of the troupe after the death of his step-father, Ackermann, and raised the stage of Hamburg to a position of literary and artistic influence in Germany, partly by his plays (collected and published in 1841 in four volumes with an introduction by Tock), partly by the rigid sense of social propriety with which he governed the theater, but especially by his grand impersonations of some of the principal Shakespearean characters, such as Lear, which he was the first to introduce on the German stage. D. at Rellingen, Sept. 3, 1816. His *Life* has been written by F. L. W. Meyer (1816) and Brander (1844).

Revised by R. B. VALLENTINE.

Schröder, SOPHIE (Bürger): actress; b. at Paderborn, Westphalia, Feb. 23, 1781; appeared upon the stage when twelve years of age in St. Petersburg, where the troupe to which her parents belonged was playing; married in 1795 Stollmers (whose true name was Smets), the director of another band, in 1804 the singer Schröder, and in 1825 the actor Kunst; acted in all the principal theaters of Germany, but principally at Vienna, and acquired a great fame by her impersonations of Phædra, Medea, Merope, Lady Macbeth, Sappho, etc. In 1840 she retired from the stage with a pension from the Austrian court. D. at Munich, Feb. 25, 1868. Her *Life* was written by P. Schmidt (Vienna, 1870).—Her daughter, **WILHELMINE SCHRÖDER-DEVRIENT**, b. at Hamburg, Oct. 6, 1804, made her *début* as a singer in 1821 in *The Magic Flute*; sang as Donna Anna, Euryanthe, Fidelio, etc., and was soon acknowledged as the first singer of Germany; was received with great enthusiasm in Paris, London, and St. Petersburg; retired from the stage in 1847. D. at Coburg, Jan. 26, 1880. She was twice married, the first time (1823) to the actor Karl Devrient. Her *Life* was written by Claire von Glümer (1862) and Wollzogen (1863).

Schubert, FRANZ: "the immortal melodist"; b. in Vienna, Jan. 31, 1797; son of a school-teacher in the Lichtenthal district of the city; was trained chiefly by the organist of the parish church; became leader of the choristers' school of the court chapel; composed his first symphony in 1813; taught in his father's school to avoid conscription; in 1818 became teacher of music in the family of Count Esterházy at Zélez, Hungary; in the same year returned to Vienna, where the publication (1821) of his *Erl King* gained him popularity; gave his first and only public concert in 1828 in Vienna. D. in Vienna, Nov. 19, 1828. He is best known by his songs, several hundred in number, of which some fifty or sixty are celebrated and will live. His music was scarcely known to the outside world during his lifetime. His fecundity was marvelous, and the quantity of MS. left behind to be discovered by the musical world was enormous. His original MSS. prove the great ease and rapidity with which he wrote, rarely making a revision. This, indeed, is the source of a characteristic drawback to the merit of most of Schubert's instrumental compositions—viz., a too great diffuseness, or lack of condensation, coupled frequently with literal repetition of large sections. Among his larger works, aside from the songs, may be specially mentioned the great *C major Symphony* (No. 9), the *Unfinished Symphony*, many fine sonatas for piano solos, and also with violin, trios for piano, violin, and violoncello, the *Mass in E flat*, etc. He wrote several operas which were not successful. Schubert's technical handling of his material compares respectably with his contemporaries, but in this regard he made no attempt at originality. The chief characteristics of Schubert are the continued freshness of his peculiarly delightful melodies, supported by harmonies of equal interest. See the *Lives* by von Hellborn (Vienna, 1865) and Reissmann (Berlin, 1875).

DUDLEY BUCK.

Schuchardt, shoo'khärt, HUGO: Romanic philologist; b. at Gotha, Germany, Feb. 4, 1842; educated at the gymnasium in Gotha and at the Universities of Jena and Bonn; 1870-73 privat docent in Leipzig; 1873-76 Professor of Romanic Philology in Halle; since 1876 professor in Graz; author of *Vokalismus des Vulgärlateins* (3 vols., 1866-68); *Ueber einige Fälle bedingten Lautwandels im Churwölischen* (1870); *Ritornell und Terzine* (1874); *Slavo-Deutsches und Slavo-Italienisches* (1884); *Ueber die Lautgesetze* (1885); *Romanisches und Keltisches* (1886); *Kreolische Studien* (1881-91); *Auf Anlass des Volapüks* (1888); *Baskische Studien* (part i., 1893); *Wellsprache und Wellsprachen* (1894). He is a brilliant creative scholar.

B. I. W.

Schulte, shoöl'te, JOHANN FRIEDRICH, von: polemical writer; b. at Winterberg, Westphalia, Apr. 23, 1827; studied law at Berlin; practiced there and at Arnsberg and Bonn; became Professor of Canon Law at Prague 1855. He wrote *Handbuch des katholischen Eherechts* (Giessen, 1855); *Das katholische Kirchenrecht* (2 parts: *Quellen des katholischen Kirchenrechts* und *System des allgemeinen katholischen Kirchenrechts*, 1856-60); *Lehrbuch des katholischen Kirchenrechts* (1863; 4th ed. 1886); *Lehrbuch der deutschen Reichs- und Rechtsgeschichte* (2 parts, Stuttgart, 1860-61; 6th ed. 1892); *Die Rechtsfrage des Einflusses der Regierung bei den Bischofswahlen in Preussen* (Giessen, 1869). He made a sensation by his pamphlet *Die Macht der römischen Päpste über Fürsten, Länder, Völker, Individuen* (Prague, 1871), for in it he set himself against the dogma of papal

infallibility. He then (1871) left Prague and removed to Bonn, to whose law faculty he belongs. He is a leader of the Old Catholics. In their behalf he has produced many books and pamphlets, of which may be mentioned a second edition of the pamphlet just mentioned with an addition, *Die entgegengesetzten Lehren der Päpste und Concilien der ersten 8. Jahrhunderte über das Verhältniss der weltlichen Gewalt der Kirche gegenübergestellt*; also *Die Stellung der Concilien Päpste und Bischöfe vom historischen und canonischen Standpunkte und die Päpstliche Constitution vom 18. Juli, 1870* (1878); *Der Cölibatszwang und dessen Aufhebung gewürdigt* (in advocacy of its abolition, Bonn, 1876); *Die Geschichte der Quellen und Literatur des canonischen Rechts von Gratian bis auf die Gegenwart* (3 vols., Stuttgart, 1875-80); *Die Geschichte der Quellen und Literatur des evangelischen Kirchenrechts in Deutschland und Oesterreich und die evangelischen Kirchenrechtsschriftsteller* (1880); *Die Summa der Paucapala über das decretum Gratiani* (Giessen, 1890); *Der Alt-Katholicismus, Geschichte seiner Entwicklung, u. s. w.* (Giessen, 1887); *Die Summa des Stephanus Tornacensis über das Decretum Gratiani* (1891); *Die Summa magistri Rufini zum Decretum Gratiani* (1892).

SAMUEL MACAULEY JACKSON.

Schultz, JOHN CHRISTIAN, M. D.: lieutenant-governor of Manitoba; b. at Amherstburg, Ontario, Jan. 1, 1840; graduated as a physician in 1861; assisted Gov. Macdavid and Bishop Anderson in establishing the Institute of Rupert's Land in 1863. In 1867 and 1868 he agitated in favor of the union of all the provinces; and when the Northwest was purchased by Canada in 1869 he and others, loyal to the Government, were captured by insurgents who opposed the transfer, and were imprisoned in Fort Garry. He effected his escape and in 1870 returned to Manitoba, and at the first general election was chosen to represent Lisgar in the Dominion Parliament, which seat he held until 1882, when he was appointed to the Senate. He was captain of the Lisgar Rifle Company 1871-74; a member of the executive council for the Northwest Territories in 1872; appointed member of the Dominion board of health for Manitoba and the Northwest Territories same year, and one of the board of governors of Manitoba medical board, and has been president of the Southwestern Railway of Manitoba. He was appointed lieutenant-governor of Manitoba July 1, 1888.

NEIL MACDONALD.

Schultze, shoöl'te, CARL AUGUST JULIUS FRITZ, Ph. D.: professor of philosophy and pedagogy; b. at Celle, Hanover, May 7, 1846; educated at the gymnasium in Celle, and at the Universities of Jena, Göttingen, and Munich; privat tutor 1869-70; high-school teacher 1870-72; privat docent 1872-75; and Professor Extraordinary of Philosophy 1875-76 in Jena University; Professor of Philosophy and Pedagogy since 1876 in the Royal Polytechnic School in Dresden. Of his pedagogical works the best known is *Deutsche Erziehung* (1893), an important contribution to Herbartian literature. Others are *Der Fetischismus, Ein Beitrag zur Anthropologie und Religionsgeschichte* (1871); *Geschichte der Philosophie der Renaissance* (vol. i., 1874); *Philosophie der Naturwissenschaft* (2 vols., 1881-82); *Die Grundgedanken des Materialismus und die Kritik derselben* (1881); *Die Grundgedanken des Spiritismus und die Kritik derselben* (1883); *Die Sprache des Kindes* (1880); *Stammbaum der Philosophie* (1890); *Vergleichende Seelenkunde* (vol. i., 1892); *Der Zeitgeist in Deutschland, seine Wandlung von 19. und seine muthmassliche Gestaltung im 20. Jahrhundert* (1894).

J. E. RUSSELL.

Schultze Powder: See EXPLOSIVES.

Schumacher, shoo'mäkh-er, HEINRICH CHRISTIAN: astronomer; b. at Bramstedt, Holstein, Germany, Sept. 3, 1780; studied mathematics and astronomy at Kiel, Jena, Copenhagen, and Göttingen, and became Professor of Astronomy at the University of Copenhagen in 1815; removed in 1821 to Altona, where he died Dec. 28, 1850. In 1821 he founded the *Astronomische Nachrichten*. In 1830 he made the observations of the length of the seconds-pendulum, which formed the basis of the Danish scale of measure.

Schu'mann, ROBERT: composer; b. at Zwickau, Saxony, June 8, 1810; after a short course in law and philosophy at Heidelberg, he settled in 1830 at Leipzig, in order to study under Wieck, an eminent piano-teacher; but having crippled his right hand he was forced to devote himself to composition instead of piano-playing, and in his studies was guided by Heinrich Dorn. In 1843 he was appointed Professor of Composition in the conservatory at Leipzig, and

in 1830 musical director at Düsseldorf. While living at Düsseldorf he became deranged, attempted suicide in the Rhine, was rescued and taken to an asylum. D. at Kiel, Schleswig, near Hamburg, July 26, 1856. With the exception of the symphonies, Schumann's works include almost every art-form: two symphonies, several cantatas, an opera, a mass, sonatas, nocturnes, quartets for strings and also for voices, many pieces for the piano, a few for the organ, and a number of song-songs. The symphonies have been accorded a rank immediately after those of Beethoven. The opera *Genoveva* was given at Leipzig, but failed. Schumann possessed a highly cultivated literary ability, and founded the *Zeitschrift* at Leipzig, a music review to which he contributed many important articles. He may also be considered the founder of the so-called romantic or emotional school. There is a certain semi-mystical trait about a number of Schumann's compositions, which, however, does not prevent him from being clear and strong in the majority of his works, at least in those composed prior to the time when he began to be clouded with coming insanity. The gradual approach of this sad fate may be traced in the works themselves. Several lives of Schumann have been published, including those by Wladislawski (3d ed., Dresden, 1891), Karg, Berlin, 1879, and Prof. Niekisch, of Edinburgh (1890). Also see his *Collected Writings* as editor of the *Neue Zeitschrift*, with a number of letters (4 vols., Leipzig, 1854; 3d ed. 2 vols., 1875).—His wife, Clara (Wiese), b. at Leipzig, Sept. 13, 1819, was the most celebrated female pianist of her day. She has contributed greatly to a correct understanding of her husband's works by her masterly interpretation of them both in public and private. Besides this, Clara Schumann may be said to have first introduced Chopin to the German musical world. DUNSTON BUCK.

Schurman, Jacob Gould, D. Sc., LL. D.: president of Cornell University; b. at Fredonia, Prince Edward Island, Feb. 22, 1824; educated first in Canada, and then (from 1850 to 1860) in England, Scotland, France, and Germany. He was Christian scholar for Canada 1875-78; holder of Robert Trevelyan fellowship (for Great Britain) 1878-80; professor of Logic, Psychology, and English Literature in Amherst College 1880-82; professor of Philosophy in Cornell College 1882-90; professor of Philosophy in Cornell University since 1890, and president since 1892; editor of *The Philosophical Review* since 1892 and of *The School Review* since 1893; author of *Kantian Ethics and the Ethics of Evolution* (1891); *The Ethical Import of Darwinism* (1892); *Belief in God* (1890); and essays and addresses on moral, religious, educational, and philosophical subjects.

Schurz, Adolph, Cam. LL. D.: statesman and author; b. a lawyer, near Cologne, Rhinish Prussia, Mar. 2, 1829; educated at the gymnasium of Cologne and at University of Bonn 1846-48; aided Prof. Gottfried Kinkel in the publication of a liberal newspaper, begun after the revolutionary outbreak of 1848; took part in the revolutionary movements of 1848 and in the following year, and succeeded in effecting the escape of his companion, Kinkel, from imprisonment in the fortress of Spandau. After spending some months in Paris (1851-52) he settled in the U. S.; entered with great interest national politics, becoming a leader of the German faction of the newly founded Republican party. He began as reporter of law at Milwaukee in 1859; was prominent in the Republican national convention at Chicago 1860, and in an ensuing presidential campaign; was appointed by President Lincoln minister to Spain Mar., 1861, but resigned in December of the same year in order to enter the army. His retirement was highly honorable. He was appointed brigadier-general of volunteers Apr., 1862; became major-general May, 11, 1863; commanded a division in the second battle of Bull Run and in the battle of Chancellorsville; was temporarily in charge of the Eleventh Army-corps at Gettysburg; took part in the battle of Chattanooga, and resigned May 9, 1865. Having settled in Missouri, he was U. S. Senator from that state 1869-73, and acquired a high reputation for ability by his speeches on finance and national policy. The policy of Grant's administration drove him into the "liberal" movement, and he presided over the Cincinnati convention which nominated Horace Greeley for the presidency 1872. After his return from a visit to Europe in 1875 he became a resident of New York. He took part in the second campaign of 1876 in Ohio, advocating the election of Hayes on a "hard-money" platform, was one of the names of the independent conference of May 15, in New York, and Secretary of the Interior 1877-81. From 1881 to

1892 he was editor-in-chief of the New York *Evening Post*. In the campaign of 1884 he repudiated the candidacy of Blaine, and was one of the earliest and most vigorous of the Republican supporters of Cleveland. Civil-service reform, tariff reform, and the purification of New York politics have received his hearty support. His *Life of Henry Clay* (1897) has given him a high place as an historical writer and interesting writer. F. M. COLBY.

Schus'tar (Arab. *Tislar*): town; in the province of Khuzestan, Persia; on the Karun; in lat. 32° 5' N., lon. 48° 02' E. (see map of Persia and Arabia, ref. 8-11). It is fortified, and its streets, though narrow and dirty, are lined with elegant houses, but large parts are in ruins and uninhabited since the plague and the inundation which early in the nineteenth century successively visited the city. It was a flourishing Persian provincial capital, and in ancient times was in a populous district, with Susa (Bibi, Shushan) to the N. W. and Ham Hormuz on the opposite side. Pop., according to Hüner, 27,000. Revised by M. W. HARRINGTON.

Schura'ov, Pyotr Alexandrovich, Count: diplomatist; b. in St. Petersburg, Russia, July 15, 1827; entered the army, and became a general at the age of thirty. As governor-general of the Baltic provinces 1863-66 he showed great tolerance in dealing with the German element in the population and opposed the persecutions of the Protestants. In 1890 he was made chief of the secret service, just as the Nikhil movement began to show its power. In 1873 he was sent as ambassador to London, and arranged the marriage between the daughter of Alexander II. and the Duke of Edinburgh. Again representing his Government at the court of St. James, he did much to avert the threatened war between Russia and Great Britain after the Russo-Turkish war of 1877-78. D. in St. Petersburg, Mar. 22, 1899.

Schuyler, Alfred: city; capital of Colfax co., Neb.; on the Platte river, Shell creek, and the Union Pac. and the Harrington Route railways; 16 miles E. of Columbus, 20 miles W. of Fremont (for location, see map of Nebraska, ref. 10-11). It contains 6 churches, high school building (cost \$25,000), a large U. S. sugar-beet experiment station, flour-mill, cigar factory, 2 national banks with combined capital of \$100,000, 2 State banks with capital of \$27,000, and 4 weekly newspapers. Pop. (1880) 1,017; (1890) 2,191; (1895) estimated, 3,100. Editor of "Sun."

Schuyler, Edmund, LL. D.: diplomatist; b. at Ithaca, N. Y., Feb. 20, 1840; graduated at Yale in 1859 and at Columbia Law School in 1863. He was U. S. consul at Moscow 1867-69 and at Reval 1869-70; secretary of legation at St. Petersburg 1870-75 and at Constantinople 1875-78; *chargé d'affaires* at Bucharest 1880-82; minister to Greece, Serbia, and Roumania 1882-84; consul-general at Cairo from 1889 till his death. In 1875 he traveled in Central Asia; an account of the journey is given in his *Turkistan* (2 vols., 1876). Besides contributions to magazines, etc., he wrote also *Peter the Great* (2 vols., 1884) and *American Diplomacy* (1886). D. at Cairo, Egypt, July 18, 1890.

Schuyler, Peter: soldier; b. probably near Newark, N. J., about 1710; recruited and commanded the regiment called the Jersey Blues, and joined the army for the invasion of Canada 1746; commanded Fort Clinton in Saratoga 1748-49; again joined the colonial army with his regiment 1754; attended the congress convoked by Gov. Shirley at New York 1755; was in command at Oswego when that place was taken by the French Aug. 14, 1756, and for a short time was a prisoner in Canada, and was again in command of the New Jersey regiment in Sir Jeffrey Amherst's campaign, which resulted in the conquest of Canada 1759. D. near Newark, N. J., Nov. 17, 1762.

Schuyler, Philip: b. at Albany, N. Y., Nov. 20, 1738. He was appointed captain of New York volunteers in June, 1755, and was engaged in the expedition against the French at Crown Point. At the end of the campaign of 1756 he left the army, but in 1758 accepted the appointment of ensign with the rank of major. Two days after the battle of Bunker Hill Congress appointed him a major-general, and placed him in command of the northern department. In the expeditions against Canada Schuyler commanded that by way of Lake Champlain, but was compelled, owing to ill health, to relinquish his command to Montgomery in September and return to Albany, after having taken possession of Isle au Noix on Nord river. At Albany, besides continuing to exercise an active supervision of affairs in the northern department, his influence among the Indians was

of great value. The failure of the Canada expedition excited much hostility toward Schuyler, and insinuations were uttered against his loyalty, which became so offensive that in the autumn of 1776 he sent in his resignation to Congress, which that body declined to accept; but the abuse continuing, Schuyler, in Apr., 1777, proceeded to Philadelphia and demanded a court of inquiry, which entirely approved his management of affairs, and he resumed command of the northern department. The forced abandonment of Ticonderoga by St. Clair, and his retreat to Fort Edward, where Schuyler had just arrived with re-enforcements, compelled the latter to fall back to Saratoga, after using every means to obstruct the advance of Burgoyne. The losses thus sustained in stores, ammunition, etc., caused a widespread consternation throughout the country, and the clamor against Schuyler was renewed, and this time Congress ordered his superseding by Gates. At the time of the latter's arrival (September) to assume command, Schuyler occupied a fortified position at the mouth of the Mohawk, to which he had fallen back from Saratoga. Gates had, since Schuyler's resumption of the command of the northern department, been unfriendly to Schuyler, and it was with feelings of mortification that the latter received the order deposing him at a time when the feeling of depression arising from former disasters had been dispelled by recent victories, and when volunteers were from all quarters swelling his army. He, however, obediently turned over his command and placed his successor in possession of full information of the situation, and, though without command, remained with the army to aid in any capacity, and was present at the surrender of Burgoyne. A court of inquiry again approved of his management in strong terms, but in Apr., 1779, he resigned, though continuing to render valuable service in the military operations in his native State. From 1778 to 1781 he was a member of the Continental Congress, and in 1789 was appointed U. S. Senator from New York, and again in 1797 to succeed Aaron Burr. In the New York Senate he contributed largely to the code of laws adopted by the State, and was an active promoter of the canal system. D. at Albany, Nov. 18, 1804. See his *Life and Times*, by B. J. Lossing (2 vols., 1860-62; new ed. 1872).

Schuykill, skool'kil [Dutch, liter., hidden channel, because unobserved by the first explorers]: a river which rises in Schuylkill co., Pa., and after a southeasterly course of 125 miles flows into the Delaware at Philadelphia, which city it traverses. Its lower portion affords extensive wharfage, and is of much commercial importance. The river was (1816-25) adapted to slack-water navigation for freight-boats to Port Carbon, 3 miles above Pottsville. The river affords the greater part of the water-supply for Philadelphia. It enters the Delaware between League island, containing a navy-yard, and Mud island, on which is Fort Mifflin.

Revised by I. C. RUSSELL.

Schuylkill Haven: borough; Schuylkill co., Pa.; on the Schuylkill river and canal, and the Lehigh Val., the Penn., and the Phila. and Reading railways; 4 miles S. of Pottsville, 31 miles N. N. W. of Reading (for location, see map of Pennsylvania, ref. 5-H). It is in an agricultural and coal-mining region, has large wharves and canal-boat docks for shipping coal, and contains rolling-mills, hosiery-works, railway car-shops, shoe and soap factories, and a weekly newspaper. Pop. (1880) 3,052; (1890) 3,088.

Schwab, shraap, GUSTAV: author; b. at Stuttgart, Germany, June 19, 1792; studied theology and philosophy at Tübingen; was appointed Professor of Ancient Literature in the gymnasium of Stuttgart in 1817; pastor at Gomaringen in 1837, and of the St. Leonhard church in Stuttgart in 1840, where he died Nov. 4, 1850. His poems show purity and warmth of feeling, though they do not possess the simplicity and classic perfection of form of Uhland's songs. Like the latter poet and other members of the Suabian school to which he belonged he wrote many ballads, some of which have become very popular. The first collected edition of his *Gedichte* appeared in 2 vols. in 1828-29; a second revised edition, *Neue Auswahl* (Stuttgart, 1838), has been often reprinted. Of his prose works, the most remarkable are *Schillers Leben* (Stuttgart, 1840; 3d ed. 1859); *Sagen des klassischen Alterthums* (Stuttgart, 1838-40; 14th ed. Güterslohe, 1882); *Deutsche Volksbücher* (1843; 13th ed. Güterslohe, 1880); and *Wegweiser durch die Litteratur der Deutschen* (Leipzig, 1846; 4th ed. 1870). See K. Klüpfel, *Gustav Schwab als Dichter und Schriftsteller* (1884).

Revised by JULIUS GOEBEL.

Schwalbe, shraal'be, GUSTAV ALBERT, M. D.: professor of anatomy; b. at Quedlinburg, Germany, Aug. 1, 1844; educated in the gymnasium at Quedlinburg, and at the Universities of Zurich, Bonn, and Berlin; became privat-docent at Halle Jan., 1870; professor at Freiburg in Baden May to Oct., 1871; professor extraordinary at Leipzig Oct., 1871 to Oct., 1873; ordinary Professor of Anatomy at Jena Oct., 1873, to Apr., 1881; held same position at Königsberg Apr., 1881, to Oct., 1883, when he accepted a chair at Strassburg. His principal works are *Lehrbuch der Neurologie* (1881) and *Lehrbuch der Anatomie der Sinnesorgane* (1887). He is editor of *Morphologische Arbeiten* (begun 1891), and has edited part i. of *Anatomy* (20 vols., 1872-92), and with Hoffmann and Hermann a *Yearly Report of Anatomy and Physiology*.

Schwal'ber [better known as CHELIDONIS, the punning Græco-Latin translation of the German *Schwalbe*, a swallow; Gr. *χελιδών*]: a friend of Albert Dürer, and the author of the text in Latin verse to his three series of wood-cuts, *The Apocalypse*, *The Passion of Christ*, and *The Life of the Virgin Mary*. Schwalber was a monk of the abbey of St. Egidius (St. Julian, St. Gilgan, St. Giles), built by Conrad III. in 1140 for a society of Scotch Benedictines. He was nicknamed Musophilus, from his love of learning, and he had a reputation for considerable knowledge of the classical Latin poetry. While a member of this monastery he wrote the text for Dürer's wood-cuts, besides verses about his monastery, *Versic. de Fund. Cœnob. Egid.*, and about the abbots, *Versic. de Abbat. nonnullis ejusdem Cœnob.* In 1515 Schwalber left Nuremberg to become abbot in the Schotten Kloster, near Vienna. D. there Sept. 8, 1521.

Schwann, THEODOR: physiologist; b. at Neuss, Prussia, Dec. 7, 1810. He studied at the Jesuits' College, Cologne, at Bonn, Würzburg, and Berlin, where he graduated in medicine in 1834. He was assistant to Johannes Müller in the Anatomical Museum at Berlin till 1838. He discovered pepsin and its function in digestion, the envelop of nerve-fibers, the organic nature of yeast, and made a series of researches on muscular contractility, and other physiological subjects. He was Professor of Anatomy at the Roman Catholic University of Louvain 1838-48, and at Liège from 1848. D. at Cologne, Jan. 14, 1882. His cell-theory, which is the basis of modern histology, was published in *Microscopical Investigations on the Accordance in the Structure and Growth of Plants and Animals* (Berlin, 1839; trans. by Sydenham Society, 1847).

Schwann, White Matter of: See HISTOLOGY (*Nerves and Nerve-centers*).

Schwanthaler, shraan'thal-er, LUDWIG MICHAEL: sculptor; b. at Munich, Aug. 26, 1802, the son of a sculptor, studied in Rome, but wrought in Munich. His statues, decorations, and models, are seen in the great cities of Germany, but chiefly in Munich. He executed the frieze of the Barbarossa hall, the colossal statue of Bavaria, and the metopes of the Ruhmeshalle which adjoins it, the colossal bronze statues in the throne-room of the palace at Munich, and the monumental images in the Walhalla. D. Nov. 28, 1848.

Schwartz, shraarts, CHRISTIAN FREDERICK: missionary; b. at Sonnenburg, Prussia, Oct. 26, 1726; studied in the University of Halle 1746-49; was ordained at Copenhagen 1749; embarked at London for India, where he arrived July, 1750; settled at Tranquebar, a Danish mission on the Coromandel coast; transferred his services to the English Society for Promoting Christian Knowledge 1766, when he removed to Trichinopoly, and in 1778 to Tanjore; was sent as ambassador to Hyder Ali at Seringapatam to negotiate a peace, and admitted by him after all other envoys had been refused, and succeeded in relieving the city of Tanjore from imminent danger of famine by his influence with the native farmers, who brought in their cattle on his personal pledge of payment. D. at Tanjore, Feb. 13, 1798. He was one of the most celebrated missionaries of modern times. He aided Schultz in translating the Bible into Tamil, and was tutor to the son and heir of the rajah of Tanjore, who erected to his memory in the mission church a magnificent monument designed by Flaxman; the East India Company also placed a monument of him by Bacon in St. Mary's church, Madras. See *Memoirs of his Life and Correspondence*, by H. Pearson, D. D. (2 vols., 1833; 3d ed. 1839).

Schwartz, MARIA SOFIA (*Birath*): novelist; b. at Braas, Sweden, July 4, 1819; was married in 1840, and became a widow in 1858. She was the author of a number of novels, all of which have been translated into German and

black, and many of them into English. Their interest eventually in their plot. Among them may be mentioned *Thomas of Lincoln grammar or folio* (The Man of Birth and the Women of the Papal, 1666); *Hand von lebendigen (1670)* and *Education*; *Arbeits- und Lebensregeln* (Luther's Rules, 1666); *Aufgaben- und* (The Nobleman's Daughter, 1666); *The Theologian's Son* (1666); *A Child of the Time* (1677). D. 1664. D. R., 1666.

Schwartz, Hermann, whose true name is said to have been *Herrmann Achenbach*; the reputed inventor of gunpowder; received the name of Bernhard on entering a Prussian infantry at Münster, Cologne, or Hildesheim, and was called Schwartz (black) on account of his position for the time being. According to legend, he invented gunpowder in 1326 (see dates 1326 and 1328 are also given), and in Freiburg, his reputed birthplace, a monument was raised in his honor in 1862. All the details of his life are uncertain, however, while it is certain that gunpowder was known before 1326, though not used in war or hunting.

Schwaburg-Rudolstadt, principally and state of the German empire, between the Saxon duchies, comprising an area of 265 sq. miles, with 85,000 inhabitants in 1890. It is located with well-wooded parts of the Thüringerwald, and occupies a north-facing slope of the principal mountain. Flax is not extensively grown, and some linen manufactures are noted. The total revenue for 1890 was 2,542,950 marks; expenditure, 4,015,688 marks. Capital, Rudolstadt.

Schwaburg-Sondershausen, *Sondershausen*, principally and state of the German empire, in the Prussian province of Saxony; comprising an area of 265 sq. miles, with 75,710 inhabitants in 1890. It resembles in every respect Schwaburg-Rudolstadt, except that it is a little smaller. Capital, Sondershausen.

Schwarzenberg, *schwarz'berch*: a princely family of Germany, descended from *Leobhard von Schwarzheim*, who was ennobled in 1417 by the Emperor Sigismund, and in 1521 bought the estate of Schwarzenberg in Franconia. In 1520 the head of the family was made a prince of the empire by the Emperor Leopold I., and in 1746 this dignity was conferred on all members of the house by the Emperor Francis I. The most celebrated names of the family are—(1) *Karl Philipp*, soldier; b. in Vienna, Apr. 15, 1771; received a military education, and distinguished himself in the battles of Würzburg, Ulm, Hollabrunn, and Wagram, after the peace of Vienna (Oct. 14, 1809) he went to Paris as Austrian ambassador, and negotiated the marriage between Napoleon and Maria Louisa. Napoleon placed great reliance on him, and demanded that he should command the Austrian contingent in the Russian campaign of 1812. The absence of his movements and the inefficiency of his measures have provoked much criticism from French historians, but Napoleon himself never uttered a doubt of his ability, and requested the Austrian emperor to make him a field-marshal. In the next year he commanded the Austrian army of observation in Bohemia, and when Austria joined Russia and Prussia he was made commander-in-chief of the allied army, gained the battle of Leipzig (Oct. 16-18, 1813), and led the army victorious into Paris. D. at Leipzig, Oct. 15, 1859.—(2) *Friedrich Johann Friedrich Schwarzenberg*, a member of the preceding; b. at Krimau, Bohemia, Oct. 2, 1800; entered the Austrian army in 1818, and became a lieutenant field-marshal in 1848, shortly before the battle of Custozza, but was mostly employed in diplomatic missions in Russia, Great Britain, Brazil, and Naples, and Nov. 29, 1848, was placed at the head of the Austrian government as chancellor of the empire. He found the empire nearly dissolved, Vienna, Prague, Hungary, and the Italian provinces in open insurrection, the treasury on the verge of bankruptcy, the Austrian influence in Germany almost annihilated, and the German states about to recognize their union under the leadership of Prussia, etc. All these difficulties he confronted with a courage and energy which earned admiration, even among those who were far from approving either his aims or his measures. By the aid of Russia he put down the revolution in Hungary, and in a very short time succeeded in trying to gather once more the disunited parts of the Austrian empire by means of a military and bureaucratic government. He was, however, by no means a mere repetition of Metternich. He was not averse to reform when it could be achieved in a prudent and settled manner. He raised the credit of Austria, and he laid all the Prussian plans in Germany by forcing the southern and middle states over to the Aus-

trian side. D. in Vienna, Apr. 8, 1862.—(3) *Ferdinand Johann Joseph Schwarzenberg*, a brother of the preceding; b. in Vienna, Apr. 6, 1809; was made Archbishop of Salzburg, 1860, cardinal 1862, Archbishop of Prague 1864. He opposed the declaration of the dogma of the papal infallibility as inappropriate, but accepted it afterward. D. in Vienna, Mar. 27, 1867.

Revised by P. M. Colby.

Schwarzwald: See *HEIDE FOREST*.

Schwatka, *schwack*: explorer; b. at Galena, Ill., Sept. 29, 1819; graduated at the U. S. Military Academy at West Point, N. Y.; commissioned second lieutenant in 1871; pursued his studies while in the army, and was admitted to the bar in Nebraska in 1879; graduated in medicine at Bellevue Medical College, New York, in 1876. In 1876 he obtained leave of absence from the army and conducted the Arctic expedition which cleared up the mystery surrounding the fate of Sir John Franklin's expedition. He returned to duty in the army in 1880, but finally resigned in 1885. Between 1881 and 1889 he made three journeys to Alaska for the purpose of exploration, and in one of these trips descended the Yukon on a raft from its source to its mouth. In 1889 he conducted an expedition to Northern Mexico to study the remains of Aztec civilization and those of the cliff and cave dwellers. He received the Linguistic Arctic medal of the Geographical Society of Paris, and a medal from the Imperial Geographical Society of Russia. D. at Portland, Ore., Nov. 2, 1892. See his *Along Alaska's Great River* (New York, 1885); *Norad of the North* (1886); and *The Children of the Cold* (1886).

MARK W. HARRINGTON.

Schwegler, *shueh'ler*, ALBERT: philosopher and theologian; b. at Michelbach, Württemberg, Feb. 10, 1819; studied theology at the University of Tübingen, where he was appointed Professor of Classical Philology in 1848, and later of Ancient History. D. at Tübingen, Jan. 5, 1857. In theology and criticism he belonged to the Tübingen school of Dr. Baur. Besides annotated editions and translations of the Clementine Homilies (1847), Aristotle's *Metaphysics* (1847-48), and Roschius (1852), he published *Der Manichæismus* (1841), which brought him into conflict with the Church and caused him to give up his ministry; *Das Nachapostolische Zeitalter* (1846); and *Ästhetische Geschichte* (unpublished; 1853-54). His best-known work is his *Geschichte der Philosophie* (1848; 11th ed. 1882), originally written for the *Neue Encyclopädie für Wissenschaften und Künste*, but afterward often reprinted and translated into most European languages—into English by J. H. Seelye of Amherst (New York, 1859), and by Seeling in England. His *Geschichte der griechischen Philosophie* appeared in 1859.

P. M. Colby.

Schweidnitz: town of Prussian Silesia; on the Weigritz, 30 miles by rail S. W. of Breslau (county of Gersdorf Empire, ref. 5-B). It is well built, contains several interesting public buildings, and carries on a flourishing manufacturing industry in cloth, paper, leather, chemicals, beetroot-sugar, vinegar, etc. Pop. (1890) 24,725.

Schweigger, *shueg'ger*, KARL ERNST THEODOR, M. D.: ophthalmologist; b. at Halle, Prussian Saxony, Oct. 29, 1800; studied medicine at the Universities of Erlangen and Halle, graduating at the latter 1852; was assistant in Krukenberg's medical clinic 1852-55; in 1856 studied the microscopic anatomy of the eye under H. Müller at Würzburg; from 1857-64 was an assistant of A. v. Grafe at Berlin; in 1860 became privat-docent of ophthalmology at the University of Berlin; in 1868 was appointed Extraordinary Professor of Ophthalmology and director of the eye clinic at the University of Göttingen; in 1871 was appointed extraordinary and in 1873 ordinary professor at the University of Berlin; in 1885 was made privy councillor. He became coeditor of the *Archiv für Augenheilkunde* in 1881. His best-known work is *Handbuch der speziellen Augenheilkunde* (Berlin, 1871).

S. T. AKERSTROM.

Schweighäuser, *shueh'hae'zer*, JOHANN: classical scholar; b. at Strassburg, Germany, June 26, 1742; studied theology and the Oriental languages; went to Paris to perfect his linguistic studies under de Guignes; visited Germany, England, and Holland; was appointed Adjunct Professor of Philosophy at Strassburg in 1770, and in 1775 Professor of the Greek and Oriental Languages. After the organization of the university at Strassburg he was made Professor of Greek Literature and dean of the faculty of letters, and was also appointed librarian. His editions are esteemed for

the elaborate and learned commentaries annexed; among the most valuable are Appian (3 vols., 1782-85); Polybius (8 vols., 1795; 5 vols., 1831, Oxford) with *Lexicon Polybianum*; Seneca's *Epistolæ* (2 vols., 1809); Epictetus (5 vols., 1799); Athenæus (14 vols., 1801-07); Herodotus (6 vols., in 12 parts, 1815), to which was added a *Lexicon Herodoteum* (2 vols., 1824); *Opuscula* (2 vols., 1806). D. at Strassburg, Jan. 19, 1830.

Revised by ALFRED GUEDEMAN.

Schweinfurth, shvîn'fôort: town of Bavaria; on the Main; 28 miles N. E. of Würzburg by rail (see map of German Empire, ref. 5-E). It is beautifully situated and well built, and has large manufactures of chemicals and pigments, especially ultramarine blue and Schweinfurth green. Large cattle and wool markets are held here. Pop. (1890) 12,438.

Schweinfurth, GEORGE AUGUST: explorer and botanist; b. at Riga, Russia, Dec. 29, 1836; studied botany and natural science at Heidelberg, Munich, and Berlin; made several journeys in the valley of the Nile to investigate the flora and fauna of those regions 1864 to 1886, and wrote *Plantæ quædam Niloticæ* (1862); *Beitrag zur Flora Æthiopiens* (1867); *Reliquiæ Kotschyaræ* (1868); *Im Herzen von Afrika* (2 vols., 1874; translated into English as *The Heart of Africa* in 1874); *Artes Africanæ* (1875), etc.

Revised by M. W. HARRINGTON.

Schweinfurth Green, or **Paris Green**: a pigment said to have been discovered by Ruz and Sattler at Schweinfurth in 1814, but there is reason to believe that it was manufactured at Vienna at an earlier date under the name of *Mitis green*. Other names are *Imperial*, *Vienna*, *Emerald*, and *Kaiser Green*. Some varieties of berg or mountain green and of Newied green consist of this pigment mixed with gypsum or heavy spar. The first chemical paper by Justus von Liebig related to this color; it was published by him in July, 1822, in the *Repertorium der Pharmacie*.

Schweinfurth green is an aceto-arsenite of copper of variable composition. It has been very extensively used for wall and other paper staining, for tarlatans, artificial flowers, and as a vermin exterminator, especially for cockroaches and potato-bugs. Its use for wall-paper has greatly diminished. Much has been written with regard to the dangers of arsenical wall-paper. It has been alleged that not only may green papers, to which the pigment is loosely attached, give off arsenical dust, which may enter the mouth and air-passages and produce harm, but that paper containing even very small quantities of arsenic, in any form, may evolve arseniuretted hydrogen or other arsenical gases of a very poisonous character. Distinguished chemists, however, deny the possibility of the production of any arsenical gases from wall-paper, and the alarming suggestions concerning arsenical wall-paper are regarded as entirely without foundation.

Revised by IRA REMSEN.

Schweinitz, EDMUND ALEXANDER, de, S. T. D.: bishop; son of Lewis David von Schweinitz; b. at Bethlehem, Pa., Mar. 20, 1825; studied theology in the Moravian seminary of his native town and at the University of Berlin; became a clergyman, and was pastor of several churches in Pennsylvania; edited *The Moravian* for several years; consecrated bishop at Bethlehem 1870; was president of the Moravian College and Theological Seminary 1867-84; was one of the translators of Herzog's *Realencyclopædie* (Philadelphia, 1856, seq.), and author of *The Moravian Manual, being an Account of the Moravian Church* (Philadelphia, 1859; 2d ed. Bethlehem, 1869); *Systematic Beneficence* (1861); *The Moravian Episcopate* (Bethlehem, 1865; 2d rev. ed. London, 1874); a *Life of Zeisberger, the Western Pioneer and Apostle to the Indians* (Philadelphia, 1870); and *The History of the Church known as the Unitas Fratrum* (1885). D. Dec. 18, 1887.

Schweinitz, GEORGE EDMUND, de, A. M., M. D.: ophthalmologist; son of Bishop de Schweinitz; b. in Philadelphia, Pa., Oct. 26, 1858; educated at the Moravian College, Bethlehem, Pa., and at the University of Pennsylvania, where he graduated in 1881; prosector of anatomy in the university 1883-88; lecturer on medical ophthalmology 1891-92; Professor of Ophthalmology, Philadelphia Polyclinic, 1891; Clinical Professor of Ophthalmology, Jefferson Medical College, Philadelphia, 1892; ophthalmic surgeon to Children's, Philadelphia, Methodist, and Orthopaedic Hospitals. His principal published works are *Congenital Anomalies of the Eye in American System of Ophthalmology* (1889); *Affections of the Eyelids, Lachrymal Apparatus, Conjunctiva, and Cornea in Cyclopædia of Diseases of Children* (vol. iv., 1890); *Affec-*

tions of the Conjunctiva, Cornea, and Sclera in System of Therapeutics (1892); *Diseases of the Eye: a Handbook of Ophthalmic Practice* (Philadelphia, 1892). He was editor, with Dr. Hare, of *The University Medical Magazine* Oct., 1888-Sept., 1889, and of the same journal with Dr. E. Martin Oct., 1889-Sept., 1891. Since 1892 he has been ophthalmic editor of *The Therapeutic Gazette*.

Schweinitz, LEWIS DAVID, von, Ph. D.: botanist; b. at Bethlehem, Pa., Feb. 13, 1780; educated in Germany, where he resided from 1798 to 1812; Moravian minister at Salem, N. C., 1812 to 1821; settled in his native town 1821, and resided there until his death Feb. 8, 1834. He added by his own researches more than 1,400 new species to the catalogue of American flora, the greater part being fungi which had been previously little studied. He was the author of *Conspectus Fungorum in Lusatia superioris agro Niskiensi crescentium e methodo Persooniana* (with Albertini, 1805); *Synopsis Fungorum Carolina superioris, etc.* (1822); *Synopsis Fungorum in America Boreali media degentium* (1831-34); and monographs on *Viola*, *Carex*, and other genera.

Revised by CHARLES E. BESSEY.

Schweizer-Sidler, shvî't'ser-zid'ler, HEINRICH: Latinist; b. at Elgg, Switzerland, Sept. 12, 1815; educated at Zurich; teacher in gymnasium of Zurich, docent in the university, and professor from 1871; author of *Elementar- und Formenlehre der lateinischen Sprache* (1869; 2d ed. as *Grammatik der lateinischen Sprache*, 1888); *Germania of Tacitus* (5th ed. 1890); and numerous articles in journals. D. at Zurich, Mar. 31, 1894.

B. I. W.

Schwenkfeld, HANS KASPAR, von: sectarian leader; b. at Ossig, Silesia, 1490; employed in the service of the Duke of Liegnitz; embraced the Reformation with great enthusiasm, but developed afterward its ideas in a manner which brought him in conflict with the Reformers. It was especially his conception of the Lord's Supper as a sacrament of spiritual nourishment without change in the elements and his demands for the establishment of a Church to which only the saints, the truly converted, should be admitted, which gave offense. His teaching was known as The Middle Way. Political pressure having forced the Duke of Liegnitz to adopt Lutheranism, Schwenkfeld voluntarily left Silesia (1529) and went to Strassburg. There he was suspected of Anabaptism, tried, and banished (1533). The next two years were passed in Augsburg, but again Lutheran antagonism drove him away and he went to Ulm, and from there as a center went about preaching. D. at Ulm, Dec. 10, 1561. In his *Grosse Confession* (1540-57, 3 parts) he gave a representation of his doctrines. An edition of his numerous writings appeared at Frankfurt 1564-70 in 4 vols. folio. A sect, the Schwenkfelders, was organized in Silesia, but most of them emigrated in 1734 and settled in Pennsylvania, where they number about 1,000 members, and have their own churches and schools. See O. Kadelbach, *Ausführliche Geschichte Kaspar von Schwenkfelds und der Schwenkfelder in Schlesien, der Ober-Lausitz und Amerika* (Lauban, 1861).

Revised by S. M. JACKSON.

Schwerin: capital of the grand duchy of Mecklenburg-Schwerin, Germany; on the western side of Lake Schwerin (see map of German Empire, ref. 2-F). It is connected by railways with Hamburg and Wismar, and is beautifully situated, surrounded with old walls, generally well built, and contains many magnificent buildings, among which the ducal palace is the most remarkable. It has good educational institutions, museums, galleries, and collections, and numerous manufacturing establishments. Pop. (1890) 33,643.

Schwerin, KURT CHRISTOPH, Count von: soldier; b. in Swedish Pomerania, Oct. 26, 1684; studied at Leyden, Greifswald, and Rostock; entered the Dutch army in 1700, and fought at Ramillies and Malplaquet; took service with the Grand Duke of Mecklenburg in 1706, and distinguished himself by repelling the Hanoverians, who invaded the country; after that part of Pomerania in which his estates were situated was ceded to Prussia, he entered the service of that country, and was sent by Frederick William I. on several important diplomatic missions. He enjoyed in a still higher degree the confidence of Frederick the Great, who raised him to the rank of field-marshal and gave him the title of count. He won the battle of Mollwitz Apr. 10, 1741, in the first Silesian war, stormed Prague Sept. 16, 1744, in the second, and fell in the battle of Prague May 6, 1757, in the Seven Years' war. See Varnhagen von Ense, *Biographische Denkmale* (Leipzig, 1873).

F. M. COLBY.

Schwesethum: See **RAVENHOLM AND RAVENS OF THE FINE FINE**.

Schwytz, *shvütts*: one of the four so-called forest cantons of the cantons of Switzerland; borders N. on the Lake of Zurich and S. on the Lake of Lucerne, and comprises an area of 251 sq. miles. It is entirely covered with mountains, but only one peak, the Rindstock, on the eastern frontier, 8,990 feet high, reaches the line of everlasting snow. Agriculture can be pursued only to a limited extent, though fruits and wine are produced. Cattle-breeding is the principal branch of industry, and cheese, cattle, and timber are largely exported. Manufactures are confined to home demands. The inhabitants speak German, and are Roman Catholics. Pop. (1890) 50,907. The capital is Schwytz, a walled town, with a good college and 6,700 inhabitants.

Sclarea, *shk-lay*: town, in the province of Girgenti, Sicily, 31 miles N. W. of Girgenti (see map of Italy, ref. 5-6). It occupies a site near the ruins of the ancient *Theraps Scythra*, the birthplace of Agathodes (220 A.D.). The cathedral was founded in 1090 by Julia de Hauteville, daughter of Roger I. At the foot of Monte S. Caterino are hot wells that have been used as baths from Phoenician times. On the sandy gravel-banks are worked. Pop. 91,431.

Scleridae (Mod. Lat., from *Scler*, from *Scler*, the typical genus, from Lat. *scler* = *Os*, *aridus*, a sea-fish, the mackerel; *Scler*, and *idus*), a family of fishes of the order *Telostei*, including the drum, croakers, kingfishes, and weakfishes. The body is more or less elongated and compressed; the scales small and distributed in very oblique rows; the lateral line continuous and extending generally between the median rays of the caudal fin; dorsal fin two, the first short and with the spines generally falcate, the second longer and with branched rays; anal fin comparatively short, generally with two, but sometimes with one or three, spines; pectoral fins with branched rays; ventrals thoracic, each with a spine and five rays; the skull is channelled by muciferous canals, bridged over by osseous bars; the stomach is caecal, and pyloric appendages are developed in moderate number; the air-bladder has generally a number of slender caecal appendages. The family is represented by about 130 or 140 species, distributed in different parts of the world; most of them are marine and inhabitants of the tropical and subtropical regions, but a few are confined to fresh waters. The most celebrated fish of this family is the famed sclera of the ancients, *Sclera aquila* of modern systematists. This grows to a very large size, sometimes attaining a weight of more than 60 lb. It was much esteemed by the Romans for the delicacy of its flesh, and was generally sold in slices. The scales or osseous of the ear are comparatively large in this fish, as in others of the family, and they were esteemed in former times as "coddles," and were encased in gold and suspended from the neck.

THOMAS GILL.

Sclafuta, *shk-lay-ut*. **ANTONIO**: economist; b. at Presida, near Naples, in 1817; studied law, and gave himself to its practice, but in 1840 he was called to the University of Turin as Professor of Political Economy; in 1848 was Minister of Agriculture and Commerce at Naples; was arrested and imprisoned in 1849, and after three years of confinement was banished. He then returned to Turin, where he resumed his chair in the university, and in 1859 was elected to Parliament; in 1860 became chief secretary of the ministry of finance, and two years later was sent to Paris to negotiate a commercial treaty between Italy and France; in 1865 he took the portfolio of finance, and during the war of 1869 signed the decree for a legal-tender paper currency and for a forced loan. He also warmly advocated the impo- sition of a tax upon personal property. In 1872-73 he was for some months Minister of Public Instruction. His chief works are *I Principi dell'Economia Sociale* (Naples, 1849); *La Proprietà dei Prodotti di Ingegno* (Naples, 1853); *La Scienza e la Pratica* (Leghorn, 1849); *Trattato elementare dell'Economia sociale* (Turin, 1849); and *Prolegomena alla prima parte del corso di economia e diritto* (Turin, 1853). D. at Presida, Oct. 14, 1877. See also *Osario*, *La vita, i tempi e le opere di Antonio Sclafuta* (Rome, 1879). **F. M. COCHR.**

Scleritis (from Lat. *scler*, from Lat. *scler* = *Os*, *aridus*, a sea-fish, the mackerel; *Scler*, and *itis*, deriv. of *argos*, pain in the loins, deriv. of *argos*, hip-socket); *neuritis* ischialis, a neuritis of neuritis of the great sciatic nerve, the great plexus, or any of the nerves of the thigh and hip. According to Nishner, the cutaneous nerve of the thigh, the superficial branches of the peroneal nerve, and the sural

nerve are the principal seats of what is called sciatica. Exposure, rheumatism, gout, tumors near the nerve, food poisoning, haemorrhoids, disordered venous, neuritis, and post-traumatic, are reckoned among the causes. It sometimes follows a severe labor in childhood. Exacerbation, cupping, the moxa blisters, hot baths, and local or general anodynes are frequently palliative, and sometimes curative. Venous stasis may often be relieved by quinine. Issues of potassium and turpentine are both sometimes extremely useful, and so is the constant electric current. Absolute rest with fixation, and dosing alternately with hot and cold water, or the application of ice for a short time daily, will sometimes cure obstinate cases. Revised by W. PERRY.

Science [tri O. Fr., from Lat. *scire*, to know, knowledge, skill, science, deriv. of *scire*, to know]: in a general sense, knowledge reduced to order; that is, knowledge classified and arranged so as to be easily remembered, readily referred to, and advantageously applied. All science is based on the assumption that the laws of nature are immutable. From this point of view science may be regarded as a knowledge of the laws of nature, embracing the processes of experiment, observation, and comparison, by which they are discovered, and the modes of reasoning by which their operation in the production of phenomena is made known. Hence most widely it signifies the knowledge of a truth in relation to other truths. Various attempts have been made to classify the sciences, so as to make clear their relations to each other. Of these the best known is that of Comte, who first explicitly drew the distinction between abstract and concrete sciences. See **HERBERT SPENCER ON THE CLASSIFICATION OF THE SCIENCES AND PRINCIPLES OF SCIENCE**, and the article **POETRY**. **R. A. R.**

Science, Christian: a doctrinal and curative system discovered in 1880, by Mrs. Mary Baker Eddy (a native of New Hampshire then resident in Lynn, Mass., and now professed and practiced by several hundred thousand disciples in both Europe and America. As stated in their Church Tenets, its members acknowledge and adore one Supreme God, and take the Scriptures for their guide to eternal life. They acknowledge God's Son and the Holy Ghost, and man as the Divine image and likeness. They acknowledge God's forgiveness of sin in the destruction of sin, and believe that sin and suffering are not eternal. They accept the atonement as the efficacy and evidence of Divine Love, of man's unity with God, and the great merits of the Way-shower. They hold the way of Salvation demonstrated by Jesus to be the power of Truth over all error, sin, sickness, and death, and solemnly promise when they unite with the Church to strive, watch, and pray for that Mind to be in them which was in Christ Jesus, viz.: to love one another, and to be meek, merciful, just, and pure. The curative system is variously spoken of as "Christian Science Mind-healing," or "Metaphysical Healing," and is based on the theory of the unreality or non-existence of matter. All is Mind, and there is, in reality, but one Mind, viz., God. Man is the idea of God.

The following authoritative statement in regard to the history and principles of the system was specially prepared for this cyclopædia by Mrs. Eddy, and is given just as it left her pen:

CHRISTIAN SCIENCE is the Science of God and His universe, including man. Its Principle is the divine triunity of Life, Truth, and Love. There is but one God, one Christ, and one Jesus of Nazareth. God is Mind, and All-in-all; therefore there can be nothing real but infinite Mind, and its manifestation.

The compound individual idea of the Divine Principle is Christ, the spiritual idea of Truth, personifying the primal order of Being, and so perfect as its source.

Jesus represented the incarnation of Christ's Principle, he stood for Truth, healing the sick and sinful, and triumphing over the tomb. By his metaphysical therapeutics, it was proved that miracles do not violate, but fulfill law.

Jesus' mission was not limited to any period, but touches universal humanity. Hence his promise: "Verily, verily, I say unto you, he that believeth in me, the works that I do shall he do also; and greater works than these shall he do." And "these signs shall follow them that believe;" the word *them*, instead of *you*, clearly making this assurance applicable to all Christians in all ages. Jesus' statement for sin was a human sacrifice which demonstrated man's life in God, divine Good, and this verity when understood is the way of salvation, for it destroys sin. (See **ROMANS 8:1**.)

In the material world, like produces like—a bird is not the product of a beast. In the spiritual world—that is the real world,—matter is not the progenitor of mind. If Mind is first, it cannot produce its opposite, matter. If matter is first, it cannot produce mind. Hence the irrefragable, logical, cardinal point in Christian

Science.—There is no matter, All is Mind. Christian Science defines Soul and dreams. In truth Soul is God. In error soul is sense. Dreams are the conscious and unconscious states of matter; wherein the night dream is quite as real and tangible as the day dream; for Life or mind in matter, is a dream at all times, and is never the reality of Being.

That matter is substance, or includes mind, is pantheism which has no kinship with Christ. Spirit must be substance, since matter is neither the substance of Spirit, nor its reflex universe.

Man's origin is not material but spiritual. The universe is not the result of physical propulsion, but is an evolution from infinite Mind. "God is Spirit," Truth. As matter is the opposite of Spirit, Truth, so must it be the opposite of God. Matter is the subjective state of error, deflecting from the everlasting uprightness, and eventuating in false personal beliefs in sin, disease, and death, only to be overcome by conquering Truth,—eradicated not by drugs or hygienic rules, that is, laws of matter, but by the power of Mind. Jesus, referring to this original evil, which he cast out in healing the sick, called it "the devil," and "a liar from the beginning."

This theory is corroborated by Jesus' supremacy over all phases of matter,—a control not supernatural, but divinely natural, in one abiding in God, Good, the centre and circumference of the universe. From this it follows that genuine healing must be wrought upon thought, not body. When following these leadings of scientific Revelation the Bible was the writer's only text book.

Practically Christian Science is the fulfilling of the law of Love, namely, loving God supremely, loving your neighbor as yourself, and loving your enemies.

These doctrines were brought into modern light by the present writer, in the years 1866-7. When apparently near death, her convictions laid hold upon the sublime verity that all evil, whether moral or physical, must be non-existent because contrary to the omnipotent Good, God. She found in the Bible a new meaning, whereby she was snatched from the Valley of shadows, and her feet set on the Rock. As it was through this understanding of God, through Christ, God's idea, that all healing must come, she adopted Christian Science as the name of this curative system.

In 1867 she began healing others with wonderful success, and taught her first student.

Her textbook, *Science and Health with Key To The Scriptures*, is the outgrowth of her experience, and was first published in 1875. On July 4th, 1876, the first Christian Scientist Association was organized. In June, 1879, the first Church of Christ, Scientist, was founded in Boston, with twenty-six members, the writer becoming its pastor, though she did not receive ordination till 1881. This Mother Church has, in 1895, a membership of five thousand one hundred in different parts of the country, about eight hundred being local residents. During the same year she founded her Massachusetts Metaphysical College in Boston, the laws then enabling her to obtain a charter for medical instruction; though no such privileges were granted after 1883. She started in 1883, as editor and proprietor, *The Christian Science Journal*, still the official organ of the Scientists. The first National Association was convened in New York, on February 11, 1886, and still meets, though discarding organized action.

The first denominational chapel was erected at Oconto, Wisconsin, in 1886, and has been followed by others. In 1894 the Boston Church completed a beautiful edifice, as a Testimonial to the writer of this. It was dedicated on Jan. 6th 1895, and cost, including the land, nearly two hundred and fifty thousand dollars. In 1894, it was estimated that in Europe and America there were at least two hundred thousand disciples, while half a million people more attest its power. In the U. S., in 1894, there were three hundred societies meeting regularly for worship, twenty-six teaching institutes, and sixty-six dispensaries and reading rooms.

The Christian Science Publishing Society, issues *The Christian Science Journal*, the *Quarterly Bible Lessons*, and many tracts, some in German and Norwegian. The writer's works include *Science and Health with Key to the Scriptures* (already mentioned), *Retrospection and Introspection* (1891), *Christ and Christmas*, a poem, illustrated (1893), *Pulpit and Press* (1895), *Unity of Good and Unreality of Evil* (1897), *No and Yes* (1891), *Rudimental Divine Science* (1891), *People's Idea of God* (1886), and *Christian Healing* (1886).

MARY BAKER EDDY.

Though numerous books and pamphlets purporting to deal with Christian Science have been published, Mrs. Eddy and her followers recognize as authoritative only those enumerated above.

ROBERT LILLEY.

Scientific Schools: See *Technical Schools*, under *SCHOOLS*.

Scilla: See *SCYLLA*.

Scilly (sil'lee) **Islands** (anc. *Cassiterides*): a group of islands belonging to Great Britain, situated 30 miles W. of Land's End, the southwestern promontory of Cornwall. It consists of 140 isles and rocks, of which six are inhabited.—St. Mary, Treco, St. Agnes, Sampson, Bryher, and St. Helen's. Total area, 3,560 acres. Pop. about 2,500, of whom about 1,300 live on St. Mary, where Hugh Town, the capital, is situated. On St. Agnes is a lighthouse; and on Bishop Rock, 6 miles westward, is one of the finest lighthouses of its kind. All

the islands are rocky, consisting of granite with a thin layer of light sandy soil. Agriculture and fishing are the principal occupations; good crops of barley, oats, and potatoes are raised. The navigation around these isles is very dangerous. In 1705 the fleet under Admiral Sir Cloudesley Shovel fell upon these rocks, when his ship and several others were lost.

Revised by M. W. HARRINGTON.

Scin'cidae [Mod. Lat., named from *Scin'cus*, the typical genus, from Lat. *scin'cus* = Gr. *σκινκος*, *σκινκος*, a kind of lizard]: an extensive family of lizards of the group *Leptoglossa*. As limited by Gray, it includes those forms in which the body is subcylindrical or fusiform, and with the tail cylindrical or tapering; the scales generally smooth, but sometimes keeled or striated; the head sub-quadrangular and regularly shielded, with the rostral plate moderate, and the nostrils lateral, and in a special nasal shield interposed between the frontal and labial shields; the limbs variable in development, typically four, generally more or less weak, sometimes atrophied. According to Prof. Cope, the temporal fossa is roofed, the premaxillary double, the palatine maxillary laminae dilated, and rarely a xiphisternal fontanelle is developed. The tongue is short, flat, and squamous. The family embraces numerous genera, distributed in almost all parts of the world. There is every gradation in the development of the members, from those forms in which the limbs are quite strong and provided with five digits each, to those in which they are entirely wanting, and the number or development of these parts is of comparatively little systematic value in the group. The family is well represented in the U. S. chiefly by species of the genus *Eumeces*.

Revised by F. A. LUCAS.

Scinde: a province of India. See *SINDE*.

Scio, or **Chios** (Turk. *Sakiz Adasi*): island; in the Aegean, in the latitude of Smyrna, and separated from the western extremity of Asia Minor by a strait less than 5 miles wide where narrowest; 32 miles long from N. to S., and from 18 to 8 from E. to W.; area, 579 sq. miles. It is rocky, but so fertile and beautiful as to justify its title of Queen of the Aegean. Water-springs abound. There are few forests near the coast, but the interior of the island is covered with firs. Toward the south there are remarkable plantations of mastic-trees, the culture of which furnishes the main support of twenty villages, and from which a valuable hygienic gum is obtained. Its many harbors render the island easy of access from every direction. The Ionians colonized Scio about 1180 B. C., and it formed a part of the Ionian confederacy. It heroically resisted the Persians, from whom it was delivered by the treaty of Cimon (449 B. C.). During the Peloponnesian, Roman, and mediæval wars, it experienced many vicissitudes. Under the Genoese it enjoyed prosperity from 1346 until 1566, when it was conquered by the Ottoman admiral Piali Pasha. As the private property of the sultana, the island was mildly governed, and the inhabitants became unwarlike and effeminate, and were undisposed to join in the struggle for Greek independence. Hence the atrocious massacre of Apr., 1822, was without provocation and almost without pretext. The Ottomans slew or enslaved 30,000 persons; 20,000 who escaped were scattered over the world, some even reaching America, and by August the population had shrunk to 10,000. Scio has suffered much from frequent earthquakes, yet the industry and intelligence of the people have largely restored their former prosperity. Pop. 70,000, of whom 68,000 are Greeks, and 1,200 Mussulmans. Scio, the capital, was founded by the Genoese at the extremity of the plain of Cambos. It has dockyards and a good harbor, and is the maritime center of the Archipelago. The principal exports are lemons, oranges, olives, almonds, anise, beans, mastic, and worked leather.

E. A. GROSVENOR.

Scloppius, stsee-op'pée-ōs (*Kaspar Schopp*): classical scholar and controversialist; b. at Neumark, in the Palatinate, May 27, 1576; studied at Heidelberg, Altdorf, and Ingolstadt; visited Italy, Bohemia, Poland, and Holland; abjured Protestantism and became a Roman Catholic in 1598. His fanatical propaganda earned for him the titles of Duke of Clara Valle in Spain and patrician of Rome. His virulent invectives against the Jesuits and Joseph Scaliger (see *SCALIGER*, JOSEPH), and his insane diatribes against Cicero, Varro, and many post-Augustan writers, alienated even his own partisans, so that he was compelled to publish many of his polemical writings under an assumed name. He died in Padua, Nov. 19, 1649. Among his scientific writings may be mentioned his *Grammatica philosophica*

which rises from the general level and forms a dead wall in front of the orbit; post-orbital processes are more or less developed; the lower jaw has its descending ramus subquadrate, the upper angle acute and sub-erect, and the lower rounded or subtruncate and bent inward; molar teeth $\frac{1}{2} \times 2$, provided with roots, and (except the anterior upper one when present) of nearly equal size, with tubercular crowns; perfect clavicles are developed; the hind limbs moderately large; the fibula and tibia separate from each other. At least 150 species are known, represented in almost all quarters of the world, except Australia. There are all gradations, between the slender and graceful form of the squirrel and the heavy, almost bear-like, form of the woodchuck. This transition is manifest from the arboreal squirrels (*Sciurus*) through the ground-loving *Tamias* with well-developed tails; the *Spermophilus*, or prairie-squirrels, with shorter tails; *Cynomys*, or the prairie-dogs, with stouter forms; and *Arctomys*, or the woodchucks, with still more robust forms.

Sclater, PHILIP LUTLEY, Ph. D., F. R. S., F. L. S.: ornithologist; b. at Hoddington House, Hampshire, England, Nov. 4, 1829; educated at Winchester College and Corpus Christi College, Oxford, graduating in 1849; took a first class in mathematics, and subsequently became a fellow; was called to the bar at Lincoln's Inn in 1855, and practiced in the western circuit for several years. In 1859 he became secretary to the Zoological Society in London, and in 1860 editor of *The Ibis*, positions which he has held ever since. He is a member of the council of the Royal Geographical Society, and from 1877 to 1882 was one of the general secretaries of the British Association. He has published about 1,000 papers on ornithology and other branches of natural science. Among his more important works are *Monograph of the Tanager Genus Calliste* (1857); *Monograph of the Jacamars and Puff-birds* (1882); *Nomenclator Avium Neotropicalium* (1872); *Catalogue of Birds in the British Museum*, vol. xi., *Certhiidae, Tanagridae, and Icteridae* (1888), vol. xiv., *Oligomyzidae* (1888), vol. xv., *Tracheophones* (1890).

F. A. LUCAS.

Scleren'chyma: See HISTOLOGY, VEGETABLE (*Stony Tissue*).

Scleroder'ma [Mod. Lat.; Gr. *σκληρός*, hard + *δέρμα*, skin]: a sub-order of plectognath fishes, in which the bones of the upper jaw are but imperfectly united, the teeth independently developed, and the scapular arch, with the hypacoracoid and hyperacoracoid bones both developed. The form is typically fish-like, in which respect the species differ much from the other members of the order. The dermal armature is developed in the form of small scale-like plates or bristles; the dorsal fin is represented by from one to six spines; the pelvic elements are well developed. To the group thus distinguished belong two well-defined families—*Triacanthidae*, including the most fish-like forms, and *Balistidae*, comprising the more aberrant species.

Sclerotica: See EYE.

Selo'pis, FEDERIGO PAOLO, Count: politician and writer on historical law; b. at Turin, Italy, Jan. 10, 1798; took his legal degree in the university of his native city in 1818, and in 1827 gave his first historical lecture, *I Longobardi in Italia*, before the Turin Academy of Sciences. This was followed by *La Storia dell' Antica Legislazione nel Piemonte* (Turin, 1833); *La Storia della Legislazione Italiana* (4 vols., Turin, 1840-64); *Ricerche Storiche sopra le Relazioni Politiche tra la Dinastia di Savoia ed il Governo Britannico* (Turin, 1853). In 1845 he was elected corresponding member of the Institute of France, and in 1869 foreign member of the same; in 1847 was made president of the superior commission of press censorship in Piedmont; in Mar., 1848, accepted the portfolio of justice; in 1849 was named senator, and from 1861 to 1864 was president of the Italian Senate; was also elected president of the Turin Academy of Sciences. In 1868 Victor Emmanuel bestowed upon him the highest order of the kingdom, that of the Annunziata; in 1871, being selected as representative of Italy in the congress of arbitration which assembled at Geneva for the settlement of the Alabama question, he was elected president of this congress, and performed the duties of his office with signal ability. D. Mar. 8, 1878.

Sclot, BERNAT: See D'ESCLOT, BERNAT.

Scollard, CLINTON: poet; b. at Clinton, N. Y., Sept. 18, 1860. He graduated at Hamilton College 1881, and studied in the graduate department of Harvard University and for

a short time at Cambridge University, England. In 1888 he was chosen Assistant Professor of Rhetoric at Hamilton College, and subsequently Professor of English Literature. He has published *Pictures in Song* (1884); *With Reed and Lyre* (1886); *Old and New World Lyrics* (1888); *Giovio and Giulia* (1891); *Songs of Sunrise Lands* (1892); and an edition of Ford's *Broken Heart* (1895).

H. A. B.

Scolopac'idae [Mod. Lat., named from the genus *Scolopax*, from Lat. *scolopax*, *scolopacis* = Gr. *σκολοπαξ*, *σκολοπακος*, snipe, woodcock]: a family of wading birds, including snipe, woodcock, sandpipers, and related forms. The bill is long and slender, rather soft and flexible, and with the sides compressed and grooved to the tip, which is blunt; the lower mandible has no angle at its lower margin; the nostrils are basal, elongated, and situated in a groove closed by a membrane; the wings are long and pointed, the first or second primary being longest; the tail is usually short and even; the legs elongated; the thighs exerted and naked; the tarsi elongated and slender; the toes moderately long and attenuated, the anterior being connected more or less by a basal membrane, the hinder short or wanting. Some members of the family are found in uplands far from water, and others in inland forests. See CUBLEW, SANDPIPER, SNIFE, WOODCOCK, etc.

THEODORE GILL.

Scomberesoc'idae [Mod. Lat., named from *Scomberesox*, the typical genus; Lat. *scomber*, from Gr. *σκόμβρος*, mackerel + Lat. *esox*, *esocis*, pike]: a family of fishes comprising the flying fishes, half-beaks, and other remarkable forms. The body is more or less elongated, the scales are cycloid, a lateral peak developed along each side of the belly; the head is more or less quadrangular and flattened above; the jaws are very variable in development, sometimes very much elongated, and sometimes short and subtruncate; the upper is constituted by the intermaxillaries at the middle and the maxillaries at the sides; the teeth are variable in development; the branchial apertures confluent below; branchiostegals in considerable number; the dorsal fin single and far back, composed mostly of branched rays; anal fin opposite the dorsal; caudal distinct and generally emarginated, and with its lower lobe longest; pectorals with branched rays and variable in development; ventrals abdominal. The air-bladder is generally present, but is shut off from any communication with the intestinal canal; the pseudobranchia are hidden and glandular; the stomach is not distinct from the intestine, which is straight and without pyloric appendages. The species are mostly inhabitants of the tropical seas.

Revised by F. A. LUCAS.

Scom'bridae [Mod. Lat., named from *Scomber*, the typical genus, from Lat. *scomber*, from Gr. *σκόμβρος*, mackerel]: an important family of fishes, including the mackerels, tunnies, bonitoes, and related forms. The body is elongated and fusiform; the scales very small or wanting (generally cycloid, but about the thorax larger and sometimes ctenoid ones are developed, which form the so-called corselet of the tunnies); dorsal fins two, the first composed of rather slender spinous rays, the second with branched rays, the posteriors of which are free and developed as finlets; anal similar to the second dorsal; caudal forked, and well adapted for powerful propulsion; pectorals pointed; ventrals thoracic, each with one spine and five rays; numerous (more than twenty-five) vertebrae; numerous pyloric caeca developed. The species vary in size from the dimensions of a small mackerel to those of the great tunny, which sometimes attains a weight of over 1,000 lb. Some are great wanderers. In the summer of 1871, for example, there appeared suddenly on the coast of Massachusetts large numbers of a small tunny (*Orcynus aliteratus*) which had previously been unknown along the coast of America, although familiar as a Mediterranean fish. See MACKEREL and TUNNY.

Scop'as (Gr. *Σκόπας*): sculptor; b. in the island of Paros, flourished a. c. 390-350, and was one of the most celebrated of Grecian artists. He worked mostly in marble, the product of his native place, and chose his favorite subjects from the myths of Dionysus and Aphrodite. With Praxiteles, he formed the character of the second or later Attic school of sculpture, in contradistinction to the earlier school of Phidias. He was celebrated also as an architect, and constructed the temple of Athena Alea at Tegea, and engaged with Leochares and others in embellishing the mausoleum at Halicarnassus. The statement that he assisted in the erection of the temple of Artemis at Ephesus rests on a doubtful passage of Pliny. Among the most noted works ascribed to Scopas were a statue of Aphrodite Pandemos in Elis, one of Apollo Smin-

place in Ceylon; the group of Nades and her children, and the grouped sea-demons escorting Achilles to the island of Lemnos. The separate figures are commemorated by Sillig in his *Iconography of Ancient Artists*.

Scorpionidae [Mod. Lat., named from *Scorpius*, the typical genus, from *Skorpiō*, high rock, cliff; a family of fishes found in the *Melanoidei*, etc., many members of which are noticeable from the possession of phosphorescent spots. They have an elongate body, either naked or covered with crocod-like scales, the upper lip formed of the immovable bones, a large gill-opening and an adipose fin; snake-like looking. The fifty species are arranged in some fifteen genera. All are marine, some living at the surface of the sea in the warm waters, others being found at considerable depths. The phosphorescent spots of *Scorpius* have been regarded as sensory eyes by Cuvier.

J. S. KIRKPATRICK.

Scorpius WILLIAMS, D.D., F.R.S.; Arctic explorer and physician; b. near Whitby, England, (Oct. 5, 1790), son of a small tradesman of the same name; went to sea in one of the East India ships when ten years old; spent the intervals between his annual voyages in scientific studies at Edinburgh; reached the highest northern latitude that had then been attained May, 1801; made important observations on the electrical phenomena of the Arctic regions, and by his communications to Sir Joseph Banks, president of the Royal Society, was instrumental in inducing the Government to send the first (1817) of the long series of Arctic exploring expeditions. After seventeen voyages to the Greenland or North-western regions he published his *History and Description of the Arctic Regions* (2 vols., 1830) and his *Journal of a Voyage* (1827). When above forty years of age Capt. Williams passed through a course of literary and theological study, graduating in divinity at Cambridge; filled several parishes, received the degree of D.D., was noted for philanthropic labors; visited the U.S., in 1842 and 1848, and made a voyage around the world for magnetic research 1849-51; D. at Torquay, Mar. 21, 1887. He published valuable works on magnetism and several scientific books, and wrote a *Life of his father* (1851). His own *Life* was written by a nephew (1891).

Revised by M. W. HARRINGTON.

Scorpaenidae [Mod. Lat., named from *Scorpaena*, the typical genus, from Lat. *scorpaen* = Gr. *skorpaen*, the scorpion-like, derivative of *scorpio*, scorpion; a family of fishes of the suborder *Atheriniformes*. The body is more or less elongate and compressed; the scales (sometimes wanting), typically smooth and indurated; the lateral line continuous. The head compressed, often inflated laterally, and more or less armed with ridges and spines; teeth acute and present on the jaws as well as palate; dorsal fin differentiated into a longer spinous and a shorter rayed portion; anal with a rayed portion smaller than that of the dorsal, and armed generally with three spines; caudal well developed and free; pectorals with at least the inferior rays generally somewhat enlarged and simple, not branched; ventrals thoracic, with a spine and generally five rays; the stomach is saciform, and pyloric appendages are developed in moderately small number. The family includes many genera, the principal of which are *Scorpaena*, *Nebulosa*, *Schodanthus*, *Percis*, *Pholidichthys*, *Tautoga*, and *Apistus*. They are chiefly inhabitants of the tropical or sub-tropical regions, but *Scorpaenopsis* is peculiar to the northern seas, and of *Schodanthus* and *Schodanthus* a number of species are found on the western coast of the U.S., as well as corresponding latitudes of the Asiatic portions of the Pacific. In some (*Apistus* and *Pholidichthys*) an independent pectoral filament or ray is developed.

Revised by J. S. KIRKPATRICK.

Scorpio See SCORPION.

Scorpioides [From Lat. *scorpio*, scorpion; a group of arachnid (spider-like) animals in which the body is divided into a short leg-bearing cephalothorax and a long abdomen, the seven basal joints of which are as broad as the thorax, the last six, including the terminal sting, being much narrower. To the cephalothorax are attached six pairs of appendages, the first pair being very short, and, like the long second pair, bearing lobster-like pincers at the end. The remaining four pairs are for locomotion. The abdomen is without dorsal appendages except a pair of comb-shaped bristles (pectens) upon the second segment. These are supposed to be sensory in function. There are from three to six pairs of eyes upon the cephalothorax. A peculiarity is noticeable in the respiratory organs, which consist of four

pairs of sacs (lungs) upon the basal joints of the abdomen. In each lung is a series of plates, through the walls of which oxygen passes to the blood. The young are born alive. Scorpions are best known for their poisonous character. The poison-plant is in the last joint of the abdomen, its duct emptying in the terminal spine. In tropical countries this sting is not infrequently fatal to man, but in the U.S., while very painful, it only occasionally causes death. The scorpions are largely nocturnal, living under logs and stones and in burrows by day. They feed upon the larvae of spiders and insects, which are killed by the sting. In inflammation they will eat humans. The scorpions are inhabitants of warm countries, but have been found as far N. as Nebraska. About 200 species are known. They occur as fossils in the Silurian rocks. To the arachnids the scorpions possess great interest, as they are the most primitive of the *Arachnida* and because they show most striking resemblances to the horseshoe-crab (*Limulus*). See THORNTON, *Classification (Annals and Magazine of Natural History, 1879)*; LANKASTER, *Limulus as Arachnid* (*Quarterly Journal of Microscopical Science, 1891*); LAURIE, *Embryology* (*Quarterly Journal of Microscopical Science, 1890*).

Black scorpion (*Scorpio*) after.

J. S. KIRKPATRICK.

Scorpion-flies See ENTOMOLOGY (under *Meconoptera*).

Scorpius, or **Scorpio**: the eighth sign of the Zodiac (q. v.), also a constellation, the Scorpion. Two thousand years ago the constellation and the sign coincided; but now, owing to the precession of the equinoxes, the constellation Scorpio is situated in the sign Sagittarius. It may be recognized by the bright red star Antares, with a smaller companion on each side of it, and a curved row of stars toward the W.

S. N.

Scorzonea [Mod. Lat., from Ital. *scorzona*, appar. alter., black bark; *scorza*, bark + *zera*, fern, of *zera*, black; a garden vegetable popular in parts of Europe, but unknown in the U.S. The *Scorzona hispanica*, *S. gladiifolia*, *S. delavayi*, and *S. tuberosa* (family *Compositae*) furnish edible roots, whose taste is compared to that of asparagus, celery, basil, and salsify. The black skin is washed off, and the root is soaked in fresh water and then boiled fifteen minutes. *Scorzona* is very highly esteemed by many, and is especially praised as food for invalids. It is very hardy and of easy cultivation.

Scotch Confession of Faith: a confession drawn up by John Knox and his coadjutors at the request of the Scotch Parliament, which assembled at Edinburgh in Aug., 1560, after the death of the queen-regent, Mary of Guise (June), and the close of the civil war. It consists of a preface and twenty-five articles on the chief doctrines of religion, which are briefly, tersely, and vigorously stated. It agrees with the other Reformed confessions of the sixteenth century, but is more pronounced in its opposition to the Roman Catholic Church than most of them. It was rather hastily composed in four days, twice read article by article in Parliament, and adopted by the same as being "based upon the infallible word of God." Only three temporal lords voted against it, for the reason that they believed as their forefathers believed. The Roman Catholic bishops were called upon to object and refute, but kept silence. Seven years later (1567), after the abdication of Queen Mary, the confession was readopted, and the Reformed Kirk of Scotland formally acknowledged and established. In 1590 the confession was signed by King James VI., and a supplementary confession (sometimes called the *second* Scotch Confession) added to it. It continued to be the only doctrinal standard of Scotland recognized by the civil government till the Revolution of 1688, but it was practically superseded by the Westminster Confession, which is more logical and complete, and was adopted by the Covenanters and the General Assembly during the Commonwealth. The Scotch Confession is printed in the acts of the Scotch Parliament for 1560, in Knox's *History of the Scotch Reformation* (ed.

Laing, vol. ii.), in Calderwood's *History of the Kirk of Scotland*, in Dunlop's *Collection of Scotch Confessions* (vol. ii.), in Niemeyer's *Collectio Confess. Reform.*, and in Schaff's *Credo of Christendom* (vol. iii.).

Scoter: any sea-duck belonging to the genus *Oidemia* of Fleming. The species are distinguished by the bill being much swollen at the base, with the terminal part depressed and broad, and the extension of the feathers of the chin forward as far as the nostrils. The color is to a great extent black. The American species are *Oidemia americana* (the common scoter), *O. fusca* (velvet scoter), *O. perspicillata* (commonly called surf-duck or sea-coot), and *O. deglandi* (the velvet duck or white-winged coot).

Scotists: among the SCHOOLMEN (q. v.), the followers of John Duns Scotus. Their principal adversaries were the Thomists. The Scotists held to freedom of the will and the immaculate conception of the Virgin. Franciscans were generally Scotists; the Dominicans, Thomists.

Scotland: that part of Great Britain which lies N. of the Cheviot Hills and the Tweed. It is bounded on the N. and W. by the Atlantic Ocean, on the E. by the North Sea, on the S. by England and the Irish Sea. Its greatest extent, from Dunnet Head in the N. (58° 41' N.) to the Mull of Galloway (54° 38' N.), is 288 miles. The area is 29,785 sq. miles, of which the islands comprise over one-seventh.

Coast.—The development of the coast-line is very considerable in proportion to the area of the kingdom, for it amounts to 2,300 miles, which gives 1 mile of coast-line to every 12 sq. miles of area. No point of the country is farther than 40 miles from the sea.

No contrast could be greater than that between the east and west coasts. The former resembles that of England. It is generally formed of soft sandstones and clays and generally low and shelving, although marked by a few bold headlands, such as Duncansby Head, Tarbat Ness, Kinnaird Head, Buchan Ness, Fife Ness, and St. Abb's Head. Its indentations, including the Firths of the Forth and the Tay, and the Moray Firth, which bifurcates into Loch Beaulieu and Cromarty Firth, are few, but they penetrate far inland, and form the estuaries of comparatively important rivers. The west coast, on the other hand, as far S. as the Firth of Clyde, is formed of hard rocks, rises boldly from the sea, and is intersected by numerous narrow sea-lochs, bounded by steep hills, and separated from each other by mountainous peninsulas. The most considerable of these peninsulas is that of Kintyre or Cantyre. It is nearly 60 miles in length and terminates in the Mull of Kintyre. Narrow sounds separate the mainland from Skye, Mull, and others of the Inner Hebrides; and a broad strait, the Minch, separates these from the Outer Hebrides, or Long Island.

The eastern coast of the Firth of Clyde is generally level, while that of the peninsula of Galloway, farther S., is generally steep, and juts out in the Mull of Galloway, the most southerly point of Scotland, in lat. 54° 38' N. The northern coast, between Duncansby Head and Cape Wrath, is wild and rugged and marked by bold headlands.

Relief.—In its broad features Scotland may be divided into a highland region in the north, a lowland plain in the center, and an upland region in the south. The Highlands are cleft in two by a long and narrow valley, the Great Glen (Glenmore), which extends along an anticlinal axis from Loch Eil to the Beaulieu Loch. This valley is occupied by a chain of lakes connected by the Caledonian Canal, and its summit-level is only 105 feet above the level of the sea. The mountain region to the N. of this glen is, for the most part, sterile and inhospitable and very thinly peopled. Lofty mountains lift their summits above its extensive moors, the most considerable being Ben Dearg (3,547 feet), Ben Wyvis (3,929 feet), and Mam Soul (3,862 feet). Toward the N. E. this mountain region merges into the undulating sandstone plains of Caithness, which form bold and striking headlands on the coast.

The mountain region to the S. of Glenmore is known as the Grampians. In its arrangement it is much more linear than the Northern Highlands. A central chain can be traced from Ben Nevis (4,406 feet) in the southwest to the coast of Aberdeen. The Pass of Drumochter, on the confines of Perthshire and Inverness, crosses this chain at an elevation of 1,488 feet. The Northern Grampians branch off from the central chain near the head-waters of the Dee, and attain an elevation of 4,296 feet in Ben Macdui. The Southern Grampians culminate in Ben Lawers, 3,984 feet. The Grampians are almost as sterile as the Northern Highlands, and

moors abound, but there are excellent pastures in the valleys; and where these open out toward the N. E. and S. E. they offer every facility for a successful pursuit of agriculture. The western coast of the Highlands is generally steep and rugged, and sea-lochs penetrate far into the land; their interior abounds in picturesque lakes. Strathmore (the great vale) extends along the foot of the Highlands from Loch Lomond, in the southwest, to Stonehaven, in the northeast. It is separated from the sea and the great central plain extending between the Forth and the Clyde by a series of hills broken through by the Forth and Tay, and known as the Campsie Fells, the Ochil Hills (2,363 feet), and the Sidlaws (1,399 feet). Southern Scotland consists of an extensive hilly region stretching from St. Abb's Head on the German Ocean to Stranraer on the Irish Sea, and culminating in the Broad-Law (2,754 feet) and the Merrick (2,764 feet). The valleys of the Tweed and Clyde almost cut off from the main mass the outlying ranges of the Lammermuir and Pentlands Hills toward the N. The range forming the boundary toward England is known as the Cheviots (2,636 feet). The southern hills are generally broad and flat; they are intersected by deep grassy glens, which open out into fertile valleys and plains. Among the latter that called the Merse, at the mouth of the Tweed, is the most considerable.

The western islands are generally of considerable height (Ben More, on Mull, 3,185 feet); the Orkneys and Shetlands, though they present bold cliffs toward the sea, and are much broken up by intricate channels, rise to a height of only 1,600 and 1,475 feet respectively.

Geology.—The rocks are chiefly of Palæozoic age. The clay and chlorite slates and the graywacke, interstratified with mica-schist and gneissose flagstones, which form nearly the whole of the Highlands, are classed by Prof. A. Geikie as metamorphosed Lower Silurian. On the west coast there occur sandstones of Cambrian age, while crystalline gneiss, equivalent to the Laurentian rocks of North America, occupy the Outer Hebrides and the west coast of Sutherland. These rocks are frequently broken through by igneous rocks, which form some of the highest summits. Granites predominate, but porphyry is found in the southwest, and basalt is highly developed on the islands of Skye and Mull. On the S. E., from the Clyde to Stonehaven, around Moray and Dornoch Firths and in Caithness, these Silurian rocks of the Highlands are bounded by flagstones and sandstones of the Devonian formation, which prevails in the Orkneys, while the Shetlands exhibit the geological features of the Highlands.

The great lowland plain is occupied by limestones and coal-measures of the Carboniferous system, the hills being largely formed of porphyritic rocks and basalt. Tuff and volcanic agglomerate occur in various localities. A narrow belt of Devonian rocks separates these lowlands from the southern uplands, whose graywacke and shale of Silurian age, pierced by masses of porphyry (Cheviots) and granite (on the west), are the prevailing rocks. Indications of an ancient glaciation are frequent. Subsequently an upheaval of the country, evidenced by raised beaches, took place. Scotland is rich in coal and iron. Lead is found in the southern hills. Excellent building-stones abound. Aberdeen is known for its granite; Craigleith for its freestone. Scotch pebbles, garnets, amethysts, and other precious stones are among the minor products of the mineral kingdom.

Hydrography.—The rivers rise in the hills, and frequently pass through mountain lakes. Their course is more rapid than that of the rivers of England. The water-parting being near the west coast the rivers of the eastern slope are much the longest. The Tweed is a rapid stream, forming in its lower course, the boundary between England and Scotland, and entering the German Ocean at Berwick. The Forth, though an inconsiderable stream, deserves to be mentioned because of its firth. It is navigable to Stirling. The Tay is the most important river of Scotland. It rises to the N. of Loch Lomond, flows through Loch Tay, leaves the mountains at Dunkeld, intersects the Strathmore, and finally enters the Firth of Tay. It is navigable as far as Perth. The remaining rivers, with the exception of the Clyde, are of little use to navigation, but they abound in fish. The Clyde rises in a small lake on the southern confines of Lanarkshire, and enters the Firth of Clyde below Glasgow. Its current is very rapid, and it forms several waterfalls, but at a vast expense for dredging it has been made navigable for large vessels as far as Glasgow.

Scotland abounds in lakes. They are almost without exception in the Highlands and collectively cover an area of

Manufactures.—These are of considerable importance, especially in the lowlands. The textile industry (1891) gave employment to 206,550 persons, and there were 747 factories with 2,413,735 spindles, 71,471 power-looms, and 154,591 hands. The cotton industry has its centers at Glasgow and Paisley; the woolen manufacture is carried on at Hawick and Galashiels on the Tweed, but also in Stirling, Kilmarnock, and Bannockburn; carpets are made at Kilmarnock and Glasgow; Dundee and Dunfermline are the principal seats of the linen, hemp, and jute industries. Knitting is widely carried on as a domestic industry. The making of machinery, which employs 51,426 men, and ship-building (23,518 workmen) have their chief seats on the Clyde, where the largest ocean steamers and ironclads are built. Other industries of importance are printing (20,317 workmen), paper-making, sugar-refining, the preserving of provisions, glass-making, and the manufacture of chemicals.

Commerce.—Glasgow is the commercial capital of the country, although as a shipping-port it ranks seventh in the United Kingdom, being preceded not only by London or Liverpool, but also by Cardiff, Hull, Newcastle, and Southampton. The railways at the end of 1893 had a length of 3,215 miles, and there were also 86 miles of tramway and 153 miles of canal. For further details, see GREAT BRITAIN.

National Wealth.—In 1886 the total value of property and profits assessed by the income-tax amounted to £59,406,708; in 1893 to £65,606,195 (all incomes of less than £150 are exempt). This increase, however, did not extend to the owners or occupiers of lands and tenements. The number of depositors in savings-banks (1893) was 596,179, and £12,583,676 stood to their credit, an increase of £4,338,681 since 1883. In 1892 there existed 342 co-operative industrial and provident societies, with 195,919 members, a capital of £2,983,303, and a turn-over of £9,743,238; and 61 building societies employing a capital of £976,255. On the other hand, in Jan., 1894, there were 61,978 paupers with 33,218 dependents (2.3 per cent. of the total population).

Religion.—Scotland, since 1560, has an Established Church, organized on the Presbyterian system, and now governed by 1,348 parochial kirk sessions of ruling elders, with the minister as moderator; 84 presbyteries, 16 synods, and a General Assembly which meets annually in May. It claims 604,984 communicants, and about 45 per cent. of the entire population are claimed to adhere to it. Since 1874 its ministers are elected by the congregations. This question of patronage led in 1843 to a secession and the foundation of the Free Kirk, with 1,260 ministers and missionaries, 1,050 churches, 343,069 communicants, and the adherence of 34 per cent. of the population. There are several other bodies of Presbyterians (e. g., the United Presbyterian Church, with 615 ministers, 573 churches, 48 home mission stations, and 188,706 members), as well as an Episcopal Church, which temporarily, 1662-88, enjoyed the advantages of establishment, although it numbered very few adherents. It now has 7 bishops, 268 churches and missions, and 266 clergy. The Roman Catholics are supposed to number 365,000 souls, and besides the Irish in the towns they embrace the inhabitants of the islands of Barra, South Uist, Eigg, and Canna, and of a few Highland valleys. See SCOTLAND, CHURCH OF.

Education.—Scotland has long been in advance of England in educational matters, more especially as regards secondary education. Since 1872 all public, elementary, and middle-class schools are administered by school boards, and education is free for all children between the ages of five and fourteen. In 1893 there existed 3,005 of these schools, attended by 617,448 children. In addition to these there are numerous superior schools in the enjoyment of endowments or supported by public bodies, the more famous among these being the Edinburgh Academy, Fettes College, the Edinburgh High School, Merchiston College, and the five schools supported by the Merchant Company. There are four universities and a university college, with 285 professors and 6,382 students. The oldest of these universities, that of St. Andrews, was founded in 1411. Among schools for special purposes may be mentioned the theological colleges, seven training-colleges for teachers, an agricultural college, veterinary colleges, and a school of medicine for women. Many of these schools are at Edinburgh, which is likewise the seat of the Royal Society (founded 1783) and of the Royal Scottish Academy. See SCHOOLS AND COMMON SCHOOLS.

Political Institutions.—Scotland sends 72 members to the House of Commons, and 16 representative peers to the

House of Lords, who are elected for the duration of each Parliament (the Scottish peerage numbers 87 members, of whom 48 are also peers of the United Kingdom). At the time of the Union (1707) the Scottish Church and the judicial system were left intact, and Scottish law differs in many notable respects from that of England. The high court of justice includes a court of session for civil cases, and a high court of justiciary for criminal offenses. The inferior jurisdiction is exercised by sheriff courts, by borough magistrates and justices of the peace (bailies). The police force numbers 4,488 men. In 1893 2,394 persons were committed for trial, and 1,902 convicted.

Local government was reorganized in 1889 on the outlines followed in England. Elected county councils have taken the place of the old commissioners of supply and road trustees. Municipal bodies, presided over by a provost, exist in numerous cities and burghs. In 1888-90 (the last year for which there is a complete return) the local expenditure amounted to £7,341,893, inclusive of £886,543 for the relief of the poor, and £1,493,015 for the support of schools. Of the total amount required £4,590,788 was raised by rates, tolls, and dues, £964,525 was contributed by the imperial Government, and £1,410,398 was raised by loans.

History.—When Scotland first became known to the Romans its Highlands were occupied by Gaelic Picts, while the south was held by Cymric Britons. The Highlands were known to them as Caledonia (a corruption of Gael Dun, Land of the Gael). Julius Agricola (80-85) first penetrated this "Barbaria" as far as the Tay, and inflicted a defeat upon the Picts at Mons Grampius, but his conquests were only temporary, and when the Emperor Hadrian was in Britannia (122) he caused a wall to be built from the Solway to the Tyne as a protection of the Roman provinces against the predatory northern tribes. Twenty years afterward, in the reign of Antoninus Pius, the legate Q. Lollius Urbicus once more advanced into Caledonia, and constructed the Antonine wall between the Forth and Clyde. In 208, however, Severus once more retired to the Tyne, and although Flavius Theodosius, the father of Theodosius the Great, once more recovered the country between the two walls (369), and bestowed upon it the name of Valentia, in honor of the Emperor Valentinian I., the Romans finally retired from their conquests and abandoned Britannia.

The Picts again swept down over the lowlands and far into England, ravaging and devastating the country with savage but irresistible valor. The Britons now called the Anglo-Saxons to their aid, and the Picts were once more confined to their Highlands; in 449 a Saxon chieftain, Edwin, founded Edinburgh. In 503 the Scots—that is, the Celts from Ireland—crossed over to Britain and founded, under the leadership of Fergus, a Scottish kingdom along the western coast of Caledonia, from the Firth of Clyde to the present Ross-shire. The Celts of Ireland were Christians, having been converted by St. Patrick, and in 563 St. Columba went over from Ireland and settled among the heathen Picts, spending the rest of his life, till 597, in converting them to Christianity. In the beginning of the seventh century Scotland formed four independent kingdoms, namely, that of the Scots, along the west coast to the N. of the Clyde; that of the Picts, to the N. of the Forth; Strathclyde in the southwest, which was held by the Britons; and the Saxon domain of Bernicia. In 836 Kenneth, a lineal descendant of Fergus, became King of the Scots, and in 843 he also became King of the Picts, transferring his residence to Forteviot in Strathorne, the old capital of the Picts. Thus the Scots and the Picts, two tribes of the Celtic race and speaking two dialects of the Celtic language, coalesced and formed one empire, which was originally known as Alban (Highlands), but developed in course of time into Scotia or Scotland, a designation by right belonging to Ireland. In 945 the King of England bestowed upon Malcolm I. (942-954) a portion of the Cambrian kingdom, and thus was established that claim for homage which subsequently led to many wars. In 970 King Edgar of England bestowed upon Kenneth III. the purely Saxon district of Lothian. The same king occupied also Strathclyde, and his successor, Malcolm II. (1003-33), acquired the Merse and Teviotdale from the Prince of Northumberland, thus extending Scotland to the Tweed.

While the Scottish kingdom was externally much extended, the Scottish people underwent an internal change by which the Celtic character almost disappeared. So many Teutonic elements were absorbed that in the course of two centuries a new national type was developed, in which the

Fierce elements were hardly more than recognizable. Two main invasions, those, and more, invaded Scotland both from the north and the south. The Norwegians and the Danes had the islands before the time of Kenneth, and afterward, as time, also large tracts of the mainland, and a lively intercourse took place between the Norse and the Scandinavians, both as friends and as foes. The Hebrides and the Isle of Man were not united to Scotland until the reign of Alexander III. (1249-60), who defeated Hacon, King of Norway, at Largs, on the coast of Ayr, and the islands of Orkney and Shetland not until the reign of James III. (1406-37), who married Margaret, daughter of King Christian I. of Denmark, and received them as her dowry. Still greater was the Teutonic influence coming from the north—first Anglo-Saxon, then Norman. Malcolm III., who slew and succeeded Macbeth in 1057, was educated at the English court and married an English princess. Her brother, Edgar Atheling, and many Anglo-Saxon nobles sought refuge and support with Malcolm after the Norman invasion of England, but in 1072 William the Conqueror penetrated into Scotland and compelled Malcolm to submit and do homage to him. David (1154-65), the youngest son of this Malcolm, who had resided for several years at the polished court of his brother-in-law, King Henry of England, married three times Scotland to support the claims of his three Matilda in the throne, but was defeated on each occasion. He is famous among Scottish kings for having introduced into Scotland the type of feudal civilization which obtained in England. He secured peace throughout his dominions, promoted trade and industry, and established schools of learning. During the whole of this period the Scottish kings were looked upon as vassals of the English crown. William the Lion (1165-1214), who resisted the claims of Henry II. of England, was captured at Alnwick (1174), and sent to England on renewing his allegiance. This question of homage and the meddling of the Scottish kings in the affairs of England led to frequent wars, for the commission made by Richard Cœur de Lion in 1189, in return for a money payment, went of a temporary nature, as John again refused the claims of the English crown (1200), and Alexander II., after an unsuccessful invasion of England, was compelled to do homage to Henry III. in 1217. When Margaret, the seventh Matilda of Norway, daughter of King Eirik of Norway, granddaughter of Alexander III., and heiress to the Scottish crown, died on her voyage from Norway to Scotland, several pretenders appeared, and finally John Balliol obtained the crown by the aid of Edward I., in whom he swore allegiance. But he was deposed by the king after the battle of Bannockburn (1296), and then the Scottish people rose and made the fiercest resistance to the English usurper—first under William Wallace, who fell into the hands of Edward I., and was put to death in London 1305; then under the younger Robert Bruce, who routed the English under Edward II. at Bannockburn June 24, 1314, invaded England twelve times in fourteen years, and ravaged the country so fearfully that Edward III. was glad to conclude a truce for thirteen years. But in 1333 a fresh war broke out and, after the battle of Halidon, and again after that at Neville's Cross (1346), the Scottish kings were compelled to acknowledge themselves vassals of England.

With Robert II. (1371-90) the house of Stuart ascended the throne, and the history of Scotland from this time to the establishment of the union with England is given in the articles on ROBERT II. and III., JAMES I.-VI., MARY II., and, etc. Most of the kings of the Stuart dynasty were valiant and energetic men, but seven of them ascended the throne as minors, and five ended their lives by untimely deaths. This circumstance gave the power of the nobility an exorbitant development, and for centuries the history of Scotland became one long contest between the crown and the nobility, and one confused maze of feuds between one various noble families. In these troubles the kings sought support from the Church; they flattered and enriched it. The Scotch Church was the richest in Christendom. In the sixteenth century it owned half of all the real estate in the country. But its members were the most debased set of men within the pale of Romanism; and were able to maintain their social position only by means of the dense ignorance which they spread around them. The nobles were jealous and afraid of the Church and embraced the Reformation with great eagerness; and the great wars in Scotch history in the sixteenth century was essentially a contest between Romanism and absolutism on the one side, represented by the crown, and Protestantism and

feudalism on the other, represented by the nobility—a contest in which the final decision was given by a third party, the middle class, the burghs, who, under the leadership of Knox, carried the Reformation through and put serious limits to the power both of the crown and the nobility. Other elements were mixed up in the contest. The relations between Scotland and England during this period consisted mainly in a continuous border feud, which was carried on almost without intermission, and which now and then grew into actual warfare on a great scale. Nevertheless, by degrees there developed an English party within the Scotch people. During the wars between England and France the Scotch went to France to fight against the English, and this circumstance opened the way for a French influence in Scotland, which became of very great importance when James V. (1513-42) married Mary of Guise. France understood that, in a conflict with England, Scotland could be used as one of the most effective weapons, but in her attempts to form a close alliance with this country Roman Catholic France was compelled to seek her main support from the Roman Catholic clergy in Scotland, and thus she caused, most unwillingly, the nobility and the Protestants to turn their eyes to England. Meanwhile, studiousness arose on both sides of the border who wished to stop the perpetual hostilities, and who understood that a union between the two countries was the only means of achieving this end. It was a favorite idea with Henry VIII., and after the death of James V., during the regency of the Count of Arundel, a treaty was made by which Mary, the Queen of Scotland, was betrothed to the Prince of Wales, the son of Henry VIII., and it was agreed that when ten years of age she should be taken to England, in order to be educated there. But Henry's demand of political supremacy soon brought discord, and before the treaty was half a year old it was broken, and war was declared. After the death of Henry VIII. the Duke of Somerset tried to re-establish the treaty, but in vain; and after the battle of Pinkie (Sept. 10, 1547), Scotland threw herself into the arms of France. The queen-mother, Mary of Guise, assumed the regency, and the queen was taken to France to be educated, and betrothed to the dauphin. At last, however, by the victory of Protestantism in Scotland, and the extinction of the house of Tudor in England, the union actually took place. The most prominent points in the history of the united kingdoms are the contest between Presbyterianism and Episcopacy, the former being supported by the common people, the latter by the sovereign, the nobles throwing their weight into either scale as it suited their policy at the time, and the Jacobite reaction which was called forth by the corrupt and oppressive government of Charles II. and James II., and which gradually became so strong that nothing short of an incorporating union seemed capable of averting the danger of a civil war. The act of union with England was formally ratified by the Parliament of Scotland on Jan. 16, 1707.

The history of Scotland has been written by Home (1657), Maitland (1757), Guthrie (1770-77), Dalrymple (1779-79), Heron (1794-99), Burton (1807-70), Mackenzie (1807), and Keith (1896). Works dealing with particular periods are Skene's *Celtic Scotland* (1876-80); Leslie's *The Early Kings of Scotland* (1886); Anderson's *Scotland in Pagan Times* (1885-86); Pinkerton's, Tytler's, and Robertson's *Historical*; R. Chambers's *Domestic Annals of Scotland* (1850-61); Mackintosh's *History of Civilization in Scotland* (1878-85); and Rogers's *Social Life in Scotland* (1884-86).

Revised by E. G. RAVENSTEIN.

Scotland, Church of: The established Church of Scotland, frequently since the Reformation called the Reformed Church of Scotland.

Early History.—There are traditions of the introduction of Christianity into Scotland in very early times, traditions in which figure such names as those of St. Andrew, St. Rule, and St. Ninian. About 563 A. D. St. Columba founded his monastery on the lone isle of Iona, and extended his missionary work all over Scotland, and even into England. His followers and successors are known as the Caledonians. In later centuries another stream of Christian influence was poured into Scotland from the South, representing the Roman form of ecclesiasticism; and after the Scottish and Pictish monarchies were united in one king during the reign of Malcolm III., and largely through the influence of Margaret, his Saxon queen, many of the Caledonians yielded to the powerful influence of the Roman Church. From this time, the middle of the twelfth century, till the dawn of the

Reformation, the history of the Church in Scotland is one of constantly increasing power and wealth, and of growing corruption. The parochial system of Scotland owes its establishment to this period, and the Scottish ecclesiastics maintained a brave and successful struggle for independence against the claims of the primacies of Canterbury and York, who successively sought to assume control over the Scottish bishops.

In the end of the fifteenth century half the wealth of Scotland had passed into the hands of the Church. The feudal power of the greater nobles was greatly weakened by this, and also by the rising up of a middle class of lesser landholders and burghers, who had become the most powerful party in Scotland in intelligence, industry, and resources. In the beginning of the sixteenth century the writings of the continental Protestant divines were introduced into Scotland, and the result was seen in the awakened intelligence and spiritual earnestness of this middle class. Patrick Hamilton, a youth of high mental endowments, returned from Wittenberg in 1527 and began to preach the Reformed doctrines. He was tried for heresy and burned at the stake (1528). Persecutions followed for thirty years, and then came the triumph of the Reformation in Scotland. See KNOX, JOHN; HENDERSON, ALEXANDER; and PRESBYTERIAN CHURCH.

Distinctive Characteristics.—The peculiar and essential features of the Reformed Church of Scotland, besides the profession of the evangelical faith common to all the churches of the Reformation, were—(1) The government of the Church by that order of men which is indicated in the New Testament by the terms presbyters and bishops or overseers; (2) the subjection of the Church in all things spiritual to Christ as her only Head, and to his word as her only rule.

The First Covenant and Book of Discipline.—In 1557 the First Covenant or Common Bond was signed. The subscribers to this document, after declaring their faith in "the Evangel of Christ," promise "before the majesty of God to maintain and defend the whole congregation of Christ, and every member thereof, to the death," and "to renounce and forsake all superstitions, abominations, and idolatries." The word *congregation* was then used as the distinctive name of all those who held to the doctrines of the Reformed Church, having the same signification as the work *kirk*, which was subsequently introduced, and the leaders of the Reformation in Scotland were known as "the Lords of the Congregation." The various congregations which belonged to the Congregation used the liturgy of Edward VI.; and the Apostles' Creed and King Edward's Catechism formed the articles of religion by which they were bound into a doctrinal unity. At the death of the regent, Mary of Guise, in 1560, the Parliament of Scotland met, and on Aug. 24 an act was passed which is described as "The Confession of Faith and Doctrines believed and professed by the Protestants of Scotland, and authorized by the Estates in Parliament." This confession was in fact "the Order of Geneva," including the confession of faith prepared for the English congregation at Geneva by John Knox. Immediately afterward, on Dec. 20, 1560, the first General Assembly of the Kirk of Scotland was held, and from this date the Assembly "took order for God's glory and the weal of his Kirk in the realm of Scotland." At this Assembly "the Book of Discipline of the Church was allowed and approved." This book was afterward submitted to the council, which refused to sanction it. Nevertheless, the Church proceeded at once to carry it into execution. The principles of religious liberty were not understood in that age, and the Scottish Reformers did not hesitate to enact laws which involved the infliction of civil penalties for offenses that were purely religious, though, to their credit, it should be stated that these penalties were seldom inflicted; but with these exceptions the great principles, both of faith and order, which were then agreed to, remain, amid all the changes of confessions, as those held by all the branches of the Reformed Church in Scotland to this day. It is especially worthy of note that in this "first Book of Discipline," while "the duty of nations and their rulers to own the truth of God and to advance the kingdom of his Son," is clearly stated, it is at the same time maintained that the Kirk possesses an independent and exclusive jurisdiction, "which flows directly from God and the Mediator, Jesus Christ, and is spiritual, not having a temporal head on earth, but only Christ, the only King and Governor of his Church." For seven years, from the death of the regent Mary of Guise (1560) till the

abdication of Mary Queen of Scots, the Kirk was without state endowment, and indeed without any recognition by the state of her jurisdiction.

Patronage.—At a very early period lay patronage was introduced into Scotland. Laymen who had endowed churches and monasteries reserved for themselves and their heirs the right of presenting incumbents to the benefices thus founded. At a later period these rights of presentation were to a large extent annexed to bishoprics, priories, abbacies, and other religious houses, so that at the time of the Reformation there were only 262 out of the 940 benefices the patronage of which remained in the hands of laymen. The rights of presentation which belonged to the religious houses were after the Reformation a continual subject of contention between the Assembly and the queen. In 1565 the General Assembly asked that the absolute right of the queen or of any lay patron to present a minister without examination be disallowed. To this the queen answered that it seemed to be "no way reasonable that she should defraud herself of so great a part of the patrimony of the crown as to put the patronage of benefices forth of her own hands." The patronage to these benefices continued to be held by the queen, or was by her distributed among her favorite nobles.

Immediately after the queen's abdication the Parliament met on Dec. 15, 1567, and passed an act in favor of the Reformed Kirk, ratifying the act of 1560 by which the Confession of Faith was sanctioned and adopted, and among other statutes one for the examination and admission of ministers by the Kirk, reserving the right of presentation to the lay patrons. This Parliament also "declared and granted the jurisdiction of the Kirk anent preaching of the true word of God, correction of manners, and administration of the holy sacraments." A similar act was passed in 1592, ratifying and enlarging the rights of the Kirk in regard to her jurisdiction over the appointment or deprivation of ministers. The acts of 1567 and 1592 have always been regarded as the solemn recognition and sanction by the nation of the constitution of the Reformed Church, and the great charters of her Presbyterian government and freedom from the supremacy of the crown in all causes spiritual and ecclesiastical.

The Solemn League and Covenant and the Westminster Standards.—In 1603 James ascended the English throne. After a long and bitter struggle, both in England and in Scotland, against the royal encroachments on the civil and religious liberties of the people, an ordinance of the English Lords and Commons in Parliament was passed on June 12, 1643, calling the Westminster Assembly. The General Assembly of the Kirk met in Edinburgh on Aug. 2 in the same year. Commissioners from England were present, and the result of their conferences was that on Aug. 17 "the Solemn League and Covenant" was passed unanimously by the General Assembly; it was then carried to the Convention of Estates and unanimously ratified by them. Commissioners were also appointed to represent the Kirk of Scotland in the Westminster Assembly. The Confession of Faith of the Westminster divines was finished in 1646, and on Aug. 4, 1647, it was adopted by the Scottish General Assembly, with two modifications; and two years later the Estates of Parliament ratified this decision.

Later History.—Charles II. was restored to the throne in 1660, and an attempt was then made to conform the Scottish Church to that of England by the establishment of the episcopal form of government. So severe was the persecution that even to be present at a field conventicle was punishable by death and confiscation of goods. Yet the great body of the Scottish people steadfastly resisted. In the year 1688 William of Orange became king. In Apr., 1689, the Scottish Parliament met and passed an act abolishing prelacy. In 1690 the Parliament passed acts rescinding the statute of 1669, which had declared the king's supremacy, and ratifying the Confession of Faith and settling Presbyterian church government. The same Parliament passed an act abolishing lay patronage, though the new monarch was known to be strenuously opposed to its abolition. In 1693 the Parliament passed an act for "settling the quiet and peace of the Church," but this act expressly provided for summoning the General Assembly by royal authority. The General Assembly met in May, 1694. The king instructed the royal commissioner that if the act of supremacy was not accepted he should at once dissolve the Assembly, but at last the threat of dissolution was withdrawn, and the independence of the Kirk was again confirmed.

Daughter Churches.—In the articles on the FREE CHURCH OF SCOTLAND and PRESBYTERIAN CHURCH (qq. v.) will be found

a statement of the extensive legislative acts in reference to the loss of patronage and the independence of the Church, and also of the long-continued struggles between the two parties in the Church itself, which resulted in the first secession in 1704, or a second secession in 1758, and ultimately in the formation of the Free Church of Scotland in 1841. In the beginning of the nineteenth century the Church of Scotland established missions in Australia and in the provinces of British North America. These missions grew into presbyteries and synods, and at length dissolved their ecclesiastical connection with the parent churches, and occupy a separate position as churches possessing supreme jurisdiction.

Present Condition.—The Church of Scotland has missions in India and missions to the Jews in Alexandria, Scyrus, and Jerusalem. During the last thirty years there has been a remarkable development of spiritual and intellectual life among the clergy of the Scottish Church and a corresponding growth of religious power in the congregations. The loss of patronage has been abolished, so that each parish is a *locus vacant*, on the payment of a small sum in the parish, has the right of electing its own minister, subject to the consent of the presbytery. The General Assembly is the supreme court of the Church and meets annually in Edinburgh. It consists of representatives from all the presbyteries, and also from the royal burghs and the four universities. The Queen is represented in the General Assembly in the most high commissioner, but he takes no part in the deliberations. According to what is called the *Secession Act*, no new introduction or innovation or change in the established laws can be passed until it has received the approval of the majority of the presbyteries.

Scotland, National Covenant of: See COVENANT, NATIONAL.

Scott, CHARLES: soldier; b. in Cumberland co., Va., in 1746; served in Braddock's campaign 1755; raised and commanded the first company of James river for service in the war of the Revolution; became colonel of the Third Virginia Battalion Aug. 12, 1776; brigadier-general Apr. 2, 1777; distinguished at Trenton, Germantown, Monmouth, and Red Bank; taken prisoner at the surrender of Charleston 1780; settled in Woodford co., Ky., 1785; brigadier-general of Kentucky Volunteers in St. Clair's unfortunate expedition against the Miami Indians 1791; but made a successful invasion to the Wabash, defeating the Indians; commanded a portion of Wayne's army at the battle of Fallen Timbers 1794; was Governor of Kentucky 1800-12, D. Oct. 23, 1814. A town and a county in Kentucky bear his name.

Scott, DAVID: painter; b. in Edinburgh, Oct. 10, 1806; son of a landscape-engraver; educated at the High School; showed prominent talent for designing and engraving; visited Italy in 1822; was a member of the Royal Scottish Academy. Among his paintings are *Nimrod, Sardan, Rutland, Mary Queen of Scots receiving her Death-warrant, John Moore found Dead in the Street, Achilles, Greek, Demosthenes, Peter the Hermit, and Christ in the Garden*. He was an author, too, and wrote an able series of papers in *Blackwood* 1840. D. in Edinburgh, Mar. 5, 1848.

Scott, DAVID: See DAVID SCOTT CASE.

Scott, Sir THOMAS GILBERT, R. A., F. S. A.: architect; grandson of Thomas Scott, biblical commentator; b. at Banast, Buckinghamshire, England, in 1811; became an architect and a prominent member of the school which effected the so-called "Gothic revival"; was largely employed in the restoration of the ancient cathedrals of England, as well as Westminster Abbey, and the building of new churches, colleges, and secular public edifices. Among his works are the university buildings at Glasgow, the Indian, Chinese, Home, and Colonial offices, London, and the national museum at Prince Albert in Kensington Gardens, which covered him the honor of knighthood Aug. 2, 1872. He was the chief promoter of the Architectural Museum at Westminster, and published several professional treatises. D. in London, Mar. 27, 1878.

Scott, JOHN MONRO: patriot; b. in New York in 1730, a descendant of the second family of the Scotts of Ayr; graduated at Yale 1746; became a prominent and wealthy lawyer in New York; was an early and vigorous opponent of the oppressive measures of the British ministry, co-operating with William Livingston, Sears, Lamb, and the Sons

of Liberty, in which organization he was a popular orator; was defeated as a candidate for the Continental Congress of 1774; was perhaps the most influential member of the general committee of New York, appointed in 1775, and of the provincial Congress 1775-76; aided in drawing up the constitution of New York 1776; was chosen by the Continental Congress as one of the first trustees-general of New York (from June 1, 1776); served at the battle of Long Island, and in Westchester County until Mar. 1777, when he became secretary of State of New York, which office he filled until 1779; was delegate in the Continental Congress 1790-93, and chosen an honorary member of the Society of Cincinnati 1794. D. in New York, Sept. 14, 1794.

Scott, LEVI, D. D.: bishop of the Methodist Episcopal Church; b. at Cantwell's Bridge (now Odessa, Newswell co.), Del., Oct. 11, 1803; educated at a neighborhood school, but mainly self-taught; received the degree of A. M. from the Wesleyan University in 1840, and D. D. at Delaware College, Newark, Del., in 1848, both honorary; joined the Philadelphia Conference in 1826; served in the pastorate fourteen years, except one (1832-33) supernumerary from failure to health; was principal of Dickinson grammar school, Carlisle, Pa., from 1840 to 1845; was pastor in Philadelphia 1845-48; presiding elder 1845-48; assistant book-agent at New York 1848-52; and bishop of the Methodist Episcopal Church from 1852 to his death July 18, 1862.

Scott, RICHARD WILLIAM, J. J., D.: statesman; b. at Prescott, Ontario, Feb. 24, 1825; educated there, and admitted to the bar in 1845. He was mayor of Ottawa in 1852; represented that city in the Canadian Assembly 1857-63, and in the Ontario Assembly 1867-72; was elected Speaker of the Ontario Assembly in 1871, but resigned that office the same year upon being appointed Provincial Commissioner of Crown Lands, which portfolio he retained until 1873. He was Secretary of State for Canada from Jan. 8, 1874, until Oct., 1878; since then has been leader of the Liberal opposition in the Senate, to which body he was appointed Mar. 13, 1874. He prepared and carried in 1868 the Separate School Law of Ontario, and framed the Canada Temperance Act, which was carried through Parliament chiefly owing to his exertions.

See MACDONALD.

Scott, RICHARD, D. D.: classical scholar; b. in Devonshire, England, in 1811; graduated at Oxford, 1830; became a fellow of Balliol; took orders in the Church of England; was rector of Dulce, Cornwall, and of South Luffenham, Rutlandshire; became master of Balliol 1864, Professor of Exegesis 1861, and dean of Rochester 1870. He translated part of the *Oxford Library of the Fathers*, and was associated with Dean Liddell in the preparation of a well-known *Greek-English Lexicon* (1845; 7th ed. 1882). D. Dec. 2, 1867.

Revised by H. L. WILLIAMS.

Scott, ROBERT TINSLEY, M. A., F. R. S.: meteorologist; b. in Dublin, Jan. 25, 1833; was educated at Rugby School, Trinity College (Dublin), and in Berlin and Munich; became secretary of the British Meteorological Office, and executive of the British weather service in 1867. He is the author of *Handbook of Volumetric Analysis* (1862); *Weather Charts and Storm Warnings* (1876); *Elementary Meteorology* (1883); and of many papers in the *Proceedings of the Royal Society*, the *Quarterly Journal of the Royal Meteorological Society*, the *Journal of the Royal Geological Society of Ireland*, and other periodicals.

M. W. H.

Scott, RICHARD NICHOLSON: soldier; b. at Winchester, Tenn., Jan. 21, 1838; appointed second lieutenant of Fourth U. S. Infantry Jan. 21, 1857, adjutant July, 1861, and captain Sept., 1861. He served on the Pacific coast until 1861, being in command of the U. S. steamer *Massachusetts* during the San Juan difficulties in 1859. He was with the Army of the Potomac as acting adjutant-general from Mar., 1862, until June, 1863; was engaged in the siege of Yorktown and battle of Gaines's Mill, where he was wounded and awarded for gallantry. From June, 1863, to Sept., 1864, he was senior aide-de-camp to Maj.-Gen. Halleck. He continued to serve on staff duty till 1870; was Professor of Military Science at Fairmount, Minn., 1872-73; commanded Fort Ontario 1873-77; major Third Artillery 1879; was engaged from 1877 till his death in publishing the official records of the civil war. Author of *Digest of the Military Laws of the United States* (1873). D. at Washington, D. C., Mar. 5, 1897.

Scott, Sir WALTER: novelist and poet; b. in Edinburgh, Aug. 15, 1771; the son of Walter Scott, a writer to the sig-

net, and Anne Rutherford, daughter of Dr. John Rutherford, Professor of Medicine in the University of Edinburgh. He was lineally descended from the ancient chieftain Walter Scott, traditionally known as Auld Walt of Harden. He was a strong and healthy child until about eighteen months old, when he became incurably lame in his right leg—a weakness which sadly interfered with his love of active sports, but never marred his cheerfulness, good temper, or courage. His early childhood was passed in the farmhouse of Sandy-Knowe. At the age of eight he was placed in the High School of Edinburgh, where he remained for four years, the first two in the class of Luke Fraser, and the remaining time under the tuition of the distinguished rector, Dr. Alexander Adam, of whom Scott gives a pleasant account in his fragment of *Autobiography*. Personally popular, and making himself respected by his courage and general ability to take care of himself, he was not regarded as a very bright scholar, although even then giving evidence of his love of knowledge, of a strong memory for whatever pleased him, and of special delight in history, poetry, fairy tales, and romances. In 1783 he entered the university, and for a year or more attended the classes in Greek, Latin, logic, and ethics, giving some attention also to history and law. In the ancient languages he made but little progress, although more successful in other studies. It is not surprising, then, that in thorough knowledge and discipline he should have found himself at fault. Years afterward, and when he had become famous, he writes in his *Autobiography*: "It is with the deepest regret that I recollect in my manhood the opportunities which I neglected in my youth. Through every part of my literary career I have felt pinched and hampered by my own ignorance; and I would at this moment give half the reputation I have had the good fortune to acquire if by doing so I could rest the remaining part upon a sound foundation of learning and science." His progress in the university was arrested by a severe attack of illness, which seems to have broken up all plans of further study, and in 1785–86 he entered into indentures with his father to serve the usual apprenticeship to a writer to the signet. In 1792 he was called to the bar. During these and the succeeding years he was crowding his mind with vast accumulations of "ponderous and miscellaneous" knowledge of poetry and archaeology, fiction, and history, not easy to condense or reduce to system and order. "My memory of events," he says, "was like one of the large old-fashioned stone cannons of the Turks, very difficult to load well and discharge, but making a powerful effect when by good chance any object did come within range of its shot." He had already begun to collect books and articles of antiquarian interest, "the germ of the magnificent library and museum of Abbotsford." His mind was already turning toward letters, and in 1796 he made his first considerable publication, being translations from the German of Bürger. This was followed in 1799 by a translation of Goethe's *Goetz von Berlichingen*. *The House of Aspen*, which was not published till 1829, and several ballads.

In the meantime, in Dec., 1797, after a serious disappointment in love, he was married to Charlotte Margaret Carpenter, or Charpentier, a young lady of French birth and parentage, but a resident in England. Two years later, through the influence of his friends, he obtained the appointment of sheriff-depute of Selkirkshire, an office with light duties, which brought the important addition to his resources of £300 a year. In Jan., 1802, he published two volumes of the *Minstrelsy of the Scottish Border*, which was completed the next year by a third volume. It was received with great favor, and may be considered as opening the way to his general fame. It brought him also into familiar acquaintance with men of genius and lovers of legendary lore, such as Richard Heber, long member of Parliament for the University of Oxford, and that eccentric genius John Leyden.

From this time onward to the year 1831, when, at the age of sixty, he gave to the world the fourth series of *Tales of my Landlord*, there was but one year (1807) which was not marked by some independent work in verse or prose, bearing the impress of his genius, giving new impulse to literature and new fame to the land of his birth. There is room to mention only the most important of these. In 1805 the *Lay of the Last Minstrel* was published. It took the world by surprise, and was received with unbounded delight, not only for its chivalric spirit, its "vivid richness of coloring," its pathos, beauty, grace, and airy freshness, but as giving the promise of original poetic fervor and power to which the kingdom had long been a stranger. Edition after edi-

tion was called for, and sold as soon as published. "In the history of British poetry," says Lockhart, "nothing had ever equalled the demand for the *Lay of the Last Minstrel*." This was followed in 1808 by *Marmion*, perhaps the strongest and boldest of his poems, and in 1810 by *The Lady of the Lake*, in some respects more pleasing than any. In these his poetic power culminated. The poems subsequently published—*The Vision of Don Roderick* (1811), *Rokeby* (1812), *The Bruce of Triermain* (1813), *The Lord of the Isles* (1815)—were unequal to the earlier, and in various ways gave evidence of a waning popularity, which Scott was among the first to recognize. Another reason for this perceptible loss of popular favor was the appearance of another brilliant light in the early poetry of Lord Byron.

During these six or eight years Scott had been advancing in fame and in pecuniary resources. In 1804 he took the house of Ashiestiel, in the Ettrick Forest, overlooking the Tweed. In 1806 his friends had procured for him the appointment to one of the clerkships of the court of sessions, worth about £1,800 a year, the emoluments of which, however, by an express arrangement, he did not receive until the death of his predecessor in 1812. Still earlier, in 1805, he had become a regular partner in the printing-house of James Ballantyne & Co., although this connection was kept a profound secret from nearly every one of his most intimate friends. This was undoubtedly one of the most important steps of his life. "He continued bound by it," says his son-in-law, "during twenty years, and its influence on his literary exertions and his worldly fortunes was productive of much good, and not a little evil." In 1806 he took a prominent part in establishing *The Quarterly Review* in London, in opposition, politically, to *The Edinburgh Review*, the acknowledged advocate of the Whigs. In 1811 he purchased Abbotsford, a property of 100 acres of land on the banks of the Tweed, near Melrose, for £4,000. To this he added estate after estate adjoining, purchasing at high rates, till he had expended nearly or quite £40,000, to which must be added £25,000 more for preparing the grounds and erecting the mansion where for a few years he dispensed a splendid hospitality, and to which his fame drew visitors from every part of the civilized world.

In 1813, on the death of Pye, he was offered the office of poet-laureate, which he refused; but in Mar., 1820, he accepted a baronetcy, and in November of the same year the presidency of the Royal Society of Edinburgh. His exertions, two years later, during the visit of George IV. to Edinburgh, seem to have tended, in company with overwork, to undermine his health.

On the decline of his popularity as a poet his fertile mind turned to another form of literature, with which for ten or twelve years he surprised and enchanted the world. In 1814 appeared, anonymously, a novel under the title of *Waverley*. The next year *Guy Mannering* was published; in 1816, *The Antiquary* and the first series of the *Tales of My Landlord*; in 1817, *Rob Roy*; in 1818, *The Heart of Midlothian* (second series of *Tales of My Landlord*); in 1819, *Tales of My Landlord* (third series) and *Ivanhoe*. This splendid series of novels, thrown off with an ease and rapidity without parallel, marks the high tide of his genius. Those which follow are on a somewhat lower level, but the abundance of the production was hardly diminished. *The Monastery* and *The Abbot* followed in 1820; *Kenilworth* and *The Pirate* in 1821; *The Fortunes of Nigel* in 1822; *Peveril of the Peak*, *Quentin Durward*, and *St. Ronan's Well* in 1823; *Redgauntlet* in 1824; *The Tales of the Crusaders* in 1825; and *Woodstock*, written in the midst of impending troubles, in 1826. *The Chronicles of the Canongate* (first and second series) followed in 1827 and 1828, *Anne of Geierstein* and *The Tales of My Landlord* (fourth series) in 1829 and 1831 close the long list.

The secret of the author of *Waverley*, although known to some and confidently conjectured by almost every one, was not acknowledged until after the bankruptcy of Constable and the Ballantynes had rendered even a formal concealment no longer possible. Early in 1826 Constable was obliged to stop payment, and the Ballantynes, including Scott as partner in the house, being closely connected, faced for a very large amount. The humiliation to Scott was indescribable, but he met the trial with remarkable strength and dignity. The most liberal offers of assistance were made to him by friends and admirers, among them one of £30,000 from an anonymous correspondent, but he firmly declined them all. He refused to take any advantage of circumstances which might have freed him from the claims

of his creditors, but insisted that they should stand, and pledged the talent of his future life to the payment of those debts. He at once entered upon that course of unflinching industry in writing new works and in the republication of the old, with novel and profusion which enabled him within a few years to pay to his creditors £40,000, and to put things in better shape than some after his death, the principal of the debt was paid for his executors. It was a tremendous exertion, and it cost him his life. In 1830 alarming symptoms, which had appeared the preceding year, were followed by a nervous attack, from which he partially recovered. In Apr., 1831, the attack was renewed, and in September he left Edinburgh for the Continent, a great part of which he had never visited. The invalidly furnished him a ship of war, on which he proceeded to the Mediterranean, landing at Malta, and thence going to Naples. Here his mind almost entirely gave way, and he hurried homeward as rapidly as possible, stopping for a few weeks in London, and reaching Edinburgh in July, 1832. He died Sept. 21, and in the 1890's was buried in the grounds of Dryburgh Abbey. His most devoted died in 1828. His two sons and two daughters survived him.

All the standard editions of his works, probably the most complete and discriminating list is to be found in Allhouse's *Bibliography of Authors*. Extensive memoirs of Scott have been written by David Walker, William Weir, George Allan, and in the *Encyclopædia Britannica* by William Spaulding; but the great work on the author and the man, and one of the best pieces of biography in any language, is the *Life by Andrew Allan*, Leithart. See *Novels and English Literature*.

Revised by EMERSON GOSSET.

Scott, William Bell, poet and artist; b. near Edinburgh, Scotland, Sept. 12, 1811; brother of David Scott, engineer, became a distinguished painter and archaeologist and head master of the Government School of Design at Newcastle-on-Tyne; afterward resided chiefly at London, associated with the Pre-Raphaelite Brotherhood of English painters. Till 1865 was art-examiner under the education board. Published *Ballads and other Poems* (1839); *The Four of the World, a Philosophical Poem* (1840); a *Memoir of his father David* (1850); *Antiquarian Glossings in the North at Edinburgh in quarto numbers*, 1849-51; *Chorus Scott's Life* (1871); *Prose* (1874); *Half-hour Lectures on the History and Progress of the Fine and Ornamental Arts* (1861); another volume of *Prose* (1875), with illustrations by himself and by Alfred Tennyson. D. New York, 22, 1890. See *Antiquarian Notes of the Life of William Bell Scott*, edited by W. Martin (New York, 1892, 2 vols.).

Scott, Waverley, soldier; b. in Darncliffe co., near Perthshire, Va., June 16, 1796; educated at William and Mary College; studied law, and was admitted to the bar, in May 2, 1819, he accepted an appointment as captain of light artillery, and was ordered to New Orleans, where a year later, for disrespectful allusion to the conduct of his superior officer (Gen. Wilkinson), he was suspended by a court martial for one year, relinquishing his command at Baton Rouge in the fall of 1811. Promoted to be lieutenant-colonel July, 1812, he was sent to Philadelphia to organize troops for the field, but an application was ordered to the Niagara frontier, reporting to Gen. Smyth Oct. 4, near Buffalo. The attack on Queensdown occurred Oct. 18; Scott did not participate in the carrying of the heights and batteries, but the ensuing battle was fought under his command, after a gallant resistance he was overpowered, and the militia refusing to cross to his support, he was obliged to surrender, but he was exchanged soon after. In Mar., 1813, he was appointed adjutant-general with the rank of colonel, and the same month attained the colonelcy of his regiment. Dismissing with his battalion to Gen. Dearborn on the Niagara frontier in May, he led the advance in the assault on Fort George, May 27. In June he commanded the rear-guard in the retreat from Stony Creek to Fort George, and in connection with the navy made the descent on Burlington and York to September. In October he joined Gen. Wilkinson at Buffalo, he established a camp of instruction. On July 3, 1814, the Niagara river was crossed by Scott's and Riedy's brigades and Fort Erie captured. The battle of Chippewa ensued July 5, in which Scott greatly distinguished himself; the battle of Lundy's Lane next

followed (July 25), where Scott was severely wounded after having had two horses shot under him. He was (July 25) promoted to be brevet major-general, and Congress voted him a gold medal. In October, when but partially recovered, he was ordered to Baltimore, then again threatened; thence to Washington, where he was engaged as president of a board on infantry tactics and of a court of inquiry in the case of Gen. Winler. Declining to act as Secretary of War, he sailed for Europe in July, 1815, returning the following year. In 1815 he began the preparation of *General Regulations of the Army*, and in 1820 his *System of Infantry and Rifle Tactics*. During the nullification troubles (1829-32) Scott was ordered to South Carolina, where his tact and decision prevented civil war. He next served in Florida and in the Creek Nation against the Indians but, being charged with ill-treatment, a court of inquiry was ordered, which resulted in Scott's acquittal. The Canada border troubles (1857-58) next demanded his attention; followed in 1859 by the task of removing the Cherokee Indians to the upper Arkansas, and in 1860-61 he was engaged in Maine during the disputed territory controversy, conducting the management of each of these important duties with great success. In July, 1861, he succeeded to the command of the army as general-in-chief. In the war with Mexico he was ordered in Nov., 1846, to take command. Amending his troops at Laredo island, whence he moved in transports in February, a landing was effected (Mar. 6) at Vera Cruz, which succeeded, together with the battle of San Juan d'Ulu, Mar. 30. (See *Vina Cruz*.) The battle of Cerro Gordo (4-5) was fought Apr. 19, and the battles of Contreras, Churubusco, and San Antonio (see *Contreras*) Aug. 19-20. On Sept. 5 the battle of Molino del Rey (4, 5) was fought; the heights of Chapultepec (4, 5) were carried Sept. 13, as well as the San Cosme and Bode gates of the city of Mexico, the army entering next day (Sept. 14), and practically ending the war. Declining the proffered presidency of the Mexican republic, Scott, having been superseded by Gen. W. O. Butler, and a court of inquiry ordered in his case, arrived in New York May, 1848. Congress in March had extended to him a vote of thanks and authorized a gold medal. In June he was a candidate for nomination in the Whig convention which nominated Gen. Taylor for the presidency. In 1852 he received the nomination from the Whig party, but was signally defeated by Franklin Pierce, though receiving a large popular vote. In 1855 the rank of lieutenant-general by brevet was conferred upon him. In 1859 he was sent to Puget's Sound to arrange the difficulty caused by the occupation of San Juan island by Gen. Harney.

Though too infirm to undertake the conduct of the army in the great civil war, Gen. Scott unhesitatingly threw the weight of his influence in favor of the Government, and in the exciting events preceding actual hostilities rendered important service. On Nov. 1, 1861, he was retired from active service, but without reduction of pay or allowances. He published his *Autobiography* in 1864. D. at West Point, May 29, 1886.

Revised by JAMES MINCK.

Scottsdale: borough; Westmoreland co., Pa., on the Penn. and the Balt. and Ohio railways; 17 miles S. of Greensburg, the county-seat (for location, see map of Pennsylvania, ref. 5-B). It is in a coal-mining region, and contains a rolling-mill, large pipe-works, and other iron manufactures; a national bank with capital of \$50,000, a private bank with capital of \$50,000, and two weekly newspapers. Pop. (1880) 1,275; (1890) 2,693.

Scottisms: words and expressions proper to the English of Scotland, and not recognized as belonging to standard English. *Suddenly* for "suddenness," used by Sir Walter Scott, is an example. In the U. S. many of the following words or phrases appear to be due to the speech of settlers from Scotland: *Assunder* (asunder), *basket* (basket), *blather*, *blather*, *big-coat* (great-coat), *bare-tree* (elder), *chuck* (chuck (n.), a slight repeat), *clash* (clamorous talk), *a cut of yarn*, *forment* (opposite), *not a hair* (white), *keel* (trudle or red chalk), *kylogus* (to plot), *red* (to comb out), *red up* (to arrange), *a room*, *scrubby* (stunted), *stomach*, *sunken* (sunk), *trap* (to get the place of a higher post by a correct answer), and others. Many words and phrases not now admitted as standard English are, however, also used in other English dialects, and the use of such words as those mentioned does not necessarily prove the speaker to be of Scotch descent. It is probable that the common misuse of *will*, *would* for *shall*, *should* in the U. S. is in great part due to the influence of the speech of settlers from Scotland and

Ireland, and the same cause perhaps has something to do with the very common pronunciation of *r* in cases where in Southern England and some regions in the U. S. that sound has been lost (though the Scotch *r* is not like the sound heard in the U. S.), as well as with the fact that in the U. S. speakers rarely drop or misplace the sound of *h* in standard English, and more generally distinguish *wh* from *w* than is the case in England. But it is not necessary to assume that Scotch pronunciation is the only or even the chief cause of these and some other features of American pronunciation. See, further, Jamieson's *Etymological Dictionary of the Scottish Language* (revised ed. 4 vols., 1879-82); J. A. H. Murray, *The Dialect of the Southern Counties of Scotland in Transactions of the (London) Philological Society* (1870-72, part ii.); A. J. Ellis, *Early English Pronunciation* (part v., 1889), etc.

S. S. HALDEMAN.

Scottish Language: the language spoken in Scotland. This is well known to be not a Celtic dialect, but a form of English which differs from the standard speech by reason of a separate development, and because of external influences to which the latter has not been subjected in the same degree. English became the language of Scotland owing to political events in the early history of the country. The Northumbrian kingdom in the seventh century included the Lowlands of Scotland in its supremacy. As a result, English, the language of Northumbria, began to spread more widely over the Lowlands. When the Scottish kingdom became separated from England, the struggles for supremacy between the Saxons of the Lowlands and the Celts of the Highlands resulted in a victory for the former, and English became after a time the recognized literary language.

The form of English thus adopted was that called Northern English, spoken from the Humber northward. Up to the middle of the fifteenth century Scotch-English did not differ from that used in Yorkshire and Northumberland. From about this time, however, owing to the development of a separate national life and literature, that form of Northern English spoken in the capital city, Edinburgh, became the standard literary language of Scotland. The literature produced in this language includes such important names as Barbour, James I. (of Scotland), Wyntoun, Henryson, Dunbar, and Douglas.

The various external influences affecting Scotch-English differ considerably in degree from those affecting the language of England. Celtic, which remained as a linguistic sub-stratum in the Lowlands and as the dominant speech of the Highlands for many years, influenced the English of Scotland more than that of any other part of Britain. Thus many Celtic words, not found in English, belong to Scotch. The Norse or Scandinavian influence was probably as great as upon Northern English as a whole, and thus greater than upon Southern or Midland English. The French influence was due not so much to the Norman conquest as to those close political relations between Scotland and France which enabled the former to retain her independence for so many years. The revival of classical learning powerfully affected Scotland, as it did the rest of Britain, but the earlier classical influence was probably not so great upon the language of the north as upon the language of the south. More powerful than all other influences has been the effect upon the Scottish language of the standard language of England. Its earliest marked effect was at the time of the Reformation, and this was greatly increased by the union of the two countries under the same king in 1603. In fact, since that time, except for a partial revival of the popular speech in the poems of Ramsey, Fergusson, and Burns, the Scottish language has gradually given place to the literary language of England. Even the speaking of Scotch-English, as distinct from the English of the south, has more and more been given up by educated people, so that this form of the language, so long dominant in the northern kingdom, has been gradually sinking to the position of a mere dialect, without a literature or a considerable body of cultivated speakers.

A systematic treatment of the subject may be found in *The Dialect of the Southern Counties of Scotland*, by James A. H. Murray, in *Transactions of the (London) Philological Society* (1870-72). See ENGLISH LANGUAGE.

Scouller, JAMES BROWN, D. D.: clergyman; b. near Newville, Pa., July 12, 1820; educated at Dickinson College and the United Presbyterian Theological Seminary, Allegheny, Pa.; pastor of the United Presbyterian churches, Fourth of Philadelphia 1844-47, Cuylerville, N. Y., 1847-52, Argyle, N. Y., 1852-62; editor, 1862-63, of *The Christian Instructor*, for which he had written *Forty Letters from Abroad, principally Italy and Egypt* (1860-61). Dr. Scouller's principal published works are *A Manual of the United Presbyterian Church* (1881; 2d ed. 1887); *Calvinism: its History and Influence* (1885); and *History of the United Presbyterian Church*, in American Church History Series (New York, 1894). C. K. HOYT.

Scovel, SYLVESTER FITHIAN: clergyman and educator; b. at Harrison, O., Dec. 29, 1835; educated at Hanover College, Indiana, and New Albany (now McCormick) Theological Seminary; pastor of Presbyterian church, Jeffersonville, Ind., 1852-61, First Presbyterian church, Springfield, O., 1861-66, First Presbyterian, Pittsburg, Pa., 1866-83; and since 1883 has been president of Wooster University, Ohio. He has published sermons, addresses, and *Centennial Volume of the First Presbyterian Church of Pittsburg* (Pittsburg, 1884). C. K. HOYT.

Scranton: town; capital of Jackson co., Miss.; on the Pascagoula river and the Louisville and Nashville Railroad; half a mile N. of the Gulf of Mexico, 45 miles S. W. of Mobile, Ala. (for location, see map of Mississippi, ref. 9-II). It saws and ships large quantities of pine lumber, has an extensive oyster industry, and contains a State bank with a capital of \$25,000, and two weekly newspapers. Pop. (1880) 1,052; (1890) 1,353.

Scranton: city; capital of Lackawanna co., Pa.; on the Lackawanna river, and the Cent. of N. J., the Del. and Hud., the Del., Lack. and W., and the N. Y., Ont. and W. railways; 18 miles N. E. of Wilkesbarre and 107 miles N. of Philadelphia (for location, see map of Pennsylvania, ref. 3-I). It is the fourth city in the State in population and the center of the great anthracite coal region, and has a picturesque location in the Lackawanna valley on a plateau at the confluence of Roaring brook and the Lackawanna river. The city is laid out with wide straight streets; has several public parks and squares, and a beautiful drive to Elmhurst; and contains 140 miles of streets, many paved with asphalt and brick, improved water-works, gas and electric light plants, and electric street-railways. The area is 19½ sq. miles. Among the notable public buildings are the U. S. Government building, court-house, municipal building, Albright Memorial Library, Moses Taylor Hospital, and the Oral School for the deaf and dumb.

Finances and Banking.—The assessed valuation of real and personal property in 1894 was \$19,291,124, and the net debt Jan. 1, 1895, was \$438,232. In 1895 there were 3 national banks with combined capital of \$650,000, 4 State banks with capital of \$500,000, a trust and safe deposit company with capital of \$250,000, and an unclassified bank with capital of \$30,000. Scranton has 15 building and loan associations, all local and all but two on the terminating plan, with an aggregate of 4,851 shareholders, 1,708 borrowers, and 25,746½ shares in force.

Churches, Schools, etc.—Scranton is the seat of a Roman Catholic bishopric and has 70 churches of various denominations. There are 37 public-school buildings, public-school property valued at over \$900,000, 4 colleges, a nunnery, 6 public libraries, 2 hospitals, and 4 daily, 17 weekly, and 6 monthly periodicals.

Business Interests.—The census returns of 1890 showed 138 manufacturing establishments (representing 41 industries), with a combined capital of \$25,144,936, employing 8,498 persons, paying \$3,921,831 for wages and \$15,968,846 for materials, with products valued at \$22,801,028. The principal industry is the manufacture of iron and steel, 4 establishments, with \$8,840,706 capital, employing 3,298 persons, paying \$1,726,229 for wages and \$10,716,206 for materials, with products valued at \$13,278,299. Then follow the manufacture of malt liquor, 3 establishments, \$471,700 capital; silk and silk goods, 3 establishments, \$440,699 capital; planed lumber, 8 establishments, \$429,536 capital; flour and feed, 5 establishments; carriages and wagons, 9. The city is an important center for general trade and one of the principal distributing-points for the anthracite coal trade.

History.—The city was founded by Joseph H. and George

W. Scrivenor in 1840, and was incorporated as a borough in 1844 and as a city in 1898. The first rolling-mill was put into operation in 1844. Pop. (1880) 12,870; (1900) 73,957; (1910) estimated, 103,000. R. F. Wren.

Screw (n): any kind of the family PALAEMONIDÆ (q. v.).

Screw (M. Ling. screw, from U. Fr. *visser* > *vis*, screw, an old French verb, akin to *visum*, *visere*, Dutch *schroef*, *schroef*, *schroef*; an elementary mechanism consisting of a cylinder having around it a projecting helical rib or thread. When the helical rib is formed on the interior of a hollow cylinder within a movable block the combination is called a nut. The screw is really a particular case of the inclined plane.

The screw was known in Egypt in the days of Herodotus (c. 450), who shows it in several propositions of his *Geometry*, and it is also figured by his *Asiatick*. It was also known to Archimedes (c. 250), and he has been credited with the invention for the purpose of launching a large vessel built under his direction. At the beginning of the Christian era it was well known to the nations on the shores of the Mediterranean, and its use in press screws has been well understood for a well-preserved manuscript of Pappus illustrates a press for linen which has two screws and a massive frame.

The earliest writer who described the laying out of a screw thread was Pappus of Alexandria, a Greek mathematician of the fourth century. His method consisted in winding a right-angled triangle of thin brass around a cylinder and then tracing the screw-thread from the hypotenuse. The space between the threads was then cut or filed off. A similar method was used but a few years ago by native workmen in India for making (of native wrought iron) press-screws 3 inches in diameter and 12 feet in length, having threads three-quarters of an inch thick. At one time it was not uncommon in India in the Southern U. S. plantation cotton gins having wooden screws 14 inches in diameter and 6 feet long, the threads being a inch thick. These screws were cut out by a millwright using ordinary hand-tools. James Harrison (1776) was the first to pay especial attention to the making of screws by machinery, and his invention may be regarded as the first example of the modern use of screw-cutting lathes, although fifty years before there had been made in France a machine for cutting the thread on the bases of valves, and 200 years before James Baines had designed a lathe for turning wooden screws. Great attention was given to the making of accurate screws by Henry Maudslay. Sir James Barton and Sir Joseph Whitworth also made improvements in screw-cutting machinery, and the latter developed what is known as the Whitworth standard thread, which is almost universally used in Europe for screw-bolts. The threads on ordinary bolts and nuts in general use in the U. S. are known as the United States standard thread, or the Franklin Institute standard, being based upon the investigations of William Sellers, as set forth in a paper read by him before the Franklin Institute in Apr., 1864.

Of the many varieties of screws, that known as the wood-screw (from their exclusive use in wood) is the most common, and it has been made by machinery for many years. In fact such screws had blunt points, and therefore it was necessary to bore a hole for their reception, but about 1850 Thomas A. Edison, a native of the U. S., devised the well-known double-pointed screw and machinery for its manufacture. The thread of this screw and those of its predecessors were formed by cutting away the metal between them; but at present made by a system of rolling combined with double-compression, the threads are raised and all the metal between them is utilized in their formation.

One of the more important uses to which the screw is applied is the moving of the tool in lathes for turning metal, and it was used for that purpose as early as 1671; but the lathe was not intended for cutting screws, and it is somewhat remarkable that the lead-screw or guide-screw, as applied to lathes, especially designed for screw-cutting, did not appear till about 180 years later.

The screw has been applied to iron piles for forming a screw-foundation in loose soil, to mooring-chains for vessels, to the raising of heavy weights by jacks and cranes, to micrometers for microscopes and astronomical instruments, to the raising of water and the propulsion of vessels—in fact, there is no mechanism so delicate or machinery so ponderous that it is not dependent either for its manufacture or operation upon some application of the screw. W. F. DENVER.

Screw-pines: the *Pandanus*, a small family of about eighty species of mostly tropical, erect, or climbing monospermatophyte trees and shrubs. The family as restricted consists of but two genera (*Pandanus* and *Freycinetia*), and the members are confined to the Old World. They bear some resemblance to the pines, some of which were formerly included in this family, but their strongest affinities are doubtless with the woods, hence they are placed in the *Nyctagynaceae*. Some species bear naked, globose, spiked flowers; the stamens are many. The ovaries are compound with many ovules, or (by reduction) simple with solitary or few ovules. Many species, especially of the genus *Pandanus*, are cultivated in greenhouses. CHARLES E. BARNES.

Scribe, skrib, *scriba*, *scriba*, *scriba*; playwright; b. in Paris, Dec. 24, 1791; studied law, wrote in 1811 his first play, *Le Peuple*, which failed; achieved his first success in 1816 with *Une Nuit de la Garde nationale*, written in collaboration with Delavigne; provided from 1816 to 1820 the Théâtre de la Ville with the Théâtre des Variétés with as many vaudevilles and small comedies with songs as they could perform; wrote for the Gymnase between 1820 and 1830 about 150 plays, mostly of comic character of a sentimental or satirical character; composed, finally, from 1830 to his death, Feb. 20, 1861, more than 100 plays in three or five acts, historical, satirical, and even tragic, for the Théâtre Français and other houses, besides a similar number of operas for Boisselot, Adam, Aubert, Donizetti, Meyerbeer, Verdi, and other composers, and some novels and romances. Most of these plays he produced in connection with some other playwright—Gérmain Delavigne, Molière, Bayard, Dupin, Legrand, etc.—and at one time, between 1830 and 1835, this artistic partnership was organized in thorough business style; one made the plot, another sketched the characters, a third wrote the dialogue, etc. After 1835, however, it became necessary to be a little more careful in order to satisfy the public. In general, his success was complete. For nearly forty years he reigned supreme in all the theaters of the world. Nor can it be said that his success was entirely undeserved; his plots have a novelty and originality, their movements an adroitness and rapidity, and the dialogue an eloquence and pungency which always will be of value; but his picture of characters is superficial, and of passions and sentiments untrue; he lacks ideas, and is deficient in style. The best are his earlier one-act comedies, such as *Les premiers Amours* (1825); the worst are his later historical dramas in five acts, such as *Bertrand et Raton* (1835) and *Le Vercors d'Élan* (1840). At present his plays are very seldom acted. His collected *Œuvres* comprise 76 vols. (1874-85). Revised by A. G. CARRMAN.

Scribes (plur. of *scribe* from Lat. *scriba*, clerk, writer, deriv. of *scribere*, write, trans. of Gr. *gramma* (deriv. of *gramma*, write) and *Heb. sopher*, scribe, deriv. of *sopher*, write); originally, officers of state who drew up the decrees of kings, wrote their letters, and kept records. Among the Lemites in Egypt (Ex. v, 6-19) and in the desert (Num. xi, 16) there were scribes whose business apparently it was to keep the consular registers, serve processes, and the like. In Palestine the scribes appear to have been chosen from the Levites (1 Chron. xxi, 4; 2 Chron. xi, 11, xxix, 12). From the time of Ezra (fifth century B. C.) they were the copyists and then naturally exponents of the Law. In the New Testament they are generally named in connection with the Pharisees, as they belonged to that party, and were noted for their hypocrisy, ostentation, and arrogance.

Scribner, CHARLES; publisher; b. in New York, Feb. 21, 1821; son of Uriah R. Scribner, a prominent merchant; educated at New York University and at Princeton, where he graduated 1840; studied law for three years, and was admitted to the bar, but never practiced the legal profession; began the business of book-publishing in the old Brick Church, New York, in partnership with Isaac D. Baker in 1846, under the style of Baker & Scribner. In 1850 Mr. Baker died, and the business was thenceforth carried on in Mr. Scribner's name. In 1870 *Scribner's Magazine* was established. D. at Laverne, Switzerland, Aug. 20, 1871.

Scribnus Lar'gus; physician to the Emperor Claudius. He composed, about the year 47 A. D., a book of medical formulas, *Compositioes*, which is valuable for the history of medicine. Best edition by G. Helmreich (Leipzig, 1887).

Scriptures, Holy: See Bible.

Scrivener, skri-ner, FURNACE HENRY ARNOLD; biblical scholar; b. at Bermondsey, London, Sept. 29, 1813;

graduated at Cambridge, 1835; was for many years master of classical schools, especially that at Falmouth, where he was also incumbent of a church 1846-61; became rector of St. Gerrans, Cornwall, 1861; vicar of Hendon and a prebendary of Exeter 1876. D. at Hendon, Oct. 26, 1891. He holds a high rank in the philological criticism of the New Testament; published valuable editions of the *Greek Testament* of Stephens (1860; 7th ed. 1877) and of the *Codex Bezae* (1864); a *Full Collation of the Codex Sinaiticus with the Received Text of the New Testament* (1863); and the *Cambridge Paragraph Bible, with the Text Revised and a Critical Introduction prefixed* (1873); *Greek Testament, with the Changes of the New Testament Revisers* (1881); wrote a *Plain Introduction to the Criticism of the New Testament* (1861; 4th ed. by E. Miller, revised and enlarged, 1894, 2 vols.), and other works of kindred character; was appointed one of the company of revision of the authorized version of the New Testament 1870, and was granted a pension from the civil list 1872, "in recognition of his services in connection with biblical criticism."

Scrivener's Cramp: See NEUROSIS.

Scrofula, or **Struma** [*scrofula* is from Lat. *scrofula*, scrofulous swellings, *scrofula*, plur. of **scrofula*, liter., dimin. of *scrofa*, sow, swine being affected by a similar disease; *struma* is from Lat. *struere*, to build, since the lymphatic glands are enlarged in this condition]: a constitutional disease characterized mainly by defective nutrition of the tissues. Persons of the lymphatic temperament are most liable to develop the marked symptoms of struma or scrofula. Scrofula is hereditary in many families. In other persons it may arise *de novo* from bad hygiene and regimen, especially in children when rapidly developing. Most cases formerly considered scrofulous are now regarded as tuberculous, directly caused by the presence of the *Bacillus tuberculosis*. Many symptoms, too, of disordered blood-states formerly grouped as scrofulous are now distinguished as having definite causes. Eczema, though often an exponent of struma, is as often due to other causes—nervous influences, gouty or rheumatic taint, gastric and intestinal derangements. The scrofulous person is often light-complexioned, the skin white, the body full, or even obese, but the muscles soft and flabby. In other individuals, of what is called the dark strumous type, there may be delicately formed features, clear complexion, and much personal beauty. The chief characteristic of scrofula is the susceptibility of the lymphatic glands and of the bones and joints to grave forms of disease from slight exciting causes. It must not be confused with rickets, or rickets, with which it has no necessary connection, nor with inherited syphilis. Either persistently or with every slight impairment of health the glands of the neck, groin, abdomen, etc., may become indurated and enlarged. Such swellings may be evanescent or leave permanent indurations. The glands of the neck frequently are so engorged with scrofulous exudative matter that it undergoes cheesy or caseous degeneration—or actually suppurates, producing scrofulous abscess. Scrofula is not, then, a definite specific disease, but a condition of serious perversions of the nutritive qualities of the blood, and resulting affections of the various tissues and organs of the body. Enlarged glands, moist skin diseases, superficial abscesses, and destructive inflammations of the bones and joints are some of its manifestations. Inherited scrofulous taint may remain latent until developed by depressing sickness. Thus measles, a harmless disorder in robust children, is hazardous when struma lurks in the system. The bottle-fed infant and the foundling are more often scrofulous than the nursed, home-reared child. The mucous surfaces are very liable to disease in struma, chronic bronchial catarrh, diarrhoea, and cholera infantum. The relation of scrofula and tuberculosis is disputed. Modern pathologists believe that the bacillus of tubercle is the efficient cause of most of the conditions formerly attributed to struma, the micro-organism lying dormant in the body until from some accidental source of depression a suitable nidus is formed for its development and multiplication; but there are some cases in which neither tubercle nor syphilis can be demonstrated, and for these the term struma may still properly be retained. The treatment of scrofula is hygienic and nutritive—warm clothing, bathing, friction to the skin, pure air, nutritious diet, special articles such as cod-liver oil, and preparations of malt and of phosphates. Iron, iodine, and arsenical preparations act as alteratives to reduce glandular enlargements.

Scrophularia'cea: See FIGWORTS.

Scruple [from Lat. *scrupulus* (dimin. of *scrupus*, a rough, sharp stone), pebble, (as a weight) a scruple]: in apothecaries' weight, one-third of a drachm, 20 grains, the $\frac{1}{48}$ th part of the pound troy. The Romans gave the name to the $\frac{1}{48}$ th part of any standard unit of measure.

Scudder, HENRY MARTYN, M. D., D. D.: clergyman and missionary; son of Rev. John Scudder; b. at Panditerra, district of Jaffna, Ceylon, Feb. 5, 1822; went to the U. S. in 1832; graduated at University of City of New York in 1840, and at Union Theological Seminary in 1843; was ordained a Presbyterian clergyman same year, and sailed for Madras as a missionary of the American Board of Commissioners for Foreign Missions. In addition to his missionary work he studied medicine in the medical college of Madras, graduated, opened a hospital and dispensary for gratuitous treatment of the poor, and received an honorary M. D. from New York College of Physicians and Surgeons in 1853. He was in Madras from 1844 to 1851, and in the Arcot Mission from 1851 to 1863; returned to the U. S. in 1864; was pastor of a Reformed Dutch church in Jersey City 1865-71; was a Presbyterian pastor in San Francisco; was pastor of the Central Congregational church, in Brooklyn, N. Y., 1871-Nov., 1882; pastor of Plymouth Congregational church, Chicago, Ill., 1883-87. His publications include several works in the Tamil language. He went to Japan in 1887 to engage in missionary work.

Scudder, HORACE ELISHA: author; b. in Boston, Mass., Oct. 16, 1838; graduated at Williams College 1858; taught in New York till 1861, when he removed to Boston and devoted himself to literary work. He was editor of *The Riverside Magazine* (Cambridge, 1867-71), and became a resident of Cambridge, Mass., 1875. In 1890 he became editor of *The Atlantic Monthly*. He is the author of *Seven Little People and their Friends* (1862); *Dream Children* (1863); *Stories from my Attic* (1869); *The Bodley Books* (1875-87); *The Dwellers in Five-Sisters Court* (1876); *Stories and Romances* (1880); *Life of Noah Webster* (1882); *History of the United States* (1884); *Men and Letters* (1888); etc.

Revised by H. A. BEERS.

Scudder, JOHN, D. D., M. D.: missionary; b. at Freehold, N. J., Sept. 3, 1793; graduated at Princeton 1811; M. D. College of Physicians and Surgeons, New York, 1815; became a physician in New York, where he was house-surgeon to the City Hospital; abandoned an extensive practice to devote himself to missionary work; was a missionary physician of the A. B. C. F. M. in Ceylon 1820-36, after which he was transferred to the Madras mission; spent several years (1842-46) in the U. S., visited the Cape of Good Hope for his health 1854, and died of apoplexy at Wynberg, South Africa, Jan. 13, 1855. Author of several publications on missionary subjects. His labors in the establishment of hospitals and schools in Ceylon and Southern India were very successful. He takes rank with the best of the early missionaries in India. His ten children—eight sons and two daughters—all became missionaries in India; most of them are also physicians. See his *Memoir*, by Rev. J. R. Waterbury (New York, 1856).

Scudder, SAMUEL HUBBARD: naturalist; b. in Boston, Mass., Apr. 13, 1837; graduated at Williams College 1857, and at Lawrence Scientific School of Harvard 1862. He has been a prominent member of the Boston Society of Natural History, holding almost every office, including that of president (1880-87). He was assistant librarian of Harvard College 1879-82; paleontologist of the U. S. geological survey 1886-92; member National Academy of Science since 1877. His publications, which number upward of 620, are mainly upon insects, especially butterflies, Orthoptera, and fossil insects. Among the more important of his works may be enumerated: *Catalogue of N. A. Orthoptera* (1867); *A Century of Orthoptera* (1868-79); *Catalogue of Scientific Series* (1879); *Butterflies: their Structures, Changes, and Life-histories* (1881); *Nomenclator Zoologicus* (1882); *Butterflies of the Eastern United States* (1888-89); *Tertiary Insects of North America* (1890); *Life of a Butterfly* (1893); *Guide to the Common Butterflies* (1893). He was also one of the founders of *Science*, and its editor 1883-85.

J. S. KINGSLEY.

Scudéry, skū'dā'ree', MADELEINE, de: poet and novelist; b. at Havre, France, June 15, 1607; was educated in Paris; became one of the most conspicuous figures in the literary circle of the Hôtel Rambouillet, and acquired great celebrity

by two rowers, *Zeppelin* (1841), *Atlantus, son of Herakles* (1842), *Zeus* (1850), *Alcibiades* (1860), etc. After the capture of the Hotel d'Amboise had been broken up the carved a statue of her own, frequented by the queen and the pretence. D. in Paris, June 2, 1701.

Scullin (Ital., *scullin*, a scull), hence a scull struck with the edge of a scull (scull = *scull*, *scull*); a scull of four oars to five lbs., and nearly equivalent to the L. 5, 6, 7, 8, 9, 10. Many different sculls were struck by the numerous scullers which preceded in Italy, and their values are extremely various.

Sculling: a method of propelling a boat by one man using the scull. The sculler usually stands, and dipping his scull deep in the water pushes or pulls the handle from side to side. The blade is inclined at a large angle to the perpendicular, and this angle is changed to the other side of the perpendicular with each stroke.

The principle of sculling is very much the same as that of the scow, scow, or windmill, and the motion very closely resembles that of a boat's tail.

The term is also applied to the rowing of boats in which the oarsmen use a pair of sculls, or short oars, but this use is confined to small and racing boats. A racing boat used for two men, each of whom rowed a pair of oars, would be called a double scull, and the oarsmen scullers. There are also a few racing-boats called catboats, rigged for four men, each using a pair of oars; but rowing in such a boat is not called sculling. The method of propelling the Venetian gondolas can hardly be classed as either rowing, sculling, or paddling. Here the oarsman stands facing the front of the gondola, pushes his single oar—always on one side of the boat—over a fulcrum, and by a turn of the blade at the end of the stroke also steers the boat. See *Rowing*.

R. HITCHCOCK, Jr.

Sculpin [etymology obscure]: any fish belonging to the family *Cottidae*; distinguished by a rather stout, club-shaped body and large head, the spines with which the head is armed, and a naked or simply rough body; the mouth is quite large. Sculpins are very destructive to other fishes and are a nuisance to the angler. These commonly found along the Atlantic seaboard of North America are species of the restricted genus *Cottus* (or *Acanthocottus* of Girard). The best known is the *Cottus octodecemspinosus*, which is the most southern species, and the *Cottus grandis*, which is the most northern N. of Cape Cod. The name deep-water sculpin, or moray, is applied to the *Hemitripterus acadianus*. On the Pacific coast the name is applied to corresponding species of the same genus. The species are rarely or never used as food except by the Greenlanders and the very poor.

Revised by F. A. Lucas.

Sculpture [via O. fr. from Lat. *sculptura*, carving, sculpture, *sculptura*, *sculptum*, carved]: carving, or shaping by means of cutting tools, including incised work or engraving as well as carving in relief or in the solid. By extension, modeling in clay, wax, or other soft material is called sculpture, especially when it is a work of fine art which is desired. The art of sculpture includes, then, all kinds of cutting and shaping of solid objects, but the chief use of the term is in naming the fine art described in this article.

Carving may be done with considerable neatness and accuracy without any model or drawing to serve as a guide. Those who have seen an old sailor cutting out a boat in pine-wood will remember how accurately the two sides are made to correspond in curvature and in projection, and how easily the smooth shaping of the bow and the run is made, apparently without special effort. In like manner it is only necessary to have at the mind a clear knowledge of the figure of man or horse one wishes to produce, and some practice to carve correctly, in soft stone or wood or plaster. It is evident that there will be here an sufficient opportunity for changes and improvements, and that therefore only a certain class of figures can be carved in this way, without previous preparation of the model. Thus the rough and picturesque features of an early Gothic capital may well have been carved without a drawing. The sculptor may have shaped the capital roughly, and may then have scratched or chalked upon the same some guiding lines, then, with a bunch of leaves before him, he may have attacked the stone directly. During the early years of the Gothic revival in England some sort of preliminary architectural sculpture was practised in this way. The workman was encouraged to bring the living plant, or a newly cut branch, perhaps to model an architectural spray of foliage or the angle of a capital, and

then to work directly upon the solid block of stone. In like manner the handicrafting of barbarous peoples is apparently done directly from the mental image, the shark's tooth or stone knife cutting what the mind suggests, as a schoolboy cuts the edge of his desk, or as the Venetian boatmen ornament the gunwales of their large boats with a succession of notches. It is to be observed, however, that the pattern used in such work as that of the Malays, South Sea Islanders, and others are traditional. Some are the common property of the tribe, others are handed down from father to son; even the complex patterns become as familiar to the workman as notches and saws. Something akin to this familiarity with the form to be reproduced, and consequent ease in bringing it in light from nothing, is to be found in the sketches of some famous sculptors. Of Michelangelo it is related that he would begin upon the block of marble with chisel and mallet, having no model before him and no guide that any one else could see, and work rapidly and furiously, knocking off large chips. Any trained sculptor of large power of imagination of the sort which gives vivid mental pictures to its possessor could do the same, within the limits set by his character and his knowledge, provided he were not wholly unaccustomed to the use of the chisel. It is known that much sculpture was done, in the years before and during Michelangelo's career, in the marble with only a small model as guide. In all refined sculpture of modern times, however, it is customary for the artist himself to make a full-sized model in wet clay, modeling this figure with wooden and iron tools and with the fingers, changing it, reconsidering it, sometimes throwing down the whole model and building it up again. The clay is kept wet throughout the duration of the work, wet cloths being kept mentled around it when the sculptor is away. From the model, when completed, a plaster cast is made; and this is the artist's work, the statue or the bust which the French sculptor sends to the Salon, and which may be honored by a medal or other recognition. It often happens that the sculptor will retouch his work in the plaster cast, in which case that cast becomes in every sense of the word the original work of art. Some works are sent to the Salon first in the plaster, and later in the marble or bronze. At the Paris Exhibition of 1875 the tomb of Gen. Lamoricière was set up in marble, the recumbent statue of the dead man being also in marble, but of the four statues of Virtues which adorned the angles two were in bronze, the others, which there had not been time to complete in the metal, being in plaster.

When the plaster is to be copied in marble it is set up beside the block of marble, and a practiced marble-cutter makes a rough copy, aiding himself by the pointing-machine, which enables him to assure himself of the exactness of every measurement. At this point the practice of sculptors begins to differ. Some begin to work with the chisel themselves at a rather early stage, and before the statue is anything like complete, while other well-known artists never touch the marble. In the case of bronze a statue or a bust is simply cast in a mould made upon the sculptor's clay model or the plaster reproduction of it. A process much used during the Middle Ages and at the time of the Renaissance was making the mould from an original model finished in wax upon a core of a coarser material. The mould was made upon this model in a single piece, its material being applied in coats, the first coats in a semi-liquid state. The liquid bronze being allowed to flow into the mould, and between it and the core, melted the wax and took its place, the mould of course had to be broken to pieces in order to remove the hollow bronze casting. This process, called *à cire perdue*, has been used also in modern times, but more commonly a piece-mould is used which allows of many successive castings being made.

Statues, busts, and groups may also be made of thin plates of metal beaten with hammers. The largest works, such as the colossal *Bavaria* at Munich and the *Liberty* in New York harbor, have been made in this way.

What has been said above applies mainly to sculpture "in the round"—that is to say, finished on all sides, like a statue. For bas-reliefs and similar sculpture see *Relief*. See also *Engraving* and *Gem* for such sculpture as is hollow instead of projecting, concave instead of convex.

The fine art of sculpture is less complex than that of painting, as it deals with form alone. It is also in a sense more simple, because it is more instinctive to make an attempted copy in any soft material or even by cutting in wood or the like than it is to represent the same object by lines and tints upon a flat surface. Drawing and painting involve much greater abstraction and a much more advanced

mental development than rude sculpture. It is not meant that sculpture always precedes drawing; probably the reverse is the case, because the temptation to scratch or otherwise mark on a flat surface, and in doing so to represent a beast or a man, must always have been present. Sculpture may not always precede drawing, but will always be found more nearly truthful to nature than the drawing of the same epoch. The sculptor having form only to consider is concerned at first with two things: The first, to produce an ornamental object, or else to ornament parts of a useful thing, as a paddle or the prow of a canoe; the second, to represent something that he takes an interest in. Another idea often mingles with these two—namely, the production of an object, like an idol or fetish, in which he can embody some notion of worship or which he can use to terrify an enemy. This last motive speedily disappears or becomes of little moment as the skill of the sculptor increases. As he becomes able to deal with form somewhat easily and with results partly satisfying to himself, he finds a pleasure so intense in the production of his work of art and also in the suggestions from nature which he is enabled to embody in it that he forgets all other considerations. Thus in an Assyrian sculptured slab covered with figures in low-relief representing a battle, the triumphal entry of a king, or the same king hunting a lion, it is evident that the sculptor's chief care is for the beauty of his work. His slab was one of many which were to form the dado of a long and narrow gallery; the persons who were to see his bas-relief would never be far away from it, and it was for a point of view 10 or 15 feet away, and for light coming from high in the wall, that he had to plan his work. Therefore his figures were small, or, when large, filled with small details; his relief was kept low, and the outline when the relief quits the background was especially cared for. Under these conditions he labored to produce the most beautiful or striking combinations of lines and masses possible to him; but in doing this he made reference constantly to nature, and indeed found in the study of nature his chief suggestions of beauty and of strength, ferocity, swift and vigorous action, and other things agreeable to look upon. Thus nothing he could imagine would be as fine, let us suppose, as a lion in free action walking or springing; to this beautiful thing he could add human interest by showing the lion struggling with the hunters; and if in so doing he was able to flatter the king who employed him by representing his majesty twice as tall as his attendants and easily victorious over lions by the score, this in no way interfered with his artistic design or its impressiveness. It is true, of course, that religious or patriotic impulses act upon the sculptor as upon other men. Such impulses, however, do not seriously modify the sculptor's work, except in so far as they stimulate the whole man, excite his enthusiasm, raise him above himself as the phrase is, and in doing this they may improve his work or ruin it as man's nature and his surroundings may decree. Thus in the famous group by François Rude on the eastern face of the Arc de l'Etoile and representing the departure for the war of patriotic volunteers, there is no question that Rude was strongly in sympathy with the subject chosen and the enthusiastic love of country which suggested it. As a sculptor, however, he was concerned chiefly with the beauty and vigor of his composition and the harmonizing of the numerous and varied masses which make it up, and at the same time with the full expression of the different figures, here of youthful agility, there of manly strength in its maturity, and in the crowning figure of womanly forms carried to superhuman massiveness and force. Patriotism and hostility to the foes of France must have acted upon Rude as a powerful stimulus throughout his life, but it is only in this indirect way that those passions can be said to have dictated the design for *Le Départ*.

History.—The earliest sculpture of which the date can be fixed approximately is that of the Egyptian buildings of the early dynasties, and the few statues of the same epoch which have been discovered. These are dated by different authorities at from 4500 to 3500 B. C. The merit of these, both artistically and in the representation of natural forms and expression of face, is very great, so that we find Egyptian fine art already in an advanced stage of development at that early age. The sculptures from Mesopotamia of a date almost as remote are indeed far inferior in merit to the Egyptian, but are still those of an advanced civilization. There is no doubt that further investigations in the region about the Euphrates will reveal a continuous series of civilizations, vying with one another in their fine arts as in other respects. That of which we know the most is the Assyrian sculpture.

(See ASSYRIAN ART.) There was also sculpture produced among the mountainous states of Asia Minor which has been studied with some success since about 1880; this is of peculiar importance because of the influence of its later productions over the early art of Greece. (For the more developed art of Greece, see GRECIAN ARCHITECTURE; also ARCHITECTURE, CHRYSSELEPHANTINE STATUES, and PARTHENON.) The dates of Greek sculpture are nearly as follows: During the years from 600 to 480 B. C. the earliest works which can properly be called Grecian were produced, such as the metopes of Selinus now in the Museum of Palermo, the *Apollo of Tenea* at Munich, the *Apollo of Thera* at Athens, the seated figures from Branchidæ (Miletus) in the British Museum, the frieze of the Temple of Assos partly in the Louvre, and the pediment sculptures of the Temple of Ægina, now in Munich. These are arranged here in the order of their increasing refinement. The two fine statues at Naples called *Harmodius* and *Aristogiton* are thought to be copies or duplicates of statues put up in Athens about 500 B. C. The remarkable statues found in Athens on the Acropolis in 1883 and 1886, and distinguished by their well-preserved painting, may be of the years from 500 to the Persian invasion in 480. The Persian wars following this year and lasting till 477 may probably have checked the growth of fine art in Greece, while preparing for a rapid and splendid development with peace. When Athens became the chief city in Greece and the head of a confederation of states, the epoch of her greatest and noblest fine art was soon to begin. The years from 460 to 430 B. C. are marked by the sculptures of the Temple of Zeus at Olympia, of the Parthenon at Athens, of the Temple at Bassæ (Phigaleia), of the Temple of Athena Nike on the Acropolis, and in part of the Erechtheum. The chief sculptors of the best time of Grecian art, with the dates of their highest achievement approximately given, are Phidias, 440; Myron, 440; Cresilas, 440; Polyclitus, 430; Scopas, 420; Cephisodotus, 370; Praxiteles, 360. From that time until the third century A. D. the history of Greek sculpture is mainly that of an art serving states or powers not Greek, the merit and importance of the work done varies very greatly, according to the opportunity offered by the new masters of the Mediterranean world, such as the Kings of Pergamum, then Alexander the Great and his successors, and finally the Roman dominion. A great deal of noble sculpture was produced in every brief epoch, if not in every year, down to the death of Marcus Aurelius in 180 A. D. See ROMAN ARCHÆOLOGY.

It must be remembered that sculpture was commonly painted in bright and varied colors among all the peoples of antiquity. Egyptians, Assyrians, Greeks, and the people of the Græco-Roman empire all agreed in this. See POLYCHROMY.

During the Middle Ages sculpture had less purely sculptural character than generally in classical antiquity—that is to say, the artists had less sense of the beauty and expressiveness of pure form, as in the human body. They knew much less about the body, partly because of the custom of wearing very full and ample clothing, and no longer bathing and exercising in public as the ancients had done; religion, moreover, taught the unworthiness of the flesh as nothing in Greek or Roman life had asserted it. On the other hand, the decorative and building instinct was very strong throughout the Middle Ages. The Byzantine artists had no sculpture beyond that of capitals and similar architectural members and rude bas-reliefs of sacred subject; their decoration was chiefly in color on flat surfaces. The Western nations in the years following the establishment of comparatively peaceful communities showed a strong taste for figure-sculpture as used in the decoration of architecture. This was rude enough in the eleventh century, but grew rapidly in refinement. The statues in the porches and the "royal galleries" in such cathedrals as Chartres in the twelfth century, Bourges, Paris, and Chartres again in the thirteenth century, are the highest development known to us of sculpture, whose chief aim is decoration, the climax of excellence being reached in the porches of Rheims cathedral (1250, and the following years). This art was pursued with almost equal success in England, Spain, and parts of Germany. In Italy the mediæval sculpture is abundant and beautiful; it keeps something of the ancient grace and also some of the ancient knowledge of the human form. For the development of sculpture in Italy at the close of the Middle Ages, see RENAISSANCE, MICHELANGELO, and the names of other sculptors of the epoch. In France and the north generally sculpture passed from the style of the Middle Ages

one artist and more varied but still decorative style, having none of the poverty and extravagance beauty of Italian work and a decorative and overwrought character of its own. Thus the famous groups in the abbey of Tolosa near Angers were made by one Donato, Verrocchio, Minerva Pisolo, and Leonardo. Italian had all done their work and had been used for less as twenty years, and yet this French sculpture, although consisting of full stature and large groups of figures in the round, is medieval in almost every respect. There were Renaissance sculptures in France, such as Jean Goussier, but their work is not quite making in the sense that the Italian Renaissance sculpture is. It follows from this that modern sculpture is found in France and elsewhere in the north fully developed, except as we know it today, in the time of Henry IV. and Louis XIII., with such names as Simon Vouet (d. 1633), Pierre-Thomas de la Roche (d. 1634), Michel and François Angier, and Pierre Puget (d. 1682). These men inherited from Michelangelo in a sense, and not from the earlier Renaissance, but were followed by the men of the Louis XIV. such as Jacques Girardon (d. 1715), Antoine Coyssier (d. 1726), Nicolas Coustou (d. 1746) and Guillaume Coustou (d. 1746), Jean Baptiste Lemoyne (d. 1755), and Jean Baptiste Pigalle (d. 1765). The sculpture of the beginning of the nineteenth century were rather cosmopolitan in life and work; thus Auguste Pajon (d. 1809), Claude Michel Chodron (d. 1814), Antonio Canova (d. 1822), John Flaxman (d. 1826), Jean Auguste Houdon (d. 1829), and Horatius Thiers (d. 1844) were Italians, Frenchmen, or Danes, but all worked under a common Romantic influence. The sculpture of the years since 1850 has been characterized, especially in France, by a very remarkable increase in energy and purpose. The skill and knowledge of many of the men whose work has been done since 1850 and 1860 is worthy to be compared with that of the men of antiquity; and if there is no school as strong as the school of the Italian Renaissance, there is no individual man worthy to be named with the great Italian and others who are equally efficient in other ways of work. There are many different tendencies visible in nineteenth century sculpture, and it is too soon to judge them here. Jacques Pradier (d. 1835), David d'Angers (d. 1835), Auguste Rodin (d. 1875), Jean Baptiste Carpeaux (d. 1875), Auguste Klotz (d. 1880), and of men living in 1895, Paul Duboué, Henri M. A. Chapu, Augustin Mercié, Emmanuel Frémont, and finally Auguste Rodin and Jules Dalou are all sculptors whose abilities and achievements would grace any work. These are all men of the great Paris art-world, but not all of the same school. Nearly all modern sculpture is concentrated in Paris, and the different influences at work there are themselves in strong contrast. Of English sculpture of the nineteenth century Thomas Woolner and Sir J. Edgar Boehm are to be mentioned, and one or two admirable works have been produced by a painter, Sir Frederic Leighton. In the U. S. of men living in 1895, the names of John A. Ward and Augustus St. Gaudens should especially be noted. See PIERRE ARNAUD. RUSSELL SEYMOUR.

Sany, or Sanyang: See PEARL.

Scurvy (the form of *scurf*, *scurf*, *scurry*, *scurry*, *scabby*; the meaning of Late Lat. *scurbutus*, *scurvy*. Cf. Dutch *scurf*, *scurf*): a diseased state of the blood, induced chiefly by prolonged privation of fresh vegetable and animal food, although not exclusively a sailor's malady, its ravages have been most disastrous at sea, devastating, previous to the nineteenth century, the navies and merchant marine of all nations. Pliny's quackron included 2,700 men, of whom but 200 survived. Ships were often lost adrift at sea, the crew unable to work and perishing. Arwen's English fleet in 1544 or thereabouts lost 624 out of 961 men. The chief cause of this pest of the marine was the exclusive diet—meat and hard, dry bread, with impure and deficient drinking water—upon which sailors subsisted during protracted voyages. Exposure to cold or to tropical heat, fatigue, and the unsanitary and foul condition of ships contributed to the development of scurvy. As early as 1617 Boeckl recorded the virtues of lemon-juice in curing this disease, and in pedlars' cases he used a vegetable diet (see the *Index* in *Boeckl*); but not until the latter half of the nineteenth century were improved ship hygiene and vegetable diet at sea enforced. Thus only thirty years after Arwen's fearful loss Capt. Cook sailed on a three years' cruise around the world, losing but one man by disease, and in three polar expeditions of a year and a half and one year's duration lost only seven men out of 324. Modern

improvements in sailing ships and the use of steam at sea by shortening voyages have tended to lessen sickness among sailors. The improved hygiene of ships, the supply of fresh meat and vegetables procured by law for sailors, and the modern methods of keeping such articles indefinitely usable for long voyages, have rendered scurvy almost unknown at sea, although it occurs occasionally on land, in prisoners and prisoners, and in communities suffering from starvation. All of the symptoms of scurvy are directly connected with the impoverished, impaired state of the blood. All parts of the body are correspondingly ill nourished. The face is cadaverous and sunken, the body emaciated, the limbs are feeble and soon rapidly heavy. The gums become dark, bloody, relaxed, and spongy. There is an early tendency for the vitiated blood to seep from its vessels—an occurrence favored both by its thinness and by the changed nutrition of the capillary walls. At first mulberry-colored purple spots of variable size appear on the legs, later on the body. Later, larger purple spots or diffused patches appear upon a tough, indurated, biliary base, due to effusion of blood in quantity beneath the true skin or between superficial muscles, infiltrating and coagulating in the minute interstices of the connective tissue. Such patches are painful to touch; they may become the site of bloody blisters or of ulcers. Bloody serum often trickles into the pleural cavities, embarrassing the respiration; also into the peritoneum, pericardium, and the cavities of the joints. "Bloody flux," or dysentery, is frequent, also consisting of blood and mucus. Death occurs from exhaustion. Critical cases may rapidly change for the better, and mild cases quickly recover, when put upon supporting and vegetable diet. Onions, cabbage, radishes, horse-radish, "scurvy-grass" or spoon-wort, watercress—the entire class of the *Cruciferae*—are especially efficacious; all the vegetable acids, lemons, limes, oranges, cherries, currants, apples, are valuable. Nascent scurvy is extolled by the Germans as combining vegetable food and acids. Ashford broths, bitters, and regimen are essential adjuncts to this treatment. It has become known that young infants improperly fed develop a form of scurvy which was formerly mistaken for an acute form of rickets. In this there are usually hemorrhages under the periosteum of the bones, disturbances of the stomach, and general wasting and weakness. Revised by W. PARRY.

Scurvy-grass: a cruciferous plant, *Cochlearia officinalis*, abundant upon many seashores (but not on those of the U. S.), and also found on mountain ranges, and sometimes cultivated as a salad-plant. It has the pungent qualities of horse-radish, and is of high rank as an antiscorbutic. The scurvy-grass occasionally cultivated for salad in the U. S. is mostly *Barbarea prunifera*, the early winter-cress, a European cruciferous plant sparingly naturalized in the U. S.

Revised by CHARLES E. DREYER.

Scutari, sko-tah-ri (Turk. *Uscudar*; Gr. *Χερσόνησος*): the largest and most distinctively Oriental of the suburbs of Constantinople; situated on several hills on the Asiatic side of the Bosphorus, directly E. of the Golden Horn. Here the pagan emperor Licinius suffered his final defeat by Constantine (324). It contains many mosques, tekies (dervish convents), several palaces, and numerous barracks. The vast cypress-shaded cemeteries are the most striking feature of the city. Musulmans dying on the other side of the strait desire to be brought here for burial. The hospital, memorable for the devoted labors of Florence Nightingale, still exists; and near it is the beautiful British cemetery wherein are interred 8,000 nameless victims of the Crimean war. In Scutari is the admirable American College for Girls, where a first-class education is given. Pop. 75,000. See CROCIANTINOPLE. E. A. GANNETT.

Scutari (Turk. *Uscudar*, or *Iskendervish*): chief town of the vilayet of Scutari in Albania; on the southern extremity of the Lake of Scutari, 12 miles from the Adriatic; in lat. 42° N. (see map of Turkey, ref. B-B). A natural fortress, it was the stronghold of Genti, last King of Epirus, who surrendered here to the proter Andron (168 a. s.), whereupon Epirus became a Roman province. In 1477 during eight months it withstood a siege by 80,000 Ottomans, commanded by Sultan Mohammed II. in person, but in the subsequent treaty between Venice and the Porte it was ceded to the latter; in consequence 600 persons the sole survivors of the siege, abandoned their homes. It is the center of trade-distribution through Albania, but its business activity is greatly checked by the lack of roads in the surrounding country. Imports are woven goods, building ma-

ber, metals, drugs, paper, and earthenware; exports (in value only one-third of the imports) raw stuffs, dyewoods, and rags. Pop. 36,000, of whom 27,500 are Mussulmans.

E. A. GROSVENOR.

Scutching: See FLAX.

Scutibranchia'ta [Mod. Lat.; Lat. *scu'tum*, shield + *bran'chia*, gills]: an obsolete term for those molluscs now included under the *Zygobranchia*. See GASTEROPODA.

Seyellite: See PERIDOTITE.

Scylax, si'laks (Gr. *Σκύλαξ*): Greek geographer of Caryanda in Caria, who, by command of Darius I., made a voyage of discovery from the Indus through the Indian Ocean to the Red Sea (Herodotus, iv., 44). The *Periplus*, which bears the name of Scylax and describes a voyage along the coast of Europe, Asia, and Africa, is a much later performance, and has been assigned to the middle of the fourth century B. C. It was edited by Müller (*Geographi Græci Minores*, vol. i., pp. 15-96). See Bunbury, *History of Ancient Geography* (vol. i., p. 384, seq.).

B. L. G.

Scylla, or **Scilla**, si'lla (Gr. *τὸ Σκύλλαιον ἄκρον*; Ital. *Sciglio*): a high and steep promontory on the Italian side of the Strait of Messina. In ancient mythology it was the home of the sea-monster Scylla, who, along with the whirlpool Charybdis, threatened destruction to all mariners.

J. R. S. S.

Scylli'idæ [Mod. Lat., named from *Scyllium*, the typical genus, in form dimin. of Gr. *Σκύλλα*, Scylla; cf. *σκόλιον*, dog-fish, and *σκόλλειν*, rend, tear]: a family of sharks distinguished by the position of their dorsal fins and their habit of laying eggs like those of the rays. It includes the dog-fishes. The body is more elongated than is the case with the sharks generally. The *Scylli'idæ* are inhabitants entirely of the seas of the Old World and Australia. They are among the few sharks which lay eggs invested in parchment-like cases, like those of the rays. Revised by F. A. LUCAS.

Scym'nidæ [Mod. Lat., named from *Scymnus*, the typical genus, from Gr. *σκόμνος*, cub, whelp]: a family of sharks distinguished by the absence of the anal fins and presence of unarmed dorsals. It includes the Greenland sharks.

Revised by F. A. LUCAS.

Scymnus, sim'nūs (Gr. *Σκύμνος*): Greek geographer, to whom has been attributed an outline of the geography of the ancient world composed in iambic trimeters. The authorship of this *πεπερηγμένης*, as it is called, is doubtful, as the original Scymnus wrote in prose, and the time is uncertain, the first or second century B. C. It was edited by Müller (*Geographi Græci Minores*, vol. i., pp. 196-237). See Bunbury, *History of Ancient Geography* (vol. ii., 71). B. L. G.

Scyphomedusæ [Gr. *σκόφος*, cup + *Medusa*, a fabled monster]: a group of cœlenterates belonging to the class SCYPHOZOA (q. v.).

Scyphoph'ori [Mod. Lat.; Gr. *σκόφος*, cup + *φέρειν*, bear]: an order of fishes established by Prof. Cope, and distinguished by the following characters: The skeleton is completely ossified; the basis cranii simple; the parietals narrow, and distinct from each other as well as the supraoccipital; the pterygoid is very peculiar, being enlarged and funnel-shaped, and excavated by a bowl-like chamber (whence the name), which expands laterally and is covered by a lid-like bone; no symplectic exists; the jaws are well developed, but the intermaxillaries coalesce, at least in the old, into a single bone, and the maxillaries are lateral; opercular apparatus complete, but with the interoperculum and suboperculum reduced in size; scapular arch with the several coracoid elements represented; the brain has over the cerebellum a peculiar plicated organ; the air-bladder is simple, and communicates by a duct with the intestinal canal. The order is related to the more generalized form of *Teleocephali*, as well as to the *Nematognathi*. It is represented by but two known families, which are peculiar to the rivers of Africa; these are the *Mormyridæ* and *Gymnarchidæ*.

THEODORE GILL.

Scyphozoa [Gr. *σκόφος*, cup + *ζῷον*, animal]: one of the great divisions or classes of the Cœlenterata (q. v.), including the sea-anemones, coral-polyps, and the acraspedote jellyfishes. The group is differentiated from the other class (*Hydrozoa*) by the fact that there is an ectodermal œsophagus formed by the inpushing of the external skin through the mouth. As in all *Cœlenterata*, there is no distinction between the digestive cavity and body-cavity, but the common enteric cavity is complicated by folds of the outer wall

(septa) which increase greatly the amount of digestive surface. On these septa are borne thread-like gastral or mesenterial filaments which play an important part in digestion. The sexes are usually separate and the genital products (eggs and spermatozoa) arise from the entoderm. Two subclasses are recognized, the *Scyphomedusæ* and the *Anthozoa*. The *Scyphomedusæ* (except the lucernarians) are free-swimming solitary forms commonly known as jellyfishes, in which the body is umbrella-shaped or disk-like, the mouth being on the extremity of a longer or shorter proboscis, while the supporting layer (mesogloea) which lies between the ectoderm and entoderm of all *Cœlenterata* is developed into a thick gelatinous mass which makes up the bulk of the body. In the *Anthozoa* (often called *Actinozoa*) are included sessile, solitary, or colonial (compound) forms commonly called sea-anemones, coral-polyps, and the like. In these the body retains a more simple condition. It is more or less columnar, and the free end or oral disk is surrounded by a circle of tentacles, the number varying between wide limits (see below). In the center of the oral disk is the slit-like mouth, no proboscis being present. From the mouth the ectodermal œsophagus extends into the body, opening below into the large digestive chamber. In many forms the two ends of the mouth differ, one being for the taking in of water, while from the other flows out the water already used, carrying with it the indigestible particles taken in with the food. The digestive cavity is partially divided by the septa (already noticed), which are folds of the lining walls which project inward from the wall of the body like the spokes of a wheel from the rim toward the hub. The arrangement of these septa varies greatly, but in all cases there are at either one or both ends of the body (corresponding to the longer axis of the mouth) septa which differ from the rest and are consequently known as directives. The supporting layer is weakly developed, never attaining the thickness presented in the *Scyphomedusæ*. The *Anthozoa* are divided into orders chiefly upon the number and arrangement of the septa. In the OCTOCORALLIA (q. v.) the septa are eight, and there are usually eight feathery tentacles surrounding the oral disk. In the TETRACORALLIA (q. v.), a group of fossil forms occurring in the Palæozoic rocks, the septa are very numerous, but are always in multiples of four. In the HEXACORALLIA (q. v.) the tentacles are always in multiples of six, while the septa, except in a few instances—e. g. *Antipathus*, with two—follow the same law. J. S. KINGSLEY.

Scyros: See SKYROS.

Scythe [M. Eng. *sithe* < O. Eng. *sigðe*: Icel. *sigðr*: Germ. *sense* < O. H. Germ. *segansa* is from same root; cf. Lat. *scā're*, cut]: a long, curved blade, sharp on the concave edge, used in cutting grass. It is attached, for use, to a curved handle, called a snath. Shorter and stronger scythes are used for cutting bushes, etc. The introduction of mowing-machines has to a great extent superseded the use of scythes in haymaking, but where the former can not be employed scythes are still indispensable.

Scyth'ia: the ancient name for the vast regions which extend N., E., and S. of the Caspian Sea and the Sea of Aral. It was not so much used as a geographical term, for the boundaries of these regions were entirely undefined; it was rather a general term by which the Romans denoted a swarm of savage tribes living there, of whom they knew very little.

Scythopolis: the *Beth-shean* of Josh. xvii. 11, the *Bethshan* of 1 Sam. xxxi. 10, now called *Beisan*, the most important city of the ancient DECAPOLIS (q. v.), and the only one W. of the Jordan, about 4 miles from that river, and nearly 14 miles S. of the Sea of Galilee. It was nearly as well watered as Damascus, four perennial streams running through it. It was a place of great strength, its acropolis rising 300 feet above the plain. The ruins, which are 3 miles in circuit, surpass all others in Western Palestine. Its classic name, *Scythopolis*, is of disputed derivation, but the old conjecture that there was there a remnant of the Scythians, who invaded Palestine on their way to Egypt (630 B. C.), is the most probable. Scythopolis was the seat of a bishopric in the fourth century A. D. The modern village, of some fifty houses, contains a colony of Egyptians established there by Ibrahim Pasha in 1848. Revised by S. M. JACKSON.

Sea: See OCEAN and PHYSIOGRAPHY.

Sea-anemones: See HEXACORALLIA and ACTINIDÆ.

Sea-bass: a serranoid fish (*Centropristis atrarius*) common on the Atlantic coast of the U. S. See FISHERIES.

Sea-beard: a fur seal of either of the genera *Callorhinus* and *Arctophoca*, especially the northern species. See **IMMATURE**.

Seabury, SAMUEL, D. D.: bishop; b. at Groton, Conn., Nov. 16, 1759; son of clergyman of same name; graduated at Yale college 1785; studied medicine and theology in Scotland; was ordained a deacon and priest of the Church of England at London 1790; was in charge of churches at New Brunswick, N. J., at Kingston, Long Island, 1796-60, and at Wincchester, N. Y., 1796-75; was imprisoned at New Haven as the supposed author of some Tory pamphlets, but soon released; resided in New York during most of the Revolutionary war; was at one time chaplain of a loyalist regiment; went to England 1784; was consecrated Bishop of Connecticut by three English prelates at Aberdeen Nov. 14, 1784, being the first American bishop; took part in revising the Prayer-book and framing a constitution for the American Church 1789; published two volumes of sermons (1791) and a number of single sermons; exercised the duties of his episcopal office at New London, Conn., until his death at that place Feb. 25, 1796. A posthumous volume of *Sermons* was published 1798.

Seabury, SAMUEL, D. D.: clergyman and author; son of Dr. Rev. Charles Seabury, and grandson of Bishop Seabury; b. at New London, Conn., June 9, 1801; was ordained in the Protestant Episcopal Church 1826; was for several years a missionary at Huntington, Oyster Bay, and Hallett's Cove (now Astoria), Long Island; was editor of *The Churchman* at New York 1841-49; rector of the Church of the Annunciation 1848-49, and Professor of Biblical Learning in the General Theological Seminary from June, 1862, to his death at New York, Oct. 19, 1873. Author of *The Continuity of the Church of England in the Sixteenth Century* (1853); *Discourses on the Supremacy and Obligation of Conscience* (1860); *American Slavery Justified* (1861); *Theory and Use of the Church Calendar* (1872); and a posthumous volume of *Discourses on the Holy Spirit* (1874), edited by his son, WILLIAM JAMES SEABURY, D. D., clergyman and author, who was born in New York Jan. 25, 1837; graduated at Columbia College, New York, 1856; admitted to the bar 1858 but entered the General Theological Seminary 1866; was rector of the Church of the Annunciation, New York, since 1868, and has been Professor of Ecclesiastical History in the General Theological Seminary since 1873. He is the author of *Suggestions in Aid of Devotion and Guitars* (1879) and *An Introduction to the Study of Ecclesiastical History* (1894). Revised by W. S. PERCY.

Seabury: See MARATHA and SIBERIA.

Seachenamber: See HOLSTENBURG.

Sea-duck: See DUCK.

Sea-eagle: See EAGLE.

Seahorse: a sea-horse. See RHINOCERUS.

Sea-unicorn: See ELEPHANT SEAL.

Sea-urchin: See URCHIN.

Seaford: town, Sussex co., Del.; on the Nantuxet river, at the head of navigation by small vessels; and the Phila. and Balt. Railroad; 33 miles E. by N. of Cambridge, Md. 94 miles S. of Wilmington (for location, see map of Delaware, ref. 7-8). It is in an agricultural region, and contains numerous oyster-packing houses, two national banks with combined capital of \$100,000, and a weekly newspaper. Pop. (1890) 1,348; (1896) 1,462.

Seaford: town of Huron County, Ontario, Canada; on Eglar and Goderich Branch of the Grand Trunk Railway; 4 miles S. E. of Goderich (see map of Ontario, ref. 4-B). It ships annually 1,000,000 bush. of grain, and is underlain with a stratum of pure rock-salt, over 100 feet thick at a depth of 1,100 feet. It has a large trade, productive salt-works, active manufactures, and two weekly papers. Pop. (1901) 2,541.

Sea-korm: See RHINOCERUS.

Sea-islands: littoral band of islands of South Carolina, especially those from Winyah Bay to the mouth of the Savannah. Their fertility is extraordinary, their cotton long-stemmed and colored, and their rice product large. They are, and especially subject to the overflows by the storm-tides of hurricanes. Those of 1823 and 1894 destroyed the crops generally, and caused thousands of deaths. The Negroes show a strong tendency to collect on these islands for permanent residence. M. W. H.

Sea-hale: the *Crucifera maritima*, a perennial cruciferous herb; a native of European seacoasts; much cultivated in England as a pot-herb. It requires a generous soil, and its large leaves and sprouts are unfit for eating until blanched.

Seal [from O. Fr. *sel* > Fr. *seal*; Ital. *sigillo*; Span. *sello* < Lat. *sigillum*, dimin. of *signum*, sign, mark, stamp]; strictly, at the common law, a piece of wax or other tenacious substance which has been affixed to the paper or parchment of an instrument in writing, and stamped with an impression for the purpose of legally executing or authenticating the instrument. The use of these seals becoming inconvenient, the name is by extension applied also to the substitutes used for it, such as an impression made in the paper or parchment of the instrument itself, or a scroll or flourish of the pen placed after the signature, or the letters L. S. The instrument by which the impression on the wax or other material is made is also called a seal. The use of the seal as a device for authenticating important instruments arose from the fact that in early times few could affix a written signature to the instruments made by them, and in place of such a signature they therefore used, with or without a mark or cross, seals with some heraldic or other device worked in relief to impress the wax. The use of the seal became especially associated with deeds and state papers because these then constituted the most important instruments which people had occasion formally to authenticate. In using a seal it is not necessary that it should be affixed by the person whose seal it is intended to be, but he may adopt as his seal one affixed by another; and so one seal may suffice for a number of signers of an instrument. The necessity for the use of a seal and the determination as to the kind of seal necessary in general depends upon the laws of the place where the contract is made; but in the case of deeds always upon the law of the State in which the land is situated.

Effect of Seal—The common law attributed a very high, but very arbitrary and technical, efficacy to the seal upon instruments of a private nature. A seal was essential to a valid conveyance of a freehold estate in land; and as no contract is obligatory without a consideration, it established a conclusive presumption that there had been some valuable consideration. In some of the U. S. the common-law rule as to presumption of consideration was more or less abandoned, and in many States it is provided by statute that a seal on an executory contract shall be only *prima-facie* evidence of a sufficient consideration.

Statutory Regulation of Seals—In most of the U. S. the use of the seal is regulated by statutes, extending the application of the term, and doing away entirely in many cases with its use on private instruments, or with any distinction between such instruments when sealed and unsealed. The word "seal" or the letters L. S. may be used instead of a seal in Connecticut and New York. The scroll may be used in place of a seal in Arkansas, California, Florida, Idaho, Illinois, Maryland, Michigan, New Mexico, North Carolina, Oregon, Pennsylvania, South Carolina, Virginia, and West Virginia; and in Minnesota, New Jersey, Wisconsin, and Wyoming any flourish or device intended for a seal may be used. The distinction between sealed and unsealed private instruments (except of corporations) has been abolished in Arizona, California, Colorado, Indiana, Indian Territory, Iowa, Mississippi, Missouri, Montana, Nebraska, Nevada, North Dakota, Ohio, Oklahoma, South Dakota, Tennessee, and Utah; so that in these States and Territories the presence or absence of a seal does not affect the validity of the instrument. In Alabama an instrument purporting on its face to be a sealed instrument is taken to be sealed.

Judicial Recognition of Seals—The public, or great, seals of all independent nations are universally recognized by the governments and tribunals of other civilized countries, so that public records, statutes, etc., when authenticated by their means are accepted as correct without further proof. The seals of notaries public are also regarded as proving themselves, especially in Europe, where the NOTARY (q. v.) is an officer of greater dignity than in the U. S. The seals of the superior courts and of many administrative officers also receive judicial recognition, and require no proof in the territorial jurisdiction to which they belong; but in other jurisdictions they must be proved unless they are privileged by custom or statutory provision.

See *American Law Review*, 638; *History and Use of Seals in England*, in vol. xviii. of *Archæologia* (London); *Blackstone's Commentaries*, F. STUBBS ALLEN.

Seal [M. Eng. *sele* < O. Eng. *seolh* : O. H. Germ. *selah* : Icel. *sefr*] : a pinniped mammal of either of the families *Phocidae* or *Otariidae*. The name is applied more particularly to the members of the family *Phocidae*, the eared seals being termed fur seals or sea-bears and sea-lions. With the exception of a species (*Phoca sibirica*) inhabiting Lake Baikal, seals are marine, but some find their way into the lakes of Newfoundland, and they ascend rivers for considerable distances, a few having been taken even in Lakes Champlain and Ontario. They are more or less gregarious in habits, especially during the breeding season, when they are found in herds of thousands or hundreds of thousands on the ice-floes. As a rule, the female brings forth but one young, and this is covered with a soft woolly coat, which is shed in two or three weeks. Seals feed principally on fish, but also eat cuttlefish, crustaceans, and molluscs. They are capable of remaining beneath the water for five or ten minutes, or, according to some observers, even fifteen or twenty minutes, but if this be true, it is certainly exceptional. Those species which winter in the ice keep a hole open to which they come to breathe, a habit of which advantage is taken by hunters, who either wait by the holes and spear the animal as it emerges or else set a net over the hole.

Four genera of seals (*Stenorhynchus*, *Lobodon*, *Ommatophoca*, and *Leptonyx*), each with a single species, are peculiar to Antarctic seas, but nearly all species and individuals occur in the northern hemisphere, and for the most part in the frigid and colder portions of the temperate zone. The most familiar of the seals is the harbor seal (*Phoca vitulina*), a species common to both the eastern and western hemispheres, ranging from New York to Spain, along the northern shores of Europe and Asia, and down the Pacific coast of the U. S. to California. It attains a length of 5 or 6 feet; the general color is yellowish gray above, varied with markings of dark brown or blackish, lighter below, but it is subject to considerable variation. The Caspian seal (*Phoca caspica*) resembles the harbor seal, and is considered a descendant of that species, having entered the Caspian Sea when it was a branch of the Arctic Ocean, and become modified by isolation. The harbor seal is found on the coast in small bands. The largest of the seals (excepting the ELEPHANT SEAL and SEA-LEOPARD, *qq. v.*) are the bearded seal (*Erignathus barbatus*) and the gray seal (*Halichoerus grypus*), each of which attains a length of 8 or 9 feet, although they are said to grow even larger. The gray seal is found only in the North Atlantic and the Baltic, while the bearded seal is circumpolar. Both are less gregarious than the other species. The gray seal, as its name implies, is free from markings, while the bearded seal is blotched with brown or blackish. The netsick, or ringed seal (*Phoca fastida*), is a species resembling the harbor seal, but is smaller, and has light markings in the form of rings surrounding oblong dark patches. This species is prized by the Eskimo, as it winters in the Arctic regions and forms an important article of food.

The curious hooded or, more correctly, bladder-nosed seal (*Cystophora cristata*) attains a length of 7 or 8 feet, and derives its name from the fact that the males possess the power of inflating the skin about the nose. It is usually incorrectly figured with the hood on top of the head. It is a northern species, and is not found in herds. See Allen, *History of North American Pinnipeds* (Washington, 1880); Elliott, *Seal Islands of Alaska* (Washington, 1881); *Fishery Industries of the United States*, Quarto Fishery Report (Washington, 1884-87). See also HARP-SEAL, MONK-SEAL, OTARIIDÆ, PHOCIDÆ, SEAL-FISHERIES, and SEA-LION.

Sealchraig : See SELKIRK, ALEXANDER.

Seal-engraving : See GEM.

Sea-leopard : an Antarctic seal (*Stenorhynchus leptonyx*) named from its spotted coat of gray and white. Aside from the sea-elephant it is the largest of the southern hair-seals and one of the most abundant. It attains a length of 10 feet, and the crowns of the molars are divided by deep notches into three portions.

F. A. L.

Seal-fisheries : industries which consist in the capturing of seals for commercial purposes, and which may be said to have arisen toward the end of the eighteenth century; though the walrus, a near relative of the seal, had been systematically pursued for at least 200 years before, comparatively few hair or fur seals appear to have been taken prior to 1790. In the present condition of the seal-fisheries

it is often found advisable to take different kinds of seals on the same voyage, or to combine the seal-fishing with the whale-fishing, especially in the Antarctic fisheries.

The principal seat of the hair-seal fishery is off the coast of Newfoundland and Labrador, the value of the seals taken there exceeding that of the catch elsewhere. Still larger numbers of seals are taken in the Gulf of St. Lawrence,

The common seal.

near Nova Zembla and Jan Mayen islands, in the White and Caspian Seas, and on Kerguelen and Heard islands in the South Pacific, as well as at other points in the Antarctic Ocean. The harp-seal (*Phoca groenlandica*) is, commercially, the most important of the hair-seals, but the hooded seal or bladder-nose (*Cystophora cristata*), the square flipper (*Erignathus barbatus*), and the Caspian seal (*Phoca caspica*) are all taken in considerable numbers. The southern sea-elephant (*Macrorhinus proboscideus*) in times gone by has furnished an enormous amount of oil. The California sea-elephant (*M. angustirostris*) and the Caribbean seal (*Monachus tropicalis*) have been practically exterminated. Within the last few years some of the large southern seals (*Stenorhynchus*, *Lobodon*, *Leptonyx*) have been taken, but there can hardly be said to be a regular fishery for them, and it is not probable that their capture would long prove remunerative. The most important part of the Newfoundland seal-fishery is carried on by steamers, and these are also employed in the Nova Zembla and other northern fisheries, having practically superseded sailing craft where the seals are taken on the ice-floes at some distance from land. Many seals are still taken near shore by nets or by shooting. Between twenty and thirty steamers are engaged in the Newfoundland fisheries, which also employ not far from 5,000 men, although only for a short time, as the season is from Mar. 10 to May 1. In the most flourishing days of the seal-fishery 8,000 to 10,000 men were engaged. In 1892 the Newfoundland sealers took 3,000, 174 seals, the value of skins and oil being \$865,784, but in 1893 the catch was only 129,061 seals. The annual product of the Norwegian fishery is about \$300,000. The seals are taken on the floe-ice which drifts down from the north, and the major part are the newly born young, which have never left the ice and are excessively fat. They are killed with clubs, and heaped up on the ice until a pause in the slaughter will admit of their being skinned. The pelt, with the attached blubber, weighs from 20 to 40 lb. Seal-skin leather is well known; the oil is used for tanning and lubricating purposes, and for making soap. It varies much in quality, according to the care used in its preparation, but the best is limpid and almost devoid of taste or odor. The sea-elephant is taken chiefly on Kerguelen and Heard islands and the Crozets, but some are killed on Macquarie island by the New Zealand sealers, and other localities are visited from time to time with more or less success, much depending on the length of time they have been left undisturbed. New London, Conn., is the principal port from which the sea-elephant and southern fur-seal fishery is prosecuted, the latter being generally carried on by the same vessel. The vessels employed are stout schooners of 75 to 150 tons, well provided with boats, and it is customary to land parties of men on the islands, and leave them to kill the animals and try out the oil, or, in the case of the fur-seals, to salt down the skins. Or, again, as at Kerguelen and Heard islands, the vessels may be anchored in the best harbor obtainable, while the greater part of the crew live on shore. The Antarctic seal-fisheries are very arduous, for the climate is severe and storms are frequent, while at the same time a successful voyage is by no means a certainty.

The mammals all belong in the family *Otariidae*, and the most valuable species is *Callorhinus ursinus* of the North Pacific. *Arctocephalus australis* is the most important southern species, but *A. gazelle*, *A. pusillus*, and *A. forsteri* are also taken. At present 1,000 to 1,500 skins is a fair season's catch; whereas 50,000, 60,000, or even 100,000 skins were formerly taken by a single vessel. The Pribilof and Commander Islands in Heceta Bay are the chief seats of the modern fur-seal fishery; in the south the South Shetlands and various small islands in the vicinity of Cape Horn, with George, the South Orkneys, the Crozets, and Lotoskoff, near the mouth of the La Plata, are also visited. In the most important locality in the control of the Argentine Republic, and the killing of seals is there regulated by law. At the Commander and Pribilof Islands, whence a large supply of fur-seal skins comes, the number of seals that may be taken annually is fixed by law, and some of the young males are killed. With these restrictions the seals might be preserved indefinitely, but unfortunately a shortage of the skins has led to the pursuit of the animals in places where they are shot from small boats or speared. Hence it is the fact that dead seals sink very quickly, about one are killed for every one secured. By an agreement between Great Britain and the U. S. the use of firearms is prohibited, but spears may be employed. The catch at the Pribilof has fallen from 100,000 to 7,500, or in 1893, 10,000, and the pelagic sealers took not far from 50,000 skins. See *the History of North American Fur-seals* (Washington, 1890), *Fur Seals and Fishery Industries of the United States* (Washington, 1897); *Fur Seal and other Fisheries of Alaska* (Washington, 1899). F. A. LUCAS.

Sealing-wax: See LAM.

Sealions: any one of several species of large seals of the family *Otariidae*. Sealions are characterized by the development of harsh hair without under-fur, and the color is usually brown in the mature, but in the young reddish brown. Two species occur on the Pacific coast of North America and are found together in the Bay of San Francisco. One (*Narceus stelleri*) is the largest of the family, and attains a length of 11 to 13 feet, while the other (*Zalophus crotchi*) is the smallest, and is only 7 to 8 feet long. The sealions is the ordinary resident of the menageries and zoological gardens. It has a slender, dog-like head and a "barking cry, or howl," while the eumetopias has a thick, wrinkled muzzle and a deep bass growl and prolonged snort. Other species are *Otaria jubata* of South America, *Arctocephalus hookeri* of the Auckland Islands, and a *lobatus* of the Australian sea. The walrus is sometimes called sea lion. Revised by F. A. LUCAS.

Sea Islands: See LONES ISLANDS.

Seahorse: See SHARK.

Sealfeld, CHARLES (pseudonym of KARL POSTEL): born at Pöppitz, Moravia, Mar. 3, 1798; entered a monastery and was ordained a priest, but fled in 1822 to Switzerland and thence to the U. S.; edited in 1829 the *Courier de l'Europe* (New York); after 1832 resided in Switzerland, although he took occasional trips to the U. S. D. at Zürich, Switzerland, May 26, 1864. Under the pseudonym *Charles Sealfeld* he published in 1828 *Die Vereinigten Staaten von Nordamerika*, and a few years later he created a sensation in German literature by a series of descriptive works, the most important of which are *Der Legitime und der Unlegitime* (1831); *Der Virey und die Aristokratie* (1832); *Lebensbilder aus beiden Hemisphären* (1833-37); *Deutsch-amerikanische Wahlverwandtschaften* (1838-42); *Der Leutnant* (1840); and *Süden und Norden* (1842-45). Some of these novels were also published in English. J. G.

Seaman: broadly, a person who is engaged in the navigation of a vessel on the high seas. This term now, however, as required in legal literature the broader significance of the term usually denoting the master, chief officer, and crew employed or aiding in the navigation of vessels, ships, boats, etc., either upon the high seas or upon inland waters. A vessel, however, for the construction of the statutes now relating to merchant shipping, the term seaman is defined as "every person (except masters, pilots, and apprentices indentured and registered) employed or engaged on board any ship." It was formerly required by law in Great Britain that a British ship must have an officer and crew only British subjects (except in certain cases), but now this is not necessary. In the U. S. the statute requires that the master of a vessel

must be a citizen of the U. S. in order that the vessel may enjoy the benefits and privileges of a vessel of that country.

Experience has shown that seamen are a class of men who need more protection at the hands of the law than ordinary persons, largely because they are more under the control of others when employed. The regulations affording this protection differ in different countries, but the general intent of them all is to do away with disputes between master and seamen as to the terms of the contract of hiring; to interest the seaman in the success of the attempted voyage, by making their earnings depend upon its termination; and to secure obedience to orders.

Shipping of Seamen.—The U. S. statutes provide for the appointment of shipping-commissioners for ports of entry and of ocean navigation, whose general duties are to facilitate and superintend the engagement and discharge of seamen, and to arbitrate in certain disputes between a seaman and the master or owner of a vessel; and at other ports the duties of a shipping-commissioner are imposed upon the collector of customs. In Great Britain similar officers are provided—the superintendents of mercantile marine offices. In general, the master of every seagoing ship must enter into a formal written or printed contract (*the shipping-article*) with each seaman of his crew, and these articles must be signed before the proper shipping-officer. They must state the nature and duration and part of termination of the voyage, the number and description of the crew and their respective employments, the amount of wages each seaman is to receive, the capacity in which he is to serve, and the time at which he is to begin work on board; a scale of provisions to be furnished; regulations as to conduct and as to fines, short allowance of provisions, other lawful punishments for misconduct; and any stipulation as to advance or allotment of wages. In the U. S. the master of every vessel of 50 tons burden or upward plying between States not adjoining must enter into a written contract, which, however, need not be signed before a shipping-commissioner. The statutes making these written contracts obligatory, however, do not make void verbal contracts in the absence of written ones.

Wages of Seamen.—The seaman is entitled in wages and provisions from the time he begins work, or from the date agreed upon for the beginning of work, whichever first happens. In case of loss of vessel wages are due only to the date of loss, and proof that a seaman has not duly exerted himself to save the vessel, cargo, and stores will bar his claim. The right to wages does not depend upon the earning of freight, and becomes a lien upon the vessel and freight, and upon the proceeds of them, in the nature of a preferred claim over bottomry or respondentia bonds. Where freight might have been earned that was not, seamen have a right of action in *personam* against the master or owner of a vessel, and this right is not barred by a proceeding *in rem* against the vessel. A seaman can not forfeit or waive by agreement his lien upon the ship, nor any remedy for the recovery of wages, except by agreement for allotment or advance. A stipulation to abandon the right to wages in case of loss of ship, or any right in the nature of salvage, is wholly inoperative; and any assignment other than advance or allotment made prior to the accruing of wages or salvage is equally void. Wages can not be insured by seamen, nor are they subject to attachment in the courts. Seamen may forfeit their wages, either wholly or in part, by any of the following offenses, viz.: desertion, absence without leave, neglecting and refusing without reasonable cause to join the vessel, willful disobedience or continued willful neglect of duty, willfully damaging the vessel, or embarking or willfully damaging any of the stores or cargo, and by any act of smuggling whereby loss or damage is occasioned to the master or owner. But upon the commission of an offense for which it is intended to prosecute or enforce a forfeiture, an entry of the offense must be made in the official log-book and signed by the master and by the mate or one of the crew, and the reply of the offender, if still in the vessel, must likewise be entered and signed; which entries must be produced or proved in any subsequent legal proceedings.

Miscellaneous Provisions.—Various other provisions are made by statute regulating the rights and duties of seamen, insuring the seaworthiness of the vessel, a proper supply of provisions and medicines, their return from foreign ports when there discharged, extra wages in case of improper discharge; imposing upon consuls in foreign ports the duty of providing subsistence and a passage to a port in the U. S. for destitute seamen of the U. S.; and providing for

the establishment of marine hospitals and relief funds by collections from the wages of seamen, etc. Seamen must submit to the usual punishments lawful and agreed upon in the shipping articles, such as short allowance, being put in irons, etc.; but flogging has fallen into disuse, and in the U. S. has been abolished by statute.

For a full treatment of the rights and duties of seamen, see the statutes; Maude and Pollock's *Compendium of the Law of Merchant Shipping* (London, 1881); Abbott's *Law of Merchant Shipping* (London, 1892); Kay's *Law of Shipmaster and Seamen* (London, 1875); Parson's *Law of Shipping* (Boston, 1869); Desty's *Revised Statutes of the United States relating to Commerce, Navigation, and Shipping*. Search and Seizure: the examination and taking into custody of one's person or property. The fourth amendment of the U. S. Constitution provides that "the right of the people to be secure in their persons, houses, papers, and effects against unreasonable searches and seizures shall not be violated, and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched and the persons or things to be seized." A similar provision exists in each State constitution. It is declaratory only of common-law principles, which were clearly announced in *Wilkes vs. Wood* (19 *State Trials* 1153, A. D. 1763), *Leach vs. Money* (*ibid.* 1001, A. D. 1765), and *Entick vs. Carrington* (*ibid.* 1030, A. D. 1765). The first two cases decided that a general warrant to seize some person or papers not named was illegal, and the third declared a warrant to seize the papers of a person named to be equally illegal. Lord Camden's judgment in the last case is celebrated for its learning and ability, and is regarded "as one of the permanent monuments of the British Constitution."

Some searches and seizures were permitted by the common law, and do not fall within the constitutional inhibition. They may be resorted to for the recovery of stolen goods, or in the case of excisable or dutiable articles, or in the case of things whose possession or sale is forbidden by law, such as burglars' tools, gambling apparatus, intoxicating liquors, and others, or for the purpose of levying an attachment or execution. Even in such cases, however, the law does not authorize the use of general search warrants, but requires the magistrate to have satisfactory evidence upon oath that a case of the kind mentioned probably exists, and to have a particular description of the place to be searched, and of the persons or things to be seized. The warrant must also name the place and the person or thing to be searched and seized. If an officer attempts to arrest a person under a general warrant, or under one which does not truly name or sufficiently identify him, he may resist the officer, and if the latter makes the arrest, he is liable for false imprisonment. (*West vs. Cabell*, 153 U. S. 78.) In some of the States statutes authorize officers to seize intoxicating liquors without a warrant, in the first instance, but the officers are required to obtain promptly a warrant therefor, or they become liable as trespassers. *Weston vs. Carr*, 71 Me. 356.

Searches and seizures which are resorted to not for the purpose of capturing stolen property, or that which is under the ban of positive law, or of levying legal process, are deemed unreasonable. Accordingly, a statute providing for the issuing of warrants by judges of insolvency on the complaint of an assignee to search for property of the debtor has been declared unconstitutional. (*Robinson vs. Richards*, 79 Mass. 454.) The U. S. Supreme Court held a statute to be unconstitutional which authorized a court, in revenue cases, on motion of the Government's attorney, to require the defendant or claimant to produce in court his private books, invoices, and papers, or else the allegations of the attorney should be taken as confessed. (*Boyd vs. United States*, 116 U. S. 616.) The provision was deemed tantamount to a

compulsory production of a man's private papers, and to effect the sole object and purpose of search and seizure; hence it was declared to be within the scope of the fourth amendment. The language of Lord Camden in *Entick vs. Carrington* was regarded as expressing the true doctrine of the subject of searches and seizures, and as furnishing the true criteria of the reasonable and unreasonable character of such seizures. It was said that the principles laid down in that opinion affect the very essence of constitutional liberty and security. They reach further than the concrete form of the case then before the court; they apply to all invasions on the part of the Government and its employees of the sanctity of a man's home and the privacies of life. It is not the breaking of his doors and the rummaging of his drawers, but the invasion of his indefeasible right of personal security, personal liberty, and private property, where that right has never been forfeited by his conviction of some crime, that constitutes the essence of the offense.

FRANCIS M. BURDICK.

Searcy: town; capital of White co., Ark.; on the Little Red river, and the Searcy and West Point Railroad; 55 miles N. E. of Little Rock, the State capital (for location, see map of Arkansas, ref. 3-D). It is an important shipping-point for cotton and fruit; has several alum, chalybeate, and sulphur springs, which have made it popular as a health resort; and contains Searcy College, for males (Methodist Episcopal, South), Galloway Female College, Searcy Female Institute, a public school, a State bank with capital of \$30,000, and a daily, a monthly, and three weekly periodicals. Pop. (1880) 840; (1890) 1,203; (1895) estimated, 3,500. EDITOR OF "CITIZEN."

Searles, WILLIAM HENRY: civil engineer; b. in Cincinnati, O., June 4, 1837; graduated at the Rensselaer Polytechnic Institute in 1860, where later he was Professor of Topography and Road-engineering for three years. He has been locating and constructing engineer on many railways, and is the author of *Field-engineering* (1879) and *The Railroad Spiral* (1882).

Sea-robin: See GUERNARD.

Sears, BARNAS, D. D., LL. D.: theologian and educator; b. at Sandisfield, Mass., Nov. 19, 1802; graduated at Brown University 1825, and at Newton Theological Seminary 1829; was pastor of a Baptist church at Hartford, Conn., 1830-32; was afterward Professor in the Literary and Theological Institution at Hamilton, N. Y. (now Colgate University), studied theology at German universities 1833-36; was professor in Newton Seminary 1836-48, acting as president during the later years; succeeded Horace Mann as secretary of the Massachusetts board of education 1848-55; was president of Brown University 1855-67, and after that the general agent of the Peabody Educational Fund. He was several years editor of the Baptist *Christian Review* (1837-40), a regular contributor to *Bibliotheca Sacra*, and author (with Edwards and Felton) of *Classical Studies* (1843), *The Ciceronian* (1844), and *The Life of Luther* (1850). He edited Nöthen's *German Grammar* (1842), *Select Writings of Luther* (1846), and Roget's *Thesaurus* (1854), and published many addresses, educational reports, and miscellaneous essays. During his stay in Europe he baptized in the Elbe near Hamburg, by night and stealthily, in order to avoid legal prosecution and police persecution, I. G. Oncken and six others, who formed the first German Baptist church in communion with the Baptists of England and the U. S. b. at Saratoga Springs, N. Y., July 6, 1880.

Revised by C. H. THURBER.

Searsport: town; Waldo co., Me.; on Penobscot Bay, 6 miles E. N. E. of Belfast, the county-seat, 27 miles S. W. of Bangor (for location, see map of Maine, ref. 9-E). It is principally engaged in ice-gathering, ship-building, hay-shipping, and the lumber-trade, and contains saw and grist-mills, spool-mill, poultry-farms, the Sears Public Library (opened in 1872), a national bank with capital of \$50,000, and a savings-bank. Pop. (1880) 2,322; (1890) 1,693. Rev. ROBERT G. HARBUTT, FIRST CONGREGATIONAL CHURCH.

Sea-serpent: a gigantic marine animal, said to have been seen in various localities, but never captured, and regarded by most zoölogists as purely mythical. The earliest references to the sea-serpent are to be found in Norse literature, where frequent mention is made of the *Sæ-Orin*. In 1557 the creature was described by Olaus Magnus in his work *Historia Gentium Septentrionalium*, where its length is set down as 200 feet and girth 20 feet. In 1734 the Rev. Paul

Lacépède gave a detailed description of a sea-serpent which he was deriving a voyage from Norway to Greenland, and in 1786, as related by Bishop Pontoppéden, another was seen by Capt. Lawrence de Barry, of Bergen, Norway, who made allusion to the truth of his story. Even that time onward the so-called sea-serpent has been reported from various localities, but most often in northern waters, and particularly on the coasts of Norway, Scotland, and New England. Many of these accounts are of a very circumstantial nature and are given by people of unquestioned veracity. Perhaps the most noteworthy is that given by Capt. Peter McQuhee, of U. S. S. *Dagobert*, who reported that on Aug. 9, 1849, in 44° 44' N., 10° 22' E. he and several of his ship's company saw an object which "was discovered to be an enormous serpent, with head and shoulders kept about four feet constantly above the surface of the sea, and as near as we could approximate . . . there was at least sixty feet of the animal above the surface. . . . The diameter of the serpent was about fifteen or sixteen inches behind the head, which was, without any doubt, that of a snake. . . . It had no fins, but something like the mane of a horse, or rather a bunch of seaweed, washed about its neck." Prof. Owen suggested that the animal seen might have been a stray sea-elephant (*Moronechasma*), but this Capt. McQuhee emphatically denied. While there is great discrepancy among the various accounts of the sea-serpent in regard to length, proportions, and general appearance of the creature, yet a certain number of them agree in the following particulars: The length is placed at about 60 feet; the color is given as dark above and light below; the creature is said to have moved steadily with its head and neck above the water, and there were appendages back of the head. These, including the animal seen by Capt. McQuhee, are explained on the theory that one of the great difficulties known to inhabit the depths of the sea has been seen at the surface with the tail projecting above it, this being taken for the head, as the squid moves not first by means of a current of water expelled from the mantle. The long arms, dragging along near the surface, would represent the body of the sea-serpent. Basking sharks, whales of porpoises, floating logs, kelp, and seals have been mistaken for the body of other sea-serpents.

A few scientific men are inclined to believe that there is some huge marine animal which has actually been seen, but not yet captured, even going so far as to suppose the existence of some reptile, like the *Plesiosauros*, or like one of the enormous marine reptiles whose remains occur in the Chalk. Oudemans considers that the creature known as the sea-serpent is a huge plimped, with long neck and long tail, to which the name of *Megaphias megaphias* (*Chelonephias*, Oudemans) belongs. The large majority of biologists, however, deny the existence of the sea-serpent in 1886, and it is to be noted that no naturalist has ever had a view of the creature, and that no one of its bones even has been seen in light.

See *The Great Sea-serpent*, by A. C. Oudemans (London, 1886). This is a monographic work containing a very full bibliography of the literature on the subject, and accounts of the various appearances of the sea-serpent. Also *The Sea-serpent of Natural History*, by George (1890); *Sea Monsters Unmasked*, by Henry Lee (1893); *Facts and Fictions of Zoology*, by Andrew Wilson, F. A. Lucas.

Seashore (in law). By the Roman or civil law the sea was, like the air and running water, common to all, and consequently not susceptible of private ownership either by an individual or by the state. This principle applied equally to the bed and shore as to the waters of the sea. The common law, however, took a different view. Owing to the gradual development of England's sea power and her consequent assertion of civil as well as political jurisdiction over the "four seas" (meaning thereby the Atlantic Ocean, the Irish Sea, the German Ocean, and the British Channel), it became the accepted doctrine of English jurists in the seventeenth century that the bed of the ocean was the property of the crown so far as the royal jurisdiction extended. When this jurisdiction was cut down by modern international law to the three-mile limit the assumed property rights of the crown were reduced to the same dimensions. It is, however, a mooted question whether the property rights of the state are coextensive with this jurisdiction or whether they are limited by low-water mark on the shore, the latter view having lately come to prevail in Great Britain, while the former has usually been taken in the U. S. *Regina v. Keyn*, 9 Exch. Div. 69; Gould on Waters, §§ 1-10.

The divergence between the common and the civil law is more marked, however, as regards the seashore itself and the arms and inlets of the sea within the territorial limits of the state. Where by the Roman law it was expressly provided that the seashore and all rivers and harbors were common to all, and that the public use of the seashore as of the sea itself was part of the law of nations, the common law in the U. S. as well as in Great Britain has always regarded the seashore and the beds of rivers and arms of the sea as subject to private property. This property in the seashore is by the common-law rule vested in the state, but it may by charter or by special grant be conferred upon a municipal corporation or a subject. Thus, for example, the city of New York became vested by the Dongan charter (A. D. 1686) with the fee simple of all the tideway on the circuit of Manhattan Island. The common-law rule is generally followed in the U. S., but in several States (e. g. Massachusetts and Maine) the property of the littoral proprietor extends to low-water mark. In the U. S., moreover, it is the several States and not the Federal Government to which the title to the seashore is vested. It is laid down in the *Institutes of Justinian* (book II., tit. I., 3) that the seashore extends to the limit of the highest tide in time of storm or winter; but by the common law the seashore is the strip included between ordinary high and low water mark.

The right of private property in the sea, whether it be limited to the shore or be coextensive with the jurisdiction of the state, whether it be vested in an individual or in the state, is always subject to certain public rights of user and enjoyment. The principal of these rights are those of navigation and of fishing, the taking of shellfish other than deep water or from the shore being included under the latter. There is, however, no right to take sand, gravel, or shells, nor to use the shore as a highway, nor to frequent it for the purpose of bathing. There seems to be no distinction between public and private ownership of the shore so far as the exercise of these public rights is concerned, and the state can not, by grant of the shore to an individual, diminish or in anywise affect these rights.

The rights of littoral proprietors as such in the shore differ from those of the public only in the fact that it affords them a means of access to their own lands. This right of access is a valuable property right, and is protected as such by the common law. In New York and New Jersey, however (and perhaps in a few other States), it has been decided that littoral proprietors have no remedy for an infringement of this right of access to navigable waters. Of course, where the littoral proprietor is also the owner of the foreshore his property rights therein are absolute, except only as they are limited by the public rights of user above referred to. It follows from what has been said that a littoral proprietor who does not own the shore is not entitled to build wharves or piers except by the consent of the state, and that such proprietor who does own the shore can not build out beyond low-water mark without such permission; nor can he even under the authority of the state build so as to interfere with navigation. In the former case his act is a *purpresture* or trespass on public property; in the latter a public nuisance, which is not justified by pleading the license of the state. The littoral proprietor, whether owner of the shore or not, is under the doctrine of accretion entitled to the increase of his land by the gradual recession of the sea. If the retreat of the sea be sudden, however, or so rapid as to be perceptible in its progress, the land gained will belong to the state.

The law governing the seashore, as above set forth, is a part of the law of public waters. So much of that law as relates particularly to navigable rivers has been treated under the head of RIVERS. See also LAKES. The literature of the subject is extensive and full of curious learning. See especially Hale, *De Jure Maris*; Selden's *Mare Clausum*; Hall on the *Seashore*; Angell on *Tidewaters*; and Gould on *Waters*.

GEORGE W. KINCHAY.

Seasickness: a nervous affection attended with nausea and convulsive vomiting, produced by the oscillations of a ship at sea. Its origin and nature are still very imperfectly known. It may attack the strong and cautious, while the debilitated and incautious go free. It may attack in calm weather and on smooth waters, while a storm and a rough sea fail to produce it. It may pass away after the lapse of a few hours, or last during a long voyage. Seasickness is probably due to circulatory disturbances in the nerve-centers, possibly to a large extent induced by irregular visual

impressions due to the rocking. In many persons a few mild doses of calomel before the voyage prevent the occurrence of seasickness. In others a little bromide of potash, soda-water, or saline draughts suffice. Persons who are specially liable sometimes escape entirely by preserving a horizontal position during most of the voyage. W. P.

Seaside-grape: a small polygonaceous tree (*Coccoloba uvifera*) of Florida and the West Indies, producing the extract called Jamaica kino. (See KINO.) It has clusters of purple edible fruit, and a beautiful hard wood, which yields a red dye.

Sea-squirt: any one of the ASCIDIA (*q. v.*).

Sea-swallow: See GURNARD.

Seattle, see-at'll: city; capital of King co., Wash.; on Puget Sound, and the Gt. Northern, the N. Pac., the Columbia and Puget S., and the Seattle, Lake Shore and East. railways; 28 miles N. of Tacoma (for location, see map of Washington, ref. 3-D). It lies on the east side of Admiralty Inlet, between Elliot Bay (salt water) and Lake Washington (fresh water). The contour of the city is hilly, with valleys running N. and S. The steep rise of the hills from the water of the sound presents a striking view, especially when approached in the evening. This is enhanced by two snow-capped ranges, the Olympics on the W. and the Cascades on the S. E., and by Mt. Rainier, rising in the south to a height of 14,444 feet. The city has seven public parks—the City, Denny, Kinnear (each partially improved), Madrona, Leschi, Ravenna, and Woodland—some of which afford scenery of rare natural beauty. The business districts are covered with handsome and substantial buildings, nearly all erected since the great fire of 1889.

Climate.—The summers are cool and pleasant; the rainy season is broken by much good weather; the annual range of temperature is from 10° to 88°; the rainfall in 1893 was 45 inches. A peculiar feature of the climate is that the rainy season is more healthful than the dry season. The death-rate is about 8 in 1,000. Ocean storms spend their force on the Olympic Mountains before reaching the city.

Public Buildings.—The county court-house occupies a prominent site overlooking the city; the county almshouse and hospital is a fire-proof structure which cost over \$80,000. The Roman Catholic Church maintains Providence Hospital and the House of the Good Shepherd, a reformatory for girls. There is an efficient board of associated charities. The Public Library (founded in 1872) is supported by a percentage of the criminal fines, and has spacious rooms and a large patronage. Terms of the U. S. circuit and district courts are held here, and a U. S. land-office, U. S. custom-house, U. S. weather bureau, and the board of U. S. inspectors of steam-vessels for Washington and Alaska are located here.

Churches and Schools.—Seattle contains 12 Methodist Episcopal churches, 9 Baptist, 5 Congregational, 5 Presbyterian, 5 Lutheran, 4 Protestant Episcopal, 3 Roman Catholic, 8 Disciples, 3 German Evangelical, 3 Methodist Protestant, 2 Jewish, and one each Advent, Free Methodist, Reformed Presbyterian, and Unitarian, besides a Salvation Army barracks, and 17 missions. The public-school system has a large endowment of State lands. There are 16 public-school buildings (which cost, with land, \$673,000), with (1893) 184 teachers and 6,424 pupils; 2 parochial schools, several private kindergartens, and girls' schools. The State University occupies a fine site on 341 acres of school land within the city limits, and has about 500 students and a valuable library, practically public. There are also a Baptist university, Seattle Female College, College of the Immaculate Conception, and the Academy of Holy Names. The Workmen's Guild supports a library. In 1894 there were 8 daily, 16 weekly, a semi-monthly, and ten monthly periodicals.

Finances and Banking.—In 1894 the city receipts were \$553,630; expenditures, \$591,000; the bonded debt was \$3,540,000; the assessed property valuation, \$32,752,153; tax-rate, 12.5 mills. There were 7 national, 3 savings, and 5 private banks. Seattle has never had a bank failure.

Business Interests.—The manufactories number 331, with \$4,758,283 capital invested and \$10,203,007 value of product, and include sawmills, a flour-mill, breweries, extensive drain-tile and brick works, foundries, boiler-works and machine-shops, sash and door factories, furniture factories, bookbinderies, tanneries, manufactories of tinware, shoes, crackers, soap, and ice, creosoting works, ship-building yards, etc. There is a large business in the wholesale shipments of fresh fish. There are 91 miles of street-railways, of which 22

miles are cable road and 69 miles electric. These lines are also used for freight. The cable lines run over the highest hills, which are the choice residence districts. Every portion of the city is easily accessible. The commercial advantages of Seattle are remarkable. By water there is regular steamship connection with the Orient, with San Francisco, and Alaska. The railway connections are superior to those of any point on the Pacific coast, four transcontinental lines competing for business, two of which have their terminals in the city. Lumber, grain, and coal are shipped to all parts of the world. The city is the center of trade for all the numerous small steamers, called the mosquito fleet, plying to the ports of Puget Sound, which has about 1,200 miles of coast-line. An immense business in cedar shingles and lumber has been developed, and shipments by rail extend to the Atlantic coast. A company has been formed for the utilization of Snoqualmie Falls by electrical transmission of power. Large sums have been invested in a steel plant. An appropriation has been secured from the U. S. Government to begin the construction of a canal connecting Puget Sound through Lake Union with Lake Washington. The lake is about 25 miles in length, and does not freeze in winter. Vessels scour their bottoms in fresh water and avoid the expense of docking. The lake is surrounded with valuable deposits of coal and iron, and with fine bodies of timber. By the canal a landlocked harbor would be formed of great value to the Government in connection with the dry dock at PORT ORCHARD (*q. v.*). A second company has entered into a contract with the State providing for a second canal S. of the city.

History.—Seattle, named from an Indian chief, was founded in 1852. It remained a village until 1880. An important episode in the early history was the protection of the Chinese by a vigilance league, which prevented the triumph of the lawless elements. The city early became the central commercial point for the Puget Sound region. On June 6, 1889, it experienced a conflagration which destroyed property valued at \$15,000,000, but one brick building remaining in the business district. Seattle was the first large city to free its streets of horse-cars.

Pop. (1880) 3,533; (1890) 42,837; (1892) State census, 58,898; (1894) estimated, 60,000. WALLACE NUTTING.

Sea-unicorn: See NARWHAL.

Sea-urchin: See ECHINOIDEA and PALEONTOLOGY.

Seaweeds: the popular name for the plants which grow in the sea, often extended so as to include all aquatic plants whether growing in salt or fresh waters. They are also known as ALGÆ (*q. v.*), sea-mosses, and sea-ferns (although they are neither mosses nor ferns). In this wide sense seaweeds belong to no less than six different classes of the vegetable kingdom, viz.: (1) *Schizophyceæ*, the fission algae, mostly microscopic and usually blue-green or smoky green, inhabiting fresh and salt waters; (2) *Chlorophyceæ*, the green algae, mostly microscopic, green (sometimes obscured by brown coloring-matter), inhabiting fresh and salt waters; (3) *Phæophyceæ*, the brown algae, including FUCOIDS and KELP (*q. v.*), mostly of large size, green (but obscured by brown coloring-matter), inhabiting salt waters; (4) *Colectataceæ*, the simple fruit-tangles, microscopic, green, inhabiting fresh waters; (5) *Rhodophyceæ*, including one order (*Florideæ*), the RED SEaweeds (*q. v.*), usually of considerable size, green (obscured by red coloring-matter), inhabiting salt waters; (6) *Charophyceæ*, the STONEWEEDS (*q. v.*), mostly large plants, green, inhabiting fresh waters. These plants do not constitute, therefore, a single natural group, although usually so treated. CHARLES E. BESSEY.

Sea-wolf: See WOLF-FISH.

Sebaceous Glands: See HISTOLOGY (*The Skin and its Appendages*).

Sebac'ic (also called **Sebic** and **Pyroleic**) Acid [*sebacic* is from Lat. *sebum*, tallow; *pyroleic* is from Gr. *πῦρ*, fire + Eng. *oleine*]: a compound with the empirical formula $C_{18}H_{34}O_2$, formed during the destructive distillation of all fatty bodies which contain oleic acid or olein. Nitric acid forms it also when acting upon fatty bodies, together with oxalic acid and other lower homologues of the same series, or those having the general empirical formula $C_nH_{2n-2}O_2$, a series of which *malonic*, *succinic*, and *suberic* acids are members. Sebacic acid is most readily obtained by fusing together castor oil and caustic potash, 2 parts of oil being slowly mixed with one part of potash, fused with a little water, and heated until the mass is faintly yellow. After boiling

German with water and adding hydrochloric acid while hot, when acid crystallizes on cooling in needles. It resembles common acid in appearance, tastes acid, reddens litmus, melts at 150°, and solidifies above this. It is slightly soluble in cold, very soluble in hot water and in alcohol. Its salts, when heated, are bifluoric, like oxalates and succinates. Neither oxalates nor succinates have been obtained as yet any practical application.

Revised by ISA. HENRY.

Seboldus: a saint of the Roman Catholic Church, and the patron of the city of Memmingen, in Bavaria; was the son of a Danish king; began his studies in Paris when only three years old; married a daughter of King Dagobert, for was released from his marriage-vow the day after the wedding had taken place; spent ten years in the practice of the asceticist asceticism; was by Gregory II. sent into Germany to preach the gospel, and finally settled in Memmingen, where he died in 801, or, according to some writers, in 804. The magnificent Church of St. Seboldus still preserves his memory, and in 1325 Pope Martin V. canonized him on account of the marvels which had been wrought by himself while alive and by his relics after his death. Aug. 14 is his day of commemoration and is still celebrated in Memmingen.

Sebeste: See **SABASTIA**.

Sebastian, SAINT: b. at Narbonne in Gaul about 255; educated at Milan; was a captain in the imperial guard when, under Diocletian, he was seized as a zealous Christian, bound to a tree, and used by the Mauritanian archers as a target. He did not die, however, but having been brought to a Christian home and cured, he was seized a second time, transported to death, and thrown into a sewer, about the year 307. His body was recognized by the Christians and buried in the Catacombs. Pope Damasus (366-382) built a church over his tomb, relics of him were sent to every corner of Christendom as very powerful against the plague; numerous churches were consecrated to him, and he was generally chosen as patron by associations of archers or soldiers. His feast is celebrated in the Roman Catholic Church Jan. 20, and in the Greek Church Dec. 18. Roman Catholic Church historians ascribe much importance to the *acta* *Sebastiani*, which have been ascribed to St. Jerome. By Christian art he is generally represented as and in a tree and pierced by an arrow. Numerous legends, pious fictions, and poems have clustered around his name.

Sebastian: King of Portugal, known as DOM SEBASTIAN; b. at Lisbon in 1554; succeeded his grandfather, John III., in 1578; headed an expedition which captured Tangier, Morocco, in 1574; made another expedition into Africa in 1578, and took part in a civil war supporting the claims of Muley Mohammed to the throne of Morocco against his uncle, Muley Mulek. On Aug. 4 he fought the battle of Alcazar, in which he lost his life and a great part of his army. As the king had no immediate heir, Portugal was soon annexed to Philip II. of Spain, but the masses of the Portuguese people refused to believe in the death of Dom Sebastian, and a series of pretenders appeared at intervals for many years, and received some popular support. One of them made a great sensation at Venice, Florence, and Naples twenty years later, was taken prisoner, and according to some accounts beheaded at San Jussar, in Spain, about 1600. The belief in the future return of Dom Sebastian continued to exist among the ignorant and superstitious for many years, and gave birth to a considerable literature of poems and romances. See *Sebastian*, *Las Juntas Dom Sebastian* (Paris, 1865). F. M. C.

Sebastopol: See **SEVASTOPOL**.

Sebesten-plum: the fruit of *Cordia myra* and *C. latifolia*, Asiatic trees of the family *Boraginaceae*. The fruit is white and was once employed in European medicine. The meat is soft, light, and readily takes fire on friction. It was used by the old Egyptians for mummy-cases. The green *Cordia* is an extensive and interesting one. Florida has two species, and there are two others in Southern Texas.

Revised by L. H. BAILEY.

Seckel Acid: See **SECKEL ACID**.

Seckendorff (properly *Seckendorff*): Alexander's name; born in the Nizam's Dominions, India; 5 miles S. E. of Hyderabad on a map of S. India, ref. 4-E). It is a British military installation. European troops were first stationed here in 1803. Pop. (1891) about 75,000.

Seckel, von, SECKEL, astronomer; b. at Reggio, Lombardy, Italy, July 20, 1818; entered the order of the Jesuits

in 1833; studied mathematics, physics, and astronomy; went to the U. S. in 1848, and taught mathematics at the college of Georgetown, D. C.; was appointed director of the observatory of Rome in 1846, and devoted himself to researches in meteorology and spectrum analysis. Besides about 100 papers he wrote, among other works, *Le Soleil* (Paris, 1870), which has been translated into the principal European languages. On the expulsion of the Jesuits from Italy in 1879, Seckel retained his office. D. in Rome, Feb. 20, 1879.

Secession (from Lat. *secedere*, derive, of *secedere*, withdraw; *se-*, aside + *cedere*, go): any withdrawal from a political or religious organization. The word has acquired lasting notoriety by being used to describe what was claimed to be the right of a State included under the Constitution of the U. S. to withdraw from the Union and set up an independent government. The way was prepared for broadening and exercising this so-called right by the theory of Nullification (q. v.) advanced by South Carolina and some of the people in other States. The tariff law of 1828 was declared by South Carolina to be "null, void, and no law," and duties on imports were forbidden to be paid after a certain day within its jurisdiction. Gen. Jackson, then President, felt that such a power lodged in a State would be a deathblow to the Union and altogether unconstitutional. His energetic opposition and the message on nullification in 1833 put a stop to this political heresy for the time, but only postponed the day of final test. The doctrine was that every State has a right to interpret the Constitution for itself, whatever be the decision of the Supreme Court on the subject, and, as interpreting, to retire from the Union. Hence there is no right to force it to return. This is really a plan to crush under the term nullification the extreme act which denies that the "Constitution, and the laws of the United States which shall be made in pursuance thereof . . . shall be the supreme law of the land," and that "the judicial power of the United States shall extend to controversies to which the United States shall be a party," and that the judges in every State are bound thereby. (Art. III, § 2; Art. IV, § 4.) The doctrine assumed practical form after the election of President Lincoln in 1860, when it was claimed on the part of many of the people in the South that the triumph of the Republican party meant the adoption of a policy of such interference with the domestic institution of slavery as to make it impossible for the Southern States any longer to secure and enjoy their constitutional rights within the Union. They accordingly attempted to withdraw from the Union by passing ordinances of secession and resisting the enforcement of U. S. law. For an account of the war, and of events connected with it, see the articles on CONFEDERATE STATES, DEMOCRATIC PARTY, REPUBLICAN PARTY, HARTFORD CONVENTION, FORT'S RESOLUTION, and NULLIFICATION.

Revised by C. K. ADAMS.

Secession Church of Ireland: See **PRESBYTERIAN CHURCH** (*Some of the Existing Presbyterian Churches*).

Seckendorff: the name of a family of German nobility, which can be traced back to the middle of the thirteenth century, and still flourishes in various branches. Several of its members have become celebrated in German literature and history: (1) VERT LAMWUS VON SECKENDORFF, statesman and author; b. near Erlangen, Dec. 20, 1626; studied law and history at the University of Strasbourg; held various important positions in the service of the Duke of Gotha, the Duke of Saxony-Zeitz, and the Elector of Brandenburg. D. at Halle, Dec. 18, 1692. He was the author of *Der deutsche Fürstenstaat* (1655) and *Commentarius Historicus et apologeticus de Lutherismo* (1692), in their time very famous books.—(2) FRIEDRICH HENRICH, Count von SECKENDORFF, soldier and diplomatist; a nephew of the preceding; b. at Königsberg, Prussia, July 5, 1671; studied law at Jena, Leipzig, and Leyden; served in the Austrian army against the Turks on the Danube, and in the war of the Spanish Succession took part in the negotiations at The Hague, which resulted in the Peace of Utrecht (1713), and held an important command in the Saxon-Polish army against the Swedes. As Austrian ambassador to several German courts he worked to secure the recognition of the Pragmatic Sanction. In the war of the Polish succession he commanded a force of 30,000 men, and defeated the French at Klausen (1735). After the death of Prince Eugene (1736) he was made commander-in-chief of the Austrian army against the Turks, but was defeated, recalled, accused of treason, imprisoned in the fortress of Gratz, and liberated only after much difficulty. He then entered the service of

Charles II. of Bavaria, who, after the death of Charles VI., laid claim to parts of the Austrian heritage, in spite of the Pragmatic Sanction, and was elected emperor under the name of Charles VII.; commanded his army with success; expelled the Austrians from Bavaria, and succeeded in negotiating a tolerable peace for his son in 1745. After this time he lived quietly on his estate, Meuselwitz, near Altenburg, in the Saxon duchies, but in 1758 he was imprisoned by Frederick II. for six months, and forced to pay a heavy fine. D. at Meuselwitz, Nov. 23, 1763.—In the nineteenth century several members have acquired a name as poets: (3) LEO (1773-1809); (4) KARL SIEGMUND (1744-85), translator of Camoëns; (5) CHRISTIAN ADOLF (1767-1833); (6) GUSTAV ANTON (1775-1823), known also in the U. S. as a lecturer under the name of PATRIK PEALE.

F. M. COLBY.

Second Advent: the visible reappearance of our Lord in the world since his ascension to heaven. More exactly, inasmuch as he revisited the world visibly to call the apostle Paul, the second advent denotes a return visible to all the world, or to the whole Church, or to an elect first-fruits of the Church. The first and the third opinion represent two schools of Christian belief. Beyond question, our Saviour himself promised to return visibly. Even assuming (Matt. xxiv., Mark xiii., Luke xxi.) to give his promise intermixed with later interpretations, the unmistakable foundation is a word of his own, which, moreover, is implied throughout the four Gospels, including John (see John v. 25, 28; vi. 39, 40; xiv. 3, 18), and throughout the Epistles of Paul, Peter, John, James, and Jude. The Revelation is full of it. Indeed, next to the Messiahship of Jesus, it has well been called the first Christian doctrine.

In the Gospels our Saviour seems to identify his coming with the fall of Jerusalem. When an evolving event includes many stages, even though widely apart in time, prophecy very commonly blends these in one, inasmuch as the subsequent stages are only an explication and amplification of the first. As has been truly said, prophecies of fundamental import have a springing and germinant fulfillment in every age. The prophecies of the first advent show the same blending of imperfect fulfillments, in which God came near to his people with the consummate fulfillment, in which God, though unrecognized, was with his people. Even so, as the fall of Jerusalem released Christ in his Church from the threatening constraint of Judaism and set him and her free for their victorious course in the world, it was a true and indeed visible return of Christ, with which he therefore fuses every fuller accomplishment of his promised return, even to the consummate fulfillment at the end. He himself, as incarnate, denies of himself any other than a restricted knowledge of times and seasons, which implies a restricted knowledge of specific phases of evolution in the Parousia, or second advent. Only two things are distinct: One, that everything which he foretells shall, in a real sense, come to pass in that generation; secondly, that his coming may be, in its absolute and final sense, long delayed, giving occasion to despondency in some of his people and to licentious security in others. This fusion of different stages of the Parousia is the more obvious, as Christ's visible return is only the highest, coercive evidence of his spiritual return, sight being used as the most convincing and most spiritual bodily sense.

The Revelation alone of the New Testament books describes the second advent as separated by an earthly reign of 1,000 years from the last judgment and reconstitution of all things. Accordingly, since A. D. 200 until of late, this opinion has never had much currency in the Church. It seems to be regaining ground.

C. C. STARBUCK.

Secondary Era: a division of geologic time co-ordinate with Primary, Tertiary, and Quaternary eras. A synonym in more general use is MESOZOIC ERA (*q. v.*).

Secondary Schools: See SCHOOLS.

Secretary: in the U. S., the name of the officer of the cabinet, the respective heads of the executive departments of State, War, Navy, the Treasury, the Interior, and Agriculture. For an account of their duties, see the articles on these departments.

Secretary-bird: a bird of prey (*Gypogeranus serpentarius*), which owes its popular name to a crest of feathers at the back of the head which suggests a pen tucked behind the ear of a scribe. On account of anatomical peculiarities the bird is placed in a distinct family (*Gypogeranidae*). The secretary-bird is readily distinguished from all other birds

of prey by the disproportionate length of its legs, for while the body is smaller than that of a golden eagle, the legs are 2 feet long. The toes are short, nails blunt; the general color is grayish blue, with blackish markings on wings, tail, and under side. The bird feeds on rats and snakes, even on the venomous species, grasping them with its long legs and using its outstretched wing as a shield on which to receive the fangs of its prey. It is found throughout Southern Africa, W. of lat. 15°, and in Cape Colony is protected by law.

F. A. LUCAS.

Secret, Discipline of the: an English equivalent of ARCANI DISCIPLINA (*q. v.*).

Secretion [from Lat. *secre'tio*, a setting apart, separating, deriv. of *secer'nere*, separate; *se-*, apart + *cer'nere*, distinguish, separate]: one of the chief physiological processes of the body; the separation of certain elements of the blood, and their elaboration to form special fluids, termed secretions and excretions. Both of these products contribute to the health and nutrition of the body, the secretion performing some positive function, as aiding digestion; the excretion subserving the same purpose negatively by freeing the system of effete matter, the *débris* of cell and tissue, which if detained in the blood develops disease. The function of the perspiratory and sebaceous glands is secretory, so far as they preserve the moisture and delicacy of the skin, but is chiefly excretory, eliminating water and various effete matters from the system, and hence is classed as an excretion. Bile is variously defined as a secretion, an excretion, and as both, its constituents being effete substances deleterious to health if not promptly excreted, yet performing an important part in the process of intestinal digestion.

Secretion is performed in several ways. The simplest form is seen in the serous shut sacs which invest the lungs, heart, and intestines—the pleuræ, pericardium, and peritoneum. These are lubricated by a fluid which filters directly through the flat endothelial lining cells from the blood-vessels beneath; so also are produced the synovial fluids of the inner smooth surfaces of the joints. A more typical secretory structure is the *tubule*, a cylindrical recess or tube at right angles to the surface, lined with secreting cells. Secreting surfaces, as the mucous lining of the bronchial tubes, stomach, and bowels, have many hundreds or thousands of such tubules to the square inch. An isolated group of tubules ramifying from a single central duct constitutes a simple gland; a number of such groups having a common duct is a compound gland; the larger glands, composed of an extensively divided tubular system with corresponding lobules, are termed racemose glands—that is, in structure resembling a cluster of berries. Such complicated glandular structures serve merely to multiply secreting surface within a limited space; the functional action is much the same whether performed on the free surface, in the tubule and follicle, or by the multiple gland. Secretion is the product of cell-activity. The cell derives its material from the blood, its stimulus to action from the nervous system, and it elaborates a peculiar fluid, in each instance predetermined by the inherent function of the gland or organ of which it is an integral part. Secreted fluids are homogeneous, consisting chiefly of water with variable quantities of salts and fatty matter, and in each case a distinguishing component, as pepsin in gastric juice and mucin in mucus.

Revised by W. PEPPER.

Secular Clergy: See CLERGY.

Secular Games [translation of Lat. *ludi sæculares* (also known as *ludi Terentini*); *ludi*, plur. of *ludus*, game + *sæcula'res*, plur. of *sæcula'ris* (whence Eng. *secular*), of a century, deriv. of *sæculum*, century]: games celebrated in ancient Rome in honor of the infernal deities Dis and Proserpina. The festival seems to have been of Etruscan origin, and to have been connected with a belief in the existence in the life of the state of great periods whose beginning and end were marked by special portents from the gods. Such a period was supposed to be equal to the longest human life, and was variously computed at 100 and 110 years. Owing to the different modes of reckoning, the games were not held at regular intervals. The first well-attested instance of their celebration at Rome was in 249 B. C. Secular games were again held in 146 B. C., and under the empire in 17 B. C., and in 47, 88, 147, 204, 248, and 262 A. D. An inscription has recently been discovered giving an account of the celebration of the games under Augustus in 17 B. C.; it was for this occasion that Horace wrote his *Carmen sæculare*.

G. L. HENDRICKSON.

Secularism (*from*, of *seculus*, from Lat. *saeculus*, a day, or century, race, generation, and, the times, the world) an ethical and social movement originated in England in 1844. Its most prominent leader during its earlier years was George Jacob Holyoake, who for several years was president of the London Secular Society. He was succeeded in 1858 by Charles Bradlaugh, who, when the Secular Society formed a national society, became its president and continued so for more than twenty years. Under his direction the movement became more aggressively anti-theological than it had been under Holyoake. His pseudonym, *Invictus*, expressed the temper of the man and of the movement as inspired by him. The idea of Holyoake is better embodied by the societies for ethical culture than by the secular societies. That idea was that ethical and moral good is "the chief end of man," and that this end is not *helped*, but rather *hindered*, by theological and especially supernaturalist considerations relating to God and a future life. Belief in these was no bar to admission to the societies, but practically those attracted were intellectually *agnostic*, and tended to be dogmatic atheists under the *discovery* system. In other particulars there was change as time went on. The political elements became more strongly marked, the social and industrial less so. As an ethical apostle of cooperation, Holyoake always insisted on that as the method of social regeneration, but being equally a disciple of Thomas Paine politically and of Robert Owen socially, the tendencies of his societies to become democratic and republican clubs were unmistakable. Under Bradlaugh this tendency became more evident. The National Society of Secularists has made a declaration of principles, which makes its objects clear, and the means and methods by which they are to be attained. It declares the promotion of human improvement and happiness to be the highest duty; that theological teachings are obstructive of this aim; that every individual should be well placed and instructed and usefully employed for his own and the general good; that civil liberty and religious liberty are necessary, and that every Secularist is bound to actively attack all barriers to equal freedom of thought and utterance for all upon political and theological subjects. Much of the energy of Bradlaugh and of the society under his direction was in the *work* of this final clause. The same declaration of principles sets forth the objects of its political and social agitation: universal education; disestablishment and disendowment of the state Church; improvement of the condition of agricultural laborers; such change in the land laws as will give the laborer an interest in the soil; abolition of the House of Lords and substitution of a national senate with life-members; investigation of the causes of poverty and plans for its amelioration. On several of these lines the national society and its local branches have done excellent service. The opposition to the state Church has been more *accomplished* than theological.

Secularism must be distinguished from agnosticism, which is merely an intellectual temper that does not admit of either theological affirmation or denial, while secularism, though *inspiring* this temper largely, is nothing if not *practical*. Compared with the ethical culture of Dr. Felix Adler and his school, that is the more subjective, this the more objective; that insisting that good character and right conduct are central to all effective social reform, secularism looking to the social reform, the improvement of circumstances, for the development of character. Secularism has been called by an English clergyman of the Established Church, "the religion of doubt." "It does not," he says, "necessarily clash with other religions; it does not deny the existence of God or even the truth of Christianity; but it does not profess to believe in one or the other." This, however, is more secularism in the abstract, and as it was in the original hope and dream of Holyoake, than as it has been practically in the course of its development. It has *coincided* with other religions "in a very lively fashion. If the temper of Holyoake could have dominated it always it might perhaps have done better service. That it has done good service in many ways is not denied by those to whom the agnostic and atheistic elements are most *deplorable*." — JAMES W. CHADWICK.

Secularization: the process of converting objects from a religious or spiritual to a common or secular use, and of removing matters from a purely ecclesiastical control to the *civil jurisdiction*. During the epoch when the Church had attained the highest degree of power its interference with secu-

lar matters extended in every direction, but was most distinctly exhibited in connection with certain special subjects, the control of which it has ever struggled to retain. Vast quantities of lands had gradually accumulated in the hands of the religious houses, and all the most valuable estates of Europe were likely to fall into their ownership. From the time of Constantine the Church had jurisdiction over certain subjects of the utmost consequence in society, the most important of which were marriage, divorce, and the succession of decedents' estates. Education in all its grades and departments was intrusted exclusively to the Church. The progress of secularization has nearly destroyed these spiritual interferences with civil affairs in many countries of Europe and America, and has greatly narrowed their extent in all the others. The first impulse of this grand movement was naturally directed against the threatened monopoly of land. At an early day statutes were passed in England and on the Continent prohibiting the acquisition of lands by religious corporations; and this policy has continued to the present day. (For a description of these enactments, their design and effect, see the article *MONASTICISM*.) In addition to this system of restraint, the accumulated possessions of the ecclesiastics and the spiritual houses have sometimes been seized by the civil authorities and appropriated to secular uses. The most remarkable instances of such enforced changes occurred in England under Henry VIII., in Scotland at the Reformation, and in France during the Revolution. The Italian and the Mexican Governments have, in the nineteenth century, pursued a similar policy. The nineteenth century also has seen important alterations in the law of matrimony. In Great Britain, France, Italy, Prussia, Austria, and several other European states, marriage has been made wholly a civil contract and status, divorce is regulated by statute, and both are placed under the jurisdiction of the ordinary tribunals. The same steps had before been taken in reference to successions. So far as education is public or is supported at the public expense, the course of modern legislation in Great Britain, France, Italy, and Germany favors a control by the state, and not by the Church. It is in the U. S., however, that the theory of secularization has had the fullest scope, and has been worked out most thoroughly and consistently. The fundamental conception of the state contained in the organic law confines the Church to functions purely spiritual and religious; the Church itself, as a spiritual society, has no legal existence, and is not recognized by the law, and all the separate congregations or parishes are in all respects civil and lay corporations. Marriage, divorce, and all other relations, domestic or social, successions and all other matters connected with property, are of course under the exclusive dominion of the civil government. A few traces are still left of ecclesiastical influence and privilege, but are the objects of frequent attacks. The removal of all distinctively religious instruction from the common schools, with the consequent secularizing of the public educational system, and the repeal of all laws which exempt ecclesiastical property from taxation are strongly advocated.

Revised by F. M. COLVER.

Secundus, JOHANNES (*San Nicolaas Everaerts*): poet; b. at The Hague, Nov. 14, 1511; studied law at Bruges, but devoted himself chiefly to poetry, painting, and sculpture. In 1533 he went to Spain and became secretary to Cardinal Tavera, Archbishop of Toledo. On his return to the Netherlands he was employed as secretary by the Bishop of Utrecht, in which city he died Sept. 24, 1596. His best-known work is *Baron* (Utrecht, 1539), consisting of amatory poems. His *Opera Poetica* was published by his brother (Paris, 1641).

Secundus, PONTIUS PORROSENUS: a Roman poet who flourished in the reigns of Tiberius, Caligula, and Claudius. He was an intimate friend of Sejanus; and when the favorite fell he was thrown into prison, in 31 A.D., and not released until the accession of Caligula in 37. In 44 he was consul, and in 50 he was sent by Claudius as legate to Germany, where he defeated the Chatti and obtained the honor of triumphal ornaments. It was by his tragedies that Secundus acquired the most celebrity. Tacitus speaks of them in the highest terms, and so does Quintilian. The elder Pliny, who was an intimate friend of his, wrote his *Life* in two books. The few fragments of the works of Secundus which have been preserved hardly suffice to give an idea of his style.

Revised by M. WARREN.

Sedalia: city; capital of Pettis co., Mo.; on the Mo., Kan. and Tex. and the Mo. Pac. railways; 95 miles E. of Kansas City, 189 miles W. of St. Louis (for location, see map

of Missouri, ref. 4-F). It was laid out by Gen. G. R. Smith from a part of his farm in 1861, was a U. S. military post during the war of 1861-65, and for several years was the west terminus of the Mo. Pac. Railway. Gen. Nathaniel Lyon and Gen. John C. Frémont fitted out military expeditions here in 1861, and for a few days in 1864 the city was held by Confederate troops. The city has an elevation of 986 feet above sea-level, and is in an agricultural, coal-mining, and limestone region, which has also beds of emery and potter's clay, and indications of iron, lead, and zinc. Sedalia contains 23 churches, 13 public schools, a high-school building that cost \$40,000, George R. Smith College, public library with over 10,000 volumes, court-house (erected in 1884, cost \$115,000), new U. S. Government building, 3 national banks with combined capital of \$300,000, 2 State banks with capital of \$350,000, 10 building and loan associations, and 3 daily, 7 weekly, and 2 monthly periodicals. The locomotive-shops of the Mo. Pac. Railway and the general offices and car-shops of the Mo., Kan. and Tex. Railway are located here. There are also flour-mills, iron-foundry, woolen-mills, machine-shop, agricultural-implement works, brewery, grain elevator, and carriage and broom factories. Pop. (1880) 9,561; (1890) 14,068. THOMAS SEDDON.

Sedan, Fr. pron. se-dāān': town; in the department of Ardennes, France; on the Meuse; 64 miles by rail N. E. of Rheims (see map of France, ref. 2-H). It contains an arsenal and several magazines, and was at one time a place of great military importance. It has manufactures of cloth and other kinds of woolen fabrics. Metal-working is also carried on. The Protestants had here a flourishing academy, which was closed by the revocation of the Edict of Nantes in 1685. On Sept. 2, 1870, Napoleon III. and his whole army of 86,000 men surrendered here to the King of Prussia. Pop. (1891) 17,023.

Sedan-chair: a portable vehicle differing from the litter and the palanquin in that the traveler is carried in a sitting posture by two men. The sedan-chair took its name from Sedan in France, where it was invented, but it had long been employed in Eastern countries, notably in India and China. It was first seen in England in 1581.

Sedatives [from Lat. *sedare*, *sedatus*, make sit, settle, compose, calm]: a term somewhat loosely employed in medical parlance to designate agents which are soothing or actually anæsthetic over the sensory function, or which in relation to various motor functions tend to diminish activity. Aconite, hemlock, and chloroform are thus called sedative—the first, because it lessens the force and frequency of the heart's beats; the second, because it paralyzes the voluntary muscular system; and the third, because it is a general paralyzer of the cerebro-spinal functions. From these examples it is obvious enough that there is no group of allied agents to which the general term sedative can apply; and where used in relation to special paralyzing power the latter term is far more accurate and expressive.

Sedge Family: the *Cyperaceæ*; a group of grass-like, monocotyledonous, herbaceous plants, numbering 2,500 to

flowers are greatly reduced from the lily type, having three stamens (rarely more) and a one-celled ovary with two or three carpels, which contains a single basifixed, anatropous ovule, the latter developing into a free seed. The perianth is wanting, or at most rudimentary, and the plants are often monœcious or diœcious.

Sedges are common in all parts of the globe and are particularly abundant upon low and wet lands. They are usually not so nutritious as the grasses, but constitute a large proportion of the coarse hay which is cut from wet meadows. The largest genera of the family are *Cyperus* (containing from 400 to 500 species), *Fimbristylis* (200), *Scirpus* (200), *Rhynchospora* (150), *Scleria* (100), and *Carex* (500). See the articles *CAREX*, *CYPERUS*, and *PAPYRUS*.

FIG. 2.—Papyrus (*Cyperus papyrus*).

Sedgemoor: a wild region of Somersetshire, England, extending S. E. from Bridgewater. On July 6, 1685, the Duke of Monmouth, son of Charles II. of England by Lucy Walters, was defeated here by the army of James II. under the Earl of Faversham. The duke was taken prisoner, and executed July 15, 1685. See Blackmore's *Lorna Doone*.

Sedgwick, ADAM, LL.D., F. R. S.: geologist; b. at Dent, Yorkshire, England, in Jan., 1786; graduated at Cambridge 1808; became fellow of Trinity College 1810; took orders in the Church of England 1817; was appointed Woodwardian Professor of Geology at Cambridge 1818; chosen fellow of the Royal Society 1819; became proctor of the university 1827; president of the Geological Society of London 1829-31; received the Copley medal of the Royal Society 1863. D. at Cambridge, Jan. 27, 1873. His geological studies covered wide areas in continental Europe as well as Great Britain, but the older sedimentary rocks of England and Wales were his special field. In classifying these he first announced the Cambrian as a system below the Silurian; and a question as to the position of the line separating the two systems occasioned a long controversy with Murchison, involving much bitterness and personal feeling. He was an active opponent of the doctrine of evolution. His works consist chiefly of reviews, lectures, addresses, and memoirs, scattered through the publications of learned societies, the most important separate essays being a *Discourse on the Studies of the University of Cambridge* (1834; enlarged ed. 1850) and a *Synopsis of the Classification of the Palæozoic Rocks* (1855). See CAMBRIAN PERIOD, and consult Geikie's *Memoirs of Sir R. Murchison* (1874) and Hunt's *Chemical and Geological Essays* (1875).

Sedgwick, CATHARINE MARIA: author; daughter of Judge Theodore Sedgwick; b. at Stockbridge, Mass., Dec. 28, 1789; undertook after her father's death (in 1813) the management of a private school for the education of young ladies, and continued in that employment fifty years. She published her first work of fiction, *A New England Tale*, in 1822, the success of which decided her to continue the career of authorship; brought out *Redwood* (2 vols., 1824), which was reprinted in England, translated into French, Italian, German, and Swedish, and compared favorably with the novels of Cooper, to whom, indeed, it was attributed in the French version; and was the author of other popular works, including *The Traveller* (1825); *Hope Leslie, or Early*

FIG. 1.—A sedge (*Carex umbellata*) reduced, with enlarged perigynium and bract at left, and pistil and transverse section at right.

8,000 species. Their stems are usually solid and three-angled, and their leaves three-ranked, with closed sheaths. The

See, HORACE: naval engineer and architect; b. in Philadelphia, Pa., July 19, 1835. He was educated at the Academy of the Protestant Episcopal Church and the Gregory Academy; became, after entering business life, interested in steamship construction. From 1887 to 1889 he was the superintending engineer of the works of William Cramp & Sons, at Philadelphia, and introduced many improvements into the design and manufacture of the steam-engine. He had much to do with the introduction of triple-expansion engines into the vessels of the U. S. navy. He designed engines for the cruisers Yorktown, Concord, Bennington, Philadelphia, Newark, and Vesuvius, and for several well-known yachts and important merchant vessels. The cylindrical face-plate, if it may be so called, has been one of those by which it has been possible to produce perfect surfaces in main bearings and crank-shaft journals, so that heating, heretofore considered a natural consequence following the trial of a new engine, has been eliminated. He has been president of the American Society of Mechanical Engineers; is fellow of the American Association for the Advancement of Science; and a member of the British Institution of Naval Architects, and of other societies.

Seed-lac: See LAC.

Seeds [O. Eng. *sēd*; Germ. *saat*; Icel. *sāð*; Goth. *-seps* in *manasēps*, seed of men, the world; cf. Lat. *se'rere*, *sa'tum*, sow, Gr. *lérai*, throw; Indo-Europ. root *sē*, throw]: the immediate result of sexual propagation in phanerogamous plants, being the ovules after fertilization and the consequent formation of the embryo, which is the germ of a new individual. A seed consists of the embryo; of the matured coats of the OVULE (q. v.), commonly two, of which the outer, and generally the firmer, is technically called the *testa*, the inner, *tegmen*; and often of a stock of nourishing matter accumulated around or accompanying the embryo. The latter was named *albumen*, from a mainly fanciful analogy; the seed being likened to an egg, the albumen was supposed to answer to its white (albumen) and the embryo to its yolk. Seeds, such as those of peas, beans, and almonds, which have no albumen—that is, no stock of nourishment outside of the embryo—have always a strong and well-developed embryo, abundantly supplied with the same or similar matter stored in its own tissues. The general structure of the seed depending upon that of the ovule, the same terms are mostly applicable to it and to its modifications and parts (such as *anatropous*, *orthotropous*, *rhaphe*, *chalaza*, etc.); but the closed orifice through which impregnation was effected is called the *micropyle*; the scar left by separation from the seed-stalk or placenta is the *hilum*; the accessory and usually partial external covering, which is sometimes developed by a growth from the micropyle or the apex of the seed-stalk, is an *arillus* or *aril*. The mace of nutmeg and the pulpy covering of *Euonymus* seeds are familiar examples. A *caruncle* and a *strophiole* are nearly similar appendages at the base or hilum, not developed into a covering. Other appendages to certain seeds are the *coma*, or tuft of downy hairs at the summit, as in milkweed, or the base, as in willow, also the wing, as in trumpet-creeper; these and various other appendages aid in the dispersion of seeds. The albumen of the seed, when distinctively present, may differ greatly in abundance, consistence, and nature; as from farinaceous or flowery in wheat to cartilaginous or horny as in coffee, or to the texture and appearance of ivory in the vegetable-ivory nuts. In many cases, as in those just referred to, it forms much the larger part of the kernel of the seed; in others the embryo is so minute as to be with difficulty discerned antecedent to germination; while sometimes the embryo is the more conspicuous, and the albumen is reduced to a thin layer. When copious, the albumen generally envelops the embryo, but sometimes the latter enfolds the former, as in mallows, or is coiled around it, as in four-o'clock and chickweeds. The embryo and its parts are described in other articles. (See GERMINATION, COTYLEDON, and EMBRYOLOGY.) Its most important structural characteristic is the number of cotyledons or seed-leaves—one in monocotyledonous or endogenous plants; two in the dicotyledonous or exogenous.

There are many conflicting accounts as to the duration of vitality in seeds. The story of grain found buried with Egyptian mummies having germinated after being exhumed is generally discredited. All recent attempts under proper observation and due precautions have failed. The appearance of plants new to the station upon the soil brought

to the surface from excavations can usually be otherwise explained when they appear to involve a high antiquity, although there is no doubt that buried seeds have germinated after a lapse of fifty or more years. The best-authenticated case, pointing to a much longer preservation of vitality under such conditions, is that of the growth of raspberry-seeds found in the abdominal portion of a skeleton exhumed from a Roman tomb near Dorchester, England; but it is one not beyond doubt and uncertainty. One or two series of experiments, conducted by the sowing of seeds of known age, and also by the annual sowing from a stock of a considerable variety of seeds of the same age, indicate a rapid extinction of vitality under ordinary conditions. Out of 328 species, representing 74 families of plants, only 94 kinds grew after 8 years, only 57 after 4 to 8 years, only 16 from 8 to 21 years, 5 from 25 to 27 years, 3 to 43 years. In ordinary cases, leguminous seeds have longest preserved germinating power, in some very well-authenticated instances up to seventy or perhaps a hundred years. Nearly uniform temperature, darkness, and either dryness or burial beyond atmospheric influences, most favor the prolongation of vitality. See also FOOD. Revised by CHARLES E. BESSEY.

See'land: the largest and most important of the Danish islands; between the Cattegat and the Baltic, and between the Sound which separates it from Sweden and the Great Belt which separates it from the island of Funen. Area, 2,718 sq. miles, or with neighboring islands administratively dependent, 2,909 sq. miles. The ground is low and undulating, dotted with small lakes and studded with forests of oak and beech, but nowhere rising more than 200 feet above the sea. The soil is very fertile and well cultivated. Pop. (1890) in the administrative limits, 722,000.

Revised by M. W. HARRINGTON.

Seeley, Sir JOHN ROBERT, M. A.: educator and author; b. in London, England, in 1834; graduated at Cambridge 1857; became fellow of Christ's College 1858; Professor of Latin in University College, London, 1863; succeeded Charles Kingsley as Professor of Modern History at Cambridge Oct. 9, 1869. Author of *Ecce Homo, or the Life and Work of Jesus Christ* (London, 1865), which rapidly passed through many editions and elicited many replies; *Roman Imperialism* (1869); *Lectures and Essays* (1870); and editor of *Livy, with Introduction, Historical Examination, and Notes* (1871); wrote *Life and Times of Stein* (3 vols., 1870); *Expansion of England* (1883); *Natural Religion* (1882); *A Short History of Napoleon I.* (1886); *Goethe Reviewed after Sixty Years* (1893); *Growth of British Policy* (1895). D. at Cambridge, Jan. 18, 1895. Revised by S. M. JACKSON.

Seelye, see'lee, JULIUS HAWLEY, S. T. D., LL. D.: educator; b. at Bethel, Conn., Sept. 14, 1824; graduated at Amherst College 1849; studied theology at the Auburn Seminary, and also in Germany; was pastor of the First Reformed Dutch church, Schenectady, N. Y., 1853-58, then became Professor of Mental and Moral Philosophy in Amherst College. In 1872 he visited India, where he spent three months, largely occupied in lecturing to educated and English-speaking Hindus on the truths of Christianity. Some of these lectures were published in Bombay (1873) by request of their auditors, and also at Boston (1874) under the title *The Way, the Truth, and the Life*. He also published a volume on *Christian Missions* (New York, 1875) an elementary text-book on *Duty* (1891), besides various sermons, addresses, and articles in quarterly reviews, and translated Schwegler's *History of Philosophy* (New York, 1856). He aided in the revision of Hickok's *Psychology* (1882). In 1874 he was elected to Congress by a spontaneous movement of the people of his district, and without having received a nomination from any political party. In 1876 he was elected president of Amherst College, retaining his professorship. He resigned both offices in 1890. D. at Amherst, Mass., May 12, 1895. Revised by G. P. FISHER.

Seelye, LAURENUS CLARK, D. D.: educator; brother of Julius H. Seelye; b. at Bethel, Conn., Sept. 20, 1837; graduated at Union College 1857; studied at Andover Theological Seminary 1857-59, at Berlin and Heidelberg Universities 1860-62; traveled in Europe, Egypt, and Palestine; was pastor of the North Congregational church at Springfield, Mass., 1863-65; was Professor of English Literature and Oratory at Amherst College 1865-74; organized and became in 1874 first president of Smith College for young women, at Northampton, Mass.; author of various contributions to reviews, including articles on collegiate education and on Celtic literature.

SEKIMAN, SEKIMAN, DORRHOLO, Ph. D.: botanist; b. at Hannover, Germany, Feb. 29, 1828; educated at the Lyceum of that city; studied at Kew, England, 1844-46; was naturalized on board H. M. S. Herald on an exploring expedition around the world 1846-47; made three Arctic voyages; explored the Fiji Islands and parts of North and South America (1860-63); editor of *Revue des Sciences* 1863-65, and of *Journal de Botanique, British and Foreign*, 1865-71; published *A Narrative of the Voyage of the Herald* (1850); *Vegetable History of Palma* (1855); *The Botany of the Voyage of the Herald* (1857); *Flora Vitensis* (1865); and other scientific works. D. at the Javali mine, Nicaragua, Oct. 10, 1871.

SEKIMAN, SEKIMAN, DORRHOLO, Ph. D.: Orientalist and traveler; b. at Javer, Oldenburg, Germany, Jan. 30, 1767; was educated at the University of Göttingen; became a friend of Humboldt and Humboldt; under the patronage of the Prince of Savoy-Geneva undertook an extensive exploration of Abyssinia, Africa and Asia; reached Constantinople in 1802; studied Arabic fifteen months at Aleppo (1803-04); diagnosed as a beggar, made valuable scientific researches in Syria and Palestine, especially in the Lebanon and the region E. of the Dead Sea (1804-05); in Egypt made a vast collection of MSS. and other objects for the Museum of Berlin, and explored Upper Egypt (1807-08); professed Islam, and as a pilgrim visited Mecca and Medina (1809); reached Mecca, whence his last letter was written on Nov. 17, 1810. Settling out for Mecca (1811), his property was seized under accusation that he was a magician. Nothing is known of his subsequent history, but he is believed to have been poisoned (1811) by command of the Imam of Sanaa. His diary and maps, recovered in 1815, were published at Berlin (3 vols., 1854-55). E. A. G.

Sekimide Nah: See HAKKE-BES-ALLAN.

Sekigars: See KIRAN (Pulley Kilan).

Segmental Organs: a name formerly given the accessory organs (appendix) of annelids, from the fact that these are typically a pair to a segment.

Segmentation: See KINEMATICS.

Segner's Wheel: See HAKKE'S MILL.

Segovia: capital of the province of Segovia, Spain; on the Duero, at the foot of the Sierra de Guadarrama; 32 miles N. W. of Madrid (see map of Spain, ref. 14-E). It is surrounded by old walls surmounted by round towers. Streets are narrow and crooked, but many of its buildings are magnificent. The aqueduct which carries the waters of the Rio Frio into the city is 2,921 feet long and rests on 170 arches, some of which are 102 feet high. It is built of granite blocks, without cement or mortar, and is the grandest specimen of Roman architecture in Spain. The cathedral is a fine specimen of Gothic architecture. There are some manufactures of cloth, paper, and pottery. Pop. (1857) 14,000. The province of Segovia is part of Old Castile, and most of it is plateau; area, 2,714 sq. miles; pop. (1857) 154,443.

Seguin, sé-gwē: town; capital of Guadalupe co., Tex.; on the Guadalupe river, and the S. Pac. Railroad; 35 miles E. of San Antonio (for location, see map of Texas, ref. 5-H). It is an agricultural and lumbering region, and contains several mills, a private bank, and three weekly newspapers. Pop. (1880) 1,005; (1890) 1,716.

Seguin, sé-gwē, Fr. pron. se-gwān, Édouard, M. D.: physician; b. at Clamecy, Nièvre, France, Jan. 20, 1812; educated at the colleges of Auxerre and St. Louis in Paris, and studied medicine and surgery under Itard, and was subsequently associated with Esquirol; undertook, soon after winning his medical degree, the training of a few idiot children. Devoting himself with great assiduity to the study of that psychological condition, he at length comprehended the nature of their idiosyncrasy so clearly that he was able to produce some remarkable results by his system. In his first experiments Esquirol was associated with him, and their names appear together on the title-page of his first pamphlet on the subject of idiotism in 1839. In 1844 a commission from the Academy of Medicine of Paris declared that up to the time when he began his labors (1837) idiots could not be educated or cured by any means previously known or suspected, but that he had solved the problem. He published in 1846 *Traitément moral, Hygiène et Éducation des Idiots et des autres Enfants arriérés*. After the Revolution of 1848 Dr. Seguin migrated to the U. S.; visited the school

for idiotic children in South Boston and the institution for feeble-minded youth at Barre, Mass., both in large measure the outgrowth of his labors in Paris; went to Albany, where Dr. Willard was just organizing the experimental school which has culminated since in the New York State Idiot Asylum at Syracuse, and rendered him invaluable assistance in that organization; in 1851 settled in Portsmouth, O., in the practice of his profession. In 1854-57 he was at Syracuse teaching and training idiot children, aiding in the establishment of new institutions in Connecticut, Ohio, and Pennsylvania, and for a time was at the head of the Pennsylvania institution. In 1859 he settled in practice at Mt. Vernon, N. Y., whence he removed to New York in 1863. In 1879 he established in New York the Seguin Physiological School for feeble-minded children, which still exists. In 1890 he published *Idioty, and its Treatment by the Physiological Methods*. He was a commissioner of the Vienna Exposition in 1873 from the bureau of education. Among his published works are *Conséils à M. O. sur l'Éducation de ses Enfants Idiots* (Paris, 1839); *Théorie et Pratique de l'Éducation des Idiots* (2 parts, Paris, 1842); *Hygiène et Éducation des Idiots* (Paris, 1845); *Images graduées à l'usage des Enfants arriérés et Idiots* (Paris, 1846); *P. R. Desir, premier Institutur des Sourds et Muets en France* (Paris, 1847); *Historical Notice of the Origin and Progress of the Treatment of Idiots* (translated by J. S. Newberry, N. D., 1852); *Medical Thermometry and Human Temperature* (1876). He was also inventor of the physiological thermometer. D. in New York, Oct. 29, 1880.

Revised by S. T. ARMSTRONG.

Ségur, sé-gür: a family of the French nobility, many of whose members have been prominent in war, literature, and politics. The most distinguished are: (1) LOUIS PHILIPPE, Count de Ségur; b. in Paris, Dec. 10, 1759; received a military education, and served in America under Rochambeau; was appointed in 1783 ambassador to St. Petersburg, where he gained the favor of Catherine II., and concluded an important commercial treaty between Russia and France in 1787; retired from the public service on the overthrow of the monarchy during the Reign of Terror, and devoted himself to literary work; was recalled to service by Napoleon; became a peer during the first Restoration. D. in Paris, Aug. 27, 1830. His principal works are *Théâtre de l'Herménégilde* (1798), originally written for the private stage of Catherine II.; *Contes, Fables, Chansons et Vers* (1801); *Tableau historique et politique de l'Europe de 1780-86* (1800); *Mémoires, ou Souvenirs et Anecdotes* (1825). His *Œuvres complètes* were published in 34 vols. in Paris (1824-30).—(2) His son, PAUL PHILIPPE, b. in Paris, Nov. 4, 1780; entered the army in 1799; became a member of the staff in 1802; governor of the imperial pages in 1804; and brigadier-general and aide-de-camp to Napoleon during the Russian campaign; after the second Restoration he retired to private life. He was made a peer by Louis Philippe. In 1824 he published *Histoire de Napoléon et de la Grande Armée pendant l'Année 1812*, which made a great sensation, and has been often republished. He also wrote *Histoire de Russie* (1829) and *Histoire de Charles VIII.* (1835); translated into English, Philadelphia, 1842). D. in Paris, Feb. 25, 1873.

Seldi, sé'l, AYTON II.: conductor; b. in Budapest, Hungary, May 6, 1850, and educated there, and at Leipzig and Bayreuth under Richter and Wagner. He assisted Wagner in making the first score of the *Nibelungen* tetralogy, and in 1876 was the chief stage-director at the first production of the *Nibelungen* drama in Bayreuth, and from that time till 1885 was well known in Europe as a Wagner conductor. From 1879 till 1882 he was conductor at the Leipzig Opera-house. In 1885 he married the opera-singer Fräulein Kraus, and in September of that year was called to New York to conduct the German opera, succeeding Dr. Leopold Damrosch. On the departure of Theodor Thomas for Olbingo in 1891, Seldi was elected conductor of the Philharmonic Society. He is also a fine pianist, an accomplished *littérateur*, and a deep student of Shakespeare. He is a naturalized citizen of the U. S. D. E. HERVEY.

Selditz Powders: See POTASSIUM (Medicinal Uses of Potassium Compounds).

Seigniorage: See CHENGAGE.

Seine, Fr. pron. sēn (the Sequana of Caesar): a river of France, which rises in the department of Côte-d'Or at an elevation of 1,545 feet above the level of the sea, flows in a

northwestern direction, passes through Paris, where it is from 400 to 600 feet wide, and enters the English Channel at Havre by an estuary 7 miles wide. Its entire length is 482 miles, of which about 350 below Troyes are navigable by barges, and 40 from Rouen to Havre (to which the term *Seine maritime* is applied) by vessels of 200 to 300 tons. It receives from the left the Yonne, the Essonne, and the Eure, and from the right the Aube, Marne, and Oise. By canals it communicates with the Loire, Saône, Rhine, Rhône, Meuse, and Scheldt. Though surpassed in some respects by the Loire, Saône, and Garonne, yet with the hills and valleys, forests and meadows, numerous villages, populous towns, and famous cities which line its banks it is one of the finest rivers in Europe.

Seine: department of France; completely inclosed within Seine-et-Oise; area, 185 sq. miles. It is the smallest but the most densely peopled and wealthiest department of France, comprising Paris and the suburban villages of Boulogne, Clichy, Puteaux, etc. The ground is undulating and traversed by the Seine and the Marne. The soil is not naturally fertile, but it has been made very productive by the skill of the farmers and gardeners. Immense quantities of vegetables, mushrooms, melons, peaches, and strawberries are raised for the markets of Paris. Beautiful forests, as those of Boulogne, Vincennes, St.-Cloud, and Meudon, cover a large part of the surface between the cities, and rich quarries of building-stone and gypsum are found. Pop. (1891) 3,141,595.

Seine-et-Marne, -ā-maarn': department of France, adjoining Seine-et-Oise on the W.; area, 2,214 sq. miles. The ground is slightly undulating and the soil very fertile. Extensive forests, yielding excellent timber, are found, among which is that of Fontainebleau. Large crops of wheat, vegetables, and fruits are raised; the wine of the department is mediocre, though it produces one of the most celebrated kinds of table-grapes, the Chasselas de Fontainebleau. On the pastures and meadows numerous cattle are reared, and immense quantities of cheese, the so-called *fromage de Brie*, are sent to the Paris markets. The manufacturing industry of the department is not of great importance. Pop. (1891) 356,709. Capital, Melun.

Seine-et-Oise, -ā-waaz': department of France. Area, 2,163 sq. miles. In the southern part the ground is almost flat; in the northern, hilly and covered with forests. The soil is generally not fertile, but, being well manured and excellently cultivated, yields large crops of fruits and vegetables for the capital. Different branches of manufactures are pursued with great success. Several fine varieties of stone and clay are found, and the porcelain manufactures of Sévres have acquired a worldwide reputation. Pop. (1891) 628,590. Capital, Versailles.

Seine-Inférieure, -ān'fā'ri-ōr': department of France, bordering on the English Channel. Area, 2,330 sq. miles. The ground is generally composed of plains, watered by numerous small streams, and broken only in the southwestern part by ranges of low hills. The soil is fertile and well-cultivated. Forests abound; large crops of grain, hemp, flax, hops, and fruits are raised, and sheep, cattle, and horses are extensively reared. Manufactures, and especially fisheries and commerce, form important sources of wealth. Large quantities of cheese, butter, and cider are made. Poultry, chickens, turkeys, ducks, and geese are raised, and enormous quantities of eggs are exported to England. Pop. (1891) 839,876. Capital, Rouen.

Seines: See FISHERIES.

Seip, sip, THEODORE LORENZO, D. D.: educator; b. at Easton, Pa., June 25, 1842; graduated at Pennsylvania College, Gettysburg, Pa., and Theological Seminary, Philadelphia. He has been connected with Muhlenberg College, Allentown, Pa., since its organization in 1867, first as principal of the academic department, and successively as Professor of the Latin and Greek Languages, becoming president in 1886. H. E. J.

Sei'sin [from O. Fr. *seisine, saisine*, deriv. of *seisir, saisir*, seize; Ital. *sagire*; of Teuton. origin; cf. O. H. Germ. *sazjan*, set]; in law, possession of a freehold estate. The term originally signified any possession, whether of real or personal property, but it became appropriated at an early period to describe the possession of a freehold tenant of lands. If such freeholder surrenders the actual physical possession to another who lays no claim to the freehold (as a tenant for years), he does not thereby lose his *seisin*.

The tenant's possession is referred to the landlord's *seisin*, and constitutes a part of it. (See PROPERTY.) But if actual possession of the land be taken, rightfully or wrongfully, by one who intends thereby to hold the freehold, the act is a *disseisin* of the owner and operates to transfer the freehold to the "disseisor." (For this extraordinary consequence of a *disseisin*, see LIMITATION OF ACTIONS.) In the same way every one who has a vested future estate of freehold, whether in reversion or remainder, is seized of such estate so long as the present or particular estate upon which the future estate is limited continues to be vested in possession. If the particular tenant is disseised, however, every future estate which depends upon his estate is divested by the same act. See LANDLORD AND TENANT and REMAINDER.

The expression "livery of *seisin*," which described the ancient process of conveyance of freehold interests, known as *feoffment*, is only the archaic equivalent for the phrase delivery of possession. See FEOFFMENT, FREEHOLD, and GRANT. GEORGE W. KIRCHWEY.

Seis'mograph: an instrument recording graphically the motions of a point on the earth's surface during an earthquake. Instruments for the automatic record of earthquakes are classed according to special function—as (1) seismoscopes, which merely detect and record the fact of an earth tremor, with or without indication of its time; (2) seismometers, which measure also the maximum force of the shock, either with or without indication of its direction; and (3) seismographs, which record the number, succession, direction, amplitude, and period of successive oscillations. Most seismoscopes are devices involving a delicately adjusted trigger whose small movement permits a weight to fall, causes an alarm to sound, or stops a clock. In seismometers a heavy liquid is agitated or made to spill from a vessel, or a movable solid is thrown down or displaced. In the construction of seismographs the primary endeavor is to give astatic suspension to a heavy body, that is, to suspend it in such way that when its position is disturbed through a small distance no force will be developed tending to restore its original position; or what is the same thing, so that if its support be moved the motion will not be communicated to the body. This ideal result has never been accomplished, but close approximations have been obtained by various devices. The complementary part of the apparatus consists in systems of levers, etc., connecting the body astatically suspended with various fixed points, or surfaces moved by clockwork, in such way as to secure a graphic record of the relative motions in various directions. The more elaborate machines record motion in the vertical direction and in two horizontal directions. See EARTHQUAKES, and consult the *Transactions* of the Seismological Society of Japan. G. K. GILBERT.

Seismology [Gr. *σεισμός*, earthquake + *λόγος*, discourse, reason]: See EARTHQUAKES.

Seismometer and Seismoscope: See SEISMOGRAPH.

Seiss, sees, JOSEPH AUGUSTUS, D. D., LL. D., L. H. D.: author and preacher; b. near Emmitsburg, Md., Mar. 18, 1823; student in Pennsylvania College, Gettysburg, Pa.; ordained to the Lutheran ministry 1844; pastor in Virginia 1842-47, Cumberland, Md., 1847-52, Baltimore 1852-54, Philadelphia since 1858. He is a preacher of extraordinary power. His literary career began with *Lectures on the Epistles to the Hebrews* (1846), and has continued until his books and pamphlets number considerably over 100. His *Gospel in Leviticus* was republished in England, and his *Lectures on the Apocalypse* has been translated and published in Germany and Holland. He has been editor of *The Prophetic Times* and *The Lutheran*. He is one of the founders of the General Council, of which, as well as of the ministerium of Pennsylvania, he has been president. He has been president also of the board of trustees of the Philadelphia Seminary almost ever since its foundation, and a member of the committee that prepared *The Church Book* and *The Common Service*. H. E. JACOBS.

Seistan, sās-tawn', or Sistan: district divided between Persia and Afghanistan, Central Asia; between lat. 30° and 32° N. and lon. 60° and 62° E., bordering W. on the Persian provinces of Khorassan and Kirman. The surface forms an extensive depression, toward which the surrounding table-lands slope gently. The soil consists either of quicksand or of a stiff clay covered with coarse grass and tamarisk-bushes, and uncultivable except along the rivers, which from the surrounding highlands gather in the middle of the

on them, but with hydrochloric acid they evolve chlorine, forming selenious acid and chlorides.

Revised by IRA REMSEN.

Selenious Oxide: the only oxide of selenium known. It is a solid white substance obtained by combustion of selenium in oxygen, or by evaporating selenious acid to dryness. Its formula is SeO_2 . It sublimes, without fusing, below redness, condensing in crystals, and is very deliquescent. Its compound with water, selenious acid (H_2SeO_3), is a strong acid, which decomposes, with heat, the chlorides and nitrates, and forms neutral salts with bases, being exceptional, nevertheless, in being decomposed by heat, as above intimated. The selenites are bibasic, and large numbers have been prepared and investigated, but for these the chemical text-books must be referred to.

Selenite [from Lat. *selenites* = Gr. *σεληνίτης* (sc. λίθος, stone), deriv. of *σελήνη*, moon. So called from its luster]: a mineralogical name for gypsum. Dana believes that the *σεληνίτης* of Dioscorides was probably really crystallized gypsum, but not the *selenitis* of Pliny. Discoveries in molecular structure indicate two distinct varieties of the species selenite or gypsum—allotropic modifications, as they may be called—one having density, when homogeneous, = 2.818 (Mohs found 2.81, and Kennigott, as the mean of 15, found 2.817), and the other = 2.837 (Fihol found 2.831).

Selenium [Mod. Lat., from Gr. *σελήνη*, moon. So called from its chemical analogy to *tellurium* (from Lat. *tellus*, earth), being as it were a companion to it]: a chemical element discovered by Berzelius in 1817. Sulphur, selenium, tellurium, and oxygen form Berzelius's natural amphigen group of elements, which are certainly separated widely from the halogen group in many respects, though fluorine apparently forms a connecting link, having many affiliations with both groups. Selenium must be considered one of the rarer elements, though several native mineral compounds of it are known. The mineral *clausenthalite* is selenide of lead, *zorgite* a double selenide of lead and copper, these being the principal sources of commercial selenium, and somewhat common in the mines of the Hartz Mountains, at Tilkerode, Clausthal, and Zorge, also at Glasbach in Thuringia. *Lehrbachite* is a selenide of lead and mercury from the Hartz; *berzelianite*, a selenide of copper from the same, and from Skrikerum in Småland, Sweden; *eucairite*, a copper and silver selenide, also from Skrikerum, and found in several Chilian localities; *naumannite*, a silver-lead selenide from the Hartz. There is a silver selenide in crystals at Tasco in Mexico (del Rio); *tiemannite*, a mercuric selenide, from the Hartz; and a few others less known. Certain iron pyrites, as at Fahlun in Sweden, contain selenium; and when these are used for making sulphuric acid, a seleniferous deposit forms in the leaden chambers, in which, indeed, the element was first discovered by Berzelius. Selenium is obtained principally from the dust that accumulates in the flues of sulphuric-acid works, and of roasting-furnaces where iron pyrites containing selenium are used. The relative quantity of selenium in the pyrites is very small, but the product of its combustion is a solid that is much less volatile than the gases given off in the burning of the pyrites, so that this product accumulates in the flues. In order to obtain the selenium from the dust, this is treated with an oxidizing agent, either nitric acid or a nitrate, and the selenium thus all converted into the dioxide, SeO_2 , or into a salt of selenic acid, H_2SeO_4 . Both of these oxides are easily reduced by sulphurous acid, the element selenium being precipitated.

There are at least two modifications of selenium which correspond to those of SULPHUR (*q. v.*). One is slightly soluble in carbon disulphide, the other is not. The soluble form is obtained by reducing selenious acid by means of sulphurous acid, or other reducing agent. The insoluble variety is obtained by melting selenium and rapidly cooling it. The soluble form is crystalline, the insoluble form is amorphous.

Selenium does not kindle easily, like sulphur, but when heated strongly will burn in the air; and selenides will burn before the blowpipe. A characteristic odor accompanies this combustion, compared by some to that of horse-radish, by which the presence of selenium in a mineral can be detected by those who know the odor.

Compounds.—Seleniatted hydrogen, corresponding to sulphuretted hydrogen, is one of the most interesting of these. It is a permanent gas, which may be formed by the action of an acid on selenide of potassium, or by heating selenium in a current of dry hydrogen to its vaporizing-point. At a

higher temperature dissociation again occurs. It is very poisonous, producing catarrhal disease when inhaled, and destroying the sense of smell. It does not liquefy at -15°C .

The electrical conductivity of selenium is influenced to a remarkable degree by heat and light. Amorphous selenium does not conduct electricity, but the crystallized does so, and the conductivity increases rapidly with a rise in temperature. According to the latest investigations, however, amorphous selenium conducts electricity when heated to 165° or 175°C , and higher.

Revised by IRA REMSEN.

Seleucia, sel-yoo'see-aa, or **Seleucia** (Gr. *Σελεύκεια*) sel-yoo'-see-aa: the name of several cities founded mostly by Seleucus I., Nicator. 1. A city on the Tigris. In the time of Titus it had a population of 600,000; it was partially burned in 116 A. D. by Trajan, and was destroyed in 162 A. D. by L. Verus.—2. SELEUCIA PIERIA in Syria, near the mouth of the Orontes.—3. SELEUCIA on the river Belus in Syria.—4. SELEUCIA in Northern Palestine.—5. SELEUCIA SIDERA discovered by G. Hirschfeld in the plain of Isparta in Pisidia.—6. SELEUCIA in Pamphylia near the mouth of the Eurymedon.—7. SELEUCIA on the Calycadnus in Cilicia Tracheia, the scene of the drowning of Barbarossa. J. R. S. STERRETT.

Seleucidae: one of the five great dynasties of ancient Persia before the Mohammedan conquest. After the death of Alexander the Great (b. c. 323) the vast empire, including Iran, that had been brought under his command, fell apart, and Syria became one of the recognized ruling powers under Seleucus Nicator (ruled b. c. 312–281), who had been one of Alexander's generals. This vigorous commander became the founder of the kingdom of the Seleucidae. He was succeeded by his son Antiochus I., Soter (b. c. 280–261), and the latter in his turn by a son, Antiochus II., Theos (b. c. 261–246). Under the first Seleucids the Greek sovereignty over Persia was preserved intact for nearly seventy years; its unity, however, was broken about b. c. 256 by the revolt of Bactria, and in b. c. 250 by the rebellion and rise of Parthia as an independent power under Arsaces. The Seleucid supremacy itself may be said to have ceased in Iran about b. c. 150, at the time of the Parthian monarch Mithradates the Great. It had lasted less than two centuries, and as a factor in Persian political history its existence was even less than a hundred years in duration. A. V. WILLIAMS JACKSON.

Seleucus (in Gr. *Σελεύκος*): the name of several rulers of antiquity. 1. SELEUCUS I., Nicator, one of the generals of Alexander the Great, b. in 365 B. C. In 321 B. C. he became governor of Babylonia and in 317 of Susiana. He was forced by Antigonus in 315 to flee to Ptolemy in Egypt. In 312 he was victorious over Antigonus and regained control of Babylonia, Susiana, and Media. This year (312 B. C.) was the beginning of the Seleucid era. Henceforth his arms were uniformly successful, and he advanced into India farther even than did Alexander, thus gaining the title of *Nicator*. He was the first of all the successors of Alexander to assume the title of king. In the battle of the kings at Ipsus in 301 he chiefly was instrumental in causing the defeat of Antigonus, and he thus added Armenia, Southern Asia Minor, and Syria to his kingdom. He then allied himself to Demetrius Poliorcetes, whose daughter Stratonice he married, but he soon became involved in a war with Demetrius, and, having taken him prisoner, held him in captivity until his death in 283. His war with Lysimachus ended in 282 with the addition of Asia Minor to his empire, which thus extended from the western seaboard of Asia Minor to India, and was divided into seventy-two satrapies. His aim, contrary to that of Alexander, was to Hellenize the Orient, and he was successful to a degree, but the removal of his capital from Seleucia on the Tigris to Antioch on the Orontes tended to estrange the two elements. In 281, in addition to the surrender of his wife Stratonice, he gave the whole of Asia to his son Antiochus, and himself undertook the conquest of Macedonia, but was murdered by Ptolemy Ceraunus in 281 B. C. before he could accomplish his object.—2. SELEUCUS II., CALLINICUS, the great-grandson of Seleucus I., reigned 246–226 B. C. He could not withstand Ptolemy Evergetes, King of Egypt, who to avenge the murder of his sister Berenice advanced victoriously against Seleucus as far as Susa, and in 239 added Palestine, Phoenicia, and Coele Syria to Egypt. Antiochus Hierax, the younger brother of Seleucus, declared himself King of Asia Minor, but was subdued. The Parthians then revolted, and in 238 were victorious over Seleucus, thus founding the Parthian kingdom. Attalus, too, sought for a slice of the crumbling empire, and in 226 defeated Seleucus, who in fleeing from the battle was

been torn from his home and killed.—4. Socrates III, Socrates, aged from 220 to 222 B.C., and was assassinated when uninvolved in a war with Athens.—5. Socrates IV, Philopator, aged from 187 to 179 B.C., tributary to the Romans.—6. Socrates V, reigned 135, 134 B.C.; was murdered by his son Cleopatra.—7. Socrates VI, reigned 86-85 B.C.; died at Capri, shortly after which Tiberius absorbed the remains of the Roman empire. J. R. S. Socrates.

Self-consciousness: consciousness of self as a person, the highest form of consciousness. The notion of self, like all notions, is a gradual growth. The vague feeling of being which the first affective experiences afford, the feeling of modification in consciousness as the background of sense of presentation, and the recurrence of this feeling and again in connection with objects new and old—attached to this the mass of more constant organic and intellectual—all this is the beginning of the sense of personality or self. Its attributes of permanence, identity, and unity become more prominent with the development of self in connection with movement, effort, and with the establishment of the relation of subject and object, which is truly a fundamental fact. By reflection is meant the feeling of the mind to itself as its own object. By the sense of reflection is meant, therefore, the knowledge which the mind has of its own operations, recognized as its own. It is an advance on the simple awareness of consciousness, which there is no reference to self, as different from its object. In reflection this reference has distinct place, and the self is discovered through the act of attentive inspection as having and exercising the characteristics of mind.

Sense of self.—Through reflection, therefore, the idea of self is attained, and assumes its important place in the mental world. Around the self as a center the intellectual life plays. To it all possible forms of experience are referred. It brings experience into the circuit of consciousness by giving a center of reference and a circumference of limitation to the individual. The growth of the sense or idea of self is one of the most interesting chapters in the mental growth of the child. One of the most remarkable tendencies of the very young child in its responses to its environment is the tendency to recognize differences of personality. It responds to what is called suggestions of personality. As early as the second month it distinguishes its mother's or nurse's touch in the dark. It learns characteristic methods of feeding, taking up, putting, kissing, etc., and adapts itself to a marvelous accuracy of protestation or acquiescence to these personal variations. Its associations of personality become such imperatives that for a long time its happiness or misery depends upon the presence of certain kinds of personality suggestion. It is quite a different thing from the child's behavior toward things which are not persons. Things become, with some few exceptions which are involved in immediate gratification of appetite, more and more impersonal, things not subordinated to regular treatment or method. But persons are constantly more important, as unbroken and dominating agencies of pleasure and pain. Movements of persons and its effects on the infant seem to be the most important factor in this peculiar influence; later the mere sounds for a person's presence, and at last the face and movements equal the person in all his attributes.

Probably this distinction between persons and things, between agencies and objects, is the child's very first step away from what has been called a "projective" consciousness. The sense of uncertainty or lack of confidence grows stronger in its dealings with persons—an uncertainty dependent upon the moods, emotions, readiness of expression, and modes of treatment of the persons around it. A person seems to a group of experiences quite unstable in its position as it is in its historical meaning. This, assuming it is not in order of development, may be called the projective stage in the growth of the personal consciousness, which is an important element in social emotion.

Further description of children shows that the instrument of distinction from such a projective to a subjective sense of personality is the child's active bodily self, and the method is the principle of imitation. As a matter of fact, accommodation by actual muscular imitation does not arise in human children until about the seventh month, so utterly opposed is the child before this, and so great is the impetus of its various instincts and tendencies. But when the organism is ripe, by reason of cerebral development, for the accommodation of its active range by mere accommodation, then it begins to be dissatisfied with projects, with contempla-

tion, and so starts on its career of imitation. And of course he imitates persons. Persons have become, by all his loneliness with them and theirs with him, his interesting objects, the source of his weal or woe, his uncertain factors. And, further, persons are bodies which move. And among these bodies which move, which have certain projective attributes, as already described, a very peculiar and interesting one is his own body. It has connected with it certain intimate features which all others lack. Besides the inspection of hand and foot, by touch and sight, he has experience in his consciousness which are in all cases connected with this body—strains, stresses, resistances, pains, etc.—an inner felt series matching the outer presented series. But it is only when there arises a new kind of experience called effort—a set opposition to strain, stress, resistance, pain, an experience which arises, probably, first as imitative effort—that there comes that great line of cleavage in his experience which mediates the rise of volition, and which separates off the series first really subjective. Persistent imitation with effort is probably the first explicit volition, and the first germinating nucleus of self-hood over against object-hood. Situations before accepted simply are set forward, aimed at, wrought; and in the fact of aiming, working, the fact of agency, which arises from the child's realization of the possible capriciousness of character, is the nascent sense of subject. The subject-sense is an actuating sense. What has formerly been projective becomes subjective. The associates of other personal bodies, the attributes which made them different from things, are attached to his own body with the further peculiarity of actuation. This may be called the subjective stage in the growth of the self-notion. It rapidly assimilates to itself all the other elements by which the child's own body differs in his experience from other active bodies—the passive inner series of pains, pleasures, strains, etc. The self suffers as well as acts. All are set over against lifeless things, and against living bodies which act, but whose actions do not contribute to his own sense of actuation or of suffering.

Again, it is easy to see what happens. The child's subject-sense goes out by a kind of return dialectic, which is really simply a second case of assimilation, to illuminate these other persons. The project of the earlier period is lighted up, clothed on with the reinvestment of self-hood, by analogy with the subjective. The projective becomes effective—i. e. other people's bodies, says the child to himself, have experiences in them such as mine has. They are also me's; let them be assimilated to my me copy. This is the third stage; the objective, or social self, is born.

The ego and the alter are thus born together. Both are crude and unreflective, largely organic, an aggregate of sensations, prime among which are efforts, pushes, strains, physical pleasures and pains. And the two get purified and clarified together by this twofold reaction between project and subject, and between subject and object. My sense of myself grows by imitation of you, and my sense of yourself grows in terms of my sense of myself. Both ego and alter are thus essentially social, which means imitative, creative; and for a long time the child's sense of self includes too much. The circumference of the notion is too wide. It includes the infant's mother, and little brother, and nurse, in a literal sense; for they are what he thinks of and aims to act like by imitating, when he thinks of himself. To be separated from his mother is to lose a part of himself, as much as to be separated from a hand or foot. And he is dependent for his growth directly upon these suggestions which came in for imitation from his personal milieu.

Self-emotions.—The emotions which terminate on one's self must be clearly distinguished from the feeling proper of self. The feeling of self underlies all other forms of consciousness when self-consciousness has once arisen. Assuming this to be so, whatever self may be, we find that the contemplation of self, when it becomes the object of our reflection, arouses certain spontaneous and peculiar forms of emotional excitement. These are the emotions of self.

Such emotions attend either an exalted estimate of one's own person or possessions, or, on the other hand, a deprecatory estimate. The former may be called emotions of pride, and the latter emotions of humility. Looked at casually, emotions of pride include the states ordinarily called pride, vanity, haughtiness, conceit, superiority, complacency, arrogance, self-confidence, forwardness, etc.; and under emotions of humility are humility, modesty, self-debasement, self-distrust, inferiority, bashfulness, meanness of spirit, weakness, poverty, shame, etc. See IDEAL FEELINGS.

Seligman, EDWIN ROBERT ANDERSON, LL. B., Ph. D.: professor of political economy and finance; b. in New York, Apr. 25, 1861; graduated at Columbia College 1879; studied three years at the Universities of Berlin, Heidelberg, Geneva, and Paris; at Columbia College Law School and School of Political Science 1882-84; lecturer on Political Economy, Columbia College, 1885-87; adjunct professor 1887-90; Professor of Political Economy and Finance 1890; treasurer of the American Economic Association 1885-90; associate editor *Political Science Quarterly* since its establishment in 1886; author of *Railway Tariffs and the Interstate Commerce Law* (1887); *Two Chapters on the Medieval Guilds of England* (1887); *Finance Statistics of the American Commonwealths* (1889); *Taxation of Corporations* (1890); *On the Shifting and Incidence of Taxation* (1892).

C. H. THURBER.

Se'lim: the name of three Ottoman sultans. **SELIM I.**, YAVUZ, the Inflexible (1512-21); b. 1467. By the aid of the janissaries he usurped the throne, deposing his father Bayezid II., whom he is believed to have poisoned shortly after. Then he put to death all his brothers and kinsmen. Attacking Persia he defeated Shah Ismail at Calderon with immense slaughter (1514) and annexed Kurdistan and Mesopotamia. Conquering Syria (1516), the title Servant of the Two Holy Cities (Mecca and Medina), hitherto reserved to the caliphs, was added to his name in the official prayer. He subdued Egypt (1517), hanging at the gate of Cairo the heroic Mameluke sultan Touman Bey. The sherif of Mecca sent him the keys of the Kaaba, and Mohammed XII., the last Abasside caliph, resigned to him the insignia and the rights of the caliphate. Since then the Ottoman sultan has been considered both political and spiritual head of Islam. The next three years he devoted to reorganization of his empire. Excessive use of opium hastened his end, and he died at Tchörliu (1521), the very place where eight years before he had fought against his father. A gifted poet, profound scholar, farsighted statesman, and resistless conqueror, he was bloodthirsty and cruel beyond expression. He is the only parricide among the Ottoman sultans.—**SELIM II.**, MEST, the Drunkard (1566-74); b. 1524; son of Suleiman II., and Roxelana. His generals subdued Western Arabia (1567) and Cyprus (1571), but lost the naval battle of Lepanto (1571), where 220 Ottoman ships were sunk or captured, 30,000 prisoners taken, and 15,000 Christian galley-slaves set free. Meanwhile Selim cared only for intoxication and the pleasures of the harem, and died from over-indulgence in wine (1574).—**SELIM III.** (1789-1807); b. 1761; son of Mustapha III.; succeeded his uncle Abd-ul Hamid I. At his accession the empire seemed near dissolution. Syria was in rebellion; Egypt was tyrannized over by the Mamelukes; the Persians and Kurds menaced the eastern frontier; armies of brigands marched through the provinces; a hopeless war against Russia and Austria was going on. Selim was the first sultan animated by Western ideas. Ridding himself of the foreign war by the disastrous treaty of Jassy (1792), he endeavored to repress disorder and introduce administrative, commercial, and military reforms. But popular fanaticism denounced his innovations as violations of the Koran. The support he received from France through the French ambassador, Gen. Sebastiani, excited the jealousy of Great Britain. A British fleet appeared before Constantinople, but was repelled. Finally the janissaries and the Mussulman clergy combined; Selim was deposed and confined in the seraglio and his cousin Mustapha IV. raised to the throne (1807). The following year Balractor Pasha, his devoted adherent, marched upon Constantinople with a formidable army. Thereupon Mustapha had Selim bowstrung, and Balractor penetrated the palace in triumph, only to find the corpse of his master in the throne-room. E. A. GROSVENOR.

Selimnia or Islimiye: See SLIVNO.

Selinsgrove: borough; Snyder co., Pa.; on the Susquehanna river, and the Penn. Railroad; 50 miles N. of Harrisburg, the State capital (for location, see map of Pennsylvania,

ref. 4-F). It has good water-power; is in an agricultural region; contains a national bank with capital of \$50,000; a monthly and two weekly newspapers, several sawmills and planing-mills, and sash-factories; and is the principal outlet for the produce of the county. The Missionary Institute of the Evangelical Lutheran Church (chartered in 1858) is located here. Pop. (1880) 1,431; (1890) 1,307.

Seli'nus (Gr. Σελίνους): ancient city; on the southwest coast of Sicily; was founded in the seventh century B. C. by a Megarian colony, and derived its name from the quantity of wild parsley (σέλινον) which grew in the vicinity. A strong and flourishing city, it was almost ruined by the Carthaginians under Hannibal Gisco, when 16,000 of its inhabitants were massacred and 5,000 made slaves (409 B. C. and was entirely destroyed during the first Punic war (264-241 B. C.). Its ruined temples served as a refuge to the early Christians, but it was never rebuilt. These temples are the vastest in Europe. The last-built and largest, measuring 369 feet by 178 feet, with seventeen columns on each side and double porticoes, was erected toward the middle of the fifth century B. C., and consecrated to Apollo. Its finest sculptures have been removed to the Museum of Palermo. See Benndorf, *Die Metopen von Selinunt* (Berlin, 1873); and Baedeker, *Southern Italy and Sicily*.

E. A. GROSVENOR.

Seljuks, sel-jooks': a Turkish tribe which, being driven from the highlands of Turkestan, settled in the plains of the E. of the Caspian Sea. There they were converted to Islam. They were famous for strength and courage, and the Caliph Motassem (833-842), chose his body-guard from among them. Under the leadership of their chief Seljuk—whence the tribe derives its name—these guards revolted, seized the temporal power, and founded an independent state in Khorassan, though all the time acknowledging the spiritual supremacy of their former masters. Togrul Beg, grandson of Seljuk, conquered Balkh and Khwarezm (Khiva) in 1041, Irak Adjemi (1043), Kerman and Fars (1047), Bagdad (1055), and Irak Arabi and Mosul (1062). Having thus completed the subjugation of Persia, he assumed the title of sultan. The extent and prosperity of the empire largely increased under his nephew Alp-Arslan (1063-73), the conqueror of the Byzantine emperor Romanus Diogenes, and under Malek Shah (1073-93), the son of Alp-Arslan. Malek Shah conquered Arabia, Syria, and Palestine, Armenia, and a large part of Asia Minor, ruling as far as the Chinese frontier and from the Caspian to the Arabian Sea. He founded at Bagdad a law school and an observatory, the first established in Asia, but removed the capital to Ispahan. He encouraged the construction of roads, bridges, canals, and works of public utility, being ably seconded in all his undertakings by his vizier, Nizam-ul-Mulk. The rapid growth of the power of the Seljuks was due to their religious ardor, to the skill and intrepidity of their early chiefs, and to their peculiar facility in assimilating not only their kindred of Turkish stock, but also subject races. Their decline dates from the division of their empire by Malek Shah into sultanates for his four sons, followed by other divisions. The sultanate of Iran was the chief, and was to exercise a sort of authority over the others. It was swallowed up by the sultanate of Khwarezm (1194), which in turn was overthrown by the Mongols (1219), when the last sovereign Ala-Eddin and his gallant son Djiala-Eddin were utterly defeated by Genghis Khan. The sultanate of Aleppo fell in 1114, that of Damascus in 1155, and of Kerman in 1191. The sultanate of Iconium comprised nearly all Asia Minor, and lasted till 1290, when Ala-Eddin III., having fled from the Mongols, died at Constantinople. From its ruins arose ten principalities, one of which under the Emir Othman was in time to subdue all the rest and to develop into the Ottoman empire. The Seljuks of Iconium and Iran were the Mussulmans earliest and most frequently encountered by the hosts of the first and second crusades, and were their most formidable antagonists. E. A. G.

Sel'kirk: a county of Scotland, anciently called Ettrick Forest; bounded by the counties of Peebles, Edinburgh, Roxburgh, and Dumfries; area, 257 sq. miles; pop. (1880) 27,712. Its surface is composed principally of rolling grassy hills, the highest of which is Dun Rigg (2,433 feet), and it is chiefly devoted to cattle-raising. Selkirk was the birthplace of James Hogg, the "Ettrick Shepherd"; and of Mungo Park, the traveler; and it is noted in both literature and history. With Peeblesshire it sends one member to Parliament. The royal burgh of Selkirk, 39 miles S. W.

Edinburgh, is the county town. Pop. (1891) 5,799. It lies with Galashiels and Hawick in sending one member to Parliament.

Selkirk, or Sealchraig, ALEXANDER: (mariner); b. at Leith, Edinburgh, Scotland, about 1676; made several voyages to the Pacific; was sailing-master to a privateer called the *Chagres*; Ports Galley, and having quarreled with the captain, one Stradling, was put ashore, at his own request, Oct. 1791, on the uninhabited island of Juan Fernandez, off the coast of Chili, with some nautical instruments, a few tools, a knife, bottle, axe, gun, and a supply of ammunition. Here he remained until Feb. 12, 1799, when he was rescued by Capt. William Rogers of the privateer *The Duke*. He lived chiefly on the flesh of wild goats, which abounded on the island. He became mate to Capt. Rogers, whom he accompanied around the world; arrived in England Oct. 1, 1800, when his narrative appeared in an account of the voyage (1791), and in several separate publications. Selkirk subsequently entered the navy, rose to the rank of lieutenant, and died on board the *discovery* at Weymouth in 1793. His life's celebrated story of *Robinson Crusoe*, which appeared in 1719, has been generally supposed to be based on the adventures of Selkirk, by whom the incidents are said to have been communicated to De Foe, but there is evidence for supposing that the latter had more than general knowledge of the facts of the case. *The Life and Adventures of Alexander Selkirk* (Edinburgh, 1829), by John Howell, is the best source of exact information on the subject.

Selkirk, Thomas Dundas, Fifth Earl of: b. in Kirkcaldy, Scotland, June, 1771; studied at Edinburgh University; succeeded his father as earl in 1789; spent several of the later years of his life in promoting emigration to the Red River of the North, British America, where the name of Macintosh was long known as the Earl of Selkirk's lieutenant. He published *Sketch of the British Fur Trade* (1804); *The Red River Settlement* (1817), and other works. *New York Times*, Apr. 2, 1890.

Selkirk Mountains: a range of Southeast British Columbia, W. of the Rocky Mountains and N. of Idaho, lying E. of the upper Columbia and to the W. of Kootenai Lake. The range is about 175 miles long by 80 broad, the summit was first generally drawn to it by the difficulties encountered by the engineers of the Canadian Pacific Railway in finding a practicable pass across it. Its elevations are from 3,500 to 5,000 feet, and the highest mountain in the range is Mt. Macdonald (formerly Mt. Osoyoos), 9,240 feet high. It is near Rogers Pass, toward the northern end of the range, a narrow, rock-bound valley 1 mile long and 4,000 feet above the sea. Although the average elevation of this range is somewhat lower than that of the adjacent Rocky Mountains, its more abundant rainfall and lower cause a much larger development of glaciers and fields of perpetual snow, which also extend here to lower levels. The line of perpetual snow is formed at an elevation of about 5,000 feet, and the timber-line rises to 4,000 feet. Numerous mountains and other traces of ice-ages are seen that the glaciers were formerly much more extensive than now. The growth of trees is very abundant and rapid, and they attain a great size. Trunks 8 feet in diameter are not rare. There are many signs of minerals, and several lode-gold mines immediately W. The Selkirk Range is thought to present many features of resemblance to the Alps. Above explanation of the range began in 1888.

MARK W. HARRINGTON.

Selma: city; capital of Alabama, Ala.; on the Alabama river, at the head of navigation by steamboats, and the Birmingham, Selma, and N. O., the Louisville and Nashville, the Mobile and Birmingham, the Queen and Green Routes, the Gulfport, and the West. Ala. railways; 50 miles W. of Montgomery, 100 miles N. N. E. of Mobile (for location, see map of Alabama, vol. 5-C). It is in a cotton-growing country, and has a large trade in cotton, coal, lumber, and rice. It contains Selma University (Episcopal, opened in 1858), Young Men's Christian Association library and reading room, a national bank with capital of \$400,000, 2 State banks and national capital of \$150,000, and a weekly and daily newspapers. There are several cotton warehouses, sugar and rice stores, and manufactories. The city was destroyed once during the war of 1861-65, having an area of 2,000 acres, artillery-foundries, and powder-works, and was captured by the Union forces Apr. 2, 1865. Pop. 1880, 12,000; 1900, 7,682; (1895) estimated with suburbs, 10,000.

Errors or "MORNING TIMES."

Selters, or Seltzer Water: the water of a mineral spring at Selters, in the valley of the River Rhine, in Nassau, which has been known since the ninth century. Having become the most famous and widely known, probably, of all mineral waters, it is very skillfully and extensively imitated by chemical means in the U. S., as well as throughout Europe. It is an alkaline water, containing over 8 grains of sodium carbonate to the gallon, with 20 cubic inches of free carbonic acid. There are also minute quantities of lithia, baryta, and strontia, and of fluorine, with other common ingredients usually found in mineral springs.

Selwyn, ALBERT RICHARD CECIL, F. R. S.: geologist; b. in England, July 28, 1834; educated in Switzerland. In 1845 he was appointed assistant geologist on the Geological Survey of Great Britain; in 1859 appointed by the Secretary of State for the Colonies to undertake the geological survey of the colony of Victoria, Australia; and in 1864 and 1869 examined and reported on the coal-fields and gold-fields of Tasmania and Australia. He was appointed one of the Victorian commissioners of mines in 1869; a member of the board of science and of the prospecting board in 1868; commissioner for the Victoria International Exhibition in 1861; and acted in various other important capacities until he left Australia for Canada in 1866. In that year he succeeded Sir W. R. Logan in the superintendency of the Geological Survey of the Dominion. He was gazetted C. M. G. in 1891.

NEW MACDONALD.

Semantics, or Semasiology [*semantics* is from the *sema*, sign, significant, deriv. of *significatio*, show by a sign, deriv. of *sign*; *semasiology* is from *Gr.* *sema*, a signifying]; the doctrine of historical word-meaning; the systematic discussion of the history and development of changes in the meanings of words. The meaning of a word at any time is determined solely by its power to convey meaning to a speech-community at such time. The so-called "etymology" of a word exercises no restraint upon its meaning; it serves only to help in explaining how a present meaning came to be what it is. Thus the comparison of *Germ.* *klein*, little, with its predecessor O. H. *Germ.* *klein*, fine, small, and with its cognate English *cleen*, surer only to show that the meaning "little" came to the word by the route: *cleen*, neat, trim, fine, small. Such determination of the history of meaning frequently aids most directly in fixing the horizon of a word's meaning, i. e. the range of its general or normal meaning, within which range the great variety of its occasional or special meanings is permitted. When the word *home* is used in the sense of an asylum, as a "home for the blind," it may be said to be a special or occasional use of the word made possible by the character of the general or normal horizon of the word's meaning. This general range of meaning covers application to an abode as habitual and permanent, and as being one's own. The intelligibility of the special uses is conditioned on the one hand by the general meaning, on the other by the power of interpretation involved in the context and situation. When it comes to pass that a special meaning displaces the general meaning and sets itself up in its stead as the general meaning, a shift of signification has taken place. Thus the word *head* once meant "prayer" (cf. *Germ.* *gohet*). It was also applied in special use to a bull of the tory that marked a prayer. This special meaning has become the normal meaning. See Paul's *Principien der Sprachgeschichte* (Eng. trans.), chap. iv.; Strong-Logeisen-Wheeler, *History of Language*, chap. iv.; Darmstadter, *The Life of Words* (1886); R. C. Trench, *Study of Words* (20th ed. 1888); also the article LANGUAGE.

BESSIE LEE WHEELER.

Semele, sem'ee-lée (*Gr.* *Σεμέλη*): in Grecian mythology, a daughter of Cadmus. She was loved by Zeus, and was persuaded by Hera to demand of her lover that he should visit her once in all his royal majesty. Zeus begged her to desist from this demand, but as she would not, and he had sworn to grant her any wish, he came to her with thunder and lightning, and she perished in the flames. At the time of her death she was pregnant by Zeus with Dionysus (Bacchus). Zeus cut the infant from the womb of the dying Semele, made an incision in his own thigh, and concealed the child therein until the full time for his birth had come, when he was born for the second time.

J. H. S. S.

Semering: See SEMERING.

Seminaries, Theological: See SCHOOLS.

Seminole Indians: See MUSKOGEEAN INDIANS, UNITED STATES (History), and OKMOLA.

Semipalatinsk: Russian province and town of Central Asia. The province is on the upper Irtysh river, between Siberia and Lake Balkash. Area, 184,631 sq. miles. It is of triangular form, with the apex directed N. A range of mountains and hills which runs E. and W. through its middle separates the great steppe of the Irtysh on the N. from the steppe of Balkash on the S. Pop. (1890) 576,578, four-fifths of whom are Kirghiz, who are generally nomadic. The remainder are nomadic Kalmuks and sedentary Russians, Sarts, and others. The chief town is Semipalatinsk, on the right bank of the Irtysh, in lat. 50° 24' N. (see map of Asia, ref. 3-E). Although of administrative importance, it is a cheaply built and decaying town, surrounded by the bare steppe, and in constant danger from moving dunes. The climate is rigorous, and industry and traffic are small. Pop. 18,000.

MARK W. HARRINGTON.

Semi-Pelagianism: See ANTHROPOLOGY (*Theological*).

Semiramis: according to Ctesias, the wife of Ninus, founder of the Assyrian kingdom,—a woman of extraordinary beauty, passion, and military prowess who flourished nearly 2,200 years B. C., survived and eclipsed her husband, and after a reign of forty-two years abdicated in favor of her son, Ninyas. All this is admitted to be mythical. Herodotus (*Hist.*, i., 184) mentions a Semiramis who ruled over Babylon five generations before Nitocris. This Semiramis of Herodotus is certainly not to be identified with the Semiramis of Ctesias. The name appears to have been derived from Sammuramat, found upon the monuments, wife of the Assyrian king Rammanirari III. (811–782 B. C.).

Semirechensk: Russian province of Central Asia; S. of Lake Balkash, and bounded on the S. and E. by Chinese territory; area, 152,280 sq. miles. The province is oval in form, with the long axis N. and S. It falls into two natural divisions, the northern plain and the southern and western mountainous region. The plain is the country of the "seven rivers" (Russian, *Semiretchie*), all tributaries of Lake Balkash. This part is dry, largely sandy, in some places a sandy desert, grows strongly alkaline toward the lake, and has a rigorous climate. The mountainous region includes a part of the Thian-shan range and many lakes, the largest being Issykul; has more rain, a milder climate, and considerable forest growth. Production and trade are very small. Pop. (1889) 671,878, largely Kirghiz, the remainder of many races, fully half nomadic.

MARK W. HARRINGTON.

Semitic Languages [*Semitic* (i. e. pertaining to Shem or his descendants) is based on the Greek transliteration (Σήμ) of Heb. *Shēm*, which literally means name, sign, celebrity]: a well-defined group of languages co-ordinate in importance with the group known as the Aryan or Indo-European, but sharply marked off from it. The principal representatives of the Semitic group are, in alphabetical arrangement, Arabic, Aramaic, Babylonian, Ethiopic, Hebrew, Phœnician, and Syriac. The name Semitic is an inexact term. It rests on the assumption that the nations classed in the tenth chapter of Genesis among the sons of Shem spoke languages belonging to a single group, and embraced also all the members of that group. Neither proposition is correct. The principle governing the order of enumeration in the famous table of nations is geographical position, and not linguistic affinity. Instead of Semitic, various terms have been proposed, the most satisfactory among them being Syro-Arabic, first suggested by Renan.

The basis of union between the languages belonging to the Semitic group is such that they form intersections of one and the same branch, in contradistinction to the Aryan languages, where two distinct branches emanating from the parent trunk are recognized; and, again, a subdivision into north and south is sufficient for the Semitic group, while in the case of the Aryan eight grand divisions are commonly recognized. The relation of any North Semitic language to a member of a South Semitic is closer than that between members (say) of the Indo-Iranian and the Teutonic division, and almost as close as that marking (say) the English and German within the Teutonic division. Correspondingly, within the Northern and Southern Semitic divisions the members stand in a relation toward one another closely approaching that of co-ordinate dialects.

The intimate relationship thus indicated between the languages of the Semitic group is due to a variety of causes, prominent among which are (1) the comparatively limited territory over which the languages are spread; (2) the uninterrupted communication in consequence largely of this limited territory among the nations speaking or adopting a

Semitic language; and (3) the closer ethnic relationship of the Semitic nations, only two races being distinguished by scholars, as against five adopted for the Aryan group.

The chief traits characterizing the Semitic languages are—(1) the peculiar relations existing between the consonants and vowels whereby the former constitute the essential elements of a stem and of its accretions, while the latter play the subsidiary though important rôle of particularizing the general meaning conveyed by the consonantal framework. (2) The triliteral character, either actual or adapted, of the stems within the historical period of the language. The comparatively small number of instances in which the number of consonants constituting the stem are four, and still more rarely five, are only apparent exceptions to the rule. (3) The arrested development in the expression of the time-relations in the case of the verb, which, starting out with the vague differentiation by means of pronominal affixes between the emphasis placed on the act and when placed on the actor, does not pass beyond the stage of distinguishing between the act when completed, whether in reality or in the mind of the speaker, and when not similarly completed. (4) The pragmatic character of the verbal and nominal formations and the parallel relationship existing between the two. The Semitic stem as such has both substantive and verbal force, and while the actual number of modal variations differs for the different languages of the group, the manner of expressing the variations, (a) by means of the reduplication of the second or third letter of the stem, (b) by vocalic lengthening after the first consonant or by a vocalic prefix, (c) by the prefixing of certain consonants *n*, *h*, *sh*, *t*, is the same in all; and not only does the noun-formation follow the same principles, but the agreement with the verb is such as to indicate the ultimate fusion of the two. (5) The paucity of auxiliary particles, more particularly of conjunctions.

Besides these general traits, there are a number of other features of a secondary order which the Semitic languages have in common. Thus, the general agreement of the vocabulary is very large, embracing a considerable number of common words, the pronouns in the first instance and terms of relationship in the second, as well as verbal stems. But within the Semitic group the agreement is closer between some as against others. The general character of the Semitic syntax is marked by its simplicity, and there is less variation between the languages in this respect than one would perhaps expect until we come to the period of a closer contact between Indo-Europeans and Semites.

Perhaps the most noticeable point of variation among the Semitic languages is to be found in the writing employed. They present at least three distinct alphabets: (a) The cuneiform characters of Babylonia and Assyria; (b) the Phœnician and its derivatives, the square-letter Hebrew, Palmyrene, Arabic, Syriac, Samaritan, together with the alphabet of the South Arabic and Abyssinian inscriptions as the probable prototype of the Phœnician; and (c) the Ethiopic, which is sufficiently distinct to merit a place for itself.

On the basis of the features enumerated the division into North and South Semitic languages is made. To the former belong the Phœnician, Hebrew, Moabitic, Babylono-Assyrian, and the various Aramaic dialects, biblical Aramaic, Palmyrene, Nabatean, the idioms of the Babylonian and of the Palestinian Talmuds, Samaritan, the North Arabic and ancient Syrian inscriptions, Syriac—Eastern and Western—Mandaic, and the modern Syriac dialects of Urmia, Tur Abdin, Salames, and of the Lebanon district. To the Southern division belong (1) classical Arabic, and the modern dialects of Egypt, Syria, and Morocco, with Maltese as a fourth, developed under Italian influence; (2) Sabæan, also known, though less correctly, as Himyaritic, of which Minæan is a dialect, and which appears to survive in some dialects spoken along the southern coast of Arabia; (3) Ethiopic or Gêz, spoken in the ancient kingdom of Abyssinia, and surviving in the modern dialects of Tigre, Tigrina, and Amharic, together with its offshoots, Gurague and Harar.

By way of simplification the North Semitic group can be said to comprise (1) Hebræo-Phœnician, (2) Babylono-Assyrian, and (3) Aramaic; and the South Semitic (1) Arabic, and (2) Yemenitic-Abyssinian. Taking these up in turn, the Hebrew and Phœnician bear so close a resemblance to one another that they may be regarded as co-ordinate offshoots of some older and lost form. Of the two, the Phœnician on the whole presents the more archaic aspect. Of literature in the true sense nothing has survived in the original Phœnician. Instead there are inscriptions on tombs, tem-

ing where offerings, seals and coins covering the period from about 800 B. C. to the third century A. D., and significantly as being contemporary with the large domains over which the language spread. The Phoenician script is as old as 1000 B. C. In the course of time slight variations arose between the Phoenician of the mainland and that spoken in the various settlements, but hardly sufficient to affect seriously the unity of Phoenician speech.

Of the Hebrew language, the oldest written remains, which date from the seventh century B. C. (see HEBREW LANGUAGE), reveal an alphabet still identical in form with Phoenician. The so-called square characters do not make their appearance till the fourth century of this era. In the Old Testament, which is the chief source of our knowledge of Hebrew, the language grows unperceived by the late editing of the various books composing it, and the unobtrusive preservation of the oldest remains occasion great difficulties in tracing the development of the language. So much, however, is certain, that the approach to the Aramaic is closer in what may safely be regarded as the earliest sections of the collection.

The bulk of the Old Testament literature, while thus containing elements of varying antiquity, dates in its present form from the centuries intervening between 600 and 500 B. C. The Psalms (with some exceptions), Proverbs, Lamentations, Ecclesiastes, Song of Songs, Ruth, Job, Esther, and Daniel as well as the final version of the Pentateuch, belong to the period subsequent to the Exile, the latest being in all probability Daniel and Ecclesiastes, which are to be placed in the second century B. C. After this time Hebrew still continues to flourish as the sacred language of the synagogue, and the medium of interchange between the Jewish colonies, gradually giving way to the Aramaic idiom adapted to the population upon the return from the Babylonian exile.

Of *Mandaic* speech there is only a single specimen—the monument of King Meshia dating from about 250 A. D., and found in 1879 at Diarra, the capital of ancient Moab. The inscription suffices to prove the practical identity of the Mandaic with Hebrew, and it is likely that the speech of the various other tribes and small principalities settled around the head seas and other parts of the Sinai peninsula did not differ materially from the speech of Moab.

Chaldean Assyrian is the language spoken by the ancient inhabitants of the country roughly included between the Tigris and Euphrates. The southern part of the district, which may be distinguished as the Euphrates valley, is the older settlement. The oldest literary remains of Babylonian are the inscriptions of rulers who reigned over the petty kingdoms into which the valley was split up. Next come a few number of religious texts—hymns to the gods and incantations to gods and spirits. From the south, the culture passed to the north, which is distinguished as the Assyrian zone. About the twelfth century B. C. Assyria secures a perfect independence from Babylon, and soon obtains the supremacy over the latter. Beyond historical annals, however, no original literature was produced in Assyria, whereas in the south poetry, astronomy (in connection with astrology), and magic (as an offshoot of magic) continued to flourish. The writing used in both Babylonia and Assyria is the cuneiform, so called from the wedge-like forms that the letters in the later phases of their development assumed. See *Cuneiform Inscriptions*.

The larger bulk of Babylonian literature consists of commercial and legal tablets of clay, giving records of all kinds of transactions, of settlements of disputes, the detailed terms of contracts, accounts, etc. Ranging from the period of 2000 B. C. through the Persian and Greek supremacy over Mesopotamia down to within a few decades of the Christian era, they furnish the most important source for the study of the common speech. The language of the north remains identical in all but minor dialectical variations with that of the south. Occupying a position midway between Hebrew-Persian and the Aramaic group, it is yet marked by peculiarities in inflection and lexicographical features that indicate an approach to the South Semitic division.

The Aramaic group presents a greater number of subdivisions than the two others, and also covers a wider stretch of territory. The oldest specimens of Aramaic speech are the inscriptions found at Gundishapur in Northern Syria, which date from the eighth century B. C. The Gundishapur inscriptions mark the northern limit of Aramaic speech, the southern being the Sinai peninsula and Central Arabia. In the course of time Aramaic became the popular idiom of the great region lying between the Euphrates valley and the Taurus range, and extending to the N. as far as

the Taurus range. The traces of this wide reach are to be seen in the numerous dialects that arise within this district. The most notable of these are (a) the dialect of Palmyra; (b) the Samaritan, of which besides the translation of the Pentateuch and Joshua some religious fragments are preserved; (c) the Syriac proper, in reality the Aramaic dialect of the Christians at Edessa. Slight variations in pronunciation and expression, in addition to distinctive syntax, warrant the division into Eastern and Western Syriac. (d) A direct offshoot of biblical Aramaic is the later Palestinian dialect, in which the so-called Jerusalem Talmud is written; while (e) the idiom of the Babylonian Talmud represents an eastern variety of the same dialect, occupying a middle ground between biblical Aramaic and Syriac. Aramaic dialects survive in various degrees of corruption in the Christian settlements around the Lake of Van, in the Jordan mountains, and in some Lebanon villages. See ARAMAIC.

Arabic.—The most important of the languages of the southern group is the Arabic, which, through the Mohammedan conquest in the seventh century A. D. successfully carried the place of Aramaic speech in the Semitic world. During the four centuries of Mohammedan supremacy in both Orient and Occident the intellectual movement accompanying the spread of the new religion produced an extensive literature. The only specimens of Arabic literature older than the time of Mohammed are poetic compositions, which in the process of gathering lost some, if not much, of their ancient character. European interpreters with Mohammedan supremacy, which begins with the crusades, has acted as a powerful factor in destroying to some extent the unity of Arabic speech, so that the dialects of Syria, Egypt, and that of the western coast of Africa have become three distinct varieties. See ARABIC.

Sabaean.—What may be considered to be an ancient form of Arabic speech has been found on inscriptions discovered by travelers in various parts of Southern Arabia (Yemen, Hadramout), and in some Sabaean settlements of Central Arabia and in Abyssinia. They confirm the existence of an advanced culture which flourished in the south as early as least as 1000 B. C., and of which Abyssinian civilization appears to be an offshoot. In the Yemenite inscriptions two dialects are distinguished, the Sabaean proper and the Minæan. The alphabet of the Sabaean inscriptions presents some remarkable features. It is certainly more archaic than Phoenician, and this circumstance, taken in connection with the high rank of Sabaean culture, lends additional force to the theory (which is growing in favor among scholars) that makes the Phoenicians the borrowers instead of the inventors of their alphabet, and fixes the place of the invention in Southern Arabia.

Ethiopic, or, to use the native name, *Ge'ez* (meaning emigrant), falls in the direct line of succession to Sabaean, being the form assumed by the language at the time (about the fourth century A. D.) when Abyssinia became a Christian possession. The alphabet, while connected with the Sabaean characters, has developed, partly on independent lines, partly under Greek influence, in such a way as to present a sufficiently unique appearance.

The Ethiopic literature is almost exclusively religious. Ethiopic continues in use as the sacred language of the Christian Church in Abyssinia. The popular speech bears somewhat the same relation to Ethiopic as the modern Arabic dialects do to the language of the Koran, except that the variations between the several dialects are hardly so pronounced.

The Original Home of the Semites.—Any attempt to trace the origin of the Semitic languages in some common starting-point does not include the problem of the origin of the races which in historic times appear as integral parts of the Semitic world. Separating in this way the question of race from that of language, three theories regarding the cradle of the Semites at present dispute the field. The one starting out from the general proposition that the most ancient Semitic culture, other things being equal, arose in the oldest center of Semitic settlement, would place in the Euphrates valley the original home of the Semites. A second view, held by perhaps the majority of modern scholars, seeks the home of the Semites in Arabia, as being the most favorable for the production of traits, customs, and religious ideas regarded as peculiarly Semitic. More recently evidence has been adduced in favor of Africa as the starting-point both of Semitic speech and of Semitic migration. An important factor in this theory is the relationship that has been demonstrated to exist between Egyptian and the Semitic

languages, a connection so close as to warrant the assumption of a common origin for the two, Egyptian itself being the result of a combination of a Semitic substratum with Hamitic elements. There is nothing improbable in the supposition of an eastern migration of Semites into Arabia and the Euphrates valley, and then by further moves an entrance into Palestine and Syria. If, as seems probable, the origin of the so-called Phœnician alphabet, which is so peculiarly adapted to Semitic speech, is to be sought in Southern Arabia, an additional support for what may be called the African theory will be found. See LANGUAGE.

LITERATURE.—Ernest Renan, *Histoire des Langues Sémitiques* (5th ed. Paris, 1878); William Wright, *Comparative Grammar of the Semitic Languages* (Cambridge, 1890); Theodor Noeldeke, *Die Semitischen Sprachen* (Leipzig, 1887); J. Barth, *Die Nominalbildungen in den Semitischen Sprachen* (Leipzig, 1889-91).

MORRIS JASTROW, JR.

Semler, JOHANN SALOMO: theologian; b. at Saalfeld, Saxe-Meiningen, Dec. 18, 1725; studied theology at the University of Halle, where he was appointed professor in 1751, and director of the theological seminary in 1757. D. at Halle, Mar. 14, 1791. He took a prominent part in the starting of the rationalistic movement in the German theology, but he was cautious in forming his views and careful in arguing them; and although his talent as an author was rather small, his works are pervaded by a spirit of genuine historical criticism, which exercised great influence. His principal works are *Apparatus ad liberalem Veteris Testamenti interpretationem* (Halle, 1773); *Abhandlung von freier Untersuchung des Kanons* (4 vols., 1771-75); *Versuch einer biblischen Dämonologie* (1776); *Versuch christlicher Jahrbücher* (2 vols., 1783-86); and an autobiography (2 vols., 1781-82). Revised by S. M. JACKSON.

Semlin (Hung. *Zimony*): town of Austria, at the eastern end of the military frontier, at the confluence of the Save and the Danube, opposite Belgrade (see map of Austria-Hungary, ref. 9-H). It is poorly built, a large portion consisting of mud huts, but it carries on a very important transit trade between Austria and Turkey. Pop. about 13,000.

Sem'mering, or Semering: a branch of the Noric Alps, forming the boundary between Lower Austria and Styria; rises 4,416 feet above the sea, and contains, at an elevation of 3,066 feet, the principal pass leading from Vienna to Trieste. The first carriage-road was built here in 1728 by Charles VI., who placed at the turning-point of the road a memorial column with the inscription, *Aditus ad maris Adriatici litora*. In 1840 a longer but more comfortable road was completed, and in 1854 a railway was opened between Gloggnitz on the Austrian and Mürzzuschlag on the Styrian side, ascending to 2,898 feet, and leading through fifteen tunnels and over sixteen viaducts. The road was constructed by Carlo Ciega, and was considered the most audacious and most ingenious engineering work of its kind.

Semmes, RAPHAEL: naval officer; b. in Charles co., Md., Sept. 27, 1809, of Scotch-Irish parentage; became a midshipman in the U. S. navy 1826; was a volunteer aide to Gen. Worth in Mexico 1847; became commander 1855; was secretary of the lighthouse board 1859-61; resigned at the beginning of the civil war; held a commission in the Confederate navy; obtained great notoriety by his exploits as commander of the Sumter and the Alabama in capturing and burning scores of U. S. merchant vessels. After the war he edited a daily paper in Mobile, Ala., subsequently becoming professor in the Louisiana Military Institute, but returned to Mobile to practice law. Author of *Service Afloat and Ashore during the Mexican War* (Cincinnati, 1851); *Campaign of General Scott in the Valley of Mexico* (1852); *The Cruise of the Alabama* (New York, 1864); and *Memoirs of Service Afloat during the War between the States* (Baltimore, 1869). He was editor of the *Memphis Bulletin* in 1867. D. at Mobile, Aug. 30, 1877. Revised by C. BELKNAP.

Semolli'na [from Ital. *semolino*, liter., dimin. of *semola*, bran (whence Fr. *semoule*, semolina) < Lat. *se'mila*, the finest wheat flour]: an article of food much used in France and Italy, and to a small extent also in Great Britain and other countries; consists of a finely cracked wheat, or a very coarse meal made from wheat. The hard-grained wheats of Spain, Odessa, and Southern Italy are best adapted for making it. As those wheats are not easily reduced to flour, small particles continually escape being crushed by the millstones, and after grinding they are separated into various grades. Semolina is used in making bread, puddings, and soups.

Sem'pach: village of Switzerland, canton of Lucerne; famous for the battle fought here on July 9, 1386, between the Austrians and the Swiss, in which the Austrian noblemen, in spite of their valor and superior numbers, were butchered like sheep by the Swiss peasants, as they were unable to use their horse, and unable to fight on foot encumbered by their heavy armor. The army of Duke Leopold, consisting of 4,000 horse, appeared before Sempach on July 9, 1386, and was there met by the confederated Swiss, numbering 1,300. As the ground was unfitted for the action of cavalry, the knights dismounted and formed themselves into a solid and compact body. The Lucerners charged, but the wall of steel was impenetrable, and not a man of the Austrians was wounded, while sixty of the bravest Lucerners, with their chief, were killed. Then Arnold von Winkelried, a knight of Unterwalden, rushed forward, grasped with outstretched arms as many pikes as he could reach, buried them in his bosom, and bore them down to the earth by the weight of his body. His companions rushed over his body into the breach thus made, slaughtered a great number of the armor-encumbered knights, and threw the remainder into the utmost confusion and dismay. See Otto Kleiser, *Die Quellen zur Sempacher Schlacht und die Winkelried-Sage* (Göttingen, 1873).

Semper, GOTTFRIED: architect; b. in Hamburg, Nov. 29, 1803; studied mathematics at Göttingen, architecture in Munich and Paris; traveled much in Italy, Sicily, and Greece; was appointed Professor of Architecture at Dresden in 1834; fled to London in 1849 on account of his participation in the revolutionary movements, and taught at the Royal Academy in Marlborough House till 1856, when he became Professor at the Polytechnic Institute of Zurich. In 1869 he was called to Vienna to give advice as to the proposed building of the museum, and in 1871 he settled there to superintend those important structures. In 1869 also he was employed upon the new Dresden theater in place of the one burned in that year; this building was not finished until 1878. His other important buildings are the Polytechnicum at Zurich, the Church of St. Nicolai in Hamburg, the synagogue at Dresden, etc. At the Universal Exposition of 1867 he exhibited a plan of a theater in Rio de Janeiro, for which he obtained a gold medal. He wrote *Die vier Elemente der Baukunst* (Brunswick, 1851); *Ueber Industrie, Wissenschaft und Kunst* (1852); *Der Stil in den technischen und tektonischen Künsten* (2 vols., Frankfurt, 1860-65), etc. He set forth with great decisiveness and defended with many ingenious arguments and acute observations the view that the antique architecture and sculpture were polychromatic throughout, and he decorated the antique department of the Art Museum of Dresden in accordance with this principle. D. in Rome, May, 1879.

Revised by RUSSELL STURGIS.

Semper, KARL: naturalist; nephew of Gottfried Semper; b. at Altona, Germany, July 6, 1832; was educated in the naval school of Kiel and the Polytechnic School of Hanover, and studied natural science in the University of Würzburg. After visiting the principal countries of Europe he embarked in 1858 for the Indies, visited Manila, the Philippine Islands, China, and Japan, and was after his return to Europe, in 1866, appointed Professor of Zoology at Würzburg, and held the position until his death May 29, 1893. He visited the U. S. in 1877, and delivered a course of lectures before the Lowell Institute, Boston, published under the title *Animal Life as affected by the Natural Conditions of Existence* (New York, 1881). He published *Reisen im Archipel der Philippinen* (Wiesbaden, 1867-72); *Die Philippinen* (Würzburg, 1869); *Die Palau Inseln im stillen Ocean* (Leipzig, 1873); *Die natürlichen Existenzbedingungen der Thiere* (Leipzig, 1880), and other works. He also edited 9 volumes of *Arbeiten aus dem Zoologischen Institut in Würzburg*. Revised by J. S. KINGSLEY.

Senancour, se-nān'koor', ÉTIENNE PIVERT, de: author of *Obermann*; b. in Paris in 1770; educated for the priesthood, but disliking that profession ran away from home and lived in Switzerland, whence after a brief period of married life he returned to France, saddened by the loss of his young wife and beggared in fortune. His scanty earnings as a hack writer in Paris were supplemented by a small pension granted by Louis Philippe, but his struggle with poverty combined with domestic misfortunes and ill health to give his books a tone of deep melancholy. His *Réveries sur la Nature primitive de l'Homme* (1799) is strongly marked by the influence of Rousseau. *Obermann* (1804) is the story of

a solitary and melancholy person, who gives expression to his skepticism and his weariness of life in a series of letters written from Switzerland. While the author belongs to the sentimental school of writers and the work is tinged with a somewhat morbid spirit, its style is good, and the subject-matter often striking and original. It exerted a considerable influence upon his own and the succeeding generation, and Matthew Arnold characterizes him as the most sincere and impressive of sentimental writers. D. at St.-Cloud, Feb., 1848.

Seneca [rēk ō fē; from Lat. *senectus* deriv. of *senex*, an old man, elder]; originally, the deliberative assembly of the Romans; in modern times the upper house of the national Legislature in the U. S. and in several other countries. See LEGISLATIVE.

Seneca Falls [sēnē'ka fāl's]; capital of Yates co., N. Y.; on the Genesee River, 33 miles S. of Albany (for location, see map of New York, ref. 3-E). It is in an agricultural region, is an important stopping-point of cars, cotton, and live-stock, and contains a Peabody public school, a State bank with a capital of \$25,000, and 2 weekly newspapers. Pop. (1880) 1,000; (1890) 1,077.

Sendai [sēn'dai]; an important city in the northeast of Japan; situated on the left bank of the Sendai-gawa, about 10 miles inland (see map of Japan, ref. 5-E). It was the birthplace of the great lords of the Date family, who at one time embraced Christianity; and relics of a mission to them made in 1613 are still preserved. The castle, partly destroyed in the civil war of 1868, is used as a barracks, Sendai being a military center for the north. It is also an educational center of importance, having a higher middle school, normal school, and several Christian schools. The Greek Church has a strong following in the neighborhood. The town is noted for the production of trays and other articles made of a hard wood. Pop. 60,000. J. M. Dixon.

Seneca [sēn'ē-ka]; city (founded in 1860); capital of Seneca co., N. Y.; on the Seneca river, and the Kan. City N. W., and the St. Joe and Gr. Island railways; 64 miles N. by W. of Cayuga, 71 miles W. of St. Joseph, Mo. (for location, see map of Kansas, ref. 4-B). It is in an agricultural, fruit-growing, and stock-raising region, has a large butter-trade, grist-mill, brewery, and shoe-factory, and contains 4 churches, a national bank with capital of \$50,000, a State bank with capital of \$75,000, a private bank, and 2 weekly newspapers. Pop. (1880) 1,804; (1890) 3,032; (1900) estimated 4,200.

Etymology: "Tamarac."

Seneca [sēn'ē-ka]; town; Newton co., Mo.; on the St. L. and San Fran. Railway; 227 miles S. W. of St. Louis (for location, see map of Missouri, ref. 7-D). It is in an agricultural and stock-raising region, has several mills and extensive coal-mining interests, and contains the only tripoint mines in the U. S.; a State bank with capital of \$10,000, and a weekly newspaper. Pop. (1880) 580; (1890) 1,101; (1900) estimated 1,500.

Etymology: "Tamarac."

Seneca [sēn'ē-ka]; philosopher and writer of tragedies; b. at Corduba, Spain, about 4 a. c.; belonged to a Spanish-Roman family, but was educated in Rome. His father, Annulus Seneca (the praenomen Marcus is without authority; *Lucius* is found in several MSS.), the Rhetorician, was later than 54 a. c. at Corduba; d. in Rome about 89 a. c. was a man of literary studies, wealthy and influential. Almost the whole of his *Senecarum Liber* and five books of his *Controversiarum Liber* *De ira* are extant, edited by Gellius (Leipzig, 1857); Kießling (Leipzig, 1872); H. J. Müller (Paris, 1887), and give a striking aspect of the moral degradation and aesthetic fertility to which the Romans had sunk in Rome at his time. (See Koerber, *Seneca der Rhetor* *Seneca und die römische Rhetorik seiner Zeit*, Marburg, 1884.) Young Seneca was trained in his father's art, and although he afterward left rhetoric for philosophy, he never forgot the lessons of his youth. His style, while all his pompous dignity and brilliant pointedness, is characterized throughout by preponderance of the form over the contents, of the expression over the thought, which manifests a lack of sincerity, and results in mannerism and affectation. Caligula said of his eloquence that it was used without time. After traveling in Greece he began to preach as an orator in Rome, and achieved great foreign success, but in A. D. Messalina had him accused of encephalitis; an adulterous connection with Julia, the daughter of Germanicus and the wife of Vinicius, and he was banished to Corsica. Here he lived for eight years, and wrote,

among other works, *De Consolatione ad Helviam matrem Liber*, a consolatory letter to his mother, and one of the best of his writings, and *De Consolatione ad Polybium Liber*, a similar letter to Polybius, a freedman and one of Claudius's favorites, who had lost his brother; but this letter is one of his most disagreeable productions on account of its flattery, and its genuineness has been disputed. When Claudius married Agrippina, Seneca was recalled by her influence in 49 and appointed tutor to her son, Domitian, afterward the Emperor Nero. Most of Seneca's very prolific authorship belongs to this last period of his life. He wrote moral essays, philosophical letters, a biography of his father, orations, physical treatises (*Quaestiones Naturales*, and others now lost), epigrams, and tragedies. The last mentioned, nine in number, are especially interesting from being the only complete specimens of Roman tragedies extant, and from their influence upon the modern revival of tragedy. It is not certain that they were ever performed, or that they were intended to be. They are admirably adapted for recitation, being largely only versified declamations decked out with rhetoric and moral sentiments. In organic structure they are weak, and they sin against the dramatic decencies. The genuineness of these plays, often attacked, is generally conceded, although Ribbeck holds to the possibility of another Seneca, and Leo suspects the latter part of the *Hercules Furens*. A tenth play, *Oedipus*, which is a *protesia* and contains an allusion to Nero's death, can not be by Seneca. The best editions are by Leo (Berlin, 1878-79, 2 vols.), and by Peiper and Richter (Leipzig, 1867). Of his prose essays, some of the most celebrated, *De Ira*, *De Tranquillitate Animi*, etc., are inexhaustible sources of piquant quotations; others, *De Clementia ad Nervum Caesarem Libri Duo*, are rather curious on account of the personal character which the author has not been able to conceal under the representation of his ideas; but the largest portion is vague and trivial—*De Constantia Sapientis*, *De Breuitate Vitae*, etc. His 124 *Epistulae ad Lucilium* have more interest, containing moral observations and aphorisms of practical value. His *Apocolocyntosis* is also worth reading. It is a satire on Claudius, written after the death of the emperor, and is very biting. It is a specimen of the Menippean satire, being part prose and part verse, doubtless written to please Nero, for whom Seneca also composed a funeral oration, not extant, upon Claudius. Seneca was consul in 56, but after the death of Burrus in 62 his influence with Nero began to wane. The emperor began to hint at the millions which the philosopher had amassed. Seneca became alarmed, and offered to repay the whole amount and content himself with a small annuity. Nero refused the offer, and Seneca then retired from the court, gave no lectures, was never seen in public, and tried his utmost to sink into oblivion. But in vain. Some one mentioned him as an accomplice in the conspiracy of Pao, and Nero sent him an order to commit suicide, which he immediately obeyed. He opened the veins in his feet and arms, and, discarding with his friends on the brevity of life and the equanimity of the philosopher, bled to death in a hot bath 65 a. c. From the revival of letters in Europe, and up to the beginning of the nineteenth century, the works of Seneca, both the philosophical and the poetical, were much read and much admired. Editions were numerous and translations were made into all European languages. There were, however, always some voices which protested against his false; and when his admirers tried to prove that he was a Christian and a friend of St. Paul, his adversaries undertook to prove that he was an atheist and a hypocrite. Among later editions of his works are those of his prose writings by Fickert (3 vols., Leipzig, 1842-45) and by Basse (3 vols., Leipzig, 1852-53); of the *Apocolocyntosis* in Buecher's *Petrus* (Berlin, 1882); and *Dialogorum Libri XII* (Gertz, Copenhagen, 1886). See Farrar's *Seneca after God*; Lightfoot's *Essay on St. Paul and Seneca*, appended to his *Commentary on the Epistle to the Philippians* (London, 1879); Westberg's *Der Ursprung der Sage dass Seneca ein Christ gewesen* (Berlin, 1881). Revised by M. Wanner.

Seneca Falls; village; Seneca co., N. Y.; on the Seneca river (the outlet of Seneca Lake), and the N. Y. Cent. and Hud. River Railroad; 3 miles W. of Cayuga Lake Park, a popular summer resort, and 16 miles W. of Auburn (for location, see map of New York, ref. 5-F). A fall of 50 feet in the river gives the village its name and affords excellent power for manufacturing. The village contains manufactories of steam fire-engines, pumps, machinery, and wooden goods;

job-printing establishment; 7 churches; an academy; a soldiers' monument; electric railway to Waterloo, Genesee, and Cayuga Lake Park; a national bank with capital of \$100,000, a savings and a private bank, and 4 weekly newspapers. Pop. (1880) 5,880; (1890) 6,116; (1895) estimated, 6,500. "COURIER" PRINTING COMPANY.

Seneca Indians: See IROQUOIAN INDIANS.

Seneca Lake: a body of water in Western New York, bounded by Seneca, Schuyler, Ontario, and Yates Counties. It is 35 miles long, from 1 to 4 miles broad, with an elevation of 447 feet, and its shores are bold, picturesque, and fertile. The lake is navigated by steamboats. Its waters reach Lake Ontario by Seneca and Oswego rivers. Its greatest depth is 630 feet.

Seneca-oil: a local name for PETROLEUM (*q. v.*).

Señefelder, ALOYS: inventor; b. at Prague, Bohemia, Nov. 6, 1771; entered on the stage at Munich, his father being an actor; afterward attempted literature, and engaged finally in the printing business, which led to his invention of LITHOGRAPHY (*q. v.*). Lack of money and the imperfection of the invention in its primitive state caused him many difficulties and disappointments, and it was not until 1806, when he settled at Munich and received the support of the Bavarian Government, that he was able to perfect his invention. D. at Munich, Feb. 24, 1834. He wrote a *Lehrbuch der Lithographie* (Munich, 1818; French translation, Strassburg, 1819; English translation, *Complete Course of Lithography*, 1819). See Nagler, *Aloys Señefelder und der geistliche Rath Simon Schmidt* (Munich, 1832).

Sen'ega: a drug consisting of the root of a polygalaceous perennial plant, *Polygala senega*, which grows throughout most parts of the U. S., frequenting open fields and rocky places. It is small, with small white flowers forming a close spike at the summit of the stem. The roots are of various sizes, tapering, branched, and twisted, with a thick gnarled head from which the several yearly stems arise. The epidermis is dark-colored, corrugated, and is the active part of the root. The dried root has little smell, but leaves a pungent and acrid impression in the mouth after chewing. Senega contains a peculiar principle called *polygalic acid*, probably identical with saponine. The drug is an acrid irritant, producing vomiting and purging in overdose. Its first use in medicine was by the Seneca Indians, who employed it as a remedy in cases of rattlesnake-bite, but by physicians it is used almost exclusively as an ingredient in cough-mixtures in the second stage of respiratory catarrhs. Its effects are analogous to those of squill. Senega is an ingredient of the compound sirup of squill of the *United States Pharmacopœia*. Revised by H. A. HARE.

Senegal': the largest river of Senegambia, Northwest Africa. It lies almost on the border of the Sahara, and derives its water chiefly from several large southern tributaries rising in the regions of Futa Jallon and Bambara. Though a bar at its mouth obstructs navigation from the sea, the lower half of the river (500 miles) is navigated at high water by small steamers. C. C. A.

Senegal: a French colony bordering on the Atlantic in the northwestern part of Senegambia, Africa. Pop. 135,000. There is a governor-general, assisted by a colonial council, at the chief town, St. Louis. See SENEGAMBIA.

Senegam'bia [named from *Senegal* + *Gambia*, names of its two chief rivers]: a French possession in Northwest Africa, with no well-defined boundaries on the E. and S. It borders on the Atlantic and the Sahara limits it on the N. The Gambia may be called its southern boundary, and its extension to the E. may be taken as including that part of the French Sudan lying W. of the upper Niger. The population, including the colony of Senegal and the upper Niger region, is believed to be about 1,850,000. In the seventeenth century France took possession of some points on the coast, but the great extension of the colony eastward dates from the middle of the nineteenth century, and particularly from the period 1871-88, which saw the gradual advance of the French power to the upper Niger, an acquisition that cost enormously in human life and money, on account of the trying climate and stoutly contested campaigns with powerful Mohammedan chiefs. The most formidable opponents of the French advance were the great religious pretenders and potentates, Mahmadu-Lamine, whose final defeat and death was the result of the campaign under Gen. Gallieni (1886-88), and Samory, the most powerful ruler in the French Sudan, who was not finally subdued until 1893. The vast ter-

ritory is for the most part sparsely peopled. It includes a number of distinct tribes, of whom the Mandingo, the Yolofs, and the Fulbe are the most important. The greater part of the country is very fertile, and rice, maize, tobacco, and cotton raising are capable of large development. In Senegal proper about one-third of the land is under cultivation, and the raising of cattle and sheep is a growing industry. The great drawbacks are the climate and the disinclination of the natives to labor, but in the best-cultivated regions the French, within a few years, have doubled the product. On the upper Senegal, in 1884-86, 45 per cent. of all the European residents died, the most fatal causes being sunstroke, dysentery, and malaria. The capital and chief port is St. Louis, on an island at the mouth of the Senegal. Pop. 20,000. From Kayes, the head of navigation on the Senegal, a railway has been built eastward 94 miles to Bafoulabe, and is to be extended to the upper Niger. Another railway connects St. Louis with Dakar, an important town at Cape Verde, and it is greatly assisting in the development of the coast districts. The most important interior settlements are Kayes, on the upper Senegal, Bafoulabe, at the mouth of the Bathoy, and Bamako, on the upper Niger, from which point the French have descended the river and occupied Timbuctu.

C. C. ADAMS.

Senescence: See OLD AGE, DISEASES OF.

Senigal'lia, or Sinigaglia (anc. *Sena gallica*): town; province of Ancona, Italy; near the Adriatic, at the mouth of the Misa, which divides the town into two parts (see map of Italy, ref. 4-E). The streets are broad and well paved, and some of them are flanked by fine buildings constructed with porticoes forming a continuous sheltered promenade. The maritime trade is carried on by means of a short canal, for which the lower arm of the Misa has been made available. The manufacturing activity is considerable, chiefly in silk and linen. The annual fair of Senigaglia (beginning July 22 and ending Aug. 8) was formerly one of the most famous in Europe, and is still much frequented. The town is the place of the victory of C. Claudius Nero over Hasdrubal (207 B. C.). Pop. 9,602. Revised by M. W. HARRINGTON.

Senior, NASSAU WILLIAM: economist; b. in Berkshire, England, Sept. 26, 1790; graduated at Oxford 1812; was admitted to the bar 1819; was Professor of Political Economy at Oxford 1825-30, and again 1847-62; was master in chancery 1836-53. D. in London, June 4, 1864. He was the author of essays upon political economy, philosophy, etc., of narratives of travel in Turkey and Greece (1859) and in France and Italy (1871), and was for forty years a leading contributor to *The Edinburgh Review* and other magazines.

Senlac: See BATTLE.

Senna [from Arab. *sana*, *senna*]: the leaves of several species of *CASSIA* (*q. v.*), various preparations of which are used medicinally. Those which constitute the commercial senna are exported from Southern India and from Alexandria. A senna-plant (*Cassia acutifolia*), indigenous in Egypt and the African deserts, furnishes most of the Alexandria senna. Great labor has been expended by chemists in endeavoring to isolate the valuable cathartic principle of senna, which was discovered by Dragendorff and Kubly in 1868 to be cathartic acid. It is a complex glucoside, and, singularly, contains sulphur. Like glucosides generally, it is easily alterable, and hence difficult of isolation and preparation. Further information may be had in the *National Dispensatory*, under *Senna*. Revised by H. A. HARE.

Sennaar': an ancient kingdom of the Eastern Sudan, Africa, which retained its name when it became a province of Egypt; lying mostly between the Bahr-el Azrek and the White Nile. The soil is so fertile along the river banks that Sennaar was long called the granary of the Egyptian Sudan, but away from the rivers the region is mostly an uninhabited sandy waste. In the flourishing days of the Egyptian Sudan there was a dense population along the two great rivers, in whose valleys a large amount of grain was raised, while in the towns gold-smelting, leather-working, pottery-making, and other industries were pursued. Sennaar, for generations the chief town, had great importance until Khartum became the center of commerce. Its population had dwindled to 8,000 before the Mahdist revolt. It was the last Egyptian stronghold to succumb to the Mahdi. Now only heaps of stone mark its site.

C. C. ADAMS.

Sennach'erib [Gr. *Σανναχέρηβος*; Heb. *San'chêrîbh*, from Assy. *Sin-achî-irîb*, liter., "the Moon-(god) has multiplied

Ishtar "I": King of Assyria 703-681 B.C., son and successor of Sargon. He was bold and mighty, a terrible scourge to war, and a great builder. His campaign against the West in 701 was unsuccessful (2 Kings xviii, xli), as may be seen also from his own account of the affair. (Cf. E. Schrader, *The Assyrian Inscriptions and the Old Testament*, I, 278-310.) He boasts that he destroyed Babylon utterly because this city kept the Assyrian yoke unwillingly. He was murdered by two of his sons.

D. G. Lyon.

Sens, *sens* (also *syndesmon*, later *Sensu*): town of France, department of Yonne, on the right bank of the Seine (one mile of Paris, 101, 4-15), has vestiges of the old walls constructed by the Romans, a fine cathedral, remains of Maxian, seign, dragons, and glass, and an active coal and iron, wine, flax, and hemp. Pop. (1891) 12,314.

Sensation: phenomena which result within the mind immediately from impressions upon the senses. The experiences of moisture and resistance which follow from contact with a piece of iron, and the pain felt in using it, are, especially sensations. Sensation must be carefully distinguished from the physical phenomena which precede or accompany it. The impression is the modification of the organ, especially of the nervous and nervous centers, which arises from an external stimulus, as the vibration of ether or air. The nature of the different sense-impressions is not well understood; but in each case they are some form of movement. They have all the characteristics of physical phenomena; they can be located, measured, apprehended by the senses. Sensations, on the other hand, can not be compared with movement of any kind. The difference between them is plainly seen in the fact that an impression may take place without any sensation. The impression may be too feeble, or too prolonged; or too often repeated, so as to produce of our clothing; or the attention may be occupied, so that the impression does not produce its usual result.

Affective and Representative Elements in Sensation.—In each sensation there is a distinct knowledge element over and above the intensive subjective state, which constitutes the sensation proper. There is an element of knowledge of things without us or of our own bodies. This is the presentative or perception element in sensation. There are great differences in sensations in this respect.

The objective or feeling quality, on the other hand, comes out most strongly in cases of massive or voluminous stimulation. Here presented relations are at a minimum and sensibility at a maximum. When a man plunges into a very hot bath, the feeling experienced is so overwhelming that the knowledge that it is a hot bath, and that it is he himself who is taking the bath, occupies a very slight degree of consciousness. In a case of severe toothache, also, what we really have, predominating in consciousness is not knowledge, but feeling. As an immediate state of consciousness, we do not know that we have a toothache, we feel it. Hamilton announced the law, already anticipated by Kant, that the two elements vary in inverse ratio—which is true only in a very rough way.

Character of Sensation.—All sensations have certain common characters, which may be subjected to investigation. These characters are four in number.

1. **Quality**: that property by which sensations are distinguished as coming from different senses, such as color, sound, taste.

2. **Quantity**: meaning intensity or mass of sensation. Intensity in intensity constitutes Psycho-energies (q. v.).

3. **Duration**: the time occupied by the sense-function with its accompanying physical and volitional processes. Impressions in this field constitute Psychoenergies (q. v.).

4. **Force**: the pleasure or pain which accompanies all sensation. See **PAIN** and **PLEASURE**.

Quality of Sensation.—There is much uncertainty as to the proper classification of sensations. It appears very easy to discover at once what is immediately given as a pure and simple sensation. But it is not so. At the age of maturity, when one is able to make an analytical study of his states, he finds them no longer in that pure and primitive state which he would wish. They have undergone a twofold alteration. In the first place, all the senses act together, and different sensations, by virtue of the laws of association, are experienced as one. And, further, by virtue of the same laws, much more elements are superposed upon our sensations, making them much more complex. These associations become, after time has made them habitual, almost

indissoluble; so that it is very difficult to isolate the different sensations from one another, or the great body of sensitive data from the contributions of reason and experience.

Relativity of Sense-qualities; Contrast.—Further, we find a series of phenomena which show that there is no fixed typical sensation of each quality; but that all determinations of quality are to a degree relative distinctions among many factors in consciousness. This principle of Relativity (q. v.) is illustrated by the so-called phenomena of contrast. The general statement of fact is this: Any sensation (color, sound, taste) which occurs after or with other sensations (color, sound, etc.) is different from what it would have been if the other sensations had not been present, or if the other sensations had themselves been different. The variation, however, is within the same sense-quality.

In the domain of the special senses, such effects of one sense-quality upon another may be subjected to experimental determination by psycho-physical methods. The phenomena of color-contrast are the richest and best understood class of facts. In general, color-contrast means that when part of the retina is stimulated to react to a particular color, there is a tendency of other portions to react to the complementary color. For example, the so-called Moyer's experiment may be cited: Put a scrap of gray paper on a colored (red) background, and spread over the whole a sheet of white tissue; the gray scrap will tend to assume the color complementary to the background (green). The white sheet over the whole is necessary to obscure distinct lines of separation between the colors beneath; if such distinct boundary-lines are exposed, the contrast-phenomena disappear. Recent research has developed a number of interesting optical phenomena of this class. Stumpf has discovered that the pitch of a tone is modified by the occurrence of another tone of a different pitch, in such a way that the interval between them is lessened. Contrasts of temperature are also easily brought about. Cold water feels colder if the hand is just from warm water. Differences in temperature of the two hands lead to exaggerated differences of sensation when they are plunged together into two vessels of water of the same temperature. Contrast is called simultaneous or successive according as the rival sensational qualities occur together or in succession.

Two theories of sensational contrast have been advocated, one called the psychological, according to which such contrasts are due to judgment or synthesis, the actual sensations themselves having fixed and unaltered qualities. This has been held by Helmholtz, and has been used to support the theory that there may be "unconscious judgments." The other, the physiological theory, holds that contrast-effects are due to complex conditions of stimulation. The different color-stimuli, for example, are not reported separately to consciousness; but only their united effect is operative in the optical center. Consequently, what we have is a case of summation or fusion of stimuli, not of comparison and judgment of sensational atoms. This latter theory is now completely victorious, principally through the brilliant experimental work of Hering.

It seems reasonably safe to conclude that there are well specialized nervous functions which correspond to the great differences of quality in sensations: this is shown by the fact that the differences are stable; that the senses are largely independent of one another in their activity; that each such function has normal minimum and maximum activities which give original degrees of intensity to consciousness. But within these limitations both qualities and intensities are subject to the law of relativity as well by reason of nervous summation as of mental synthesis.

J. MARK BALDWIN.

Sensationalism: a term in philosophy sometimes used to denote the doctrine that all knowledge is derived originally from the senses. Various other terms are used as its synonyms—viz., "sensism," "sensualism," "sensuism," "empiricism," etc. Hobbes (in 1650) taught that all knowledge grows out of sensations. After sensation there remains behind the memory of it, which may reappear in consciousness. The memory of objects once perceived is aided by words. We therefore connect words to our mental representations of objects. The same word, serving as a sign for numerous similar objects, gives rise to general ideas. Locke held substantially the same views. Condillac (1755) likewise endeavored to explain all mental functions as transformations of sensation (*sensations transformées*). Desire arises from the recollection of a past sensation; the Ego is the

totality of sensations. Bonnet (1755), von Holbach (1770), Buffon (1780), Cabanis (1798), Destutt de Tracy (1815), Laromiguière (1818) held the doctrine of sensationalism. Among recent German writers Czolbe has elaborated a system of psychology that derives all the elements of self-consciousness from sensation. But he has to assume teleological forms—"the sensations and feelings which are hidden in space or the world-soul"—to explain the "fundamental limits of knowledge." His contemporaries, however—Moleschott, Büchner, Vogt—proclaim not only sensationalism, but materialism without reserve. While Cabanis said that thought is a secretion of the brain, Carl Vogt added, "the brain produces thought in the same way that the liver produces bile," etc. John Stuart Mill (1865) defines matter to be "a permanent possibility of sensation," and mind to be "a series of feelings with a background of possibilities of feeling"; thus making sensation the central principle, not only of knowledge, but of being, and apparently reaching the doctrine of Berkeley, *Ease est percipi*. Post-Kantian sensationalism has had to explain away the existence of universal and necessary ideas, such as time, space, causality, etc. Mill holds the geometrical axioms to be "generalizations from observation." Herbert Spencer (1860) holds that knowledge consists in "symbolic conceptions" when it relates to aught else than concrete objects that are not "too great or too multitudinous to be mentally represented." In contrast to this, he holds that "the ultimate truth which transcends experience by underlying it is the persistence of force." Thus he makes in one instance all general ideas "symbolic," the real being particular things only; and then he makes force, which corresponds to the most symbolic of our ideas, to be the most real of realities. Within the period 1870-95 a more thorough study of physiological psychology by a scientific method has done more to clear up and reduce to exact knowledge the theory of the action of the five senses than the loose observations of twenty-five centuries previously. The articles on PSYCHOMETRY and PSYCHO-PHYSICS give the history and bibliography of this movement. It is too early to perceive the effects of these investigations into the essential nature of sense-perception upon general philosophical theories, but it is certain that they will modify very materially the conceptions and method of presentation of those who in the future defend the doctrine that all knowledge is derived from the five senses.

WILLIAM T. HARRIS.

Senses [from Lat. *sen'sus*, feeling, one of the senses, deriv. of *sen'ti're*, *sen'sum*, feel]: special developments of the general sensibility of the living organism. In the special senses, i. e. hearing, sight, etc., the property of general sensibility of the organism has become immensely modified and intensified by being concentrated and localized in distinct organs, the ear, the eye, etc., and by being specialized so that each organ transfers from the object to consciousness only a distinct part of that total impression which the object is able to give and consciousness is capable of receiving—the ear only the audible, the eye only the visible, etc. There are five such senses—hearing, sight, smell, taste, and touch—but they all rise simply as individual developments of the same fundamental faculty of general sensibility. Their degree of individualization is very different, being highest in sight and feeblest in smell and taste; the latter both disappear very easily in mere feeling, as smell in sneezing and taste in nausea. It is apparent, however, that the general sensibility of the human organism covers a much larger ground than its five individual senses. There are sensations which enter into consciousness with great vividness without going through the special senses, as, for instance, the feelings of hunger, thirst, suffocation, pleasure, pain, rest, fatigue, etc., which are termed general sensations. See ACOUSTICS, MUSCLE-SENSE, VISION, etc., and *Organs of Special Sense* in the article HISTOLOGY. Revised by EDWARD T. REICHERT.

Sensibility: See FEELING and SENSATION.

Sensitive Plant: a low leguminous plant, *Mimosa pudica*, of tropical America, now widely dispersed over the world and commonly cultivated, on account of the rapid movement of the leaves which, when brushed or jarred, appear to shrink from the touch. This faculty is shared in a less degree by several other species of *Mimosa* and some related plants, such as the sensitive brier (*Schrankia*) of the southern parts of the U. S. See *Plant Movements* in the article PHYSIOLOGY, VEGETABLE.

Senso'rium [= Lat., the seat or organ of sensation, deriv. of *sen'sus*, sense, feeling]: the supposed seat in the

nervous system of the processes which underlie sensation. The cortex or gray matter of the brain is considered the sensorium in modern discussion in physiology and psychology. J. M. B.

Sentence [viâ O. Fr., from Lat. *sententia* (for **sentien tia*), way of thinking or feeling, opinion, judgment, deriv. of *sen'ti're*, feel, think]: in the law, a judgment or determination pronounced by a court after the trial or hearing of a cause, by which the remedy is granted or the sanction is imposed. In the common-law courts the term is confined to criminal cases, their final decision in civil suits being called a "judgment"; while the corresponding act of a court of equity is usually denominated a "decree." In those tribunals whose procedure is based upon the civil law—in the admiralty courts, the English ecclesiastical courts, and sometimes in the U. S. in the probate or surrogate courts—the term "sentence" is used, instead of "judgment" or "decree," to designate all judicial determinations. The sentences in civil causes like judgments are either final or interlocutory—final, when they pass upon all the issues material to the decision, determine the rights and duties of the parties, and terminate the pending controversy; interlocutory, when they pass upon some collateral matter or proceeding in the action, or when they establish some right preliminary to the final adjudication. In criminal trials, according to the common-law methods, the sentences are all from their very nature final. It is the exclusive province of the jury to determine the guilt or innocence of the accused. When a verdict of guilty is rendered, the prisoner is thereby convicted, and it then becomes the duty and function of the court to pronounce upon him the judgment or sentence which the law provides as a punishment for his crime. Previous to this final act in all cases of felony the convict is publicly asked by the judge if he has anything to say why the sentence of the law should not be pronounced upon him. This proceeding, which was originated at an early period of the English law, when the prisoner could not be defended by counsel, in order that he might have an opportunity to suggest any error that had occurred, is now an empty form, and yet the form must be observed, or else the judgment would be void. No error being shown, the presiding judge declares the sentence, whereby the court orders the prisoner to be capitally executed on a certain day named, or to be imprisoned for a specified period, or to be fined in a designated amount, or otherwise punished as provided by law. This sentence is entered by the clerk, and constitutes a most important part of the judicial record. The doctrines and rules of the law in reference to the nature and effects of a JUDGMENT (q. v.) apply also to sentences. See the treatises of Bishop and Wharton on *Criminal Law*, and Black on the *Law of Judgments*.

Revised by F. STURGES ALLEN.

Sentiment: the higher form of emotion, attaching to ideals of art and life. (See IDEALS and IDEAL FEELING.) The great classes into which the sentiments fall are usually distinguished as ethical, æsthetic, and religious. The religious are the most complex, and rest upon the other two. Religious objects and ideals involve both the ethical and æsthetic determinations—that is, they are both beautiful and good.

Ethical Sentiment: its Nature and Origin.—Conscience is the popular term for this emotion. It involves three elements, which are, however, closely united in a single state of mind, called ethical. If we fancy the mental life cut right through at the moment of a moral decision, we should find three elements which moralists distinguish by the phrases moral quality, moral authority, and moral ideal. These may be made clearer by a concrete instance: I give money to a beggar because I am bound by conscience to do so. The moral quality of my act is my feeling of its harmony with my better acts as a whole, and the exactness I make upon other men to be charitable also; without this conscience would be wanting—the act would be indifferent. The moral authority of the act is the feeling which at once arises that this quality has an immediate reference to my will. I am bound to choose it as my act; without this there is no conscience—conscience is dead. The moral ideal is the outreach of my feeling toward a state of will in which such a relative and hesitating decision would yield to clear and more direct moral vision; a state of will which I can not picture, can not conceive, but which I feel my will is meant for, and for which my present act for conscience's sake is the only means to prepare me.

Moral sentiment arises evidently around acts and atti-

mental will. It is accordingly to be expected that the account of the growth of Will (p. 15), cast throws some light upon the conditions of the rise of conscience. So it is because that present character is the deposit of all former positions of whatever kind, and that what we call will is a general term for concrete acts of volition, and further that various representations of tendencies, their ascending as these tendencies are suggestions from other persons, on the one hand, or represent partial expressions of each own personal character on the other hand, there arises a division within the sense of voluntary agency, which is the germ of the notion of self. (See *Self-consciousness*.) Your suggestion to me may conflict with my desire; my desire may conflict with my own present sympathy. Self means self, as to speak. The self of accommodation, imitation, through these means, collides with the self of habit, of character, the self that seeks to dominate. It is no longer a matter of simple habit versus simple suggestion, as is the case in infancy, before the self gets the degree of complexity which constitutes it a voluntary agent. It is that form of habit which is personal agency coming into conflict with that form of suggestion which is also personal to me as representing my social self. Your example is powerful to me intrinsically; not because it is absolutely good or evil, but because it represents a part of myself, inasmuch as I have become what I am in part through my sympathy with you and imitation of you. My own inclinations to me bring out a difference of motor attitude between what is socially responsive to me, to a sense public, and that which is relatively no more, my private self.

When I come to a new moral situation, therefore, I am in a condition of relative equilibrium, or balance of two before—my personal or habitual self and my social suggestive self. Your natural inclination to attend a social gathering at the house of Mr. A may be overcome by an appeal to your family, social, public self in its broad sense, represented by an appeal to your sympathetic, narrower, social self. The new decision tends to destroy this equilibrium in re-enforcing my "copy," and its influence in my character, on one side or the other, and so to lead me out to further habit or for new social adaptations.

Now this basis comes a new mental movement which involves a further development of the imitative self—a development which substitutes warmth and life for the horrible coldness and death of that view which identifies voluntary agency with submission to a "word of command." This shift is at least very soon comes across that mass transcending in its moral environment called authority; and requires that most magnificent thing in our moral equipment called conscience. He acquires obedience in one of two ways, or both: by suggestion or by punishment.

But whether obedience comes by suggestion or by punishment, it has the genetic value; it leads to another refinement in the sense of self, at first projective, then subjective. The child finds himself stimulated constantly to deny his impulses, his desires, even his irregular sympathies, by conforming to the will of another. This other represents a regular, systematic, unflinching, but reasonable personality—still a person, but a very different person from the child's own. It is a stage of the child's apprehension of persons—beyond the regularity of personal character in the midst of the experiences that before this stood out in contrast to an irregularity of mechanical movement in things. There are processes of maturation, the child learns, which even the mother does not permit; there are extremes of severity from which even the cruel father draws back. Here, in the narrowing sense of the larger limits which set barriers to personal freedom, is the "copy," forming which is a sense of personal authority or law. It is projective because he sees and understands it, can not anticipate it, can not find it in himself. And it is only by imitation that he is to reproduce it and so arrive at a knowledge of what he is to understand it to be. He is a "copy for imitation." It is its nature may the child say to himself—and should be mine and I am unable to do so to have me obey it, act like it, think like it, be like it in all respects. It is not I, but I am to become it. Here is my ideal self, my final pattern, my thought, set before me. My parents and teachers are good persons, with all their differences from one another, they yet seem to be alike in their requirements to this law. Only in so far as I get into the habit of being and doing like them in obedience to it, get my character moulded into conformity with it, only so far as I grow. And so, like all other imitative functions, it teaches its lesson only by stimulating to

action. I must succeed in doing—he finds out as he grows older and begins to reflect upon right and wrong—if I would imitate him. But as I thus progress in doing, I forever find new patterns set for me; and so my ethical insight must always find its profoundest expression in that yearning which anticipates but does not overtake the ideal.

My sense of moral ideal, therefore, is my sense of a possible perfect, regular will taken over to me, in which the personal and the social self—my habits and my social will—are brought completely into harmony; the sense of obligation in me, in any case, is the sense of lack of such harmony—of the actual discrepancies in my various thoughts of self, as my actions and tendencies give rise to them. The friend who urges you to accept an invitation to Mr. A's reception adds to the reasons for your attendance, this one: "And, besides, you ought to go out more." This is the profoundest reason of all—not because it has in it the word "ought," merely, but because it makes appeal to the ideal self, before the law of which all the earlier claims have their lesser or greater value. And the thought of this ideal self, made objective, as it must be by the statistic of this socializing social sense, out of and beyond me—this is essential in the moral sanctions of society, and finally in that; and it is at this highest level of mental growth that the religious sentiments come fully into play.

Aesthetic Sentiment.—In beauty, the elements of the ideal seem at the outset to be most fully set forth. The simplest observation of beautiful things suffices to illustrate the necessity of both unity and variety in form. There is no beauty when unity is absolute, and it is only when arrangement is possible to a degree which allows a distinction between variety which is yet unity, which has a plan, and variety which is multiplicity, which has no plan—that any such feeling arises at all. It is equally evident, also, that meaning, significance, contributes to aesthetic effect. The beauty of a landscape is cold and formal until the stroke of a peasant's hut, or the spire of a country church, is added to give it a touch of human interest. The village green has more meaning than snow-clad Alps. And, further, we feel the essential share-ableness, universality, validity of all beauty. I expect a face to appeal to you as it appeals to me.

Nature and Origin of Aesthetic Sentiment.—Psychology seems to be tending to a view of art which emphasizes the subjective or emotional side of aesthetic. Considering pleasure the most general element in aesthetic experience, we may bring the topic under the head of Hedonics, and ask what are the marks of objects, situations, ideas, which make them suitable for arousing in us the particular kind of hedonic experience called aesthetic, i. e. what constitutes beauty?

Experiments on sensation-states—especially on the apprehension of visual forms—result in showing that whenever union of parts is effected without strain to the organ stimulated, at the same time that the elements preserve their individuality in a measure, we experience pleasure. In perception a similar principle is found, known as assimilation, to which current psychological analysis is reducing the old laws of association. When a new experience is assimilated readily to old categories—fits into the ready moulds of experience, thought, or conception—then we invariably experience pleasure, not the pleasure of pure identity, but of progressive identity of a process in consciousness. In the higher spheres we find the same fundamental movement. Conception is a process by which detached elements are arranged, brought to unity, sorted out, assimilated; an arrangement is such a scheme of notions, which go together without strain or conflict; and a beautiful character is one whose acts of will are consistent with one another, and gets assimilated readily to an ideal of duty.

The essential thing in it all—in sensation as well, in assimilation, in logical consistency—is this: Does the attention with both its intellectual and its narrow processes move easily?—that is, is the psycho-physical process impeded or advanced? If the latter, then pleasure, and aesthetic pleasure, just in proportion as the processes to which the attention ministers, all tend to give the best sense or emotion of accommodation.

The older criteria of beauty can be accounted for on this view: unity in variety, adaptation, association, meaning, or expressiveness; and it tends to put an end to the lasting controversy between "form" and "meaning."

For Wundt's facts showing that visual beauty of form is due in case of eye-movements, and Zeising's "golden section," and Bain's "associations of utility," and the "teleological judgments" of the intellectuals, and the "moral

worths" of the ethical idealists, as well as the "real beauty in objects" of the realists—all these get their due, as far as their psychology is concerned, in some such formula as this: The sense of beauty is an emotional state arising from progressive psycho-physical accommodation to mental objects. Of course the metaphysics of beauty and art is not touched by this, and it does not prejudice full metaphysical treatment.

Seoul, sā-ool' [from Korean *seul*, liter., capital], or officially *Han-yang*: the capital of Korea; on the right bank of the Han-Kang, a tributary of the Yellow Sea; lat. 37° 31' N., lon. 127° 7' W. (see map of China, ref. 4-M). It is surrounded by a wall, 12 to 25 feet high, now partly in ruins, with eight gates which are closed at night. It has three straight streets, about 60 feet wide and starting from the three principal gates. These are fairly well kept, but the other streets are narrow, uneven, and filthy. There are but two noteworthy buildings, the palace of the king and a small Buddhist temple of white stone, once richly ornamented, but now much defaced. The other buildings are small, low, thatched, or tiled, and densely peopled, and these buildings encroach on the great streets, from which they are cleared from time to time. There are no arrangements for sanitation or public comfort. A noteworthy object is the great bell which sounds the hours for opening and closing the gates. It was made in 1468 and is alleged to be the third in size in the world. The city dates from 1397 A. D.; became a royal city at the end of the sixteenth century, and was sacked by the Manchus in 1637. It is the heart of Korea in the same sense that Paris is the heart of France, and the ambition of every Korean gentleman is to pass his life there, at leisure to enjoy its attractions. It was long forbidden to foreigners, and in 1888 a fanatical outbreak against foreign residents occurred. The city was occupied by the Japanese in 1894. Pop. (by census in 1793) 163,000, estimated by Cavendish (1891) at 250,000, of whom 50,000 were in the suburbs. See Cavendish, *Two Months in Korea*, in *Scottish Geographical Magazine* (Nov., 1894), and the works mentioned under KOREA. MARK W. HARRINGTON.

Separate Baptists, Separate Churches, or Separates: See BAPTISTS and FREE-WILL BAPTISTS.

Separate Lutherans of Prussia: those Lutherans who refused to comply with the order of Frederick William III. uniting the Lutheran and Reformed Churches. See LUTHERANISM AND THE LUTHERAN CHURCH (*The Lutheran Church in the Nineteenth Century*).

Separatists: in general, those who withdraw from an established church or religious organization; sectaries. The term was commonly applied in England in the sixteenth and early part of the seventeenth centuries to those Christians who were also called Brownists and Barrowists, and later INDEPENDENTS (q. v.).

Septia: See INDIA INK.

Sept'idæ: See CUTTLEFISH.

Sep'oy [Fr. *spahi*, *cipaye*, from Hind. *sipāhī*, native soldier, from Pers. *sipāhī*, horseman soldier, deriv. of *sipāh*, whence Hind. *sipāh*, military force, army]: a native soldier in the British service in India. The practice of employing the natives as troops dates back to the middle of the eighteenth century. A large force of Sepoys took part in the battle of Plassey, and Clive afterward organized a native army in Bengal. Their good conduct inspired general confidence in their loyalty, and their numbers were increased till at the time of the mutiny (see INDIA, *History*) they were about 230,000 strong, while the European troops numbered about 40,000. After the suppression of the mutiny (1858) their numbers were reduced, and in 1894 there were 145,000 natives to 75,000 Europeans in the British army in India. The Sepoys consist of Mohammedans, Rajputs, Brahmans, and men of other castes, besides Sikhs, Gurkhas, and hill-men of various tribes. The higher officers are European.

September [viā O. Fr. from Lat. *Septem'ber* (sc. *men'sis*, month), liter., the seventh month, deriv. of *septem*, seven]: the seventh month of the old Roman year, but the ninth of the Gregorian. It is the month of the autumnal equinox, which occurs about the 22d.

Septicæ'mia: See BLOOD-POISONING.

Septima'nia [Late Lat., deriv. of Lat. *septima'nus*, pertaining to the number seven, deriv. of *septem*, seven. So called from its seven cities—Toulouse, Agen, Bordeaux, Poitiers, Saintes, Périgueux, Angoulême]: an ancient district in the southwest of France; ceded to the Goths in 419. Its name appears in the writings of Sidonius Apollinaris (490-482). It was conquered by the Saracens in 712-719; devastated by Charles Martel in 737; conquered in part by Pepin in 760; became a part of the kingdom of Aquitaine in 778; became a dukedom in 817, a marquisate in 844; and was devastated by the Normans in 859. The Spanish March was set off in 864, and soon after it passed to the house of Toulouse.

Septim'ius Severus: See SEVERUS, SEPTIMIUS.

Septuages'ima [Lat. (sc. *di'es*, day), the seventieth day, liter., fem. of *septuagesimus*, seventieth, deriv. of *septuaginta*, seventy]: in the ecclesiastical calendar, the third Sunday before Lent. The first Sunday in Lent is termed Quadragesima, the three preceding ones Septuagesima, Sexagesima, and Quinquagesima.

Septuagint, or LXX. [from Lat. *Septuaginta*, liter., the seventy, applied to this version because of the alleged number of its joint translators]: the name commonly given to the earliest Greek translation of the Old Testament, otherwise called the Alexandrian version. According to the fabulous account of its origin in the letter of the pseudo-Aristeas, repeated by Josephus (*Ant.*, xii., 2) and others, Ptolemy Philadelphus, King of Egypt from 283 (285) to 247 B. C., at the instance of his librarian, Demetrius Phaleron, sent an embassy to Jerusalem to procure from the high priest Eleazar a copy of the Jewish Law, and to make arrangements for a translation of the same into Greek for the Alexandrian Library. Seventy-two learned men were accordingly selected by the high priest, six from each tribe, and sent to Egypt with a magnificent copy of the Law written on parchment in letters of gold. They retired to the island of Pharos, where they completed the translation in seventy-two days. According to Philo (*Life of Moses*, ii., 5-7), they were divinely inspired. The legend appears with embellishments in Justin Martyr (*Hortatory Address to the Greeks*, chap. xiii. [*Ante-Nicene Fathers*, i., 278]), according to whom the translators were shut up in separate cells and worked independently, yet their several versions, being compared, were found to agree verbatim. So also Irenæus (*Against Heresies*, chap. xxi., 2; do., i., 451, seq.) and Clement of Alexandria (*The Stromata*, i., xxii.; do., II., 334). In this later form of the story the translation is made to include the whole Old Testament. All that can be inferred with certainty from this legend is the high estimation in which the translation was held by the Jews as early as the first century of the Christian era. There is no improbability in the supposition that Ptolemy Philadelphus may have procured a copy of the books of Moses for his universal library. Jews were then numerous in Alexandria. On the other hand, a translation of the Old Testament, or at least of the Law, must have become a necessity at that period to the Hellenistic Jews, to most of whom the Hebrew original, long before the Christian era, was a sealed book; and to this necessity alone it may have owed its origin.

The character of the translation proves it to have been the work of many hands. The Pentateuch is best translated. Anthropomorphisms and offensive expressions are, however, often softened; e. g. for "they saw the God of Israel" (Ex. xxiv. 10) we read "they saw the place where the God of Israel stood." The translation of Proverbs has considerable merit, and the book of Job was rendered by a man of genius, who was better acquainted, however, with the Greek poets than with Hebrew, and dealt very freely with his text. The speech of Job's wife (ii. 9) is a curious interpolation. Ecclesiastes is rendered with barbarous literalness, so as to be in some places unintelligible; e. g. Eccl. vii. 30. The prophets are for the most part poorly translated, especially Isaiah; and the translation of Daniel was so bad that the version of Theodotion was early substituted for it in Christian use, and but a single manuscript of it is known. In some books, particularly Jeremiah, a recension of the text was followed differing from our present Hebrew; to others, as Esther and Daniel, apocryphal additions were made. The version contains all the books commonly printed in the English Apocrypha of the Old Testament, except the second book of Esdras. Some manuscripts and editions add a third, others a fourth book of Maccabees.

As to date, the time assigned by the pseudo-Aristotle for the invention of the Pentateuch has nothing against it; and even a passage in the Prologue to Deuteronomy, which alludes to a Greek translation of "the Law and the Prophets," and the fact of the books, it seems probable that the collection of books had assumed something like its present form before 120 B.C.

In the controversies between Jews and Christians in the second century it was found that the LXX. could not be read on as an accurate representation of the Hebrew. Older translations were accordingly made, of which the principal were—(1) that of Aquila in the first half of the second century, slavishly literal; (2) of Theodotion, issued as the LXX., but aiming at greater fidelity; and (3) that of Symmachus, distinguished by greater freedom and elegance. These were presented in parallel columns, together with the Septuagint and the Hebrew text (in Hebrew and Greek characters), in the *Hexapla* of Origen in the first half of the third century; in the Septuagint column words and phrases not in the Hebrew were marked with an obelisk or some other sign as false, and words in the Hebrew not represented in the translation were added from one of the other versions, generally Theodotion, with an asterisk prefixed. Origen's *Hexapla* as a whole was never copied, and probably perished in the destruction of the library of Pamphilius at Caesarea in Palestine. Copies were taken, however, of the Hexapla text of the LXX., parts of which have come down to us in various manuscripts, and also in a Syriac version. The best edition of the remains of the *Hexapla* is that by Field (Cambridge, 1807-75, 2 vols. 4to).

The Septuagint has had a wide influence. It was habitually used by Philo and Josephus, and very often quoted by the New Testament writers. Most of the ancient versions of the Old Testament were made from it, as the Old Latin, Syriac, Gothic, Ethiopic, Armenian, Slavonic, etc. Even all its faults, it has been the only representative of the Old Testament to the Greek or Eastern Church from the beginning, and a knowledge of it is essential to one who would understand the language of the Christian Fathers and the history of theological opinions. From no other source is so great illustration to be derived of the peculiar views of the New Testament. It has also considerable value as a help in the criticism of the Hebrew text.

The text of the LXX. became early corrupted, and the Hexapla edition of Origen increased the corruption, his obelisks and asterisks being often omitted or misplaced by scribes. Existing manuscripts differ considerably, and the correction of the text is a difficult problem. The primary sources of the LXX. are—(1) that contained in the Complutensian Polyglot (1514-17; published 1592); (2) the Aldine (Venice, 1519); (3) the Roman, Vatican, or Sixtine (Rome, 1587 fol.), founded largely on the Vatican manuscript of the fourth century; and (4) that of Græce (Oxford, 1707-30), the best of which was the Alexandrian manuscript. The edition of Bæ (Vindobonæ, 1793, 4to) exhibits the Roman text with the variations of the other three editions; and the great edition of Holmes and Parsons (Oxford, 1796-1827, 5 vols. fol.) gives the same text, with the various readings of more than 600 manuscripts collated for it at great expense. The text of nearly all the oldest manuscripts of the LXX. (fourth to ninth century), as the Sinaitic, Vatican, Alexandrian, etc., has since been accurately published, but no critical edition exists in which these rich materials have been judiciously used. Most useful, the most convenient manual edition are those of Tischendorf (8th ed. Leipzig, 1875) and Griesbach (Cambridge, 2 vols. 1887-94), the best; cf. *Introd. to Septuagint, Greek and English* (London, 1870, 8vo), giving the Roman text with Brenton's translation in parallel columns. The concordance to the Septuagint by Trappesius (Amst., 1716, 9 vols. fol.) will be superseded by that of Edwin Hatch and Henry Adeney Rodpath (Oxford, 1888 seq.); there are lexicons by Diel (The Hague, 1779-80, 4 vols.) and Schleusner (Leipzig, 1820-21, 5 parts, or Glasgow, 1822, 3 vols.). The principal works on the version are of long standing—e.g. the classical work by H. Hody, *De Septuaginta* (Oxford, 1703, fol.); H. G. J. Thiersch, *De Hist. Pers. Alex.* (Helmstadt, 1841), excellent in regard to the language; K. Frankel, *Historisch-Kritische Studien über Septuaginta* (Leipz., part 1 [all pale], Leipzig, 1841); and A. Tölgner, *Verbreitung u. Uebersetzungen d. Bibel in ihrer Entwicklung aus der innern Entwicklung des Judentums* (Gießen, 1897). Cf. *Hebrew, Jewish People in the Time of Jesus Christ* (Eng. trans., second division, iii., 159-168).

Septuaginta: See FORTALIS.

Sequense (vulg. O. Fr. from Lat. *sequens*, a following, deriv. of *sequi* (pres. partic. *sequens*, *sequens* (de), follow); in music, a peculiar chain-like progression, in which a short musical figure or group of notes is repeated several times on successive steps or degrees of the ascending or descending scale. As a sequence is thus only a group placed one degree higher or lower at each repetition, it can have (in itself) no proper termination, but may be continued indefinitely or through the whole range of the scale. One of the simplest forms of sequence is that made by a chain of thirds and sixths, with each sixth suspended by the seventh, as at *a*, Ex. 1; or with a suspension of the sixth by the fifth, as at *b*:

Ex. 1—*a*

In sequences the leading trait or figure may lie in the treble, the bass, or one of the middle parts, or in any two or more of the parts together. In Ex. 2 the most forcible expression of the sequential idea is found in the treble at *a*, and in the bass at *b*, while at *c* it appears in the treble and bass combined:

Ex. 2—*a*

Sequences are of infinite variety, and occupy an important place in fugues, organ-pieces, and instrumental compositions of almost all kinds, furnishing a grateful relief to the ear, and awakening certain emotions which seem peculiar to progressions of this class. Those given in the above examples are founded on the diatonic scale, but many of the richest sequences derive their beauty from the peculiarities of the chromatic scale, and are sometimes exceedingly elaborate and complex.

Revised by DUDLEY BUCK.

Sequin [= Fr. from Ital. *sechino*, later, dimin. of *secco*, mint, from Arab. *sakka*, die, stamp]; a name applied to various Italian and Levantine coins. The original sequin was a Venetian gold ducat of the thirteenth century.

Sequoia (Mod. Lat., named in honor of Sequoyah, the Cherokee Indian who invented letters for his people); a genus of coniferous evergreen trees of the sub-order *Cupressaceae*, or cypress family, remarkable for the great size which they attain, being the "redwoods" and "big trees" of California. They are natives of California only, and of two species—*S. sempervirens*, the true redwood, confined to the Coast Ranges; the other, *S. gigantea*, properly called big tree or rarely mammoth tree, restricted to the western slope of the Sierra Nevada. The Pacific forest-belt produces large trees generally, but the sequoias surpass in girth, if not in height, the sugar-pines, Douglas spruces, etc., with which they are associated. They are distinguished at sight from other trees by the peculiar fibrous bark of a rich cinnamon-brown color.

The nearest relative of the genus is *Taxodium*, which is represented by the bald cypress of the southern Atlantic U. S. and Mexico. The foliage of the two species is strikingly different. The leaves of the redwood resemble those of the yew, being spreading and arranged comb-like on two sides of the branchlet; the cones are the size of a hazel-nut. The leaves of the big tree are smaller, awl-shaped, and closely oppressed to the branchlet; the cones of the size of an English walnut. The wood of the redwood is light, but firm, straight-grained, and handsome, although the rich brownish-red color fades on exposure without protection, while, like most of the cypress family, it is very durable. Only the redwood, which occurs in large quantities, affords a material of commerce, being lumbered on a large scale, and used for construction, interior finish, railway ties, etc.; the available supplies are being rapidly exhausted by the wasteful methods of lumbering. The tree is tenacious of life, the stumps even of the oldest trunks long retaining their vitality at the circumference, and sprouting into a circle of fresh young shoots, in which it differs from most other conifers. This tree (the redwood) occurs along the west slope of the Coast Ranges from Monterey Bay to the Oregon line, but is most abundant N. of San Francisco Bay up to lat. 40°. Where the redwood abounds it forms forests almost by itself. There are trees from 50 to over 75 feet in circumference and from 200 to 275 feet in height, and credible accounts are given of still larger ones. Archibald Menzies was the first botanist to collect specimens of the redwood (about 1810). They remained undescribed until 1832, when one of these specimens was figured by Lambert, and named *Taxodium sempervirens*. Soon after the tree was made known to botanists by David Douglas; in 1847 Endlicher founded upon it the genus *Sequoia*.

S. gigantea, the big tree, appears to have been first discovered in the spring of 1852 by a white hunter named Dowd, who reached the Calaveras grove. Specimens reached the Atlantic States and Europe in 1853, and Lindley first described the species as *Wellingtonia gigantea*, on Dec. 24, 1853; a figure of it also appeared in 1854 in *The Botanical Magazine*. The Californian botanists proposed to call it *Washingtonia californica*, and under this name it was published in the *California Farmer* in 1854. Meanwhile Dr. Torrey determined that this tree was of the same genus as the redwood—i. e. *Sequoia*—notwithstanding the difference in foliage, a conclusion announced also by Dr. Asa Gray in *The American Journal of Science* for Sept., 1854. Prof. Decaisne in Paris had already taken the same view, assigning the name *Sequoia gigantea*, which the tree now bears, as early as June 1854. (*Bull. Soc. Bot. France*, i., 70.) The name *Sequoia wellingtonia*, proposed by Seemann in 1855, is therefore antedated by *S. gigantea*, which must stand.

Although in general of greater size than the redwood, this tree is not so handsome. The branches are short, the spray less graceful. The wood is similar, but of a duller reddish hue. This species nowhere forms a forest by itself, but is mixed with other coniferous trees, mainly sugar-pines, and generally occurs in detached "groves." Its range in latitude is only between two and three degrees, in longitude being confined to a narrow belt on the western slope of the Sierra Nevada; its vertical range is restricted between 4,760 feet (at the northernmost locality) and 7,000 feet.

There are some twenty groups or groves segregated and named. The most northern grove known is situated in Placer County, 50 to 60 miles N. of the two groves, first discovered and most accessible in Calaveras County. The North Calaveras grove, covering 50 acres, contains ninety-three trees, of which four are over 300 feet high, the tallest standing, called the Keystone State, being 325 feet, and its diameter, 6 feet from the ground, 45 feet. Between these groves and the Merced river are two or three patches of big trees (Tuolumne and Merced grove), but none of great note until the Mariposa grove is reached. This is 16 miles S. of the Yosemite valley, and is in two patches, the lower one at 5,500 feet containing about 125 large-sized trees, one of the largest being the Grizzly Giant, over 93 feet in circumference at the ground, and over 64 at 11 feet, which is measured above the bulge of the trunk, characteristic of the cypress family. Most of these trees have been sadly injured by fire. About a dozen miles S. of this grove is the Fresno grove, said to contain about 600 trees, the largest 81 feet in circumference. From this district S. to the Tule river, but at greater elevations, trees appear to be more abundant than elsewhere, and more widely dispersed through the forest. The Dinky, King's river, New King's river, and Kaweah

having been named. The age of sequoias was formerly estimated as high as 4,000 to 6,000 years, but countings of an-

FIG. 1.—Grizzly Giant, "Wawona," 275 feet high, 28 feet diameter.

nual rings reduce the age of the oldest to between 2,000 and 2,500 years, most of them probably below this. Authentic accounts of the trees are to be found in J. D. Whitney's *Yosemite Book*, and in the writings of Muir, Clarence King, Lemmon, and others. See also *Garden and Forest*, especially vol. iii., p. 573, for a map of the groves.

FIG. 2.—Section of a big tree, 92 feet in circumference.

Both species seem to require for their success the humid atmosphere of the region in which they occur. They thrive well, however, in many parts of Europe, especially in England and Ireland. Several trees of the *Sequoia gigantea*, over 40 feet in height, are to be found in Rochester, N. Y. In former ages, seven or eight species were in existence and distributed over a large part of the world, especially in the Tertiary period, when it occurred all around the Arctic zone, and in Europe, as far S. as Greece. B. E. FERNOW.

Sequoyah: See GUESS, GEORGE.

Séracs: See GLACIERS.

Seraing, se'rañ': town; in the province of Liège, Belgium; on the Meuse; 4 miles by rail S. W. of Liège (see map of Holland and Belgium, ref. 10-G). It has large manufactures of steam-machinery, locomotives, iron goods, and mirrors, and has rich coal mines in its vicinity. Pop., with the commune (1891), 32,912.

Serapheus. See **SARAPHEUS**.

Seraphim. See **SARAPHEUS**.

Serampore. town, in Bengal, India, on the Hooghly, in lat. 22° 45' N., lon. 88° 20' E., 15 miles below the town of Hooghly; a neat and well-built city, European in style, extending for about a mile along the right bank of the river, and two large manufacturing of paper (see map of N. India, vol. 1-4). It was originally a Danish settlement, founded in 1755 but was sold in 1846 to Great Britain. Under Danish rule Serampore did not prosper. It was the seat of the first Protestant missionary establishment in Hindustan, founded there in 1813. Pop. (1891) 35,042.

Revised by M. W. HARTWORTH.

Serapeum (= *Lake Lake* = Gr. *Serapeion* or *Apollonion*), a temple of Serapis, deity of *Zeus*, *Serapis*; the name given to the collective temples and tombs of the Apis bulls and Serapis, at Memphis in Egypt. The site, now covered by about 60 feet of sand, is in the N. of the group of pyramids of Saqqara, and the present remains are all subterranean. They were explored by Mariette in 1851-52 and all except two of the Apis-serapeutic were found to have been sealed. Several mummies of Apis-bulls, taken from the serapeum earlier in the century, are preserved in the Universal Museum in New York. The earliest remains found in the Serapeum date from the reign of Amenemhat III. of the eighteenth dynasty, and the Apis-tombs of the last of succeeding reigns down to the thirteenth year of Ramesses II. form a class by themselves. Each Apis had its own separate chapel, which was connected by an inclined passageway with a single rock-hewn chamber, where the mummy-serapeutic of the Apis-bull was placed. In the following period, which lasted till the time of Psammetichus I. of the twenty-sixth dynasty, the tombs were arranged in two separate chambers on either side of a gallery about 330 feet long. This gallery and its chambers early fell into ruin, and are inaccessible. They were replaced by Ptolemaic tombs with a larger series of galleries, which aggregate 131 feet in length, and average 10 feet wide and 17½ feet high. Enclosed therewith are sixty-four chambers (26 feet high) in the rock and now accessible. They still contain twenty-four large sarcophagi, each of which measures 4 feet in length, 11 feet in height, and 7 feet in width, and is reported to weigh 65 tons. Only three are inscribed. The contents of the Serapeum above ground seems to have been built after the general plan of Egyptian temples, with two pylons, courts, and inclosures. Before it was a dromos and avenue of sphinxes which led directly to the Greek Serapeum, which was a Greek temple with cells and pronaos, and was adorned with two Corinthian columns. The importance of Mariette's discovery consisted mainly in the fact that some 500 historical monuments were found in the shape of obelisks and statues erected by pilgrims, who gave the name of their pious visits. In this way many data were obtained for fixing the length of reigns and succession of various Pharaohs.

According to the *Antiquities Hieroglyphic*, another Serapeum was located near the present line of the Suez Canal, at a point overlooking the Bitter Lakes. The Serapeum at Alexandria, erected by the Ptolemies, was probably in the form of a Greek temple, and was dedicated to the god in a way that was Greek-Egyptian. In the same building was the Alexandrian library, and both perished together after the edict of Theodosius, about 390 A. D.

CHARLES R. GILBERT.

Seraph, plur. **Seraphim** [from Heb. *seraphim* (plur.), *seraph*, of *seraph*, burn] a word which occurs but twice in the Bible (Isa. vi, 2, 6). The seraphim are described as creatures, human in appearance, with six wings, symbolical of the "devouring fire" of Jehovah's holiness.

Seraphic Heathen. See **PHARISEAN**.

Seraphim, Order of the, in Sweden and Norway, a military order founded in 1280 or 1285 by Magnus I., King of Sweden, or, as others say, by Magnus II. in 1334. Charles IX. abolished it about 1610, and Frederick I. re-established it, Feb. 11, 1748. The bishop of the Seraphim, the holder of the order, belongs to the national Lutheran Church.

Serpapla (= Lat. = Gr. *Serpapla*, *Serpapla*, from Egypt. *Serpapla*, *Serpapla*, *Serpapla*) an Egyptian deity, ostensibly a combination of Osiris with the Apis, the bull sacred to Isis, an incarnation of Osiris, which symbolized the "perpetual regenerating power of the god." In some con-

ceptions the Apis was associated with the moon. His native name, *Hapi*, belonged also to the Nile, which fertilized the land at the inundation, and to the cyncephalous deity of the dead, who represented the principle which revived the dead. In the later conception the deity bore a mixed character, and was Greco-Egyptian, combining in one the Greek Pluto and Esculapion and the Egyptian Osiris. The Apis-bull, which was the basis of the Serapis worship, was thought to have descended from a cow that had been impregnated by a ray of the moon. He must have distinctive marks: A triangular white spot on his forehead, a scab-like growth beneath his tongue, a white vulture or eagle and a scorpion on his flank and haunches, and a tail with both white and black hair. The discovery of an animal that possessed these features was greeted with universal joy, and its death with an universal mourning. He was kept with greatest care in a temple (the Apion) at Memphis, where he received divine honors. When he died he was carefully mummied, and buried with great pomp and expense in the Egyptian Serapeum (q. v.). His emblem was a bull with the sun-disk and uraeus serpent between his horns. The worship of the Apis began early; it is said to have been taken from Heliopolis to Memphis in the second dynasty, and Apis-worship is mentioned as early as the fourth dynasty. In pure or mixed form it continued throughout Egyptian history, and was transferred to other lands. Alexander the Great and the Roman Titus paid honors to the Apis of Memphis. According to Strabo (*Geogr.*, xvi, 1, §§ 10, 25), the worship of Serapis was also practiced at Alexandria, and at the river mines near Naucratis in the region which the Greeks called Nitria or Nitriotes. His worship spread also to other countries, and in 82 A. D. Domitian built a temple in his honor at Rome.

CHARLES R. GILBERT.

Serena, Lat. capital of Cognac (q. v.).

Seres (= Lat. = Gr. *Sēra*; cf. Chin. *ser*, *ser*, *ser*, *ser*, *ser*, *ser*); Greek and Roman name for a people of Eastern Asia, without doubt the Chinese. See **CHINA**.

Seres (Lat. *Sericeum*; Gr. *Sēra*); town, in the vilayet of Salonika, European Turkey; the center of the Turkish cotton culture; and trade (see map of Turkey, ref. 4-5). Here the cultivation of the silkworm was introduced by Justinian (530). Two monks brought the eggs of the worm from China in a hollow walking-stick. Pop. 20,000 (19,000 are Greeks, 9,000 Ottomans, and 3,000 Jews).

R. A. G.

Serf [from O. Fr. *serf* < Lat. *servus*, slave; cf. Eng. *servant*]; a person held in a modified form of slavery, bound to the soil and without rights as against his master, who could not, however, sell him like a chattel slave. During the Middle Ages serfdom formed one of the most prominent elements of the existing social order. It originated from the slavery of the ancient republics, and was transformed by the unearring influences of Christianity and feudalism. Slavery existed among the Germanic tribes, who reduced their captive enemies to that condition, but after the invasion of the Roman empire these slaves or thralls were raised to the position of serfs, whose numbers were greatly increased by the addition of the native population of the conquered districts. Then, too, the frequent famines and the need of protection from enemies drove many to sell themselves to the more powerful, especially to churches and monasteries. While the institution of serfdom differed both in origin and in character in the different countries of Europe, it was generally true that the condition of the serf was far superior to that of the slave under Roman law.

It is probable that the mastership which the feudal and ecclesiastical lords exercised over their serfs was for centuries felt as a blessing rather than as a burden; for the feudal system was indeed, up to the tenth century, the main support of social order, the condition of life. In countries into which feudalism did not penetrate, such as Italy, no serfdom was developed; here the peasants, the population of the agricultural districts, entered the grades of the city republics in which they belonged, and their position as citizens was not very different from that of the burghers. In England before the Norman conquest a large part of the population were in a state of serfdom, the *thengs* being the lowest in the social scale and approaching the condition of a slave, while the *eorls* could not be bought or sold and enjoyed some personal rights. With the conquest the *thengs* disappeared and the *eorls* became the Norman *villens*, whose condition was an improvement on that of his Anglo-Saxon predecessor. If maltreated by his master he might have a hearing in the king's court, and he enjoyed the full protec-

tion of the law against strangers, but he could not own property, and could be sold with the land which he tilled. The terms *serf* and *villain* are used almost indiscriminately of the non-freemen, though originally the former term signified a lower order of bondman.

The abolition of serfdom in Europe was a gradual process. In England it gradually disappeared during the fifteenth and sixteenth centuries. It is mentioned for the last time in 1574 by a commission issued by Queen Elizabeth for its abrogation in the counties of Cornwall, Devon, Somerset, and Gloucester. In France, where both Louis IX. and Louis X. had sought support in the serfs against the feudal counts, serfdom was maintained, often in very harsh forms, up to the Revolution. In Denmark it was abolished in 1784 by Frederick VI., at that time heir-apparent only, but actually governing instead of his insane father; in Prussia in 1808 by von Stein; in Hungary in 1848 by the revolutionary anti-Austrian Diet; and in Russia in 1861 by Alexander II. See SLAVERY.

Revised by F. M. COLBY.

Serge [viâ O. Fr. : Ital. *sargia* < Lat. *se'rica*, silken garments, liter., neut. plur. of *se'ricus*, silken, deriv. of *se'res*. See SERES]: a name applied to various twilled fabrics. Silk serge is a coarse and strong material used for lining coats, making light shoes, etc. Woolen or worsted and woolen serges are made for ladies' cloaks and other uses. Some kinds of coarse serge are employed for making the garments of certain ecclesiastics. Other finer kinds are in some countries used exclusively for shrouds.

Sergeant [viâ O. Fr. *serjant* : Ital. *serviente* < Lat. *serviens*, *servien'tis*, servant, vassal, soldier, liter., pres. partic. of Lat. *servi're*, serve]: a non-commissioned officer (i.e. an enlisted soldier holding an appointment from the colonel authorizing him to exert a limited authority over his fellow soldiers) in the army and marines, of a rank higher than that of corporal. Each infantry company has a certain number of sergeants, one of which is of higher rank and pay than the rest, and is called first sergeant. Each battalion (or regiment, if, as in the U. S., it has but one battalion) has a sergeant-major, who is the highest non-commissioned officer of the battalion. He is the executive officer of the adjutant, and superintends the making out of details and the performance of other camp duties for the adjutant. There is also a quartermaster-sergeant to each battalion. In the U. S. service a number of quartermaster and commissary sergeants not attached to battalions, and the ordnance sergeants, whose duty relates to the care of ordnance, arms, ammunition, and military stores at the posts to which they are attached, are provided for by law to be selected from sergeants of the line who have served for a certain length of time as privates and non-commissioned officers.

Revised by JAMES MERCUR.

Sergeant, JOHN, LL. D.: lawyer; son of Jonathan D. Sergeant, lawyer; b. in Philadelphia, Pa., Dec. 5, 1779; graduated at Princeton 1795; was admitted to the Philadelphia bar 1799; was appointed a commissioner of bankruptcy 1801; was subsequently deputy attorney-general of Pennsylvania; sat several times in the Pennsylvania Legislature; was member of Congress 1815-23, 1827-29, and 1837-42; was the leading representative of the Northern States in advocating the passage of the Missouri Compromise Act 1820; was minister to the Panama congress 1826; Whig candidate for the vice-presidency on the ticket with Clay 1822, in which year his *Select Speeches* were published; president of the Pennsylvania constitutional convention 1830; declined the mission to England 1841; for half a century was regarded as one of the leaders of the Pennsylvania bar. D. in Philadelphia, Nov. 23, 1852.

Sergi, sār'jō, GIUSEPPE: psychologist and anthropologist; b. at Messina, Sicily, Mar. 22, 1841; educated at Messina; became Professor of Philosophy in lyceums at Messina and Milan; in 1880 Professor of Anthropology in the University of Bologna, and in 1884 professor in the University and director of the Institute for Anthropology at Rome. His principal works are *Elementi di Psicologia* (Messina, 1879); *Teoria fisiologica della Percezione* (Milan, 1881); *L'origine dei fenomeni psichici* (Milan, 1885); *Psychologie physiologique* (French trans., Paris, 1887); *Principi di psicologia*, vol. i., *Dolore e Piacere* (Milan, 1894); together with many anthropological memoirs. J. MARK BALDWIN.

Sergipe, originally **Sergipe del Rey**, sār-zheep'-ā-dāl-rā': an eastern maritime state of Brazil; between Bahia, Alagoas, and the Atlantic. Area, 15,090 sq. miles. The interior

is included in the Brazilian plateau, which is here low, much broken, and has little forest; a broad belt of lowland is separated from the ocean by extensive sand-dunes. The great São Francisco River (q. v.) forms the northern boundary; aside from it the state has only a few insignificant streams, and the mouth of the São Francisco forms the only harbor. The climate is dry and much of the land is unfit for agriculture; the best is in the coast belt and on the edge of the plateau, where sugar and cotton are cultivated. In the interior cattle-raising is the principal industry. Sergipe is the smallest and one of the least populous and progressive of the Brazilian states. The exports are hides, sugar, cotton, tobacco, and a little gold obtained from surface-washings. Pop. (1894) estimated, 261,991. Capital, Aracajú, a small town on the coast. H. H. SMITH.

Sericulture: See SILK.

Series [from Lat. *se'ries*, connection, row, succession, series, deriv. of *se'rere*, join, bind together]: in mathematics, a succession of terms whose values proceed according to some law. The most familiar examples are the progressions of elementary algebra, called respectively arithmetical and geometrical progression. A series may terminate at a certain term, but more commonly it may be continued without end. In the latter case it is called an *infinite series*. The above-mentioned progressions are examples of infinite series, because either of them, when once started, may be continued indefinitely.

An infinite series may be either *convergent* or *divergent*. A convergent series is one the sum of all of whose terms approaches a certain limit if the series is continued indefinitely. A familiar example of this is afforded by a decreasing geometrical progression. Students of algebra know that the progression

$$1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \text{etc.}, \text{ ad infinitum,}$$

will approach 2 as a limit, always differing from that limit by a quantity equal to the last term included in the addition, which term may be made as small as we please by continuing the series.

A divergent series is one the sum of whose terms does not thus approach a limit. A series may be divergent in two ways; the sum of the terms may increase beyond all limit, when their number becomes infinite, and may therefore be called infinity. But the sum may also be continually larger and smaller, without increasing indefinitely. Such a series is

$$1 - 1 + 1 - 1 + \text{etc.}$$

The sum of this series will always be either 0 or 1, according as the number of terms added is even or odd. It is therefore called divergent.

Series are of very extensive use in advanced mathematics, especially in the applications of algebraic methods, because of the great number of quantities which can not be expressed in any other way. Quantities expressed by a series are said to be developed in a series, and if the series is convergent their true values can be found with any degree of accuracy by taking a sufficient number of terms. But if the series is divergent the development is made is divergent, it can not represent the quantity. S. NEWCOMB.

Serinagur: city of Kashmir. See SRINAGAR.

Seringapatam: city of Southern India and formerly capital of Mysor; on an island in the Cavery, in lat. 12° 25' N., lon. 76° 48' E. (see map of S. India, ref. 6-D). Under Hyder Ali and Tippoo Sahib its fortifications were strengthened, and although unhealthy it had 300,000 inhabitants. In 1799 it was conquered by the British, and now it has less than 12,000 inhabitants, and these mostly in the suburb of Ganjam. M. W. H.

Sermon: See HOMILETICS and HOMILY.

Serous Membrane [*serous* is deriv. of *se'rum*. See SERUM]: in the human body the membranous walls of the arachnoid, pleural, pericardial, and peritoneal cavities, and the investing membrane of the testis. Serous membranes in all instances, save the peritoneum in women, are closed sacs, with their opposed walls more or less in contact, but lubricated by secreted serous fluid, so as to permit of free motion. The serous membrane is therefore a contrivance of nature to insure the freedom of the large organs of the body in the limited movements incident to their functional activity. The movements of the heart, lungs, and intestines, the more limited increase and decrease of size of the brain, and the considerable friction of the joints are facilitated and made easy by the well-lubricated serous mem-

bones covering these structures. In certain parts the recesses of the ventral surfaces serve as ligaments to hold the organs in their proper places. (See *Herpetology*.) The tissues of serous membranes are chiefly inflammatory, and often involve the underlying internal organs. Hence they are usually very grave. Acute meningitis, acute pleuritis, acute involving the lung also, pleuro-pneumonia, pericarditis, and peritonitis, all are attended with danger, and often are fatal.

Revised by WILLIAM PIERCE.

Serra Pinto, ALEXANDRE ALBERTO DA ROCHA: explorer; b. in Portugal, Apr. 30, 1848; entered the army, and as major led a Portuguese scientific expedition (1877-79) from Angola to the Transvaal. His *How I Crossed Africa* (1881) appeared in several languages. In 1884-86, with Cardozo, he led another expedition, extending Portuguese influence to Moçambique to Lake Nyasa.

Serpent: a musical wind instrument of brass invented by Sébastien Trillardeau of Auxerre in 1599. It has a cylindrical bore, is composed of a mouth-piece, a neck, and a tail, and has six holes stopped with the fingers, with a compass from B flat below the bass staff to G, the treble-clef line.

Serpentine (named from its mottled yellow and green colors, thought to resemble those of the skin of certain serpents): a rock chiefly composed of hydrous magnesium silicate. Minerals associated with it may be calcite, dolomite, iron oxides, pyrite, amphiboles, pyroxenes, olivine, etc. The rock is usually green in various shades, often quite dark; sometimes broken or red. The mottling is due to the admixture of other minerals. White spots are usually due to calcite or dolomite, the rock being called ophiolite or ophite.

See *serpentine* in the name of any serpentine marble. Red, brown, and dusky shades are due to the presence of iron compounds.

Serpentine occurs in large bodies interbedded with limestone and various crystalline schists in veins, dikes, or irregularly shaped masses, traversing other rocks in the same manner as igneous rocks. In most cases it can be shown to have resulted from the decomposition of magnesium silicates, chiefly olivine and pyroxenes. Many occurrences are slightly altered igneous rocks rich in magnesia. The origin of those serpentines which are associated with the crystalline schists is not so evident. In some cases they are altered forms of magnesium silicate minerals, possibly from argillaceous rocks or volcanic tuffs associated with rocks subsequently metamorphosed. In others they may have resulted from the alteration of magnesium carbonate into a hydrous silicate.

Serpentine is widely distributed throughout the world. On account of its color and its susceptibility to high polish it is much employed for ornamental purposes, as well as for general building. Details of its occurrence and data of economic importance may be found in Merrill's work, *Stones for Building and Decoration* (New York, 1891). See *Brunner*, J. P. *Innomis*.

Serpent of Delphi: a column of Corinthian brass, fashioned by representing three intertwined serpents, and consecrated by the Greeks to the god Apollo after the battle of Plataea (479 B. C.). It was taken to Constantinople by Constantine, and has stood ever since in the Atmeban, the ancient Hippodrome. The heads and upper portion have been broken off, but the mutilated base still remaining is 164 feet high. The names of nineteen of the Greek cities which refused Xerxes may be distinctly discerned, cut deep in the metal not later than 478 B. C. The twelve other names have not been almost obliterated. No more precious monument of Greek antiquity exists. See *Grosvener*, *The Remains of Constantinople and its still existing Monuments* (London, 1899).

E. A. GROSVENER.

Serpents [Gr. *Ophi*, from Lat. *serpens*, liber, pres. partic. of *serpere*, creep; *Ophi*, from *Sin*, *serp*, *crep*, *crawl*, *glide*, *move* (see *deris*, *serp*, *serpent*); the *Ophi*, an order of snakes. They are recognized by the absence of true external scales, and their very elongated body, which regularly graduates into the tail, there being no abrupt distinction between the two; the back and sides have generally imbricated scales. These scales are rarely granular, while the lower surface is generally covered in front of the anus with a row of very broad plates, and behind the anus with usually two, sometimes one, row; sometimes, as in the sea-snakes of the genus *Platyrhina*, the scales extend upon the abdomen as well as on the sides and back; the head is covered with plates. The principal characteristics of the order, especially as given

by Prof. Huxley, are as follows: the premaxillaries are generally rudimentary, and represented by a single small bone, which is connected with the maxillaries only by fibrous tissue; the palatine bones never unite directly with the vomer or with the base of the skull, but are usually connected with the maxillaries by transverse bones, and by the pterygoids with the movable quadrate bones; thus the connection of the palatine-maxillary apparatus with the rest of the skull is more or less lax, and in the typical species exceedingly so; in certain worm-like forms, however, this is not the case; the lower jaw has its ramus connected at their symphysis, generally by ligamentous and extremely elastic fibers, the result of the mechanism exemplified in the typical serpents is that the mouth-piece are extremely distensible, and hence prey of much greater diameter than that of the serpent in its ordinary condition can be ingested. The teeth are acute, and directed more or less backward, and are generally developed simply upon the maxillary, palatine, and dentary bones; in one genus (*Rhachiodon*) the inferior spines of eight or nine of the anterior vertebrae are developed into tooth-like processes tipped with enamel. In the specialized poisonous species poison-fangs only are developed on the maxillaries, the roots on the palatines and dentaries existing as in the typical species; in an intermediate type, containing very poisonous species, there are also rows of teeth behind the poison-fangs. The vertebrae have ball-and-socket articulations and each of them bears ribs, with the exception of the first one or two, which may be considered as cervical. Anterior limbs are absent in all forms, but the posterior are in some types represented by rudiments which appear externally as hooks on either side, and a little in advance of the vent. The lungs are unequal in size, and in the typical forms the disparity is very great, the left one usually being the smaller of the two; sometimes (especially in the venomous species) only one of the lungs is developed: the form of the lungs is that of an elongated sac, in which the walls are produced into numerous septa "which render the cavity highly cellular near the bronchus, while at the opposite end they become smooth and but little vascular; in this latter region the lung may receive its blood from the systemic, and not from the pulmonary, circulation." The bronchus opens directly into the lung. The heart is divided into two auricles and a single very imperfectly separated ventricle.

The movements of serpents are often misconstrued. They progress by sinuous flexures from side to side, and are incapable of the vertical undulating movements which are sometimes ascribed to them in pictorial illustrations. Progression is greatly facilitated by the transverse plates with which the abdomen is covered. Many serpents are also capable of ascending trees, and vertical surfaces; but they are unable to progress on polished or glass-like surfaces. Some live in marshy regions, some in rocky, some on sandy desert plains, others among the trees, and still others burrow in the earth; again, some frequent fresh waters, while a few are even modified for swimming in the ocean. These sea-serpents, the *Hydrophidæ*, are not to be confounded with the mythical sea-serpents (see *Ska-sa-sa-sa*), for they are comparatively small species, with the tail strongly compressed and adapted for swimming, and with small poison-fangs. The *Solenophidæ*, in part at least, burrow in the earth, and thus by their habits, as well as form, justify the term of worm-like snakes.

Most serpents are oviparous, and lay eggs whose shell is generally more or less soft and yielding, but which have, at the same time, a greater or less amount of lime; and sometimes this is developed in sufficient quantity to give a considerable rigidity to the shell; other serpents are ovoviviparous. The innocuous species are generally oviparous, and the venomous ovoviviparous, but the exceptions are numerous. The eggs are generally extruded in a chain, being connected by a viscid substance. In most cases the mother, after laying her eggs, leaves them to be hatched by the sun or decaying vegetable matter, but some species—the pythons, for example—coil themselves around the eggs and thereby hatch them. Many species go with their young for some time after birth, and protect them from enemies. It has been well ascertained that with some species the parent opens its mouth at the approach of danger, and receives therein its young, which are afterward allowed to depart therefrom unharmful.

The venomous serpents belong to the *Proteroglyphæ* and *Solenoglyphæ*, the first including the *Elapidæ* (coral-snakes, etc.), *Najadæ* (cobras, etc.), and the second the *Viperidæ* (vipers) and *Crotalidæ* (rattlesnakes, etc.).

The order is represented by over 1,500 living species. The

representatives of the order as a whole live in hot regions, and are averse to cold. They are absent altogether in the extreme northern and southern countries, and sparingly developed and hibernating during cold weather in the temperate regions, but almost equally abundant in the tropical regions of the several quarters of the globe. In the northern part of the U. S. only three species of the poisonous snakes (the scale-headed and plate-headed rattlesnakes and the copperhead) occur, and the greatest number in any one region within the U. S. are found in Arizona and New Mexico. See POISON OF SERPENTS and the names of different genera and species.

Revised by F. A. LUCAS.

Serpent-stars: See OPHIUROIDEA.

Serpent-worshippers: See OPHITES.

Serpukhof: town; in the government of Moscow, Russia; on the Nara; 57 miles by rail S. of Moscow (see map of Russia, ref. 7-E). It has a fine cathedral of the fourteenth century, and manufactures of linen fabrics of different descriptions, mostly coarse; also leather, paper, earthenware, and furniture. Pop. (1888) 22,718.

Serpula [Mod. Lat., from Lat. *serpula*, little snake, deriv. of *serpere*, creep]: a genus of annelids which build calcareous tubes in which they live. The head is surrounded with feathery tentacles, one of which is modified into a stopper to close the aperture of the tube when the animal is retracted.

Serra, JUNIPERO: missionary; b. in the island of Majorca, Nov. 24, 1713. He entered the Franciscan order, was sent to Mexico in 1749, and labored for years among the Indians of the northwestern districts. When the Jesuits were expelled, in 1767, their missions were placed in charge of the Franciscans. Father Junipero was made president of those of California, then confined to the peninsula of Lower California. One of his first measures was to extend his field to Upper California (now California). The San Diego mission was founded July 16, 1769, Monterey soon after, and others later. These were the first civilized communities within the bounds of the present State. Many of the buildings remain. D. at the San Carlos mission, Aug. 28, 1784. See Bancroft, *History of the Pacific States: California, and The Century Magazine* (May, 1883).

H. H. S.

Serra do Mar: a division of the Brazilian Coast Range bordering the coast or running near it from Southern Paraná to Espírito Santo. The Parahyba valley separates it from the Serra da Mantiqueira. The bizarre forms of many of its peaks make this region extremely picturesque. It culminates in the ORGAN MOUNTAINS (q. v.).

H. H. S.

Serran'idæ [Mod. Lat., named from *Serranus*, the typical genus, from Lat. *serra*, saw]: a family of fishes of the sub-order *Acanthopteri*, including the sea-bass, groupers, jewfish, etc. The body is oblong and compressed; the scales ctenoid and generally moderate; the head compressed, and more or less pointed; the supranaxillary bones not retractile behind under the supraorbital bones; the spinous portion of the dorsal fin about as long as the soft or longer; anal like the soft portion of the dorsal, and with three spines. The variation in size among the species of the family is great, some being only a few inches long, while others exceed 7 or 8 feet. Among the gigantic forms are the jewfish (*Promicrops guasa*) of the Southern States and Cuba, which attains a weight of 500 or 600 lb., and the *Stereolepis gigas* of California, which appears to attain an equally large size. Almost all the species are esteemed as food.

Serrano y Dominguez, sār-raa'nō-ee-dō-meen'gāth, FRANCISCO, Duke de la Torre: soldier and statesman; b. at San Fernando, near Cadiz, Spain, Sept. 18, 1810; entered the army and rose rapidly in rank; joined Narvaez in effecting the overthrow of the regent Espartero in 1843; became lieutenant-general and senator in 1845, and obtained such influence over the young queen after her marriage (1846) as to give rise to much scandal. After taking part in several political intrigues and holding some important offices, he became captain-general of Cuba 1860-62, and won a dukedom as a reward for his successful efforts to reannex San Domingo to Spain. In 1866 he became president of the senate in Spain and suffered a short imprisonment in the same year. His continued opposition to the Government caused his exile to the Canary Islands July, 1868, when he took part with Prim and Topete in effecting the revolution which drove Isabella from the throne. He then became the ostensible head of the Government as president of the council of ministers and commander-in-chief of the army; was elected regent June 16, 1869; negotiated the acceptance of the Spanish

crown by Prince Amadeus of Italy, by whom he was made premier Jan., 1871; resigned that post in July of the same year; took the field as commander-in-chief against the Carlists Apr., 1872; concluded with them the convention of Amorevieta in May; returned to office as premier for a few months; fled to France soon after the proclamation of the republic (Apr., 1873), but shortly returned; was made chief of the executive after the *coup d'état* of Gen. Pavia Jan., 1874, and remained at the head of the Government till the end of the year, when he resigned his authority into the hands of Alfonso XII. D. in Madrid, Nov. 26, 1885.

F. M. COLBY.

Sertorius, QUINTUS: Roman general. He was a native of Nursia in the country of the Sabines; distinguished himself in the battle of Aquæ Sextiæ (102 B. C.) under Marius. He fought with Cinna at the Colline gate in 87 B. C. against Pompeius Strabo, but he did not participate in the bloody massacre which Marius instituted at the capture of Rome. On the contrary, he put to death a gang of about 4,000 slaves whom Marius had let loose on the city, and who had perpetrated the most horrible cruelties. In 82 B. C. he was sent to Spain as proprator, but in the same year Sulla returned to Rome from Asia, and the power of the democratic party came to a sudden end. Although he had in the beginning only a small army, Sertorius maintained his position in Spain against the leading generals of Rome. He gained the favor of the natives, especially the Lusitanians, who became his faithful allies, and gradually drew about him the remnant of the Marian party. In 74 B. C. he formed an alliance with Mithridates. Metellus Pius, whom Sulla first sent against him, was repeatedly defeated, and even Pompey, who came to Spain in 76 B. C., achieved nothing, and was driven back across the Ebro. But intrigues and jealousies arose in Sertorius's camp, and in 72 B. C. he was invited to a banquet by Perpenna and treacherously assassinated at the festival. His biography by Plutarch is very interesting, though more full in its description of his personal character than in its narrative of his exploits.

Revised by G. L. HENDRICKSON.

Sertulariæ: a group of HYDROIDA (q. v.) of uncertain position. They form colonies sometimes 10 inches in height. The individual polyps are situated in horny cases (thecae). No medusa (jellyfish) stage occurs in the life-history.

Serum [from Lat. *serum*, whey; cf. Gr. *ops*, whey, and Sanskr. *sāra*, curds]: the watery portion of certain animal fluids. Serum of milk is whey containing no albuminous matter, whereas serum of blood, the fluid part left after the separation of the coagulum from blood, is a strong solution of albumen in a liquid containing certain salts, neutral and alkaline. The total amount of saline matter in the serum of a healthy man is somewhat over 10 per cent., and there are present carbonates and phosphates of sodium, potassium, calcium, and magnesium, with considerable chloride of sodium, some chloride of potassium, a sulphate of sodium and potassium. The amount of albumen is in the neighborhood of 7 per cent. Both the salts and the albuminous matter prevent the solution of the blood globules, which are very soluble in water itself, and are attacked at once on addition even of a very little water to blood. The physiological and pathological properties of blood serum have recently occupied much attention, and there bids fair to be great advancement in the treatment of disease, based upon these studies. The serum of an animal is known to possess properties which render it more or less destructive to invading micro-organisms. According as this is ill or well developed will be the likelihood or unlikelihood of a severe attack.

Revised by W. PEPPER.

Serum Therapeutics: that department of medical practice which secures IMMUNITY (q. v.) by the introduction of certain substances in the blood which act in an antagonistic manner to the bacteria of the disease in question, or to the toxic substances developed from these or by them. According as the protective substances are present in large or small quantity, permanently or temporarily, so will be the permanence and completeness of the immunity. The same sort of immunity may be developed by artificial inoculation with the specific micro-organisms themselves. The latter may be made less powerful by certain methods of cultivation, as was done by Pasteur in the case of the anthrax bacillus, or they may be injected in small amounts, and thus immunity developed without risk of a serious attack. Immunity may, however, be obtained by injection of the products of the bacteria, obtained either from cultures of

the microorganisms or from the blood of a person or animal previously rendered immune by a natural or experimental attack of the disease. The same substances in larger doses are also in a curative way.

Recently this treatment has been particularly lauded in France. The exact method by which the antitoxic substances in this disease are prepared is as follows: Horses or some preferably the former, are inoculated with cultures of the specific micro-organisms, rendered less virulent by addition of kochin or of sodium or other substances, or with small doses of the toxins of these organisms. There is thus established a specific intoxication of slight intensity, with development of antitoxic substances and leaving a certain degree of immunity, so that the animal may be injected with greater quantities the second time, etc. After repeated injections of this kind the animal becomes practically immune from any dose of the poison. The blood-serum obtained from such an animal will be active for the production of artificial immunity in another animal, or in larger dose it will prove curative of the developed disease. Whatever the outcome of this method of treatment may prove to be in man, it is admirably established that immunity may be conferred upon animals in this way for infection with the organisms of anthrax, malignant edema, anthrax, cholera, typhoid fever, pneumonia, and other diseases. WILLIAM PERREN.

Serval—the *Felis serval*, an animal of the *Felidae* or cat family, having a slender body, small head, long legs, long and shaggy hair, body spotted with dark brown, the general color being yellow, and the lower parts white. It is about 1.5 m. long, exclusive of the tail, which is tipped and ringed with black. It is found in the southern part of Africa.

Servant: See **MAJORS AND SERVANTS**.

Servetus Lupus: polemical writer; b. about 805; was educated in the monastery of Perrières, in the diocese of Evreux, and studied afterward in Fulda under Rabanus Maurus. For some time he lived at the court of Louis the Pious, and in 842 he was made abbot of Perrières by Charles the Bald. D. after 863. He played quite a prominent part in the ecclesiastical history of his time. In the controversy between Gottschalk and Hincmar he sided with the former, but defended him both by his words in the synods and by his pen: *De tribus questionibus* and *Collectaneum*. His works, which also comprise a number of very interesting letters (last, ed. by G. Desclaux du Desert, Paris, 1889), are found in Migne, *Patrol. Lat.*, xix. See Nicolas, *Études sur la littérature Servet-Lup* (Paris, 1881); F. Spratte, *Servetus Lupus* (Halsbam, 1886). Revised by S. M. JACQUES.

Servetus, Michael [the popular Latinized name of Miquel SERRA]; theologian; b. at Villanueva, near Saragossa, Spain, in 1511, or more probably at Tudela, in Navarre, 1511, his own testimony, though contradictory, inclining to the latter place and date; son of a notary, who sent him at the age of thirteen or seventeen to study law at the University of Toulouse, France; gave his attention principally to theology, in which he became proficient; visited Italy, and was present at the coronation of Charles V. at Bologna (1530); traveled in Germany and Switzerland; became acquainted with many of the Reformers, and partially adopted their doctrines; resided some months at Basel, where he discussed theology with the celebrated Hans Haagen (Gangreponius), and launched for the first time his criticism of the current doctrine of the Trinity; proceeded to Strasbourg, acquainted himself with the teachings of the Protestant divines Bucer and Capito; went thence to Lugdun, Alsace, where he published his *De Trinitate liber unus* (1531) and *Dialogorum de Trinitate Liber unus*; in *Notitia Regni Christi Capitulo quatuor* (1532), works which excited him both with Roman Catholics and Protestants; took up his residence at Lyons under the name of Michel de Villanueva about 1533; studied medicine, and supported himself by working as an editor of scientific works; settled at Paris (1536); studied medicine under another, Dintius, and Forest; took the degree of M. D. with his honors (1536), in which year he first met with Calvin; became an eloquent and popular lecturer at the university in medical science and mathematics; published a treatise, *Compendium Universæ Ratiō* (1537), attacking opinions of some of the Paris faculty of medicine; had about this time several conferences on theology with Calvin, who proposed, as he himself says, to set him right on theological matters; proceeded to Châlon, near Lyons, 1538; lived some time at Arignon; published at Lyons editions of *Salmeron's Cosmographia* (1541) and of the Bible (1542) with

Latin notes, which were condemned as heretical by the Roman Catholic Church; took up his residence in 1542 at Vienna, Dauphiné, living as confidential physician in the palace of the archbishop, Pierre Paulmier, a former pupil; carried on with Calvin, then at Geneva, an active theological correspondence, which resulted (1546) in a bitter quarrel; published anonymously his chief work, *Christianorum Reformationis* (Vienna, 1550), the authorship of which was recognized by Calvin, to whom he had sent much of it in MS., and made known by him to the Roman Catholic Archbishop of Lyons, Cardinal Tournon. Arrested and imprisoned by the Inquisition at Vienna, at the instance of that prelate Servetus would probably have been acquitted for lack of evidence had not Calvin supplied portions of his correspondence as proofs against him. Servetus escaped from prison, crossed the frontier into Piedmont, and remained in concealment several months. Meanwhile his trial went on; he was condemned for heresy, and burned to effigy at Vienna June 17, 1553. He then resolved to go to Naples, but by a strange fatality went first in disguise to Geneva, where, his presence having become known to Calvin, he was arrested, brought to trial (Aug. 14) before the municipal court on charges of heresy, sedition, insult to the Fathers of the Church, and calumny against Calvin and other Protestant divines; was forced to discuss doctrinal points with Calvin, who appeared as prosecutor and drew up the final articles of accusation, thirty-eight in number; was condemned to the stake, and, notwithstanding the desire of Calvin for his decapitation as a milder form of death, was burned alive on a hill near Geneva Oct. 27, 1553. The Roman Catholic Inquisition had previously (June 17) sentenced him to the same punishment. The Reformers generally, including Melancthon, approved his execution. Calvin might easily have been antithetical of his accidental presence in Geneva, but he had threatened him with death if he came within his reach and he kept the promise he had made. *Lives of Servetus* have been published by Modestus (1750), Trechsel (1836), W. H. Drummond (London, 1845), and Brunnemann (1865). Cf. Schaff's *Church History*, vol. vii. The most careful study of his career and the best authority on his life is H. Tollin's *Chemisch-historische Michael Servetus*, and many articles that Tollin published in various journals. The theological position of Servetus was extremely individual. He was no Arian, and while denying the tri-personality of the Godhead and the eternity of the Son, he was passionately devoted to the person of Christ and equally to the Bible as the sole standard of authority. His was a boundless intellectual curiosity, a wide and various culture, an absolute sincerity, but withal a love of controversy, not peculiar to him in his generation, which brought him into frequent danger and finally to a cruel death.

Revised by J. W. CHADWICK.

Ser'via [from Russ. *Serbiya*, deriv. of *Serbi*, a Servian, from *Serr*, *Serb*, a Servian (Turk. *Syryl*): a kingdom of Southern Europe in the Balkan peninsula; between 42° 20' and 45° N. lat., and 19° 10' and 22° 45' E. lon. It is bounded N. by the Austro-Hungarian empire, from which it is separated by the Save and Danube rivers, E. by Roumania, from which it is separated by the Danube, and Bulgaria, S. by Bulgaria and Albania, W. by Albania and Bosnia. Area, 10,050 sq. miles.

Topography, Products, Commerce, etc.—Servia is divided by the river Morava into two unequal sections. The western section is broken by the Dinaric Alps, the eastern by the Balkans. At Orsova, on the Danube, the Balkans are separated from the Carpathians by a narrow cleft, called the Iron Gates, through which the Danube rushes. From its southern frontier, dominated by the Kopaonik Mountains nearly 7,000 feet high, Servia slopes to the north in a roughly inclined plane, and on the northwest spreads out in level tracts. The soil in the valleys and lower regions is fertile, producing rice, maize, wheat, flax, hemp, and tobacco. Along the Danube are numerous vineyards and orchards, especially of plum-trees, whence the *slivovitz*, a popular sort of brandy, is obtained. More than half the territory is covered with forests, wherein oaks and walnuts abound. Iron, copper, lead, and coal are found in certain localities, but absence of roads and lack of enterprise prevent their being worked. From the same cause the forests are untouched, except that they are given over to raising immense herds of swine. These hogs are exported, and constitute the chief industry and the principal source of revenue. There are practically no manufactures except in a primitive way, as each household supplies its own necessi-

ties. Commerce is confined to the exportation of raw materials and the importation of the most essential manufactured goods. The system of agriculture is simple and rude; little attention is paid to education, and the condition of the country and people presents a striking contrast to the progress made by Roumania and Bulgaria since 1870.

The unit of value is the dinar or franc. During the fiscal year 1894 the state receipts were 63,755,600 dinars; expenditures, 63,736,300. The public debt is 359,144,500 dinars. In 1893 the imports amounted to 40,922,525 dinars, seventieths of which were from Austria-Hungary; exports, 48,910,400, about five-sixths of which were to Austria-Hungary. There are 388 miles of railway. Length of telegraph lines, 1,946 miles; offices, 143.

Servia is an hereditary monarchy. The national assembly or Skupstchina consists of 134 members and meets annually. Pop. (1894) 2,256,084. Except 143,684 Roumanians and 37,581 gypsies (1891), there are few not of the Servian race. With rare exceptions the inhabitants belong to the national Church, the Eastern Orthodox or Greek. Pop. of chief towns (1890): Belgrade, the capital, 54,249; Nisch, 19,877; Kragujevatch, 12,669; Lescovatch, 12,132; Pojarevatch, 11,134. In 1892 there were 20,934 marriages, 93,833 births, and 74,128 deaths. By statute of 1889 military service is obligatory on every able-bodied male Servian from the age of twenty-one to fifty-one; 1 year in active service, 9 in the reserve, 10 in the first division, and 10 in the second division of the national militia. Servia claims ability to put into the field 5,700 officers, 239,950 men, with 45,100 horses and 402 cannon.

History.—The Servians are a branch of the Slavic family. During the seventh century they were induced by the Byzantine emperor Heraclius I. to abandon their homes in the Carpathians and colonize the then depopulated territory between the Danube and Adriatic. Bound to the Byzantine empire by friendship and allegiance, they formed an efficient defense against the barbarians of the north. Christianized in the ninth century, Servia became independent in the eleventh, and its sovereign, the Grand Shupane, was recognized as a king by Pope Gregory VII. Stephen Dushan, the tenth sovereign, conquered nearly all the Balkan peninsula, threatened Constantinople, and in 1346 took the title of czar. In 1389, at the terrible battle of Kossova where the Servian king Lazarus and Sultan Murad I. were slain, Servia lost its independence, and disappears from history till the early part of the nineteenth century. Then the peasant Kara George, aided by Russia, expelled the Ottomans, and ruled from 1804 to 1813. Again the Ottomans overran the country when the swineherd Milosch Obrenovitch, who had assassinated Kara George, headed a desperate resistance during fifteen years. Supported by Russian diplomacy he forced the Porte in 1830 to recognize him as hereditary prince of Servia. In 1869 a constitution was framed, according to which the Government appointed one-third of the Skupstchina, while the electorate of the other two-thirds was greatly restricted. In 1876 Servia declared war against the Ottomans, and was saved from destruction only by the interference of Russia. The Congress of Berlin (1878) recognized the independence of the principality, and increased its territory on the south at the expense of the Ottoman empire. Servia declared itself a kingdom Mar. 6, 1882. In Nov., 1885, King Milan made an unjustifiable attack on Bulgaria, but was ignominiously defeated and his kingdom maintained intact only through the intervention of Austria-Hungary. In 1889 a more liberal constitution was granted, all taxpaying citizens becoming electors, by whose votes the entire Skupstchina was elected. The Servians are a brave and generous people, and the unfortunate history of Servia since 1868 is largely due to the influence of their incapable and pusillanimous ruler, MILAN I. (q. v.), who on Mar. 6, 1889, abdicated in favor of his son, Alexander I. The latter in May, 1894, by a *coup d'état*, abolished the new constitution and restored that of 1869.

Servian Language: See SLAVIC LANGUAGES.

Servian Literature: in its broadest sense, the literary monuments of the Servian or Servian-Croat language, spoken by most of the inhabitants of Servia, Bosnia, Herzegovina,

Montenegro, Dalmatia, and Croatia (including Slavonia), about 6,000,000 in all. This belongs to the southern division of the Slav languages, and, though somewhat influenced by Turkish, is most closely related to Bulgarian, Slovenian, and Russian. In a narrower sense the term Servian is restricted to Servia alone. The Servian and Croat languages and literatures, although essentially of the same origin, and differing in little except that the former employs the Cyrillic (Russian) alphabet and the latter the Latin, had for centuries an independent development, owing to political, religious, and territorial influences. While Croat literature developed under the Roman Catholic Church and Western European influences, Servian literature, as the intellectual medium of a people belonging to the Greek-Oriental Church, grew under the influence of that Church and the Byzantine empire. Consequently the Servians received with the Old Slovenian liturgy also the Old Slovenian or Old Bulgarian language. This, by an admixture of dialectic peculiarities, was gradually moulded into the so-called Servian Church Slavonic, in which, until the destruction of the Old Servian realm (battle at Kossova in 1389), a rather extensive Church literature was produced.

Early Servian Literature.—Among the first writers was Stephen, first King of Servia (crowned in 1217), who wrote a biography of his father, Stephen Nemanjas (ed. by Šafarik, *Život sv. Simeuna*, Prague, 1868 and 1870). His brother Sava, who founded the Servian monastery Chilandar on Mt. Athos, and was in fact the apostle of the Servian people, wrote a legend, a ritual, and a liturgy from Old Bulgarian sources. Domentian wrote lives of St. Sava and St. Simeon (ed. by Daničić, Belgrade, 1865). The *Radostor*, by Archbishop Danilo (1291–1338), is a genealogical account of Servian kings and archbishops (ed. by Daničić, Agram, 1866). These works were of a panegyric ecclesiastical nature, hardly popular enough to encourage secular literature.

The most important productions for the study of the old language and history of Servia are the documents and records of the old kings, and especially the *Zakonik* (a collection of laws), by King Stephen Dushan (d. in 1356). The Turkish yoke after Kossova almost completely checked literary life in Servia for nearly 400 years; but the Gospels were printed in Belgrade in 1552, and Georg Branković, during his captivity in Eger, wrote a chronicle of Servia from the origin of the Servian people to about 1700.

Literary Activity during the Turkish Supremacy.—While Servian literature was thus suppressed by the Turkish conquest, a similar and cognate literature sprang up and attained full development in the Illyrian towns or the Dalmatian cities and islands from the end of the fifteenth to that of the seventeenth century, gradually declining thereafter. Its language was Croat (West Servian-Croat) in the old historic sense, although in the south (at Ragusa) the South Servian or Herzegovinian dialect predominates. This literature frequently loses the national Slavic color owing to the imitation of the various Italian literary movements. A considerable portion of it is actual translation from the Italian, but most of it is lyric poetry, love songs in the style of the Italian sonnet poetry, idyllic tales, and epics; even the drama is represented in both tragedy and comedy. The oldest writer of this literature is Marko Marulić, at Spalato (1450–1524); his poetry is biblical, its form yet rather imperfect. The island of Lesina produced two masterly poets—Hannibal Lučić (1480–1525), author of lyric songs and the drama *Robinja*, and Peter Hektorović (1486–1572), who wrote the descriptive poem *Ribanja* (a fisherman's tale). Then Ragusa took the leadership, owing to such lyric poets as Menčeta (1457–1501) and Držić (d. about 1510), both masters of love poetry. Greatest of all was Ivan Gundulić (d. 1638), the author of the epic *Osman*, celebrating the Polish victory over the Turks at Chocim. In 1667 Ragusa was destroyed by an earthquake, which ended its material and intellectual development. Jacob Palmotić (d. 1680) portrays its destruction and rebuilding in his epic *Dubrovniki ponovljen* (Ragusa Renewed). The works of Dalmatian poets have been edited by the South Slavonic Academy at Agram (1869, seq.).

The revival of Servian literature was due to the political struggles carried on by Austria against the Turks for the liberation of the Servian people, at the end of the seventeenth and the beginning of the eighteenth centuries. A considerable part of Servia was thus restored to Western European life and civilization, but at the same time a reaction against the latter took place; Russian teachers were called to the schools, and the Church-Slavonic language in its Russian form introduced into the service of the Church.

The Archbishop Ivan Račić's *History of the Slavonic people especially the Bulgarians, Croats, and Serbians* (1905; n. s. 4 vols., Budapest, 1923), was an important country. Đorđević Obradović and Vuk Karadžić, an able and energetic, reorganized and reformed the popular Serbo-Croat language proper, and with the liberation of the Serbian nation from the Turkish yoke its literature took a high stand among those of Europe. The monk Đorđević (1738-1811), who was the teacher of the children of Kara George and died a senator, exerted a permanent influence on the revival of national life and literature in Serbia. Vuk Karadžić (1797-1864) collected the Serbian songs which attracted much attention in Germany and England as pearls of popular poetry. The first modern poet was Ljudevit Mulić (1777-1847), but his pseudo-classicism did not exercise a beneficial influence upon the developing taste of his people. More popular and natural in the poetry of Sima Milutinović, who wrote poems on the heroic war of independence (Leipzig, 1826) and the history of Serbia in 1812-14 (Leipzig, 1857). The greatest poetical treasure of the nation, however, is their ballads. (See *Serbs*, *Serbia*, by Child, vol. 1, p. 409.) With the increasing enlightenment of the nation many prose works also were written and journals sprang up over the country, the most important among them being the *Novi Listopis* (Serbian News Journal), published since 1822. During the second half of the nineteenth century Serbian poetry became more and more original, national, and independent, reflecting the inner life of the aspiring state.

Josif Petrović Njegoš (Vladika of Montenegro) wrote the celebrated epic *Džeko vojvoda* (Vienna, 1847), describing the mass liberation of Montenegro from the Turkish yoke at the end of the eighteenth century. The other nation's best poets are those of the lyric poets Branko Radičević, Ivan Mašević, and Djura Jakšić, and the novelist Milicaević who, in the *Zemlja* series, tales of Serbian life. The *Illustri*, edited by the Society of Scientists since 1847, contains valuable statistical history, geography, literature, and philology.

The *new Croat literature*, permeated by the Pan-Slavic desire to become intellectually united with the Serbian sister nation, has been so modified that the only difference between them is one of external form. The publicist Ljudevit (1829-72), an Agrian, the center of the South Slavic movement, was especially active in this respect since 1834. The *new Serbian dialect* and the Latin characters were to be employed by the authors of this school, but in actual fact, and for ethnological and political reasons, this literature was to be called *Illyrian*. Since 1848, however, the *new Croat and Serbian-Croat* have prevailed. The most important parts of this literature are Peter Preradović (1818-76), known also for birth a Slovene (1819-51), excellent lyric poetry; Matković, the author of the famous patriotic song, the epic of hero, *Novi Smol-naga Čovjek* (Death of Lord Agia), and Bogović, author of dramas, songs, and political novels. The epic popular songs of the Croats have been collected and edited by Bogović (*Narodna pjesma*, Belgrade, 1876), and partly by Mikesich (*Die Volkslieder der Kroatens der slow. Volksweisen*, J. Die Volkslieder der Croaten, Vienna, 1870).

Illyrianism.—*Narodna škola pjesma*, a work on Serbo-Croat popular poetry, by Karadžić (Germ. trans. by Talvj, Leipzig, 1864); *Kapitel, Geschichte der Serben* (Leipzig, 1852); *Illyrianism, History of Serbo-Croat Literature* (1867); *A. N. Pypin, I. Pypin, Serbo-Croat* (Paris, 1888); *A. N. Pypin and V. D. Pypin, Illyrian, slavisch-lit. Literatur* (Germ. trans. by T. Pypin, vol. 1, Leipzig, 1889). HERMANN SCHÖNKNECHT.

Service-berry (See **DICTIONARY**).

Service-tree: a roseaceous tree, *Pyrus domestica*, of Europe, Asia, and Africa, much resembling the Medlar and *Malus* (q. v.). Its fruit, when overripened and blotted, is soft and pleasant to eat. It is considerably cultivated. The wood is very hard and valuable, and is used as a substitute for oak. In parts of North America the name *service* is applied to the chest-tree, and in others to the mountain-ash.

Revised by L. H. BAILEY.

Servites: a community of Augustinian friars, called Servants of the Virgin Mary; founded at Florence in 1239. Giulio Strozzi was their first general and one of their founders. They were confirmed in 1255 by the pope, and in 1263 a part received a reformed rule. There is also a community of Servite Terziars, and there are a few houses of Servite nuns. The Servites are mostly found in Europe, and have a monastery at Chicago, Ill.

J. J. K.

Servitudes (from Lat. *servitudo*, deriv. of *servus*, slave): The term *servitudes*, as employed in the Roman law, covers not only the Easement (q. v.) of the English law, but also life-estates in land and life-interests in personal property. It is a right to use the property of another, whether real or personal. The term does not include purely contractual rights of use, such as are established by *lease* or *loan*, but is restricted to such property rights as are enforceable against all the world by actions in rem.

Servitudes on land, if established in favor of an adjacent and "dominant" estate, are termed *real* or *predial servitudes*. These are again divided into *ruralis* and *urbana* servitudes. The former include rights of way, rights of drawing water from or conveying water across neighboring land, etc. Examples of the latter class are rights of light and prospect, right of discharging rain-water on neighboring land, right to have a wall or beams supported by the neighbor's wall. The modern European law of real servitudes is substantially Roman.

Servitudes upon land, if created in favor of a particular person without regard to his ownership of adjacent land, and property rights less than ownership in movables, are *personal servitudes*. They are always limited to a single life, while the real servitudes are in principle perpetual. The most important of the personal servitudes is *usufruct*. This may be established not only in land (life-estate of the English law), but in any property which is capable of being used without material impairment of its substance (so-called "non-consumptibles," e. g., a collection of books or jewels, a service of pasture). The right may be exercised directly, or it may be sold or leased. The usufructuary is bound not to deteriorate the property, and he must give security for its restoration. In the case of consumptibles (including money) a so-called *quasi-usufruct* is recognized. Here the usufructuary is really owner, and gives security for the restoration, not of the things or money which he has received, but of their equivalent or value.

Limited rights of using land may be conferred by law upon a neighbor or upon the public generally. In such cases continental jurists speak of *legal servitudes*.

Agroperitina.—Hilvers (Marburg, 1856); Gavini de Campile (Paris, 1870); special works upon usufruct: *Usus* (Paris, 1859); *Hausrecht* (Erlangen, 1879). MANNUS SMITH.

Servius: a Roman grammarian of the latter half of the fourth century A. D. He is frequently mentioned in the *Saturnalia* of Macrobius, but is chiefly noted for his complete commentary upon Vergil, which is based upon the labors of many earlier scholars, and embodies much useful information on the text and in general on Roman religion, history, and antiquities. This commentary exists in a longer and shorter form, and the relation between the two has caused much discussion. The last edition is by Thilo (and Hagen) (Leipzig, 1821-27). See also E. Thomas's *Commentarii Servii* (Paris, 1880), and Nettleship's *Lectures* (Oxford, 1885; p. 322 f.). M. WARDEN.

Servius Tullius: the sixth King of Rome (legendary dates 578-534 B. C.). The account of his life is full of fables and wonderful traditions—his being the son of a female slave by the god Vulcan; his education in the royal household under the special care of Queen Tanaquil; his marriage with the king's daughter, and his accession to the throne by the stratagem of his mother-in-law; his death in Vico Secleratus, by being thrown down by the younger Tarquin from the stone steps of the senate-house, then overtaken and stabbed by Tarquin's servants on his way home, and finally driven over by the chariot of his unnatural daughter, Tullia, the wife of Tarquin. But amid the many mythical elements which cling to his name there appear to be some remnants of tradition that have a genuine historical value. To him is attributed a constitution which made landed property the basis of the military system, and thus admitted the plebeians to a place in the army and a share in the government. He formed an alliance with the Latins, and completed the city by incorporating with it the Quirinal, Viminal, and Esquiline hills, and surrounding the whole with a wall 5 miles in circumference, which was the legal boundary of the city up to the time of Sulla. Revised by G. L. HERRINGTON.

Sesame, or **Benne-plant**, as it is called in the southern parts of the U. S. (*sesamum* = Gr. *sesadon*, *akrasos* (whence Lat. *sesame*, *sesamum*); cf. Arab. *simsim* and Hind. *simsem*, *sesame*); an herbaceous plant, *Sesamum indicum*, belonging to the small family *Pedaliaceae*, sometimes annexed to *Rhamnaceae*, valued for the oil expressed from its seeds.

There are several varieties, which have been regarded as species. They are annual Oriental plants, naturalized in most warm climates. Sesame was probably introduced into the U. S. by slaves from Africa. Its rich oily seeds are prized by the Negroes, who also make a thick gelatinous drink of the leaves, which is very bland and useful in diarrhoeas. The seeds can be made to yield half their weight in oil, which is in some respects better than olive-oil. The oil is called oil of benne and gingelly-oil.

Revised by CHARLES E. BESSEY.

Sesame-grass: a large grass, *Tripsacum dactyloides*, of the U. S. growing in moist soil near the Atlantic coast from Connecticut southward, with broad leaves and a solid stem, like that of Indian corn or sugar-cane, which it somewhat resembles. It is very coarse, and in the North is not valued, but in parts of the South and in the West Indies and Mexico is used as fodder.

Ses'amoid Bones [*sesamoid* is Gr. *σάμων*, sesame + suffix *-oid*, like; so called from their supposed resemblance to a sesame-seed]: bones developed in the tendons of muscles. The most familiar example is the patella or knee-pan. They do not belong to the vertebral appendages proper, but to the sclero-skeleton.

Sesot'stris [Gr. *Σεσωτρίσις*, or *Σεσωτρίς*; cf. Egypt. *Sesetsu* = Ramses II.]: the name applied by Greek writers to Ramses II. of the nineteenth Egyptian dynasty, about whom they grouped the record of the deeds of other famous Pharaohs as well as those which belonged to himself, thus forming a single exaggerated personality. Views have differed as to the persons thus combined, Bunsen holding to a commingling of two kings of the ancient empire, while Lepsius held that Ramses II. formed the central figure. Manetho applies the name Sesotris to Usertasen II. of the twelfth dynasty, while Herodotus and Diodorus evidently have Ramses in mind. According to the Greek story, Sesotris was reared with children born on the same day, apparently 1,700 in number, and in his youth led victorious expeditions into Ethiopia and Libya. After his father's death he equipped an army of 600,000 infantry, 24,000 cavalry, and 27,000 chariots, giving the command to his fellow students, marched against Ethiopia and took heavy tribute. He then fitted out a navy of 400 vessels and sailed to the end of the Arabian peninsula. Thence he proceeded through Arabia and along the coast, crossing the Indus and conquering India. Returning by land he subdued the Scythians. According to one account he left a portion of his army in this region, and they became the ancestors of the Colchi. Then, after conquering Thrace, he returned to Egypt with great spoil and many captives, having been absent exactly nine years. The remainder of his reign occupied fifty-nine years. He divided Egypt into thirty-six nomes or districts; built roads, canals, cities, and temples, using his captives as laborers; by grace of Thoth was learned in the law, and was reckoned among the great Egyptian lawgivers; introduced the worship of Serapis; and divided the Egyptians by a system of caste, forbidding also that a son abandon the calling of his father. In his old age he became blind and took his own life. The Greek story is in accordance with the actual facts only in a few particulars. For the Egyptian account, see RAMSES. See Herodotus (ii., §§ 102-110) and Diodorus (i., §§ 53-58), and the authorities quoted by Wiedemann, *Aegyptische Geschichte*, p. 429. CHARLES R. GILLET.

Sessa Aurun'ca (anc. *Suessa*): town: in the province of Caserta, Southern Italy; on the crater of an extinct volcano about 6 miles from the Tyrrhene Sea (see map of Italy, ref. 6-F). Suessa was a conspicuous city of the Auronians or Auruncians as early as 418 B. C., and, judging from the position of important architectural remains, antiquarians and geologists are of opinion that the town was, in part at least, buried by a volcanic eruption. The present town is poorly built, but it has a cathedral, a theological seminary, and a technical college. Pop. 6,000.

Sester'tius [Lat., liter., two and a half; *se'mis*, half + *ter'tius*, third, i. e. the third (*as*) being only a half]: in ancient Rome, a silver or bronze coin worth one-fourth part of a denarius. Originally, it was worth two and a half asses, but in later times four asses made one sestertius, and the coin, originally of silver, was struck in fine bronze. The sestertium was a money of account equal to 1,000 sestertii, but it was never coined. The value of the sestertius, roughly stated, was from one and a half to five cents of U. S. money, for the value declined greatly after the fall of the republic.

Sesto, CESARE, da; painter; b. at Sesto, Milan, in the sixteenth century. He was a pupil or imitator of Leonardo da Vinci. He afterward went to Rome and became acquainted with Raphael, whose style he adopted. Baldassare Peruzzi engaged him to assist in executing the frescoes in the citadel at Ostia. His masterpiece is the picture in the Church of San Rocco of Milan, in several compartments. At Saronno he painted four narrow pilasters with figures of St. Martin, St. George, St. Sebastian, and St. Roch (San Rocco), which he inscribed *Cesar Magnus fecit*; this has led some critics to believe that he belonged to the de Magni family, or that these frescoes were by another painter, but the similarity of workmanship does not allow of the latter hypothesis. The date of his death is supposed to be 1524.—His brother STEFANO was a sculptor whose bas-reliefs in the Certosa of Pavia are remarkable. W. J. STILLMAN.

Sestri Ponente: town: in the province of Genoa, Italy; beautifully situated on the seashore about 5 miles W. of Genoa (see map of Italy, ref. 4-B). It has a delightful climate, and is a favorite summer resort. The inhabitants of Sestri Ponente are extensively engaged in ship-building, and are otherwise very industrious. Pop. of commune, 10,656.

Sestus, or Sestos: See ABYDUS.

Sete Quedas: See PARANÁ (river).

Seth, ANDREW, M. A., LL. D.: educator and philosopher; b. in Edinburgh, Scotland, Dec. 20, 1856; educated in Edinburgh, Berlin, and other universities; became assistant in logic in Edinburgh in 1880; professor in University College, Cardiff, 1883; lecturer in the University of Edinburgh 1883; professor at St. Andrews 1887; and Professor of Logic and Metaphysics in Edinburgh University 1891. His principal works are: *The Development from Kant to Hegel, with Chapters on the Philosophy of Religion* (1882); *Essays in Philosophical Criticism* (1883; edited in conjunction with W. R. B. Haldane); *Scottish Philosophy: a Comparison of the Scottish and German Answers to Hume* (first series of Balfour Lectures, 1885; 2d ed. 1890); *Hegelianism and Personality* (second series of Balfour Lectures, 1887; 2d ed. 1893). J. MARK BALDWIN.

Seti [*Seti meri-n-Ptah*, belonging to Set, beloved of Ptah; Gr. *Σετις*]: name of two Egyptian kings, the first and fourth rulers of the nineteenth dynasty.

SETI I., son of Ramses I. and father of Ramses II. (see RAMSES), ruled for about twenty-seven years. The period just preceding had been one of weakness, in which the limits of the kingdom were narrowed from those established by Thothmes III. (See THOTHMES.) This resulted from the internal dissensions caused by the effort of KHUNATEN to establish the solar monotheism of Aten and to abolish the worship of Amon. Monumental proof of the return of the nation to the old religion under Seti is seen in the inscriptions and representations on the walls of the hypostyle hall at Karnak, which Seti founded. Besides this great building, he was architecturally active elsewhere in Thebes and also in many parts of Egypt. He was a patron of art and left many monuments bearing his name, some of them undoubtedly usurped. From some of his monuments even his own name has been erased, indicating the later revulsion of the Egyptians against the cult of the foreign deity Set, in whose honor Seti was named.

Manetho marked a dynastic division between Ramses I. and Seti I., and, for reasons unknown, began a new dynasty with the reign of the latter. On obvious grounds, however, the dynasty is reckoned by some from the ascent of Ramses I. to the throne. In his first year Seti I. was compelled to proceed to Asia against the beduin (*Shasu*) and the peoples of Palestine and Syria. Among the conquered peoples the Hittites (*Kheta*) are enumerated, but the strength which they exhibited under Ramses II., the succeeding king, renders this record somewhat doubtful. Later Seti I. engaged in war with the Libyans and overcame them. Gradually they enlisted as mercenaries under Seti and his successors, till some 400 years later they had grown to such power that the Libyan Shishak usurped the throne and founded a new dynasty. Seti's inscriptions claim for him a dominion extending from Mesopotamia to Punt, Nubia, and Libya, and they show that under him the mines of Sinai and Nubia were worked. The record of his exploits is sculptured on the north wall of the hypostyle hall at Karnak. (Lepsius, *Denkmäler*, iii., 126a-130b; Brugsch, *Geschichte Aegyptens*, pp. 457 ff.; Broderick's English edition, pp. 242 ff.; Wiedemann, *Aegyptische Geschichte*, pp. 416 ff.; Lushington,

Transactions of the Society of Biblical Archaeology, vi, pp. 388-394. Set's tomb at Bilis el-Muluk contains a copy of the myth of the destruction of mankind by Ra. See Brugsch, *Die ägypt. Weltordnung* (1889), and Naville, *Records of the Past* (1891), vol. vi, pp. 103 ff.

Set II, was the fourth king of the same dynasty. Little is known concerning him except that he was the grandson of Nubkheperre Intef. His name is found on various small objects and upon monuments of his predecessors, which he usurped. His tomb at Bilis el-Muluk is ornamented with well executed inscriptions and reliefs. The famous Tale of the Two Brothers (in the d'Arnyer papyrus in the British Museum), recording a woman's tale of Joseph and Potiphar's wife was prepared for his collection. CHARLES R. OLLIVER.

Set-off, in law, a counter-claim existing in favor of a defendant which in certain actions and under certain conditions may be introduced as a defense, either partly or wholly satisfying the claim by the plaintiff or even resulting in a recovery against him. A set-off is distinguished from a defense by the moment when the latter must be filed, the fact that it is an ordinary defense, as of payment, former judgment, non-occurrence, etc. It is not pleaded upon the trial of the action against which it is a defense, the right to set it up is lost, whereas in a set-off, except as otherwise provided by statute in a few States of the U. S., if not pleaded as a defense, may be used upon a separate action. Set-off should be distinguished from *Recoupment* (q. v.), although it is often difficult to say in which form the opposing demand should be set up as a defense. The word *recoupment* has a broader meaning, ordinarily including both set-off and *recoupment*.

This species of defense (analogous in the composition of the verb) and *Set-off* and the *recoupment* of the law of the State of Louisiana) was unknown to the common law, and was first authorized by the English statutes 2 Geo. II, c. 28, § 10, and 2 Geo. II, c. 24, § 4, which have been substantially re-enacted in the several States of the U. S. The original statute only permitted a set-off in the case of mutual "debts" of a definite character. The use of the compound word "debts" restricted the set-off to actions brought for the recovery of a fixed certain sum of money due upon a contract, and the demand in favor of the defendant had to be of the same nature. There could be no set-off of unliquidated damages resulting from the breach of a contract, but only of those claims the amount of which had been ascertained and settled by the promise itself, whether that promise was express or implied. The debts had to be also mutual and due to the parties in the same right.

The provisions of the original statute, however, have now been generally more or less modified by later statutes enlarging the scope of the defense. In Great Britain a defendant in an action may now set off or set up by way of counter-claim against the claims of the plaintiff any right claims, whether such set-off or counter-claim is based in damages or not. The provisions of the statutes in the different States of the U. S. vary, but in the majority of them the restriction of the defense to liquidated claims is removed and also the restriction as to mutuality. Where the counter-claim is asserted in favor of the actual parties, the plaintiff and the defendant, if the defendant's claim is the counter-claim of the two he may not only defeat the plaintiff's recovery, but reserve a judgment for the excess. Where the counter-claim is originally asserted in favor of persons who are not both the parties to the action (as, for example, where the plaintiff is an assignee of the demand in suit and the defendant's claim is against the assignor) and set-off is allowed, it can only avail as a partial or total defense. No judgment for any excess can be recovered by the defendant, since the plaintiff is not his debtor. Courts of equity, setting upon the analogies of the statute, have created an equitable set-off broader and more comprehensive than that authorized by the courts of law. See *Parsons on Contracts*; *Greenough's Law of Set-off, Recoupment, and Counterclaim*; and *Baylis's Law of Set-off*. F. STREUMER ALLEN.

Seton [= *Fe*, *Rice*, augmentative of Lat. *seta*, bristle, comb. *lance* (in Latin *Seta*) silk] in surgery, a twist of silk or wire of leather, India-rubber, or other material passed through a fold of skin and beneath the subcutaneous tissue for the purpose of exciting suppuration. Its action may be *decompressive*, or it may tend to promote a solitary abscess or *inflammation*. The use of setons is less common than formerly, but they nevertheless often serve a very useful purpose.

Seton, ELIZABETH ANN (*Bayly*): philanthropist; b. in New York, Aug. 28, 1774; married William Seton about 1798, and on his death at Pisa, 1804, returned to New York; joined the Roman Catholic Church Mar. 14, 1805; established a school at Baltimore 1805-08. She and her sisters-in-law, Harriet and Cecelia Seton, took the veil as Sisters of Charity Jan. 1, 1809, at Emmitsburg, Md., being the first members of that order in the U. S. A conventual establishment was opened at Emmitsburg July 30, 1812, with Mother Seton as superior-general. The new order took charge of orphan asylums in Philadelphia 1814, and in New York 1817, in which year it was incorporated by the Legislature of Maryland. At the death of the founder, at Emmitsburg Jan. 4, 1821, there were fifty members. There are in the U. S. about 110 houses and 1,450 Sisters of Charity.

Revised by J. J. KRASE.

Settembrini, LEONARDO; author; b. in Naples in 1812; was appointed professor in the Lyceum of Cumana in 1835, but, becoming compromised in political affairs, was arrested in 1839 and imprisoned at Naples. Being set at liberty in 1843, he gave private lessons in literature until 1848, publishing in the meantime his bold *Protesta del Popolo delle Due Sicilie*. In 1848 he held an important post in the ministry of public instruction; on May 16, 1849, the reaction having triumphed, he was arrested and thrown into the prison of San Stefano, where he occupied himself in translating the works of Lucian into Italian. On his release he devoted himself wholly to literature, and published *Lettere di Letteratura Italiana* (3 vols., Naples, 1867-73). In 1871 he was appointed senator of the Kingdom of Italy. D. in Naples, Nov. 4, 1876. See his *Ricordanze della mia vita* (2 vols., Naples, 1876-80).

Setter: a hunting dog of a breed apparently intermediate between the pointer and the spaniel. This dog was formerly trained to sit or drop when marking down game, but at present it stands at its work like a pointer. There are several distinct strains, as the Irish and the English setters, and of late there are several new stocks which are highly prized. Notable among these are the Gordon, the Maslin, and the Laverack setters. The colors vary, but a liver color is a favorite one. See *Dogs*.

Setignano, set-tén-ran'ñ, Designano, dai' seniphar; b. at Settignano, a suburb of Florence, in 1434. He is reported to have studied with Donatello. Very little is known of his life, which was probably spent in and near Florence. According to Vasari, he died very young, but recent writers have disputed this. His most important work, which, moreover, is not disputed, is the wall-tomb of Santa Croce in Florence, erected in memory of the scholar Niccolò Nicomachi of Arezzo, one of the finest of the many splendid monuments of the Renaissance. The portrait-bust of Marietta degli Strozzi, placed in the Berlin Museum about 1890, the bust of Beatrice d'Este, in the Louvre; an exquisite bas-relief in the Via Carnar in Florence; a large marble, or rather anlely (Italian, *sterni*) in the Church of San Lorenzo, are generally recognized as his work. Probably he was one of the most busily employed of these able designers in mingled architecture and sculpture in which the Florentine Renaissance was so rich. D. Jan. 16, 1464. HERBERT STROUD.

Settlement, Act of: See *Act*.

Set-Ty'phon: an Egyptian deity. Set (Gk. *Σετ*) was classed as parallel with the monster Typhon (Gk. *Τυφών*, or *Τυφών*), son of Tartarus and Gaia or of Hera, who desired to gain mastery over the gods, but was slain by Zeus and hurled in Tartarus. Set was believed to be the son of Seb and Nut, brother of Osiris, Isis, and Nephthys, the last being also his wife. As a solar deity he stood for the evil power of the sun's heat, and in general represented the principle of evil and harm, just as Osiris was the type of all that was good and beneficent. The worship of Set was very ancient, dating from the fifth dynasty at least, and his principal sanctuary was at Ombos in Upper Egypt, where he was regarded as the lord of the South. There he was sometimes confounded with the crocodile-headed god Sobek. It is probable that at the time of the eighteenth to the nineteenth dynasties Set was still worshipped, since several kings and other persons bore names compounded with his, such as *Seti*, "belonging to Set." As Osiris, the god of the dead, was revered out of hope, Set held his worshippers through fear of the evil which he had power to inflict on gods and men. For his connection with the Osiris myth, see *Osiris*.

In general Set was regarded as a foreign deity like Baal, and was in fact the principal god of the Hyksos, under the name

of Sutech. It was the demand of the Hyksos king Apepi addressed to the Egyptians, that they should adopt Set as their chief god, which led to the religious war that ended in the expulsion of the Hyksos by Aahmes, the first king of the eighteenth dynasty. In the Hyksos city Tanis Set was regarded as a solar deity, the enemy of the serpent Apepi, whereas the general Egyptian view identified the two. Set was not only a foreign god, but came to be regarded as the god of the foreigners, and after the evils of foreign oppression had been experienced, the honor paid to him gradually ceased, till during the twenty-second and following dynasties the general detestation in which he was held is evidenced by the fact that his name was erased from the monuments and his images destroyed. He is also found as the god of the Hittites, and consequently he was regarded as the enemy of Rā, the sun-god. Set was represented in the hieroglyphics as an ass-headed figure, or as an ass seated on his haunches with a forked tail in a vertical position. The ass, crocodile, and hippopotamus were sacred to Set, and red-haired men were under his special protection. See Meyer, *Set-Typhon* (Leipzig, 1875). CHARLES R. GILLET.

Setu'bal (sometimes called **St. UBES**): town; in the province of Estremadura, Portugal; on the Bay of Setubal; 20 miles S. of Lisbon (see map of Spain, ref. 17-A). It has an excellent harbor, lined with broad quays and defended by five forts. It is an old town, the *Cetobriga* of the Romans, and is surrounded by walls, but it is well built and clean. It is the chief seat of the Portuguese salt-trade, and has also an extensive trade in wine and oranges. Considerable pilchard-fisheries are carried on. Pop. 15,600.

Revised by M. W. HARRINGTON.

Seoul: same as **SEOUL** (q. v.).

Seurt, or **Saird**: town; on the upper Tigris; in the vilayet of Bitlis, Kurdistan (see map of Turkey, ref. 5-1). It is probably the ancient *Tigranocerta*, built by Tigranes the Great (80 B. C.). It carries on trade in wheat, barley, mohair, and gallnuts. Pop. 12,000, Kurds, Armenians, Syrians, and Chaldeans. E. A. G.

Seusse: See **SUSO**.

Sevasto'pol, or **Sebas'topol**: seaport and fortress; near the southwest extremity of the Crimean peninsula in the Black Sea (see map of Russia, ref. 11-C). The roadstead and the harbor, and the extensive establishments connected with them, form the most important features of the place. It was a Tartar village (*Akh-tiar*) until 1780, when the Russian Government commenced the work of establishing here its naval arsenal. The great harbor fortifications which existed at the period of the siege were planned in 1834, and also at the same time land-defenses. The latter had not been constructed when (Sept., 1854) the allied armies of Great Britain and France established themselves before the place and the memorable siege commenced. Every effort was then made to increase the strength of existing intrenchments, and the process continued *pari passu* with the siege. The bastions (of earth) mentioned in accounts of the siege had been previously thrown up. The connecting lines had not the strength of ordinary field-fortifications, the scarcity of earth preventing the excavation of ditches, except about the bastions and other points of support (e. g. the Malakoff, originally a stone tower; the Redan, an earthwork, etc.). To compensate for want of ditches, every practicable expedient was adopted to render access difficult.

Though compressed into comparatively small linear space, the real magnitude of these defenses was enormous, 5,000 or 6,000 men being at some periods daily engaged on them, and the labor being unintermitted during the eleven months of the siege. The garrison during this period (always in free communication with the external forces by which it was replenished) was usually about 30,000 men; the number of guns mounted at the final assault is said to have been 800, several times that number having been rendered unserviceable in the course of the siege (Oct., 1854-Sept., 1855). The Russian loss in the defense was 84,000 men. (*Todleben*.) The forces actually engaged were, during the latter months, about as follows: French, 120,000; British, 27,000; say, 147,000 men. The Sardinians (5,000) and Turks are not included, as they were not directly engaged. The former and a portion of the Turkish force helped to hold the base (Balaklava) and communications of the besiegers. The French loss was 44,500 (*Niel*); hence the total loss of allies must have been about 60,000. The total loss of besieged and besiegers must have been nearly 150,000.

The fortifications and naval establishments were, after the capture, destroyed by the allies, and by the Treaty of Paris, which terminated the war, Russia was debarred from building arsenals and maintaining a naval force in the Black Sea beyond a very limited magnitude; but this restriction was removed by the abrogation of the neutrality of the Black Sea by the Conference of London (1871). The town has been rebuilt, and since 1885 the fortifications have been actively replaced and the docks reconstructed. Sevastopol has become a pleasant watering-place, and is Russia's greatest southern naval headquarters. It has ceased to be a commercial port since the opening of the new harbor at Kaffa (1895). Pop. (1890), inclusive of the garrison of 12,000, 41,000. See **CRIMEAN WAR**. Revised by M. W. HARRINGTON.

Seven Pines, Battle of: See **FAIR OAKS**.

Seven Sages (or **Wise Men**) of **Greece**: according to most authorities, Bias, Chilon, Cleobulus, Periander, Pittacus, Solon, and Thales, but the names are variously given. Many aphorisms in prose and verse, chiefly practical observations for the regulation of life, the work of these and other wise men of the antephilosophic period of Greece, have been collected in Orelli's *Opuscula Græcorum Veterum Sententiosa et Moralia* (vol. i., p. 188, seq.). J. R. S. S.

Seven Sleepers: according to an early tradition, seven Christian brothers of Ephesus who, during the persecution of Decius (251), took refuge in a cave, the entrance of which was walled up immediately after by the heathen. There they slept miraculously until 447. Then they awoke, told their story to many persons—among others to the Emperor Theodosius II.—and died after having thus confirmed the faith of the Christians. The Roman Catholic Church commemorates them on July 10. This legend can be traced at least as far back as the beginning of the sixth century. It is also told by Mohammed in the Koran. Kindred tales are found in various forms in the folk-lore of the East. E. A. G.

Seventeen-year Locust: See **CICADA**.

Seventh-day Adventists: See **ADVENTISTS**.

Seventh-day Baptists: a denomination of Christians formerly called *Sabbatarians*. They hold to the immersion of adult believers, and also to the observance of the seventh day of the week as the Sabbath, arguing that since the institution of the Sabbath at the close of creation and its formal annunciation as a part of the Sinaitic code there has always been an unbroken chain of men who have kept the seventh day of the week as a Sabbath, according to its original institution and enjoyment, and considering the introduction of the observance of Sunday, in the middle of the second century, as the first step to apostasy. Traces of the peculiar practice of observing the seventh day of the week as the Sabbath among some of the early Reformers are not few. The Sabbatarians began to attract attention in England about the time of the Commonwealth. In 1650 they assumed a denominational form in that country. The first Sabbatarian church in America was organized at Newport, R. I., in 1665, under the care of Stephen Mumford. In 1671 they left the Baptist denomination. In 1818 they assumed their present name. In the U. S. they have three colleges, one at Alfred Centre, N. Y., one at Milton, Wis., and one at Salem, W. Va., a number of academies and periodicals, a tract and publication society, and a missionary organization. The number of organizations in 1892 was 112, the number of members 9,317. In England they are at present few in number.—**SEVENTH-DAY BAPTISTS** (GERMAN), a small sect which in 1728 seceded from the Dunkers of Pennsylvania, and established at first a solitary, and then a conventual, life at Ephrata, Lancaster co., Pa. They hold a part of their property in common, adopt the Capuchin habit and a system of monastic names, and recommend, but do not absolutely require, celibacy. At present their leading establishment is at Snowhill, Franklin co., Pa. In 1890 there were six organizations and 194 members. Their founder was Conrad Beissel. See *A General History of the Sabbatarian Churches*, by Mrs. Tamar Davis (1851). See **BAPTISTS**. Revised by W. H. WHITSITT.

Seven Up: a game at cards known also as *all-fours* and *old sledge*. It is designed for two players and is played with a full pack, the cards ranking as in whist. Six cards are dealt each player, three at a time, and the next is turned face up. If the non-dealer is dissatisfied with this for trump he "begs," and the dealer must either immediately add one point to his opponent's score or lay the turned card aside and deal three more to each player, turning the next card for trump; but if this be of the same suit as before he must

as it wins and deal three more to each, and so on until a new trump is turned. The oldest hand leads first, and thereafter the winner of the trick. A player must follow suit if he can, except that he may play a trump instead. One point is scored for (1) playing the highest trump (high), (2) playing the lowest trump (low), (3) turning up a knave or taking the knave of trumps (jack), and (4) taking the most valuable cards (trumps), counting here each ten as 10, ace 4, king 3, queen 2, and knave 1. The first to score seven points wins; in the last hand the points are scored in the order given above not in the order in which they are made, except that the point for turning a knave is scored when it is turned. This game is much played, and is of especial interest as being a game from which many others have been derived by greater or less modifications and additions; examples are California jack, Pedro, vint, or double Pedro, draw Pedro, and pitch.

S. A. TORRANCE.

Seven Wonders of the World: variously given, but generally as follows: The Colossus of Rhodes (see CHARLES), Diana's temple at Ephesus (see DIANA, TEMPLE OF), the Mausoleum at Halicarnassus (see MARCULLUM), the Pyramids (see), the Pharos at Alexandria (see LACRIMOSUS), the Hanging Gardens of Babylon (see LACRIMOSUS), and the colossal gold and ivory statue of Zeus, by Phidias, at Olympia.

Seven Years' War: the contest between Prussia and several of the other powers of Europe extending from 1756 to 1763. Prussia, which had previously seized the Austrian province of Silesia, held it despite the efforts of Maria Theresa to regain it. The latter was determined to crush, or at least humiliate, the house of Brandenburg, and since the Peace of Aix-la-Chapelle (1748) the Austrian generals had been busy in reorganizing and increasing their armies, while the emperor and his agents had been forming alliances against Prussia. The Czarina of Russia, Elizabeth, was a willing ally; she knew that Frederick II. need to make her humiliations the favorite subject of his sarcasms. But with respect to France, the hereditary enemy of Austria and just then at war with England, the former ally of Maria Theresa, the difficulties seemed almost insurmountable. Nevertheless when George II. concluded an alliance with Prussia Jan. 16, 1756, in order to secure his Hanoverian possessions against a French invasion, and when Maria Theresa stooped to write a letter to Madame de Pompadour, Prince Kaunitz lost in forcing an alliance between France and Austria (May 1, 1756). London, whose possessions in Northern Germany were confined to Stralsund and the island of Rügen, was easily persuaded by France to make a descent on Pomerania. In Saxony the elector was so exasperated at Prussia that he even came forward with a proposal of alluring the Prussian king into Bohemia by a feigned neutrality, and then throwing an army into his rear to cut off his lines of retreat and communication. Frederick II. knew of all these plans, and when he saw that war was unavoidable he set at once, without any declaration of war, upon Saxony with 60,000 men (Aug., 1756), took Dresden Sept. 9, shut up the Saxon army of 15,000 men in its camp between Pommersfelden and Kottbus, defeated the Austrian army under Daun, who from Bohemia hastened to the support of Saxony, compelled the Saxon army to surrender Oct. 15, and placed the whole country under Prussian control. But notwithstanding this brilliant beginning the situation in the spring of 1757 was almost overwhelming. At the north 22,000 Swedes gathered in Stralsund ready to cross the Pomeranian coast; 100,000 Russians under Apraxin pushed onward to Moscow; in the southwest two Austrian armies approached through Bohemia—the one, of 76,000 men, under Charles of Lorraine, destined for Silesia, the other, of 46,000 men, under Daun, destined for Saxony; in the southwest two French armies marched toward Prussia—the one, of 100,000 men, under d'Estrées, through Hanover; the other, of 36,000 men, under Montmory, through Hesse-Cassel; in the south an army from the neighboring of the South German states was destined to maneuver in connection with the Western Austrian and Eastern French armies. In the center of this circled Frederick II. with an army of about 200,000 men, first Britain, his only ally, promised and paid him for several years a handsome subsidy, but her representative, the Duke of Cumberland, commanded an army of only 40,000 British-Hanoverian troops in Hanover. In Apr., 1757, Frederick broke into Bohemia; attacked the Austrian army under Charles of Lorraine before Prague May 6; split it in two, of which the rear part retired into Prague, and the other retreated to the southwest to join Daun; invested and be-

sieged Prague; marched with one division of his army against Daun, who came to re-enforce the city; met him at Kolin June 18; was completely defeated, and retreated with his whole force into Saxony, closely followed by Daun, while Charles of Lorraine marched onward to Silesia. In Hanover the Duke of Cumberland was totally defeated by d'Estrées at Hastenbeck July 26, and compelled to conclude the capitulation of Kloster-Zeven Sept. 8, by which his army was dissolved. D'Estrées's successor, the Duke of Richelieu, was too much occupied with plundering Hanover to do anything serious, but in the meantime Montmory, with the second French army, had conquered Hesse and penetrated into Saxony. Frederick II. met him at Rossbach Nov. 5, and literally scattered his army to the winds. With incredible rapidity he then turned to Silesia, which had fallen into the hands of the Austrians; routed Charles of Lorraine at Leuthen Dec. 5, and reconquered the whole province with the exception of Schweidnitz. In the north the Swedes were driven back into Stralsund, and the Russians, although victorious at Grossjägerdorf Aug. 30, and still occupying Memel, suspended all hostilities on account of the illness of the czarina, which changed the whole policy of the country. Thus, when winter set in and stopped all military operations, the actual loss which Frederick II. had sustained was not great, and the prestige he had gained was enormous. The capitulation of Kloster-Zeven was not ratified by the British Parliament. On the contrary, a new British-Hanoverian army was organized and placed under the command of Duke Ferdinand of Brunswick, and during the subsequent campaigns he succeeded by his vigilance, energy, and shrewd tactics, and by several brilliant victories—at Crefeld June 23, 1758, over Clermont, and at Münden Aug. 1, 1759—in keeping the French on the other side of the Rhine. In the sea-war between Great Britain and France, Spain joined the latter in 1761, but Great Britain was so successful in North America, the West Indies, the African coast, and India, and showed herself so superior to France in all their great naval encounters—at Quiberon, 1759, and Belleisle, 1761—that she then laid the foundation of her great maritime empire. In 1758 Frederick II. defeated the Russians at Zorndorf Aug. 25, but he was himself defeated at Hohenkirchen Oct. 14, by the Austrians under Daun. He nevertheless kept both Silesia and Saxony, but in 1759 was so completely routed at Kunersdorf, Aug. 12, by the Russians and Austrians, that the morning after the battle he could hardly gather 5,000 men. Dresden and a large part of Saxony fell into the hands of the allies, and although he reconquered it in 1760 by the brilliant victories at Liegnitz Aug. 15, and at Torgau Nov. 2, his ruin seemed, nevertheless, unavoidable. On Oct. 25, 1760, George II. died, and the British subsidies stopped. The Russians under Tottleben took Berlin and plundered it for three days. In large districts, especially of the eastern part of his kingdom, the houses were burned, the animals driven away, the men killed, and the women and children left to starve. Frederick's army, mostly foreigners and young recruits, numbered only 50,000, and with this force he had to face three hostile armies at once, each superior in numbers to his own. But the czarina died Jan. 5, 1762, and her successor, Peter III., was an enthusiastic admirer of Frederick II. Peace was concluded with Russia May 3, and with Sweden May 22, and although the projected Russo-Prussian alliance was frustrated by the assassination of Peter III., Catherine II., his successor, declared herself neutral; Austria felt too weak to carry on the war alone. Almost without any preliminary negotiations peace was concluded between Prussia and Austria at Hubertsburg Feb. 15, 1763, by which "all should remain as it had been before the war." The effort to wrench Silesia from Prussia had failed, and the heroic and triumphant resistance of the king gave him the permanent appellation of Frederick the Great. See Frederick II., *Histoire de la Guerre de Sept Ans* (6 vols., 1794-1801); Carlyle, *Frederick the Great*; Ranke, *Ergebnisse der siebenjährigen Kriege* (1871). Revised by C. K. ADAMS.

Severinus, SAINT: the apostle of Noricum; b. in Italy in the beginning of the fifth century; made a journey to the East, where he adopted a life of the severest asceticism, and devoted himself, after his return to the West, to missionary work. He first visited Pannonia, but afterward settled in Noricum, a Roman province comprising the present Austria, Styria, Carinthia, Cariola, and Tyrol. He died, after an eventful life, at Favianis, a city situated on the Danube, near the present Vienna, Jan. 8, 482. His *Life*, by his pupil Eugippius, is in Migne, *Pat. Lat.*, 1st, 530, seq.

Severn: a river of England which rises in Montgomeryshire at an elevation of 1,500 feet above the level of the sea, flows east, south, and then southwest, and falls into the Bristol Channel after a course of about 210 miles, though the distance from source to mouth is only 80 miles in a straight line. It is navigable for 150 miles, and the tide, which in its estuary assumes the character of the bore, locally called *hygre*, is perceptible 120 miles from its mouth. Its chief affluents are the Terne and the upper and lower Avon on the E. and the Teme and the Wye on the W. A canal 18½ miles long, and navigable for vessels of 400 tons, extends from Gloucester to the upper portion of the estuary. Other canals establish communication between the Severn and the Thames, Trent, and Mersey.

Severus, ALEXANDER: See ALEXANDER SEVERUS.

Severus, SEPTIMIUS: Roman emperor (193-211 A. D.); b. near Leptis in Africa in 146; married the famous Julia Domna, daughter of Bassianus, priest of the Sun at Emesa. While commander-in-chief of the Roman armies in Illyria and Pannonia he was proclaimed emperor by his troops. He deposed the Emperor Julianus and crushed the rival claimants Pescennius Niger and Clodius Albinus; captured Byzantium (197) after a memorable siege which lasted three years; invaded Parthia and captured Ctesiphon; from 203 to 207 remained peacefully at Rome, where he remodeled the constitution of the Pretorian Guards; was then called to Britain to repress rebellion and marched the entire length of the island, subduing the Caledonians; died at Eboracum (York) in 211, his death being hastened by the unnatural conduct of his son Caracalla. E. A. GROSVENOR.

Severus, SULPICIUS: See SULPICIUS SEVERUS.

Severus, Wall of: a wall of stone partly built or repaired by the Emperor Severus in 208 A. D. to protect Roman Britain from the Caledonians. It was originally erected by Hadrian. It extended from the Solway to the Tyne, immediately N. of the wall of Hadrian, and consequently far S. of that of Antoninus. Considerable portions of the wall still remain. See HADRIAN'S WALL.

Sevier, sev-er', JOHN: pioneer and soldier; b. on Shenandoah river, Virginia, in 1745, of French parents; originally named XAVIER; explored the Holston river in East Tennessee (then North Carolina), built Fort Watauga, and fought successfully against the Indians. During the Revolutionary war he distinguished himself by his bravery. He was foremost in almost all the battles and skirmishes, as well as treaties and negotiations, with the Indians during many years, and was regarded by the settlers as their friend and protector; was chosen in 1785, without opposition, Governor of the anomalous State of Franklin, comprising Western North Carolina and Eastern Tennessee. He received from President Washington the commission of brigadier-general of the territory S. of Ohio river. In 1796 the State of Tennessee was erected and admitted into the Union, and Sevier was chosen Governor, served for two consecutive terms, and was re-elected in 1803; was elected a Representative in the U. S. Congress in 1811, and re-elected in 1813. D. near Fort Decatur, Ga., Sept. 24, 1815, while on a mission to the Creek Indians. F. M. COLBY.

Sevier Lake: a body of salt water in Western Utah; in lat. 39° N., lon. 130° 10' W.; altitude, 4,000 feet. Its sole tributary is the Sevier river, which enters at the north end. Its valley is a southward arm of the Sevier desert, limited at the W. by the House Range of mountains and at the E. by the Beaver Creek Range. The lake, having no outlet, is of variable size, its extent depending on the relation between inflow and evaporation. In 1872 its length was 28 miles, its width 10 miles, its area 188 sq. miles, and its depth 15 feet; but its natural size was somewhat greater, for at that time a portion of the water of the Sevier river was used for purposes of irrigation. The whole of the river is now utilized in that way through the entire spring and summer, so that little water reaches the lake except in winter. As a result its bottom generally becomes dry each year, and the water acquires in winter a depth of but a few inches. The salts which made the natural water a strong brine have been precipitated and form a crust over the lake-bottom. This crust is estimated to contain 1,500,000,000 tons, of which about three-fourths is sodium chloride and the remainder sodium sulphate and magnesium sulphate. The only inhabitants of the lake are a species of brine-shrimp (*Artemia*) and the larvæ of certain insects. Such fishes as reach it from the river are poisoned by the brine. Old water-lines

about the margin of the valley show that the lake was once of greater extent. At the time of its extreme depth, 590 feet, it coalesced with Great Salt and other lakes, the whole forming a vast inland sea. See BONNEVILLE LAKE.

G. K. GILBERT.

Séguigné, sã'veẽn'yã', MARIE DE RABUTIN CHANTAL, Marquise de: writer; b. in Paris, France, Feb. 6, 1626; was left an orphan very early, but received an excellent education from her uncle, Abbé de Coulanges, and married in 1644 the Marquis Henri de Séguigné (d. 1651), to whom she bore a son and a daughter. She was rich, spirited, beautiful, one of the most prominent members of the literary circle of the Hôtel Rambouillet, and on intimate terms with all the principal actors in the civil war of the Fronde. In 1669 her daughter, to whom she was passionately attached, was married to the Marquis de Grignan, governor of Provence; the consequent separation occasioned a correspondence which, although not intended for publication, appeared after the death of the authoress, and has made her name celebrated, the letters being at once of great historical interest and of the highest literary merit. D. at Grignan, Apr. 18, 1696. The chief edition of her *Letters* is that of Regnier (14 vols., 1862-67; new ed. begun 1887). See also Walckenaer, *Mémoires touchant la Vie et les Écrits de Madame de Séguigné* (1842); Capmas, *Lettres inédites de Madame de Séguigné* (1876); Combes, *Madame de Séguigné historienne* (1885); the biographies by Bossier (1887) and Valléry-Radot (1888); and Saporta, *La famille de Madame de Séguigné en province* (1889). F. M. COLBY.

Seville, sev'il (Span. *Sevilla*, anc. *Hispalis*): capital of the province of Seville, Spain; on the left bank of the Guadalquivir, 70 miles from its mouth (see map of Spain, ref. 19-C). Under the Romans, Goths, and Moors it was the capital of wealthy and powerful empires. The earlier kings of modern Spain also resided here; and though Charles V. removed the royal residence to Valladolid, Seville rose to a still higher degree of splendor and prosperity when America was discovered, as it became the mart of the new colonies. During the French invasion (1810-13), and by the subsequent loss of the Spanish colonies, it suffered very much, but it recovered rapidly, and is an enterprising modern town. Its old Moorish walls, 5 miles in circuit, pierced by fifteen gates, and surmounted by sixty-six towers, have disappeared, except the single gate called Triana. Across the city runs the Alameda, a broad, open street lined with palaces, planted with magnificent elms, and adorned with numerous fountains, which, like the city in general, are provided with water by several great aqueducts, of which that built by Julius Caesar and rebuilt by the Moors in 1172 is a magnificent structure resting on 410 high arches. The rest of the city, with the exception of the numerous public squares and promenades, consists mostly of narrow streets lined with high, somber-looking, but substantial houses of Moorish construction. Among its edifices the cathedral is the most remarkable. It is one of the greatest Gothic structures in the world, 481 feet long, 315 feet wide, and 145 feet high under the transept dome, and it is most magnificently adorned with paintings by Murillo, the Herreras, and other masters of the school of Seville, besides being almost overloaded with sculptures. Unique of its kind is the Giralda, a belfry 350 feet high; and most interesting on account both of their architecture and ornamentation are the Alcázar, the royal palace and the university, founded in 1579. Besides the university, to which several scientific establishments are attached, Seville has many good educational institutions, and several valuable libraries and art collections. Among its manufactures are an immense cigar-factory, a cannon-foundry, several manufactories of muskets and other firearms, powder, saltpeter, soap, leather, cotton thread, etc. Its chief exports are oranges, olive-oil, wine, wool, cork, copper, lead, and quicksilver. As Seville was held by the Moors for five centuries and entirely rebuilt by them from the materials of former Roman edifices, it became a purely Moorish city, and to a certain extent it still preserves that character, though the narrow, tortuous streets are gradually giving way to broad and straight boulevards. Pop. (1887) 143,182. The province of Seville occupies the lower valley of the Guadalquivir, bounded W. by Huelva and S. by Cadiz; area, 5,235 sq. miles; pop. (1887) 544,815.

Revised by M. W. HARRINGTON.

Sèvres, sev'r: town; in the department of Seine-et-Oise, France; on the Seine; 10½ miles S. W. of Paris by rail (see map of France, ref. 3-F). It is celebrated for its manufactures of

presiding, which are generally acknowledged to be the most elegant ever produced in bold design and painting. The porcelain museum contains a large collection of china and services from all parts of the globe. Pop. (1891) 6,904.

Sèvre-Bony, *département* of Western France, deriving its name from two rivers—the Sèvre-Nantaise, which flows into the Bay of Biscay, and the Sèvre-Nantaise, which joins the Loire. Area, 2,167 sq. miles. The northern part is hilly, with mountains; the southern level. The soil is everywhere fertile; it produces more wheat than is necessary for home consumption, and affords excellent pastures. Cattle, horses, mules, and asses are extensively reared. Iron, marble, and granite are found, and considerable manufactures are carried on. Pop. (1891) 334,285. Capital, Niort.

Sewall, JONATHAN, LL.D.; b. in Boston, Mass., Aug. 28, 1753; graduated at Harvard 1778; taught school at Salem 1776; began the practice of law at Ellington in 1779; became attorney-general of Massachusetts 1787; secured a writ by which slavery recovered his freedom at common law 1793, resided at Cambridge until 1774, when the three settlements owned his house to be wrecked by a mob; went to England in 1775; was included among the sufferers by the penal act of Apr. 30, 1775, against the loyalists; settled at St. John, New Brunswick, 1788, and was judge of the court of vice-admiralty until his death Sept. 26, 1796. He was long reputed the author of the letters signed Massachusetts published in defense of British policy, and refused to let John Adams over the signature of Novanglus, but it is now known that they were written by Daniel Leonard, of Taunton.—His son, JONATHAN SEWELL, LL.D. (1793-1839), who adopted the English form of the name, was chief justice of Lower Canada 1808-28.

Sewall, MAY (Wright); educator; b. at Milwaukee, Wis.; educated at the Northwestern University at Evanston, Ill.; taught public schools in Michigan, and was soon made principal of the High School in Plainfield, in that State; later became, successively, the principal of the High School in Franklin, Ind., and teacher of English and German in the High School in Indianapolis; married in 1880 Theodore L. Sewall, principal of a private school for boys in that city. In 1882 Mr. and Mrs. Sewall opened a girls' classical school. Mrs. Sewall's energies were enlisted in reforms soon after reaching womanhood. She was first actively connected with the National Woman Suffrage Association, in which she held for many years the office of chairman of the executive committee. She was one of the promoters of the International Council of Women which convened in Washington in 1893, and conceived the idea of perpetuating its influence through permanent International and National Councils of Women. In the organization of both these bodies she subsequently aided, and has served as president of the National Council and vice-president at large of the International Council. She was also one of the committee that formulated the plan for the general federation of women's clubs. In Indianapolis she was one of the founders of the Woman's Club, of the Art Association; of the Equal Suffrage Society; of the Kamabai Circle; of the Indiana Branch of the Association of Collegiate Alumnae; of the university extension work in Indianapolis, under the auspices of this latter society; of the Local Council; of the Women's Exchange; and of the Contemporary Club. She also originated the plan of the Indianapolis Proprietary, an incorporated joint-stock company of women, which has erected a handsome building for social and educational purposes. Mrs. Sewall was appointed member at large of the board of World's Fair managers for Indiana, was chairman of the committee on women's work, and a member of the committee on education in that body. She was also made the chairman of the committee on the World's Congress of Representative Women, in the World's Congress Auxiliary of the Columbian Exposition of 1893. She has lectured frequently on social, educational, literary, and reform topics, a contributor to periodicals, and has edited *The Historical Journal of the World's Congress of Representative Women* (1893).

SURAN B. ANTHONY.

Sewall, SAMUEL; jurist; b. at Bishopcote, England, Mar. 20, 1652. His parents emigrated to New England and settled at Newbury, Mass., 1667, and he entered Harvard, graduating 1671; studied theology; preached for a short time; acquired a fortune by his marriage (Feb. 28, 1676) with Hannah, daughter of John Hull, master of the mint at Boston; was assistant governor 1684-86 and 1689; visited England 1686-89; was annually chosen a member of the

executive council from 1692 to 1735; was judge from 1692 to 1718, when he was made chief justice, being at the same time judge of probate for Suffolk County; presided at the trial of some of the victims of the witchcraft delusion of 1692, but was soon convinced of his error, for which he publicly asked pardon of God and man in a paper read in the congregation of the Old South church, Boston, on Fast Day, Feb. 14, 1697, by his pastor, Rev. Samuel Willard; was noted for his clarity and philanthropy, having been perhaps the first American writer against slavery, in which theme he published a tract, *The Selling of Joseph* (1700); was secretary and treasurer of the society for the malice of Indian missions, and was author of *An Answer to Queries respecting America* (1699); *Accomplishment of Prophecies* (1718); *A Memorial relating to the Kennebec Indians* (1721); and *A Description of the New Heaven* (1727). He resigned his judicial office 1729. D. in Boston, Jan. 1, 1780. His diary and other papers have been published by the Massachusetts Historical Society.—His son, JOSEPH, b. in Boston, Aug. 20, 1698, graduated at Harvard 1717; studied theology; was ordained village pastor of the Old South church Sept. 16, 1713; declined the presidency of Harvard College 1724; received the degree of D. D. from the University of Glasgow 1731; gave to that institution a fund for the education of indigent students; was a friend of learning and a man of great benevolence and worth. D. in Boston, June 27, 1769. Author of *Four Sermons* (1741) and of twenty-three other sermons separately printed.

Sewall, STEPHEN; scholar; b. at York, Me., Apr. 4, 1764; graduated at Harvard 1781; taught the grammar school at Cambridge; became instructor in Hebrew in Harvard 1762, and was Hancock Professor of Hebrew 1784-85; published a *Hebrew Grammar* (1765); wrote seven of the Greek and Latin poems in *Poetae et oratores* (1761) and other works, and left several MSS., now in the library of Harvard, including a *Chaldee and English Dictionary*. D. in Boston, Mass., July 23, 1804.

Seward, *synonym*: city; capital of Seward co., Neb.; on the Big Blue river, and the Pac., Elk, and Mo. Val. and the Burlington Route railways; 25 miles W. by N. of Lincoln, the State capital (for location, see map of Nebraska, ref. 10-6). It is in an agricultural region, and contains 2 national banks with combined capital of \$100,000, a State bank with capital of \$60,000, a savings and investment company with capital of \$50,000, and a monthly and 4 weekly newspapers. Pop. (1890) 2,032; (1891) 2,106.

EDITOR OF "BLUE VALLEY BEAVER."

Seward, ANNA; poet; b. at Epsom, Derbyshire, England, in 1747; obtained some celebrity as a poet, chiefly by her elegies upon her friend, Maj. André (1781), and upon Capt. Cook; resided most of her life at Lichfield, where her father was a canon residentiary; published a *Life of her friend Dr. Erasmus Darwin* (1804), in which she laid claim to the authorship of the first fifty lines of *The Botanic Garden*; also *Lancelot*, a poetical novel (1782); and *Sonnets* (1789). D. at Lichfield, Mar. 23, 1809, bequeathing her MSS. to Sir Walter Scott, who published her *Poetical Works and Correspondence* (3 vols., 1810), with a prefatory memoir, but the collection met with little favor, though by her contemporaries she was called the Swan of Lichfield. Considerable published six volumes of her correspondence (1811-13).

Revised by H. A. HEARS.

Seward, THOMAS FRANKLIN; author, composer, and teacher; b. at Florida, Orange co., N. Y., Jan. 25, 1835; studied music with Dr. Lowell Mason and others; taught vocal music and edited and compiled many sacred and secular music-books; edited several music periodicals; managed the concerts of the Jubilee Singers in Europe; introduced the tonic sol-fa system of instruction into the U. S. in 1880; in 1891 founded the Brotherhood of Christian Unity; author of *Hebrew Theology, or the Gospel according to Sator*; *The School of Life, or Divine Providence in the Light of Modern Science* (1894); *A Plea for the Christian Year*, and other books. D. R. HERVEY.

Seward, WILLIAM HENRY, LL.D.; statesman; b. at Florida, Orange co., N. Y., May 16, 1801; educated at Farmers' Hall, Goshen, and at Union College, where he took the degree of A. B. in 1820; studied law in New York and Boston, and was admitted to the bar at Utica in 1823; settled in Auburn in 1823, where he soon took a prominent place among the leaders of the profession. In 1824 his political proclivities be-

came conspicuous, and from that time he was prominently connected with all the political movements of importance in the State and nation. He earnestly advocated the election of John Quincy Adams: was one of the State committee to welcome Lafayette in 1827; was elected in 1830 as an anti-Masonic candidate for the State Senate, where he labored for the improvement of schools, construction of railroads and canals, and for the collection of those documents which form the monumental *Colonial History of New York*. During the next four years he delivered frequent addresses, denouncing the course of President Jackson, and supporting the newly formed Whig party with such fervor and success that in 1834 he was nominated for Governor. In this he was unsuccessful, but on the triumph of the Whigs in 1837 he was again nominated, and was elected by a small majority. Though his administration was one of peculiar difficulties, owing to bitter factions within the party, he recommended and succeeded in carrying so many wise measures that his position in the party was much strengthened. He was re-elected in 1840. During his administration Roman Catholics were first admitted to the public schools, many of the disabilities of foreigners were removed, the natural history and geological survey of the State were begun, and the State Museum of Natural History at Albany was established. From 1843 to 1849 his activities were confined to professional practice and to occasional addresses on scholastic and political subjects. In 1849 he was chosen as a Whig to the U. S. Senate, where at once he took a position of prominence not only as one of the leaders of his party, but also as an influential adviser of President Taylor. It was in Mar., 1849, in a speech on the admission of California, that he spoke of the exclusion of slavery from all new States as demanded by "the higher law," a phrase which was so severely criticised as treasonable by Southern members that it became famous as a watchword of abolition. On the accession of Fillmore after the death of President Taylor, Seward declined to follow his party in the support of what was deemed Fillmore's pro-slavery policy. His speeches in the Senate and before public audiences during this period gave him great prominence by reason of their comprehensiveness and independence. In 1852 he favored the nomination of Gen. Scott, but opposed the statement of the party platform concerning slavery. Re-elected to the Senate in 1855, he took prominent part in the political agitations extending to the outbreak of the war. In 1858, in the course of a speech at Rochester, he coined the second of the famous phrases that are inseparably connected with his name when he declared that the slavery question indicated "an irrepressible conflict" which could only terminate by making the country either entirely a free nation or entirely a slave-holding nation. Both in 1856 and in 1860 he was the most conspicuous candidate of the Republican party for the nomination for the presidency. In 1860 the New York delegation, headed by William M. Evarts, went to the Chicago convention with much confidence that their candidate would be chosen. On the first ballot Seward received 173½ votes and Lincoln 102. The vote of Pennsylvania went over to Lincoln and other States followed. Seward, though defeated in the convention, supported Lincoln earnestly by speaking in the West as well as in the East. When Lincoln assumed office the arduous and delicate post of Secretary of State was given Mr. Seward. Though he habitually underestimated the strength and the earnestness of the South, his management of the delicate foreign relations of the Government were characterized by tact and skill. When the Confederates Mason and Slidell were taken from the British vessel the Trent, Great Britain made a peremptory demand for their restoration, and for a time war seemed almost inevitable. The answer, first drawn by Mr. Seward and then slightly modified by President Lincoln, was a masterpiece of tact and diplomatic skill. The position taken was that the exemption from search claimed by Great Britain was what the U. S. had fought for during the war of 1812 against Great Britain, and that as Great Britain had come to the position of the U. S. the Government very cheerfully released the prisoners. In all the negotiations with foreign powers to induce them to preserve a position of strict neutrality the duties of the Secretary were performed with great skill. On the evening of Apr. 14, 1865, when President Lincoln was assassinated, one of the conspirators forced his way into Mr. Seward's bedroom, where he was lying ill, and struck him several times in the face and neck with a dagger. The wounds, though severe, did not prove mortal. Recovery, however, was very slow. Seward was retained in his posi-

tion by President Johnson, whom the Secretary supported in his policy of reconstruction. After a memorable service of eight years he retired in Mar., 1869. Though much enfeebled in body he undertook with his family a voyage around the world in 1870, and published in 1871 an account of his observations. He died at Auburn, Oct. 10, 1872. His works, in 5 vols., include the most important of his speeches.

C. K. ADAMS.

Sewell, ELIZABETH MISSING: author; b. in the Isle of Wight in 1815; became well known as the author of novels of the so-called High Church school of fiction, among which were *Amy Herbert* (1844); *Gertrude* (1845); *Laneton Parsonage* (1846); *Margaret Percival* (1847), which were republished in the U. S. She also wrote works of travels, many volumes of a devotional character, poems, and histories of Greece, Rome, and Egypt for young people. D. in London, June 10, 1884.

Revised by H. A. BEERS.

Sewel'lel [from native (Amer. Ind.) name]: a rodent, *Haplodon rufus*, representing a special family, *Haplodontidae*. It is noted for its rootless molars; is reddish brown, with very small eyes and a short tail; is about the size of a muskrat, and has very strong jaws and a plump, heavy body. It is found on the Pacific coast in California, Oregon, and Washington, is gregarious, and lives in burrows. Its skin is employed by the Indians as an article of dress.

Sewen: See BULL-TROUT.

Sewerage [deriv. of *sewer* < M. Eng. *assewer*, from O. Fr. *essewer*, to drain < Lat. *ex*, out + deriv. of *aqua*, water]: a system of sewers or underground channels for carrying off the sewage or liquid refuse and the storm-water of a locality. The construction of such a system for a town is also called sewerage.

In all densely populated areas a proper regard for the health of the community requires the removal of solid and liquid refuse from the neighborhood of dwellings. Where dwellings are far apart, as in country districts, the liquid wastes from the house may be safely disposed of on the soil by very simple means; but when dwellings are crowded together, as in towns, there is no longer sufficient available open ground in the vicinity for such disposal, and sewers become a necessity. In towns where there are no sewers the sewage is run into cesspools, where it decomposes, contaminating the earth, air, and water in the vicinity, and becomes the disseminator of disease. To provide for the prompt and rapid removal of this sewage is the object of sewerage. The requisites for a sewer are that it be so constructed as to carry the sewage to its outfall with the least possible delay; that it be smooth on its interior surface, so as not to retard the flow of sewage and afford no lodging-place for the solid particles; that it be water-tight throughout its entire length.

The foremost nations of antiquity understood the necessity for sewerage, and their great cities had carefully designed and well-constructed sewers. In the ruins of Babylon and Nineveh and of the ancient cities of Egypt are found the remains of systems of sewerage. Exploration has brought to light the extensive sewers of ancient Jerusalem, and the visitor in Rome to-day sees in the Cloaca Maxima a sewer which still fulfills the purpose for which it was constructed twenty-five centuries ago.

During the dark ages sanitary works were neglected, but fatal epidemics and plagues brought thinking men at last to realize in some degree the necessity for attending to matters relating to the public health. Sanitary works were again undertaken, and with advancing civilization sanitary science has received more and more attention.

Sewers designed to carry both the liquid wastes and the storm water from any locality are called combined sewers. Those designed to carry only the sewage proper are called separate sewers.

THE SEPARATE SYSTEM OF SEWERAGE.—In this the first thing to be determined is the size of the sewers. The proper size of any sewer depends upon the number of people contributing sewage to it; the amount of sewage per day for each person; the maximum rate of discharge; and the form, grade, and interior surface of the sewer. In estimating the number of people provided for on any line of sewers, provision must be made for the extension and growth of towns and a liberal allowance made for an increase in the volume of sewage.

Amount of Sewage.—The amount of sewage per capita depends very largely upon the water-supply. It is also dependent upon the habits of the people, the amount of manufacturing in which large quantities of water are used, and

the use of water-motors for elevators, etc. The volume of sewage to be provided for per day may be taken as equal to the volume of water supplied. This varies greatly in different towns, and in different years in the same town. U. S. statistics show that the use of water varies in the different cities from 25 to 170 gal. per day per capita, and that the amount used is rapidly increasing. In many cases the increase has been 100 per cent. in twenty years. It would not be safe in any case, to assume the consumption of water to be less than 100 gal. per day per capita, and where water is much used for manufacturing purposes and for motors a still larger amount must be provided for.

Varying Rate of Discharge.—The consumption of water, and hence the discharge of sewage, is not constant. It varies with the different hours of the day, the days of the week, and the months of the year. The time of maximum discharge varies in different places with the habits of the people and the climate. The daily maximum of water consumption is from five to seven o'clock a. m., and the amount of maximum flow per hour is from 30 to 100 per cent. in excess of the mean hourly consumption. The maximum daily consumption for the week is on Monday. Taking the whole year into consideration there are two maxima of daily consumption. One of these is during the coldest weather in winter, and the other to the hot, dry weather in summer. The maximum daily consumption varies from 20 to 50 per cent. in excess of the mean daily consumption.

The flow of sewage not being uniform, the sewers must be made large enough to provide for the maximum flow. On the other hand, any unnecessary size is a serious detriment to the efficient working of the sewer. Any increase in size of the sewer, the amount of sewage remaining the same, decreases the depth and velocity of flow of the sewage, and hence its transporting power and effectiveness.

The following table shows the comparative depth and velocity of flow in circular sewers of different sizes, laid on the same grade and carrying the same amount of sewage:

SEWER	Depth of flow, inches.	Velocity in feet per second.	Discharge in cubic feet per second.
4-inch sewer	2.09	1.47	14.40
6-inch "	1.92	1.59	14.40
8-inch "	1.78	1.72	14.40
10-inch "	1.68	1.84	14.40
12-inch "	1.57	1.92	14.40

The following table shows the comparative velocity and discharge of a circular sewer at different depths of flow. The depth is given in fractions of the diameter, and the velocity and discharge are given in fractions of the velocity and discharge when the depth is the diameter of the sewer.

Depth of flow.	Velocity.	Discharge.	Depth of flow.	Velocity.	Discharge.
0.087	0.414	0.0277	0.800	1.0534	0.6332
0.170	0.426	0.0426	0.750	1.0622	0.7041
0.1405	0.507	0.0605	0.720	1.0664	0.7658
0.1334	0.5610	0.1000	0.600	1.1025	0.8822
0.240	0.7080	0.1374	0.550	1.1040	0.9377
0.300	0.810	0.2410	0.500	1.0918	0.9950
0.367	0.9265	0.3736	0.450	1.0766	1.0371
0.447	1.0533	0.5333	0.400	1.0603	1.0300

Grade.—A certain velocity of flow is required in a sewer to prevent deposit. The minimum velocity to prevent deposit varies with the size of the sewer, and is from 2 to 3 feet per second. The following table gives the minimum allowable inclination for self-cleansing sewers, running half full.

4-inch pipe	1 in 142 = 0.704 per 100
6-inch "	1 in 208 = 0.481 per 100
8-inch "	1 in 265 = 0.378 per 100
10-inch "	1 in 375 = 0.267 per 100

While in extreme cases sewers may be laid with a lower grade than that indicated above, it is always at the risk of unsatisfactory working and ultimate stoppage.

In localities where the surface of the ground is nearly level and sufficient grade can not be obtained to dispose of the sewage by gravity, the sewage may be carried to its outlet by pumping, or by one of the pneumatic processes. The three most important of the pneumatic processes are the *Interim*, *Becker*, and *Shomo*.

In the *Interim* and *Becker* systems the sewage is carried through air-tight iron pipes by atmospheric pressure, the air being exhausted from the pipes by large air-pumps.

In the *Shomo* system the sewage is raised from a lower to a higher level by being admitted to a running-chamber or

pneumatic ejector, and then forced by compressed air out of the ejector and to the desired elevation, when it again runs on through the sewer pipes by gravity.

The ordinary hydraulic formulas for the flow of water in pipes will apply to sewers. The amount of sewage which any pipe will carry depends upon its velocity. The following formulas are among the best in use:

$$\text{Weisbach's formula: } v = \frac{V \sqrt{gh}}{\sqrt{1 + k + \frac{fL}{D}}}$$

in which v = velocity of flow in feet per second.

h = head of water in feet.

L = length of pipe in feet.

D = diameter of pipe in feet.

k = coefficient of resistance for entrance of water into the pipe.

f = coefficient of friction in the pipe.

Baldwin Latham, in his *Sanitary Engineering*, gives tables of values for the coefficients, and extensive tables of velocities for different-sized pipes at different inclinations, according to Weisbach's formula.

Kutter's formula is

$$v = \left(\frac{41.66 + \frac{1.4913}{n} + \frac{0.002807}{S}}{1 + \left(\frac{41.66 + \frac{0.002807}{S}}{n} \right) \sqrt{R}} \right) \sqrt{RS} = C \sqrt{RS}$$

in which v = mean velocity in feet per second.

C = coefficient of mean velocity.

S = sine of slope.

R = hydraulic mean radius.

n = coefficient of resistance to flow, determined by experiment.

Flynn's hydraulic tables are based on this formula.

The most rapid method of determining the necessary size of sewers under given conditions is from diagrams or graphical tables. Pierson's graphical calculations, published in Staley and Pierson's *Sanitary System of Sewerage*, give results for pipe-sewers by both Weisbach's and Kutter's formulas.

Material for Pipes.—The best material thus far produced for sewers up to 2 feet in diameter is salt-glazed, vitrified, earthenware pipes. Sewers more than 2 feet in diameter may be constructed of brick, stone, or concrete. Sewer-pipes is sometimes made of hydraulic cement. Pipe of excellent quality can be made of this material, but it is difficult to secure uniformity of quality. Vitrified earthenware pipe has a smooth surface, is impervious to moisture, is not affected by sewage, and does not deteriorate with time. It is made of all sizes up to 2 feet, and special forms are manufactured for certain purposes. It is usually made of cylindrical form, and in lengths of 2 or 3 feet. In the usual form each length has a bell, or socket, at one end to hold the spigot end of the adjoining piece in laying. This is called the bell and spigot joint. Another method of making the joints is to make the pipes plain cylinders, and provide separate collars to slip over the joints where the pipes meet. A hand-hole is a length of pipe with a detachable section, which can be removed at any time after the pipe is laid without disturbing the line of pipe. Junctions are formed by Y or T branches. The T-branch is a socket on the side of a pipe to receive a branch at right angles. The Y-branch is a socket made to receive a branch at an acute angle. Curved pipes are prepared for turning bends. Junctions of laterals with mains, and of house-sewers with street lines, should be made with Y-branches. Fig. 1 shows in plan and elevation a junction. The Y should be elevated so that the curved piece, joining the Y with the lateral, will bring the top of the branch sewer as high or higher than the top of the main sewer.

Sewers more than 2 feet in diameter are usually built of hard-burned brick, laid in hydraulic cement. All junctions for lateral branches and house-connections should be put in when the sewer is built, as much better workmanship can then be secured in making the connections, and with less danger to the sewer.

Location.—Sewers may be located either in the streets or, where alleys are regularly laid out through the center of the blocks, in the alleys. When only one line is laid in a street it should be on the center line. In some cases, where the streets are wide or the center line is occupied by street-railway tracks, it may be advisable to put a line of sewers on each side of the street.

Depth.—The sewers should be far enough below the bottom of the cellars, to afford sufficient fall for the house-drains starting from beneath the cellar floor. The minimum depth will usually be from 6 to 8 feet.

ELEVATION

PLAN

FIG. 1.

Laying.—In laying the sewers care should be taken to keep the flow-line on a continuous grade, and to make the joints water-tight. The joints should first be caulked with a gasket of oakum, or some similar material, to prevent the entrance of cement to the inside of the pipe, and the joint filled with pure cement, mixed with sufficient water to make it of the proper consistency for working. Y-branches should be placed along the line of sewers in front of each lot, so that house-drains may be connected at any time without cutting or disturbing the main line of sewers. The opening of the Y-branches should be closed with an earthenware cover.

Manholes are masonry shafts extending from the sewers to the surface of the ground, and large enough to admit a workman to inspect or clean the sewers. They are usually formed of an 8-inch brick wall. The form is the frustum of a cone with the large end down. The top should be about 2 feet in interior diameter, and the bottom about 4 feet. The form at the bottom is sometimes elliptical. The top is finished by a cast-iron cap, level with the surface of the street. The cover is perforated to aid in ventilation. Sometimes a dust-pan is placed under the cover to catch the dirt which falls through the openings in the cover.

The bottom should be of concrete, and built so as to be water-tight. It should be formed to the contour of the invert of the sewer, so that the flow of the sewage will not be checked in the manhole. Steps should be built into the wall to facilitate getting in and out. Fig. 2 is a vertical section of a manhole at right angles to the axis of the sewer. Manholes should be placed at the junctions of the laterals with the mains, and at changes of direction in the line of sewers.

Lampholes, or observation openings, are formed by a T-branch extending from the sewer to the surface of the ground. The top of the vertical pipe is covered with a cast-iron cap having a movable cover level with the pavement. Sometimes the vertical pipe is not carried to the surface, but is capped below the pavement and its position carefully recorded.

FIG. 2.

The advantage of this method is that each section between the manholes is independent of the rest of the system, and any stoppage in one section will not affect any of the other sections.

Size of Combined Sewers.—In determining the size necessary in any case, the disposal of the storm-water is the only question to be considered. The ordinary flow of sewage is

so small compared with the volume of storm-water delivered to the sewers during and immediately after a storm that the sewage may be left out of consideration. In estimating the necessary size the following conditions must be taken into consideration: The area to be drained; the rate of rainfall; the percentage of the rainfall reaching the sewer; the grade of the surface of the ground; the grade of the sewer; and the amount of ground-water.

Sewers are rarely built large enough to provide for all of the water which falls in extraordinary storms lasting only a short time. Besides this, not all of the rainfall reaches the sewers. The percentage of that which does pass into the sewers depends upon the relative proportion of roofed and paved area to the whole area to be drained, and the nature of the soil of the unpaved part. The grade of the natural surface of the ground affects the rapidity with which the storm-water reaches the sewer. It is customary to assume a certain depth, varying from half an inch to 2 inches per hour, as reaching the sewer, although the rainfall may occasionally be several times that amount.

Different formulas have been proposed for determining the size of sewers. The following are some of these. Julius W. Adams's formulas:

$$D = \sqrt[3]{\frac{QL}{1542H}}$$

in which D = diameter of sewer in feet.

Q = cubic feet per second to be provided for.

L = length of sewer.

H = rise for length L .

$$\log D = \frac{2 \log A + \log N - 3.79}{6}$$

in which D = diameter, in feet, of sewer.

A = acres to be drained.

N = length in feet in which the sewer falls 1 foot.

These formulas are on the basis of 1 inch of rain per hour, half of which reaches the sewer within the hour.

Thomas Hawksley's formula, used in the main drainage of London:

$$\log \text{diameter of main (in inches)} = \frac{3 \log A + N + 6.8}{10}$$

in which A = acres drained.

N = length in feet in which the sewer falls 1 foot.

This is on the basis of 1 inch of rain per hour.

The principal difference in the various formulas is in the assumption of the amount of water which the sewer is to provide for. They are never built large enough to carry all of the water of the heaviest rainfall. Having decided the amount of water which the sewer is to carry, the size may be calculated by the formulas previously given for the flow of sewage in pipes.

Form of Sewers.—If a sewer has an approximately constant flow and is to run half full or more, the best form is circular. In combined sewers, however, the ordinary flow of sewage usually fills but a small part of the cross-section of the sewer, and in that case the egg-shaped section with the small end down is best. This concentrates the flow in the bottom of the sewer, so that the depth and velocity of flow may be kept as great as possible when the quantity of sewage is at its minimum, and by expanding in the upper part provides for the greatly increased amount delivered to the sewers by storms.

Fig. 3 shows one of the many forms of egg-shaped sewers. The vertical diameter AB is one and a half times the greatest diameter CD . CAD is a semicircle described on CD . The lower arc is described with a radius equal to one-fourth CD , and the sides are described with a radius equal to the vertical diameter. The shaded portion at the bottom of the figure shows the relative depth, and hence velocity, of the same amount of sewage in a circular and in an egg-shaped sewer of the same capacity.

Manholes.—The manholes for the combined system differ from those in the separate system, as shown in Fig. 2, only in resting on the sewer itself instead of a concrete founda-

FIG. 3.

time. The construction of the manhole begins at the springing line of the upper arch of the sewer.

Catch-basins.—The storm-water in passing over the surface of the street and along the gutters carries with it dirt, pieces of stone and brick, leaves, sticks, and other refuse. In order to keep this stuff out of the sewer the storm-water is first received into a catch-basin, where the solid matter is held and the water passed on into the sewer. The opening into the sewer should be several feet from the bottom, and should be so arranged as to guard against admitting any of the solids from the catch-basin.

FIG. 4.

At the bottom of the partition *a*, the gas from the sewer can not escape. Sometimes the outlet to the sewer is trapped.

Catch-basins should be cleaned frequently, as the organic matter carried into them by storms will decompose and become offensive. They should be placed at the lowest points, and from 200 to 300 feet apart on both sides of the street.

Sometimes when combined sewers are built provision is made for purifying the ordinary flow of sewage, but not the much larger volume of storm-water. In that case a storm-overflow is arranged, as shown in Fig. 5.

FIG. 5.

As the flow deepens with the storm-water the velocity increases until it is sufficient to keep the opening *O* and pass out through the storm-water outlet *A*.

Flushing and Ventilation.—In order to keep sewers in the best possible condition and reduce the evolution of sewer-gas to a minimum, provision should be made for flushing and ventilation. In the separate system, with its comparatively small pipes, this is not difficult. With an even flow of sewage on low grades there is always a tendency to form deposits on the bottom of the sewer on account of the fungus growth on the pipes under the sewage. It needs a rush of water to detach the fungus and carry along the sediment. By discharging into the sewer the down-spouts from the gutters of a few houses near the head of each lateral sewer, flushing can be accomplished whenever there is sufficient rain. Sewers may also be flushed by making a connection between the upper ends of the laterals and the open supplying water to the town, and admitting the water to the sewers by turning a valve, or by taking the water from a hydrant and conducting it to the sewer through a hose. Where there are no water-works, flush-tanks mounted on wheels have been used. In some cases underground wells are used to collect the house sewage, and when full they discharge automatically.

The best method is in place at each dead end an automatic flush-tank supplied with water from the water-works. Flaps are set on as to discharge as often as may be thought desirable. A good form of flush-tank is shown in Fig. 6.

It is built of brick laid in hydraulic cement, and plastered with cement outside and in, so as to be water-tight. The top is finished with a cast-iron cap provided with a movable perforated cover. Water is supplied to the tank from

FIG. 6.

the pipes of the water-works, and the faucet is adjusted as to fill the tank as often as is desired. The tank is supplied with an automatic emptying device, which discharges the water into the sewer whenever the tank is full. There are several devices for this purpose. Under ordinary circumstances the tank should hold about 200 gal., and should be set so as to discharge once in twenty-four hours.

Ventilation of Sewers.—Separate sewers are best ventilated by continuing the house-drains, untrapped, above the roofs of the houses, either inside or outside of the house. If the holes in the manhole and flush-tank covers are kept open, and the sewers are properly flushed, the air in the sewers will be changed so frequently that comparatively little trouble will be experienced from sewer-gas from separate sewers.

In combined sewers the case is very different. The difficulties in the way of flushing and ventilating large sewers are almost insurmountable. The interior surface of brick sewers is rough, and becomes smeared with organic matter from the sewage which is constantly undergoing decomposition. During storms, debris and the litter from the streets is swept into the sewers, and when the flow slackens to the usual dry-weather volume the debris from the streets is stranded and forms obstructions to the shallow, sluggish stream, formed by the sewage proper in the large sewer. Pools of sewage are formed along the line, and the decomposition of the organic matter in these pools produces sewer-gas in enormous quantities, and affords a breeding-ground for bacteria. To flush such a sewer thoroughly is usually impracticable, as it requires too much water. Sometimes an attempt is made in this direction by damming up the sewage for a time and then releasing it, producing a current strong enough to carry forward the sediment. This improves the lower lines of sewers, but is not applicable to the upper ends. Where this method is applied there is always danger of a deposit on the line above the temporary dam.

Since the evolution of sewer-gas can not be avoided, the question of ventilation becomes the more important. Several plans have been proposed for the ventilation of large sewers, but none have been as successful as could be desired. High chimneys have been used, and in some cases a draught has been secured by means of a fan or a fire. Owing to the many openings into the sewer, one chimney will affect only a limited section of the sewer. Another plan is to purify the air from the sewer by passing it through charcoal filters.

Fig. 7 is a manhole fitted with a charcoal filter for purifying the air from the sewer. It consists of a sheet-iron cylinder, open at both ends, containing a series of pans with perforated bottoms, placed one above another and filled with charcoal. The cover of the manhole is water-tight, to exclude moisture from the filter, and a separate chamber with a perforated cover is built inside the manhole to pro-

vide an escape for the air. The charcoal is about 3 inches deep in the pans. It is renewed about once a month by being returned in retorts from which air is excluded.

Plans.—The design for a system of sewers for any town depends upon local circumstances. No one system, however well adapted for a given locality, will be universally applicable. The separate system is to be preferred where the storm-water can otherwise be provided for, or where the sewage must be pumped, or where sewage disposal-works are necessary, and its cost is a small fraction of that of combined sewers for the same locality. In some cases in addition to the small sewers, special conduits for storm-water are needed for a limited area. These need not be placed deep in the ground, and they can be discharged into the

FIG. 7.

nearest natural watercourse, even within the town, where sewage could not be discharged.

Disposal of Sewage.—After the sewage has been collected and carried away from a locality the problem of its disposal remains to be solved. It may be discharged without purification into a stream or large body of water; it may be partly purified by subsidence, or filtration, or chemical process, or by a combination of these, and then discharged; or it may be purified by application to the soil in several ways. When sewage is emptied into a large stream or body of water its disappearance is due to several causes. It is diluted by the large volume of water into which it is discharged; part of the impurities are deposited by subsidence; part of the organic matter becomes food for aquatic plants and animals; and part of it is destroyed by oxidation and nitrification. So long as the amount of sewage is very small in comparison with the volume of water into which it is discharged, this method may not be objectionable, unless the stream receiving the sewage is to be used for water-supply. The pollution of streams and lakes by sewage is a growing evil. In many countries in Europe it has been forbidden by law, and in the U. S. such laws are imperatively required in order to preserve sufficient unpolluted water-supply for the large towns.

When sewage is purified by subsidence it is collected in tanks and allowed to stand until the particles in suspension are deposited on the bottom of the tank, when the partly clarified liquid is drawn off. Sieves and filters are also employed for purifying sewage. Chemical processes of many kinds have been used. In these processes certain chemicals are mixed with the sewage, and it is purified by the precipitation of the suspended impurities, and some of those held in solution. All of these methods remove the suspended impurities and the organic matter from the sewage to a greater or less extent, but the effluent is still unfit to be turned into the natural watercourses.

A still more efficient method of purification is by applying the sewage to the soil. This may be done by broad irrigation, intermittent filtration on limited areas, or by sub-surface irrigation. Where broad irrigation is employed the ground is first underdrained and the sewage is applied to the surface by leading it in furrows. The method of application depends upon the crop under cultivation. Sometimes it is spread over nearly all of the surface for a time, and sometimes it is only run in the furrows, placed from 2 to 4 feet apart. The sewage is absorbed by the soil, and wherever the sludge accumulates it is spaded under. The city of BERLIN (q. v.) has an excellent system of sewage farms.

Where the method of intermittent filtration is employed, filter-beds of soil are prepared with the sole object of filtering the sewage, and no attempt is made to raise any crop. The sewage is applied to the filter-beds in succession, time being given between the applications for the aëration of the soil. In sub-surface irrigation the sewage is delivered to the soil through drain-tile laid from 6 to 10 inches below the surface of the ground. The sewage passes out of the tile at the joints, and is absorbed by the soil. This method is especially applicable on private grounds, where no sewers

are available. The action of the soil in purifying sewage is somewhat complicated. It filters out the suspended particles, and the organic matter in the sewage is destroyed by oxidation and by the bacteria in the soil. The effluent water is collected by drain-tile and delivered to the natural watercourses.

For further information, see Latham's *Sanitary Engineering*; Adams's *Sewers and Drains for Populous Districts*; Staley and Pierson's *Separate System of Sewerage*; and Baumeister's *Cleaning and Sewerage of Cities*. See PLUMBING. CARY STALEY.

Sewing-machines [*sewing* is pres. partic. of *sew* < M. Eng. *sewen*, *sew* < O. Eng. *seowan* : O. H. Germ. *siuwan* : Icel. *siya* : Goth. *siujan* < Teuton. *siu-* : Lith. *siuti* : Lat. *su* err. Gr. *nao-siaw*]; machines for stitching fabrics, operated by the foot, hand, or other motive power.

In 1790 Thomas Saint, an Englishman, secured a patent for a machine intended for "quilting, stitching, and sewing, making shoes and other articles." This machine, although made chiefly of wood, had many features similar to those common in modern sewing-machines, such as the overhanging arm, a vertical reciprocating needle-bar, having secured in its lower end by means of a set-screw a straight needle with a terminal notch instead of an eye. There was also, at a short distance from the needle, a straight awl to make the holes through which the thread was to be pushed by the notch-ended needle. On the top of the needle-bar was a large spool, from which the thread was drawn as required to form the stitch. This machine also had what is now called a feed, for moving the material after each stitch the proper distance for the next, and thread-tighteners (tensions) above and below it. The stitch used by Saint was known as the tambour stitch (now called the chain stitch)—the continuous thread was pushed by the notch-ended needle through a hole made by the awl, and the needle was then withdrawn, leaving a loop of thread below the material, which was then moved by the feed the proper distance for the next stitch, a second loop being formed passing through the first, which was then drawn tight.

At intervals in the first half of the nineteenth century machines for embroidering and ornamental stitching were invented. These could have been made to fasten two or more pieces together, but they were not intended for that work, and therefore can not with propriety be called sewing-machines. Several machines were also patented for making a running stitch, by means of fluted rollers which folded the cloth in short vertical convolutions and forced it on to a horizontal needle. Such machines used needles full of thread, and the needle was threaded in the ordinary way. In 1815 the Rev. John Adams Dodge, of Monkton, Vt., invented and (with the assistance of John Knowles, a mechanic) constructed a sewing-machine which made a back stitch in a satisfactory manner, but it was never patented or manufactured for sale.

The first sewing-machine that was manufactured for sale was patented in France in 1830, and in a modified form in the U. S. in 1850. Its inventor, Barthélemy Thimonnier, constructed of wood eighty machines which made a chain stitch of such strength that they were used in the year 1830 for manufacturing army clothing. These machines were destroyed by a mob which alleged that they were depriving tailors of their bread. A few years later Thimonnier had other machines constructed of metal, which were driven by a treadle and cord. These were also destroyed. Thimonnier's machine anticipated many of the more important features of the machines of to-day. It had the overhanging arm, flat cloth-plate, vertical post, vertical reciprocating-needle, continuous thread, and a presser-foot.

The Hunt Machine.—About 1832-34 Walter Hunt, a New York mechanic, invented, manufactured, and sold a few sewing-machines which were successfully operated. His machine had a curved needle with an eye near its point, attached to the end of a vibrating arm. It used two continuous threads, the lower being wound on a bobbin carried in a shuttle, and made a lock stitch—i. e. one in which the thread from the needle and that from the shuttle are interlocked at or near the middle of the thickness of the materials being sewn. Hunt neglected to apply for a patent for his invention for about twenty years, and during that time the manufacture and sale of the machine was not prosecuted; his tardy application for a protecting patent was denied on the ground that he had forfeited his rights by neglect and the sale and public use of the machine at the

ness of his invention. In 1842 J. J. Greenough patented a machine for sewing leather and other heavy material. This machine had a needle pointed at each end, and an eye at its center; this needle was passed in and for through holes previously punctured in the material by an awl, and was alternately moved over by plungers on each side of the work. This machine would make either a back stitch or a "double-stitch," at the pleasure of the operator. The needle used simple lengths of thread, and required frequent stoppages of the machine for retreading. Greenough's machine did not come into extended use.

In 1843 a sewing-machine somewhat similar to Greenough's was invented by George H. Corlies (later an inventor of the steam-engine), but it used two needles with eyes near their points, which were thrust horizontally through holes previously made by awls in the material to be sewed, which passed between clamps, and automatically moved at right angles to the path of the needles. The feed was automatic, and all the movements were derived from suitably placed cams on a revolving shaft.

The Howe Machine.—In 1846 a patent was issued to Elias Howe, Jr., for a sewing-machine on which he had been experimenting for three years. It had a curved needle (with an eye near its point) attached to the end of a vibrating arm; this needle carried the upper thread, the lower thread being wound upon a bobbin in a shuttle which was made to pass between the needle and its thread at each vibration of the arm. The cloth was suspended on pins projecting from the edge of a thin steel bar called a *baster-plate*, provided with perforations in which worked the teeth of a small pinion or which the *baster-plate* was given an intermittent movement or "feed" after each stitch. When the machine was manufactured it was found to be unsatisfactory. The chief difficulties experienced in operating it were these: The *baster-plate* was not satisfactory as a "feed," the vertical suspension of the shuttle was awkward and unmanageable, and the tension could not be regulated to prevent the skipping of stitches, the making of large loops in some places, and the drawing of the thread too tight in others.

Between 1846 and 1851 several inventors attempted to make sewing-machines of more practical value. Messrs. Howe and Blodgett made a machine which was used to a limited extent in the manufacture of clothing. This had a circular loop studded with pins for a *baster-plate*; its shuttle was curved and had a continuous revolution in a circular groove; its feed was adjustable, and its tension automatic. Messrs. Murey and Johnson and John Bachelder constructed single-thread machines for making the loop or chain stitch, and these were the first in the U. S. which made that stitch.

The A. H. Wilson Machine.—In 1849 Allan B. Wilson (of the original firm of Wheeler & Wilson) made and in 1850 patented a sewing-machine having a vibrating shuttle, and the original form of what he afterward patented as his four-motion feed. This machine had a considerable sale, but was not satisfactory to its inventor, who set himself to work to produce something more practical. His efforts resulted in the invention of the revolving hook (patented Aug. 12, 1851), which carried within its concave double-convex circular section, and a ring which held it in place. This hook caught the loop from the descending curved needle, whose eye was near its point, and passed it around the bobbin, thus dispensing with the shuttle. Wilson afterward perfected the four-motion feed and other details.

The Singer Machine.—In Sept., 1850, Isaac M. Singer, a mechanic of New York, who had become interested in sewing-machine experiments and was familiar with the Howe and Blodgett machine, made a contract to invent an

FIG. 1.—Singer shuttle.

improved sewing-machine and have it built for \$40. He accomplished this within twelve days, and the machine was found to be practical and efficient. This machine was the first which had the rigid overlying arm to guide the vertical needle, in combination with a shuttle and what was called a *whisk-feed*. A patent for this machine was issued Aug. 12, 1851. At about this time William C. Howe (afterward of the firm of Grover & Baker of Boston) was attempting the solution of the sewing-machine problem in a different manner.

The Grover & Baker Machine.—On Feb. 11, 1851, Messrs. Grover & Baker patented a sewing-machine making what

has been called the *double-loop* (or Grover & Baker) stitch, which was made by a combination and joint action of a circular reciprocating under needle, with a curved upper needle having an eye near its point, thus dispensing with both shuttle and bobbin, and enabling both the upper and under threads to be taken from commercial spools. These machines were very popular and for several years took the lead of all others, but they are no longer manufactured. Although up to this time Elias Howe, Jr., had never made a practical sewing-machine, his patents were so skillfully drawn that Grover & Baker, Singer, and Wheeler & Wilson were obliged to pay him royalty which amounted to \$25 per machine, but in 1859 an agreement was entered into between the above-named manufacturers and Howe by which the royalty was considerably reduced to them, but under it manufacturers outside "the combination" (as the quadruple syndicate was called) were still obliged to pay a heavy royalty. Howe's patent was extended in 1860 for the term of seven years, at the expiration of which he again applied for a further extension; but, as he acknowledged that he had received between \$1,000,000 and \$2,000,000 for the use of his invention, it was thought that he had been sufficiently remunerated and his application was rejected.

Previous to the final expiration of Howe's patent (1867) but few machines for making the lock-stitch had been invented and manufactured except by "the combination."

The Willcox & Gibbs Machine.—In June, 1857, James F. A. Gibbs, of Millpoint, Va., took out his first patent for a machine having a rotating hook for using a single thread to make the twisted loop stitch, a variety of the chain or tambour stitch which possesses much merit. This, with some improvements of its details by James Willcox, of Philadelphia, became the Willcox & Gibbs sewing-machine, the most popular of the single-thread machines. Several years later this machine was improved by Charles H. Willcox, who invented an automatic tension which readily adapts itself to the requirements of varying thickness of cloth, seams, folds, etc., and draws the stitch equally tight under all conditions.

At the expiration of Howe's patent in 1867 a large number of new machines were brought out, but few or none of them are in use.

Button-hole Machines, Leather-sewing Machines, etc.—There have been two machines and two attachments invented for finishing button-holes by the button-hole stitch—viz., the Union button-hole machine, made by the Singer Manufacturing Company, and the Howe or Wheeler & Wilson button-hole machine; the American button-hole and the Wheeler & Wilson button-hole attachments. A multitude of other accessories and attachments in sewing-machines, such as hemmers, braiders, corders, tuckers, fellers, platers, binders, quilters, rafflers, and gatherers, have been invented for the purpose of executing special kinds of work with facility, and the total number of patents issued for sewing-machines and their adjuncts is upward of 4,000.

Among the more important inventions for sewing by machinery must be mentioned machines for sewing leather goods with waxed thread. Of these, the Kents No. 1 and the Kents lock-stitch machines, the McKay shoe sewing-machine and the Goodyear & McKay sewing-machine are the most prominent. Each of these machines has been largely used in the manufacture of boots and shoes, harness, and other articles made of leather. Machines have also been invented for sewing books; of these, the Smyth and the Bampton are the best known.

Classification of Machines.—Sewing-machines are best classified by the kind of stitch produced, and although upward of seventy kinds of stitches and machinery for making them have been invented, yet there are at the present time but three types of stitches used in machine-sewing—viz., the lock stitch, the chain stitch, and the button-hole stitch.

Lock-stitch machines may properly be divided into two types—those making the lock stitch by means of a shuttle which is thrust through the loop of the upper thread, and those in which that loop is carried by a revolving hook over a stationary bobbin. More than half of the machines manufactured are of the first-named type, of which the Singer and Domestic machines are the chief examples, the Wheeler & Wilson machine being the original and still by far the most prominent of the revolving-hook type of lock-stitch machines. These machines are all made on the "interchangeable principle," each part being exactly like its corresponding part in every machine; and in such perfection is this system

carried that the machines are assembled by selecting their component parts at random from the hundred or more receptacles containing them. This interchangeable method of construction is adopted by all sewing-machine manufac-

FIG. 2.—The lock stitch.

FIG. 3.—Grover & Baker stitch.

FIG. 4.—Twisted loop stitch.

FIG. 5.—Button-hole stitch.

turers, and by its use the business can be thoroughly systematized and the manufacture be carried on at a minimum cost.

The revolving hook used in the Wheeler & Wilson sewing-machine has been much modified and improved; that at

FIG. 6.—Domestic shuttle.

present used in their No. 9 machine is represented in Fig. 7. A greater possible rate of speed is claimed for these machines than

for those which employ a shuttle; a further advantage is found in their running with less noise. A variety of rotating-hook lock-stitch machine, and one which embodies an entirely new departure in sewing-machines, is the invention of Mrs. Harriet Ruth Tracy. It has a rotating bobbin-holder provided with three hooks, which in turn operate to carry the loop from the upper thread over the bobbin-holder, and a bobbin or cop containing 1,000 yards of thread. The special features of this machine are: (1) its large thread-carrying capacity in the bobbin-holder; (2) the fact that it has no take-up above the bed, the three rotating hooks disposing of all the slack (a feature which permits a large amount of thread to be carried); and (3) the rotating positive motion of the entire mechanism, which allows of very rapid running. In five seconds, by a slight change of adjustment, this machine can be made to take a chain stitch with a single thread or a chain stitch having a second or locking thread run through it on the under side of the cloth, which prevents raveling and at the same time

FIG. 7.—Wheeler & Wilson bobbin and bobbin case in the rotary hook.

leaves the stitch elastic. The machine is characterized by simplicity and great ingenuity.

The twisted loop or chain stitch is made only by the Willcox & Gibbs machine. A short straight needle is carried by a vertical reciprocating bar, actuated by a vibrating lever, put in motion by a link connecting it to an eccentric on the main shaft of the machine. At the front end of the main shaft is a peculiarly shaped hook, which in its rotation catches the upper thread as the needle, having an eye near its point, descends through the cloth, and forms a loop through which the needle passes on taking the next stitch;

the hook then engages the upper thread again, and at the same time the first loop is thrown off the hook and the first named stitch drawn tight by the operation of forming the

FIG. 8.—The Tracy circular three-pointed rotary-shuttle with bobbin placed inside its case ready for use.

second loop. This machine is practically silent in its operation, even when running as rapidly as to make 3,000 stitches per minute.

The button-hole sewing-machines do their work in a thoroughly efficient manner, the button-hole finished by it being much more durable than those made by hand-work. Button-hole attachments are intended to be used in connection with an ordinary lock-stitch sewing-machine; they not only make a perfect button-hole, but will also make the button-hole stitch on the edges of garments, shoes, etc., which the button-hole machine can not do.

Besides those already enumerated, there is a large variety of sewing-machines manufactured for doing special work. Among them are the cylinder sewing-machine, having a cylindrical work-holder, for sewing seams on sleeves, trousers, water-hose, boot-legs, leather buckets, and other articles of tubular form; and the carpet sewing-machine, for making up carpets.

The operations required for the manufacture of a sewing-machine are very numerous, embracing designing, drawing, pattern-making, casting, pickling, tumbling, tool-making, forging, annealing, stamping, swaging, filing, polishing, screw-making, turning, drilling, plating, japanning, ornamenting, assembling, testing, and packing. For the manufacture of sewing-machine needles, see NEEDLES AND NEEDLE-MAKING.

There are but two sewing-machine factories in which all parts of the machine, including cases and needles, are manufactured. The manufacture of sewing-machine needles and cases has reached large proportions as independent industries. The census returns of 1890 showed that 59 establishments manufacturing sewing-machines and attachments reported. These had a combined capital of \$16,043,136, employed 9,121 persons, paid \$5,170,555 for wages and \$3,502,173 for materials, and had products valued at \$12,823,147. There were also reported 7 establishments manufacturing sewing-machine cases, which had a combined capital of \$1,430,403, employed 1,842 persons, paid \$886,725 for wages and \$990,439 for materials, and had products valued at \$2,249,551.

W. F. DUFFEE.

Sextage'sima [= Late Lat. (sc. *di'es*, day), liter., fem. of *sexage'simus*, sixtieth, deriv. of *sexagin'ta*, sixty]: in the calendar the eighth Sunday, nearly sixty days, before Easter. See SEPTUAGESIMA.

Sextant [from Lat. *sex'tans*, *sextan'tis*, the sixth part of an as, also a sixth of certain other measures of land, length,

FIG. 9.—Willcox & Gibbs hook.

index, etc.) a portable astronomical instrument, invented by William, and improved by Thomas Godfrey, of Philadelphia, in 1730, and John Hadley, of England, in 1731 (see *SEXTANT*, 1731), being for the measurement of an angle a graduated arc of the sixth part of a circle, and employing in its construction the following theorem of optics: If a pencil be reflected by each of two plane surfaces, the deviation of the axis of the pencil is double the inclination of the reflecting planes, supposing its course to be in one plane perpendicular to the intersection of the surfaces. To show the ap-

FIG. 1.

plication of this theorem to the sextant in Fig. 1, let I be the index-glass, H the horizon-glass, S the star, S I H E the pencil of light from the star S as it suffers the two reflections at the respective glasses. The star will be seen by the eye projected in the horizontal line RS. Since $RIE = rIH$ is the law of reflection of light,

$$\angle RIA = HIA;$$

$$\therefore RIA = HIA.$$

is a similar manner $RHA = PHA$.

$$\angle RHE = \angle RIE = \angle HIE + \angle IAH.$$

$$\angle RHA = \angle RIA = \angle HIA + \angle IAH.$$

$$= \angle HIA + \angle IAH;$$

$$\therefore \angle RHE = \angle RHA.$$

But $\angle RHE$ is the deviation of the pencil produced by the double reflection, and we see this angle is twice the angle of the inclination of the mirrors. So long as the line of sight RS is directed to any fixed point the angular distance to any other point may be determined by the revolution of the mirror at I; the angle through which this mirror is moved may be indicated by the revolution of the line IA , which serves at some part of it an index sweeping over a graduated arc, which is graduated to twice as many degrees as it measures in its own circumference.

The following description of the instrument is taken from *Wheeler's Astronomy*, vol. II, art. 51; Fig. 2 represents the most common form of the sextant constructed upon these principles. The frame is of brass, constructed so as to sustain strength with lightness; the graduated arc, inlaid in the brass, is usually of silver, sometimes of gold or platinum. The divisions of the arc are usually 10' each, which are subdivided by the vernier to 10". The handle, H, by which it is held in the hand, is of wood. The mirrors, M and m, are of plate-glass, silvered. The upper half of the glass is so left without silvering, in order that the direct view from a distant object may not be intercepted. To give greater distinctness to the images, a small telescope, E, is fixed in the line of sight at K. It is supported in a ring, R, which can be moved by means of a screw in a direction at right angles to the plane of the sextant, whereby the star of the telescope can be directed either toward the silvered or the transparent part of the mirror. This motion changes the plane of reflection, which, however, remains always parallel to the plane of the sextant, the use of the handle being merely to regulate the relative brightness of the direct and reflected images. The vernier is read with

the aid of a glass G, attached to an arm which turns upon a pivot, N, and is carried upon the index-rod. The index-glass, M, of central vision, is secured in a brass frame, which

FIG. 2.

is firmly attached to the head of the index-rod by screws, a a a. This glass is generally set perpendicular to the plane of the sextant by the maker, and there are no adjusting screws connected with it. The fixed mirror m is usually called the horizon-glass, being that through which the horizon is observed in taking altitudes. It is usually provided with screws, by which its position with respect to the plane of the sextant may be rectified. At P and Q are colored glasses of different shades, which may be used separately or in combination, to defend the eye from the intense light of the sun.

For astronomical purposes the sextant is sometimes modified by making the arc a complete circle. The instrument is then known as a reflecting circle. This form has the advantage of securing higher precision in the observations.

For a discussion of the sextant generally, see William Chauvenet, *Manual of Practical and Spherical Astronomy* (Philadelphia, 1874); Dr. C. M. Bauernfeind, *Elemente der Vermessungskunde* (Munich, 1872); Merrifield and Rivers, *Navigation and Nautical Astronomy* (London, 1868); E. Leavis, *Practical Astronomy* (New York, 1855). For special problems and capacity of the sextant for scientific purposes, see *Monthly Notices R. A. S.*, vol. xiii, p. 61; 1879, November; *Washington Astron. Obs.*, 1887, App. II; 1890, App. I; *Phys. Ann.*, vol. lxxix, p. 126; *Astron. Nach.*, vol. vii, p. 262; vol. xxiii, p. 224. Revised by S. Newcomb.

Sextus Empiricus: Greek philosopher of the end of the second century; a physician of the "empirical" school, whence his surname. He revived the skepticism of Pyrrho and laid down the *Outlines of Pyrrhonism* in his *Pyrrhonian treatises* (three books), and in a work on skepticism (ten books), commonly cited under the title *Adversus Mathematicos*—a formal assault on all branches of learning, and valuable for the information it contains about the things assailed. His works were edited by Bekker (Berlin, 1842); German translation by Pappenhelm (Leipzig, 1877). H. L. G.

Sexual Selection: a factor in organic evolution, in which there is a struggle of the individuals of one sex for the possession of the other. In the struggle for existence the less fitted perishes; in sexual selection the unfortunate one is left without offspring. Usually the struggle is between the males, and may take the form of actual battle, but not infrequently it is one in which the aesthetic senses seem to be important. See *Evolution*. J. S. K.

Seydheles, of shel: a group of over thirty small islands in the Indian Ocean, between lat. 3° 30' and 5° 45' S., and between lon. 55° 20' and 56° 20' E., belonging to Great Britain and a dependency of Mauritius. Area, 100 sq. miles. They are rocky and high, but very fertile and covered with a luxuriant vegetation, especially of palms. Cotton is cultivated with some success. The largest is Mahé, 16 miles long and 4 miles broad. The Seydheles were discovered by the Portuguese early in the sixteenth century; they were first settled by the French in 1756, and became a British possession in 1794. Pop. (1891) 16,440.

Revised by M. W. BARRINGTON.

Seyffarth, zif'fäart, GUSTAV, Ph. D., D. D., LL. D.: scientist and archaeologist; b. at Uebigau, Prussian Saxony, July 13, 1796; educated at Leipzig University, where he was Professor of Oriental Archaeology from 1825 to 1855; professor in the Concordia Lutheran Theological Seminary at St. Louis, Mo., 1855-71, and afterward took up his residence in New York. He was the author of numerous works in German and Latin upon theology, Oriental philology, mythology, history, and chronology, chiefly notable for their extreme advocacy of the literal school of biblical interpretation and their entire rejection of the system and results of the Egyptian researches of Champollion and Bunsen. He resided in New York from 1871 till his death Nov. 17, 1885. See his autobiography, *Literary Life* (New York, 1886).

Seymour, see'mör: town; New Haven co., Conn.; near the junction of the Naugatuck, Bladen, and Little rivers, and on the N. Y., N. H. and Hart. Railroad; 10 miles N. W. of New Haven (for location, see map of Connecticut, ref. 11-F). It contains 5 churches, new high-school (building cost \$40,000), several other schools, public library, a weekly newspaper, and manufactories of paper, rubber, woolen goods, pins, nails, and mechanics' tools. The manufacture of woolen cloth was begun here over a century ago. In 1803 Gen. David Humphreys, who imported the first merino sheep into the U. S., bought the clothing-works here and built a large mill. The place was incorporated as the borough of Humphreysville in 1836, and as a town under its present name in 1850. Pop. (1880) 2,318; (1890) 3,318.

W. C. SHARPE, EDITOR OF "RECORD."

Seymour: city (laid out in 1852); Jackson co., Ind.; on the Balt. and Ohio S. W., the Evansv. and Terre H., and the Pitts., Cin., Chi. and St. L. railways; 18 miles S. of Columbus, 51 miles N. of Louisville, Ky. (for location, see map of Indiana, ref. 9-E). It is noted for its manufactories, which include rolling and planing mills, foundry, woolen-mill, and spoke, carriage, furniture, harness, and cradle factories. It contains the machine-shops of the Ohio and Mississippi Division of the Balt. and Ohio S. W. Railway, 10 churches, 5 public-school buildings, including the Shields high school, 2 national banks with combined capital of \$200,000, and 2 daily and 3 weekly papers. Pop. (1880) 4,250; (1890) 5,337; (1895) estimated, 6,500. EDITOR OF "DEMOCRAT."

Seymour, EDWARD, Duke of Somerset: See SOMERSET, DUKE OF.

Seymour, FREDERICK BEAUCHAMP PAGET, first Baron Alcester: naval officer; b. in London, Apr. 12, 1821; entered the navy in 1834, and passing through the different grades became admiral in 1882. In 1880 he was appointed commander-in-chief in the Mediterranean, and assumed supreme control of the allied fleet on the coast of Albania. In the military operations in Egypt in 1882 he bombarded the forts of Alexandria July 11-13, for which service he received the thanks of Parliament and was raised to the peerage. D. in London, Mar. 30, 1895.

Seymour, GEORGE FRANKLIN, D. D., LL. D.: bishop; b. in New York, Jan. 5, 1829; graduated at Columbia College in 1850 and at the General Theological Seminary in 1854; had charge of a mission station at Dobbs Ferry for six years; became first head of St. Stephen's College, Annandale, 1860, and in 1861 rector of St. Mary's church, Manhattanville, N. Y.; in 1863 went to St. John's church, Brooklyn, N. Y., and was in 1865 elected Professor of Ecclesiastical History in the General Theological Seminary; in 1874 was chosen bishop of the diocese of Illinois, but the General Convention refused to confirm him; in 1875 was elected dean of the General Theological Seminary. In 1877 he was chosen Bishop of Springfield, Ill., and was consecrated June 11, 1878. Bishop Seymour has published numerous pamphlets and works, all of a theological nature, and chiefly written in defense of church doctrine. Revised by W. S. PERRY.

Seymour, HORATIO, LL. D.: Governor of New York; nephew of Senator Horatio Seymour; b. at Pompey, Onondaga co., N. Y., May 31, 1810; removed in childhood to Utica; studied at Oxford and Geneva Academies, N. Y., and at Partridge's Military Institute, Middletown, Conn.; was admitted to the bar at Utica 1832, but soon withdrew from practice to devote himself to the management of the large estate he inherited by the death of his father; was a member of the staff of Gov. Marcy 1833-39; was elected to the State Assembly as a Democrat 1841, and three times re-elected, serving as Speaker in 1845; was chosen mayor of

Utica 1842; was an unsuccessful candidate for Governor 1850; was Governor 1853-55; vetoed a prohibitory liquor law Mar., 1854; was defeated in the election of that year by the Prohibitionist candidate, Myron H. Clark; was again elected Governor as a War Democrat 1862; aided in suppressing the riots in New York, and rendered efficient co-operation to the national Government in the war for the Union; was defeated for re-election in 1864, in which year he presided over the national Democratic convention at Chicago, as he did again at New York 1868, when he was nominated for the presidency much against his will, and received 80 electoral votes. D. at Utica, Feb. 12, 1886.

Seymour, Lady JANE: third queen of Henry VIII., sister of Protector Somerset, and daughter of Sir John Seymour, b. in England about 1510; became maid of honor to Queen Anne Boleyn; married Henry May 20, 1536, the day after the execution of Anne, and died shortly after giving birth to a son (Edward VI.) Oct. 24, 1537. She was chiefly notable for her sympathy with the Protestant Reformation.

Seymour, THOMAS DAY: scholar; b. at Hudson, O., Apr. 1, 1848; graduated at Western Reserve College 1871; studied in Berlin and Leipzig 1870-72; Professor of Greek in Western Reserve College 1872-80; appointed Professor of Greek in Yale College 1880; chairman of the managing committee of the American School of Classical Studies at Athens since 1887. He has published as author and editor *Selected Odes of Pindar* (1882); *Homeric Language and Verse* (1885); *Homer's Iliad* (i-iii, 1887, iv-vi, 1890, *School Iliad* (1889). C. H. THURNER.

Seymour, THOMAS HART: Governor of Connecticut; b. at Hartford, Conn., in 1808; educated at Partridge's Military Academy at Middletown; became a lawyer at Hartford, and editor of *The Jeffersonian* (1837), a Democratic newspaper; was some time judge of probate; sat in Congress 1843-45; entered the Mexican war as major of the 1st Regiment; became lieutenant-colonel Aug. 12, 1847; commanded the regiment after the death of Col. Ransom at Molino del Rey; was breveted colonel for services at Chapultepec Sept. 18, 1847; was Governor of Connecticut 1848-55, and minister to Russia 1853-57. D. at Hartford, Sept. 18, 1868.

Seymour, TRUMAN: soldier; b. at Burlington, Vt., Sept. 25, 1824; graduated at West Point 1846; entered the First Artillery; was breveted lieutenant and captain for gallantry in the Mexican war; was assistant professor at West Point 1850-53; served under Maj. Anderson at Fort Sumter, Apr., 1861; became chief of artillery of McCall's division, the Army of the Potomac Mar., 1862; was commissioned brigadier-general of volunteers Apr. 28, 1862; was distinguished in the Virginia and Maryland campaigns, commanding a brigade at Mechanicsville, Gaines's Mill and Glendale, and a division at Malvern Hill, Manassas, South Mountain, and Antietam; was severely wounded at Fort Wagner July 18, 1863; commanded an expedition to Florida Feb. 1864; was taken prisoner at the Wilderness; commanded a division in the Shenandoah valley Oct., 1864, and in the operations around Petersburg up to the close of the war. Brevetted from major to major-general in both the volunteer and regular army. Mustered out of volunteer service Aug. 1865, he returned to his regiment; received the degree of A. M. from Williams College; major Fifth Artillery 1866; retired 1876. D. at Florence, Italy, Oct. 30, 1891.

Revised by JAMES MERRELL.

Sfax (probably the *Taphoura* of Ptolemy): fortified on the Gulf of Gabes, or Lesser Syrtis, Tunis; lat. 34° 44' N. lon. 10° 45' E.; is divided into two cities, the upper and lower, the latter also called Rabat. The harbor is safe, shallow, and large ships must anchor 2 miles out. The commerce is very large, and is chiefly with France, Italy, Great Britain, and Greece. Sfax is celebrated for its cambric sponges, and gardens. It is intensely Mohammedan, and is much admired in Arabic literature. Pop. 30,000, of which about 5,000 are Europeans. M. W. H.

Sforza, sfort'sä: the name of an Italian family who ruled Milan as a dukedom in the fifteenth and sixteenth centuries and exercised considerable influence on the politics of Italy by their ambition, which was generally accompanied with violence and faithlessness, and by their taste, which was not always accompanied with education, though several members showed interest for and gave much protection to science, poetry, and art. The founder of the family was (1) GIACOMUZZO ATTENDIOLO, a peasant-boy from

born in the Romagna, b. June 10, 1580. He distinguished himself by his bodily strength, and received the surname *l'invincibile*, because chief of a band of ransomed, and saved the service of Queen Joanna II. of Naples, who made him grand constable; served afterward Pope Martin V., who sent him a count, and died Jan. 4, 1624.—(3) His son, FRANCESCO, b. July 27, 1601, was chief of a large troop of mercenaries, and served the papal banner. He formed a new sect, and which made his troop very effective in battle; served the service of Visconti, Duke of Milan, and was very successful in his undertakings; received Visconti's daughter, Maria, in marriage, and became as her dowry; and took refuge from the pope. In 1647 Visconti died without any male issue, and Milan instituted a republican government; but in 1650 Francesco seized the dual crown, defeated his opponents both in Milan and among the other states in northern Italy, reigned well, and died in Milan, Mar. 9, 1690, much beloved by his subjects.—(4) His son, GASTONE MARCO, b. Jan. 24, 1644, was vicious and cruel, and was assassinated Dec. 26, 1678.—(5) He was followed by his son, FRANCESCO GASTONE, b. in 1668, during whose minority the government was exercised on by his mother, Donna di Savoia.—(6) In 1680 Francesco was killed, b. in 1681, a brother of Gastone Marco, married Donna and assumed the regency, and in 1694 he poisoned his nephew and ascended the ducal throne himself. As Giovanni Gastone had married a Neapolitan princess, Naples concentrated against the usurper, and in order to avert the impending danger Lodovico second Charles VIII. of France to assert his claim on Naples. The success of the French, however, alarmed him more than the threat of Naples, and he formed a league between the North Italian states against France. To punish him, Louis XIV. invaded his country, which he claimed as a fief of Valentinus Visconti, captured him in 1690, and confined him in a castle of Loches in the present department of Indre-et-Loire, where he died in 1710. He was possessed of great talents and considerable literary and scientific accomplishments, and the magnificent encouragement he gave to literature and art made him very popular; but he was a weak character, of a low moral standard, and all his sciences and cunning were of very little avail to him on account of the violence of the times.—(7) His son, MASSIMILIANO, b. in 1691, was made duke in 1712, but expelled by the French in 1713; reinstated in the same year by Charles V. after the battle of Novara, but was again driven out by France, after the battle of Marignano, 1715, and finally lost his claims to the dukedom in France for a pension.—(8) His brother, FRANCESCO II., b. in 1692, was made Duke of Salaparuta by Charles V. in 1712 after the battle of Pavía, but rendered himself unpopular by oppressive taxes, and at his death (1744, 1753), he being the last representative of the main line of the house, the country was incorporated with Sicily. The Counts of Santa Flora and the Dukes of Sardinia are descended from collateral branches of the family.

Revised by F. M. COLBY.

Shabbatai Tsevi, shab-bah-d'ee-see: the most noted of the messianic impostors and self-deluded aspirants to be the Messiah of the Jews; b. in Smyrna, 1626, of Spanish descent; followed the mystic Cabala, and became an ascetic. The air was full of messianic ideas, the year 1666 being looked forward to by both Christians and Jews. Having divulged his intentions in 1668 he was banished; went to Salonica, Mecca, Athens, Cairo and Jerusalem, and achieved success, which was largely due to the circumstances in which his brethren lived and to the active assistance of his second wife Sarah; of Raphael Chelim, a rich Jew of Cairo; and of Nathan of Gaza, who pretended to be Shabbatai's Kijjah. In 1665 the company arrived in great pomp to Aleppo and Smyrna; in December Constantinople was officially proclaimed Messiah. Mystic tales of all sorts led to immortal actions; but his fame spread abroad. Jews all over Europe believed in him, even defied him. They hoped for a speedy restoration to Palestine. In the early part of 1669 Shabbatai went to Constantinople, where he was imprisoned. Sept. 14 he saved his life by professing a Mohammedan under the name of Mehmed Effendi. He played the double game of being a Mohammedan to his captors and a Jew to his followers. The Turks were used of this. He was banished to Dulcigno in Albania, where he died 1676. Even after his death the movement continued; there are still secret believers in his Messiahship, who dream of him in Balanica (Austria, 1888, 10, 11). The most complete account will be found in Grätz, *Gesch. d. Judenth.*, pt. 2, pt. 2, p. 712. For the older literature, see Grätz

(*ibid.*, notes 3-7); *First Hist. Judaism* (1863), ii, pp. 184, seq.; see also *Zeit. Gesch. d. Judenth.* (1863), p. 158; Neubauer, *Wahrheit der Sabbatians*, in *Grätz's Monatshefte* (1867), p. 204; *Illustrated France's Life of Shabbatai*, in the *Shabbatai*, published by the Meitzner Kirschen (p. 138); *Wiener Zeit. f. Kunde d. Morgenl.* (1867), p. 201.

Revised by RICHARD GOREMAN.

Shad [O. Eng. *scadda* (Germ. *shad*, *schad*; cf. Welsh *ywaddog*; Ir. and Gael. *scadan*, herring); any one of several species of the family *Clupeidae*, occurring in the possession of a rather high and compressed body, with trenchant and serrated belly, the preoperculum and suboperculum higher than long, a deep re-entering notch in the upper jaw, and the rest of the mouth and tongue at least trenchant; there are by some naturalists combined in a peculiar genus, *Alosa*, but by others they are regarded as constituents of the enlarged genus *Clupea*, including the salt-water herrings, etc. The species are all inhabitants of the northern hemisphere, and anadromous, like the salmon, living for the greater portion of the year in the sea, but in the spring ascending the rivers in large schools for the purpose of spawning. The time of ascent is determined by the temperature, and the point is only limited by insurmountable obstacles in the form of dams or falls which can not be overleaped, although the larger portion spawn at intervals far below this final point. The eggs are moderate in size, the ovaries of a single female having generally, it is said, about 25,000 eggs, although sometimes as many as 100,000 to 150,000. They are discharged near the surface, and slowly sink to the bottom. The time between impregnation and hatching depends on the temperature, and varies from about three to six days; thus when the temperature is about 75° to 80° F. they hatch in about seventy hours or little more, while at a temperature of 62° to 67° they are delayed to about six days. The best-known species are four—viz. *Alosa vulgaria* and *Alosa fida* of Western Europe, *Alosa sapidissima*, ranging from the Mississippi to the Alabama, and the *Alosa rostrata* of China, which especially ascends the Yang-tse-Kiang. The European species are held in much less esteem than the American and Asiatic. The last are esteemed among the best of fishes in their respective countries, and their ovaries are also regarded as special objects of luxury. The capture of these fishes gives rise to a large industry, and in the early spring months the fishermen are to a large extent engaged in their capture by means of fixed nets as well as seines, and to a small extent by dipnets. Shad eat little or nothing when in fresh water, but sometimes rise to the fly, although not enough to constitute them generally recognized game-fishes. In the salt water and estuaries they feed chiefly on small crustaceans, such as species of *Myda*, etc. See *FISHES*, *FISH-CULTURE*, and *PISCICULTURE*.

Revised by F. A. LUGER.

Shad-bush or Shad-tree: See *JUNO-BERRY*.

Shaddock (called *Pumpelmousse* in the East Indies): the large fruit of the *Citrus decumana*, a small tree of the orange family (*Rutaceae*). It has a watery pulp, cooling, acid, aromatic, and somewhat bitter. It is used for preserves. It was named from one Shaddock, who is said to have carried it from India to Jamaica. His descendants six varieties. The fruit sometimes weighs 15 lb. It is also called pomelo and grape-fruit. In botanical characters it differs from the orange in having a pubescent young growth, the leaves very large and often emarginate and pubescent beneath, petioles much winged. It is a native of Polynesia, but is widely spread in the tropics.

Revised by L. H. BAILEY.

Shadow-bird: a wading bird (*Scopus umbretta*) related to the snipe and herons, found throughout the greater part of Madagascar and Africa. It is named from its color, a deep brown with bronze reflections. The tail is barred with black, the bill is deep and compressed and hooked at the tip, and the head bears a long crest. The bird is rather sluggish. Although only 20 inches in length it builds a hollow nest of twigs about 6 feet in diameter, which is placed on a tree or ledge of rocks.

F. A. L.

Shadwell, THOMAS: dramatist; b. at Stanton Hall, Norfolk, England, about 1640; educated at Jesus College, Cambridge; studied law at the Temple, London; traveled on the Continent; acquired considerable reputation by his comedy, *The Sullen Lovers*, produced in 1668; devoted himself thenceforth to literature, chiefly dramatic; was author, among many other plays, of *The Virtuoso* (1676), *Lunar*

shire Witches (1682), *The Squire of Alsatia* (1688), and *Volunteers, or The Stock-jobbers* (1693); became poet-laureate and royal historiographer 1688, succeeding Dryden in both posts, and thereby incurring a resentment which led to his unjust impalement by that poet as the hero of *Mac Flecknoe* in the character of "monarch of dullness." D. Dec. 6, 1692. His collected *Works* appeared in 4 vols., 1720.

Revised by H. A. BEERS.

Shaftesbury, ANTHONY ASHLEY COOPER, First Earl of: party leader; b. at Wimborne St. Giles, Dorsetshire, England, July 22, 1621; entered Exeter College, Oxford, 1637; was elected for Tewkesbury to the Short Parliament in 1640; at first supported the king, but after ten months' service in the royalist army went over to the popular party in 1644, and took an active part in the war. He was a member of the "Barebones" Parliament in 1653, and of Cromwell's council of state in the same year, but later separated from the cause of the Protector and co-operated in the restoration of Charles II. As a reward for his services he was made a privy councillor in 1660 and Chancellor of the Exchequer in 1661, having previously been raised to the peerage with the title of Baron Ashley. He was one of the grantees of the province of Carolina 1663 and 1665; secured the services of John Locke as private secretary 1666, and prepared with Locke the famous aristocratic constitution for the government of the Carolinas. A member of the "Cabal" 1670, he allowed himself to be deceived as to the true nature of the disgraceful Treaty of Dover. In 1672 he was made Earl of Shaftesbury and Lord Chancellor, but in 1673 went over to the opposition and lost his office. Protesting against the prorogation of the Parliament, he was imprisoned in the Tower 1677-78, but on his release continued as the bitter foe of the court party, and, professing to believe the perjured testimony of Titus Oates, took the lead in the persecutions of the Catholics. He procured the passage of the Habeas Corpus Act 1679; presented the Duke of York before the court of king's bench as a "Popish recusant" in 1680; brought armed followers to the Oxford Parliament in 1681; was thrown into prison by order of the council on a charge of high treason July 2, but released Dec. 1, 1681, the grand jury having refused to find a true bill; went to Amsterdam Nov., 1682, and died there Jan. 22, 1683. He was the Achitophel of Dryden's satire, is brilliantly sketched by Macaulay in his *History*, and gave name to Ashley and Cooper rivers in South Carolina. See his *Life*, by W. D. Christie (1871); also Fox-Bourne's *Memoir of John Locke* (1876); and a biography by H. D. Traill in the English Worthies Series (1886).

Revised by F. M. COLBY.

Shaftesbury, ANTHONY ASHLEY COOPER, Third Earl of: grandson of the first earl; b. in London, Feb. 26, 1671; was educated under the supervision of Locke; entered Parliament 1693; resided in Holland 1698-99; succeeded to the peerage 1699; supported the administration of William III., and retired from public life on the king's death; was noted as a philanthropist and stigmatized as a free-thinker; published a *Letter on Enthusiasm* (1708) in defense of the rights of the "French Prophets," *The Moralists*, a *Philosophical Rhapsody* (1709), *Sensus Communis* (1710), *A Soliloquy, or Advice to an Author* (1710); spent much of his time on the Continent, and was preparing a work upon the arts of design when he died at Naples, Feb. 15, 1713. His principal work, *Characteristics of Men, Matters, Opinions, and Times*, was posthumously published (3 vols., 1713-23; often reprinted), and enjoyed great popularity. See Fowler, *Shaftesbury and Hutcheson* (London, 1882).

Shaftesbury, ANTHONY ASHLEY COOPER, Seventh Earl of: b. in London, Apr. 28, 1801; took a first class in classics at Oxford, 1822; was made D. C. L. 1841; entered Parliament 1826, representing the borough of Woodstock from 1826 to 1830, Dorchester 1830 and 1831, the county of Dorset, in which the estates of the family are situated, from 1833 to 1846, and the city of Bath from 1847 to 1851; supported the administrations of Liverpool and Canning; was made a commissioner of the India board of control by the Duke of Wellington 1828; was a lord of the admiralty under Sir Robert Peel 1834-35; succeeded his father in the peerage 1851. He was chairman of the Lunacy Commission from 1828 till his death, and did much to secure the passage of bills which have been called the Magna Charta of the liberties of the insane. He labored zealously to improve the condition of the working classes; carried through the Ten Hours' Bill, and followed it up by obtaining the assent of Parliament

to other measures regulating defective workshops and factories, night work, and the treatment of children by their employers in trades and manufactures, etc. His course in public life was always very independent. He was the leading philanthropist in English-speaking lands, and stood in public estimation as the embodiment of every virtue. His endorsement of any scheme was sufficient to give it success. He was therefore continually called upon to preside at meetings of all sorts. He was president of the British and Foreign Bible Society, the Pastoral Aid Society, the Evangelical Alliance, and other organizations for the propagation of evangelical doctrines, and was long regarded as the head of the so-called Exeter Hall school of Low Churchmen. He was an active promoter of the abolition of slavery throughout the world. D. at Folkestone, Oct. 1, 1885. See his *Life*, by Edwin Hodder (3 vols., London, 1886; n. e., 1 vol., 1887).

Revised by S. M. JACKSON.

Shagreen' [from Fr. *chagrin*, from Turk. *sāghri*, back of a horse (from the skin of which shagreen was first made, shagreen): a variety of tawed leather made in Persia and other parts of the East, and long celebrated for its hardness and strength. The name shagreen is also given fish-skins, principally those of sharks and rays, covered with calcified papillæ. Shagreen prepared from the tuberculous skin of the ray (*Trygon sepien*) is called *galuchat* by the French. Shagreen is dyed in various colors, and is used as a covering for small articles, as boxes and handles of swords.

Shah [from Pers. *shāh*, king; cf. *chess*, *pasha*, and *sattrat*; Pers. *kshātra*, province; Sanskr. *kshātra*, rule, power]: the title of the ruler of Persia and of certain other Asiatic princes. The sons and other male relatives of the Persian shah also assume this title, the full title of the monarch being *shah-in-shah*, king of kings.

Shāh Abbās: See **ABBĀS I.**

Shahap'tian Indians: a family of North American Indians, comprising the following named tribes: Chopunnish, Sahaptin, Nez Percé or Nimapu (the last being their true name), Klikatat, Palooos, Tenaino, Tushpaw, Tyigh, Umatilla, Walla Walla, Yakima.

Habitat.—The tribes occupied a large section of country along the Columbia river and its tributaries, their western boundary being the Cascade Mountains. The Chopunnish were found in 1804 occupying a large area in Western Idaho, Northeastern Oregon, and Southeastern Washington, on the lower Snake river and its tributaries. The Klikatat occupied the head waters of Cowlitz, White Salmon, and Klikatat rivers, Washington. The Palooos in 1805 were on Clearwater river, Idaho, above the Forks, and on the small streams tributary to it, W. of the Rocky Mountains. The Tushpaw appear to have been an eastern branch of the Nez Percé. According to Lewis and Clark's report the Walla Walla lived on both sides of Columbia river, from the mouth of Lewis (or Snake) river to the Musselshell Rapid, wintering on Tapteel (or Yakima) river. It is probable that under the general name Lewis and Clark included one or more other divisions, the Umatilla, for instance, who originally lived on Umatilla river, Oregon. The Tenaino, who are nearly related to the Warm Spring Indians, formerly lived at Gilliam, Oregon, on Columbia river. The Tyigh originally occupied Tyigh creek and valley, the former being a tributary of the Des Chutes river, Oregon, about 30 miles S. of the Dalles. The Yakima (called Shanwappam by Lewis and Clark) were found in 1805 on the head waters of Cataract (or Klikatat) and Tapteel (or Yakima) rivers, Washington.

General Characteristics.—Comparatively little is known of the mutual relations of the several members of this family. The linguistic family as a whole is a rather well-defined one, though in some of its sounds and in its harsh character the language considerably resembles the Chinook and Salishan. In habits of life the Shahaptian tribes differed considerably from the Chinook of the Columbia, to whom they were much superior, and more nearly resembled the inland Salishan tribes. Living as they did on the large water courses, salmon constituted their most important food, but the possession of horses (for all the tribes were "horse Indians") undoubtedly wrought considerable change in their habits, and caused them to become, to some extent, hunters. At the time of Lewis and Clark's visit (1804-05) none of these tribes had any idea of agriculture, and some of the bands met by the explorers on Snake river periodically suffered from hunger. The Chopunnish were then living, like the Chinook, in communal houses, and the same custom probably prevailed also in the other divisions of the family.

the village on the Clearwater was 150 feet long, and surrounded about 60 families and 100 fighting men. Each village was under the nominal control of a chief, but nothing showed of the nature of the federation of the separate villages if any such existed. Of late years, at least, the Nez Percé (Plaiusé Nussé) have not worn ornaments inserted in the nose, but it is probable that at one time the custom was a general one.

Dalles.—When Lewis and Clark passed down the Columbia in 1804-05, the lowermost Shalupian tribe, the Sossuier, was at the Dalles, while the first Chinookian tribe, the Chinook, was found at the Dalles, the two tribes being in a state of war. They were then at war, and there is evidence to show that during the next few years the Shalupian tribes encroached upon the Chinookian territory, and were westward from the Chinook the Dalles, probably the last Chinookian station on the Columbia. The Kiklatat, who, according to Gibbs, first crossed the Cascade Mountains from the Kiklatat river, Washington, crossed the Chinookian between 1810 and 1820 and overran the Willamette valley, taking their way as far S. as the Umpqua valley, Oregon. Subsequently they were compelled to retire to their own country. In 1820 they were found in the wooded and prairie country between Vancouver and the Dalles, at the base of Mt. Hood, Washington. In 1840 the Pelouse dwelt S. of the Cayuse. Love (1896) mentions the Pelouse (Palouse), who were then in British Columbia, at the mouth of Pelouse river. The Shalupian Indians are now located on various reservations in Idaho, Washington, and Oregon.

Population (1890).—Nez Percé, 1,515; Kiklatat, 115; Palouse (number unknown 181 to 1851); Tenino, 60; Tygh, 20; Pasailla, 170; Walla Walla, 405; Yakima (numbered 20 in 1825), 841.

LITERATURE.—Bancroft, *Native Races of the Pacific States*, II, 565, 650 (1895); Cox, *Bishop of the Nez Percé*, in *Indian*, 1893, 95 (1891); Gallatin in *Schubert's Indian Tribes*, II, 406 (1853); Hale, in *United States Expl. Rep.*, VI, 119, 212, 542 (1846); How, O. O. Howard, *True Story of the Nez Percés*, in *North American Review*, 129, 53 (1879); Lee and Frost, *Nez Percé in Oregon* (1844); Lewis and Clark, *Narrative*, ed. Allen, II, (1814). See INDEX OF NORTH AMERICA.

Shahjahanpur: large city of Rohilkhand, Northwest Provinces, British India, in lat. 27° 52' N., lon. 79° 28' E.; on the Ganges, a tributary of the Ganges (see map of N. INDIA, col. 4-17). The city was founded in 1647 during the reign of Shah Jahan, whose name it bears, and contains many fine mosques and the ruins of a castle. It has some sugar cane in cereals and sugar. Pop. (1891) 78,522. It is one of the chief places of a district of the same name. Area, 178 sq. miles. Pop. 800,000. Shahjahanpur is the name of several other towns in Northern India.

Shairp, JAMES CAMPBELL: author and critic; b. at Housness House, Gleditsgowshire, Scotland, July 30, 1819; educated at Edinburgh Academy, Glasgow University, and Balliol College, Oxford; was for some years assistant master of Rugby School; became Professor of Humanity at the same College, St. Andrews, 1861, and principal of that institution 1868, and was elected Professor of Poetry in the University of Oxford in 1877. He was the author of *Kilncliff, a Highland Pastoral* (1864); *Studies in Poetry and Philosophy* (1869); *Lectures on Culture and Religion* (1870); *Prose Interpretation of Nature* (1877); *Aspects of Poetry* (1881); *Lays of Robert Burns* in the *English Men of Letters Series*; and numerous contributions to magazine literature. D. at Gremsey, Argyleshire, Sept. 18, 1885. *Glen Gremsey and Other Poems* was published posthumously in 1886, edited by F. T. Palgrave. See *Portraits of Friends* (New York, 1890) for a memoir of Shairp, by William Lancel Holman.

Revised by H. A. BURNS.

Shakers (so called from certain rhythmical movements of the members in dancing, which forms part of their worship), more accurately, THE MILLENNIAL CHURCH, or UPRIGHT SOCIETY OF NEWBURY: a religious body which originated in England about the middle of the eighteenth century, having as its first leaders James Wardlaw, a tailor, and his

† Of late years the term Yakima includes a considerable proportion of the tribes speaking the shalupian language, and probably originally having little or no connection with the Yakima proper.

wife Jane, members of the Society of Friends. Jane Wardlaw, who claimed to have received from on high a call to announce the second coming of Christ in the form of a woman, gained access to her followers Ann Lee, daughter of a blacksmith, who was born in Manchester, Feb. 29, 1736; married Abraham Stanley, a blacksmith, and united with the society of James and Jane Wardlaw in Sept., 1790. She was imprisoned in the summer of 1779, during the persecution that arose against the Shakers, and while a captive received a revelation from the Lord which showed her that by obeying only could mankind be restored to a proper relation with God, and become the acknowledged head of the society.

On May 13, 1774, in obedience to a revelation, she embarked for North America with seven adherents, including her husband, who afterward left her, and John Hancock, who had some property. She landed in New York Aug. 6, settled in Watervliet, 2 miles S. W. of Albany, 1776. On the famous "Dark Day" (May 19, 1780) Elder James Whitaker preached the first public testimony of Mother Ann's gospel in America. Between that time and her death at Watervliet, in Sept., 1784, it is thought that over 2,000 people received her testimony. James Whitaker succeeded as leader of the people till his death at Enfield, Conn., July, 1797.

After him Elder Joseph Meacham led the people, and, assisted by able helpers, established communal order and regulation in all their families, guiding them till his death at New Lebanon, July, 1798. He had been a Baptist elder, and was son of a Baptist elder of the same name; was born in Enfield, Conn., in 1740. He is called the Father of Church Order.

After him Lucy Wright, who was Father Joseph's chief helper on the sisters' side, guided the people twenty-five years, till her death, at the age of sixty-one, at Watervliet, Feb., 1821. She was born in Pittsfield, Mass. During her ministrations five societies were established in Ohio and Kentucky, and believers increased in number thousands. Eleazer Bishop, Rufus Bishop, Bush Landan, and Asenath Clark were the leading ministers from 1821 to 1852. From 1820 to 1826 three new societies were established, and the population of the seventeen societies then existing was about 5,000 souls.

In 1827 remarkable spiritual manifestations began at Watervliet, and in less than a year spread through all the families. First the youthful and untutored class, taken away in visions and trances, described scenes and dwellers in the spirit spheres, being, as they believed, inspired to deliver messages, both vocally and in writing, from Mother Ann and her collaborators when in the body, and their successors, from Jesus, from apostles, patriarchs, and prophets, and other exalted witnesses, to the effect that they had come to help the leaders, to purge out disorder, and to restore church rules and discipline to the rectitude of their beginning. They brought a flood of light and of spiritual gifts, humbling and mortifying to a carnal nature, to the vanity of youth, and pride staining to all flesh, but edifying and strengthening to the little child in Christ. They said it was to prepare us for the gospel to go forth in mankind. At the end of fifteen years one spoke in the name of Mother Ann, that evil was that day so bound and put down that it had no power to rise in the church, which then stood in purer rectitude than ever it had before. Mother Ann's special ministration lasted, it is claimed, about three years. But there were many subsequent spiritual manifestations, and many were converted by them. Crowds of spirits from Hades were taught the gospel of the judgment, and the absolute necessity of confessing and forsaking their sins to find acceptance with God.

Shakers believe that Christ has made his long and anxiously awaited second appearing in Ann Lee and her followers; that God is one in essence, but dual in his complete and perfect manifestation, the redeemed and perfected man and woman; that they are in the work of the harvest, the resurrection, the judgment day, ending the world in themselves by obedience to the everlasting gospel, and entering in the dawn of the millennial age. They own no wives, nor husbands, nor private personal property, nor have carnal relations; they hold their possessions as a united and concentrated interest, each toiling for the good of the whole, in love serving one another, in honor preferring one another as brothers and sisters of one family. The government is wholly parental. The leading authority is vested in four persons, two of each sex, called ministry. The head of a family is an eldership, consisting when complete of four,

two of each sex. Elders are assisted by deacons, two of each sex when the order is full, or more if necessary, who manage temporal affairs. The total number of Shakers in the U. S. is about 1,000, forming 15 societies or settlements, of which 2 are in the State of New York, 3 in Massachusetts, 1 in Connecticut, 2 in New Hampshire, 2 in Maine, 3 in Ohio, and 2 in Kentucky. New Lebanon, in Columbia co., and Watervliet, in Albany co., N. Y., are the most important.

The Shakers publish a monthly, called *The Manifesto*, at East Canterbury, N. H. It was started in 1871. See also *The Concise History of Shakers* (East Canterbury, 1894); *Pearly Gate* (Chicago, 1894); and *The Millennial Church* (Albany, N. Y., 1848). ALONZO G. HOLLISTER, Elder.

Shakespeare, WILLIAM: dramatic poet; b. at Stratford-on-Avon, Warwickshire, England, in Apr., 1564—on the 28d of that month, O. S. (N. S., May 8), it is supposed. His father, John Shakespeare, was of the yeoman class; his mother, Mary Arden, was of a family of the minor gentry. John Shakespeare seems to have been a man of character and ability. He became a landholder, and rose rapidly through all the grades of office in Stratford until he became chief alderman and *ex-officio* justice of the peace. Misfortune, however, befell him, and he was reduced to comparative poverty, and was even subject to arrest for debt. Of Shakespeare's boyhood nothing is known; but he was doubtless educated at the grammar school in Stratford, where he got the "small Latin and less Greek" with which Ben Jonson credits him. Passages in his works showing more than ordinary familiarity with law-terms have been regarded as indicating that he was for a time in an attorney's office. This is more probable than the tradition that he was apprenticed to a butcher. The first fact that is really known about him, after his baptism, is that in his eighteenth year he had become entangled with a woman of twenty-five, Anne Hathaway, the daughter of Richard Hathaway, who lived at Shottery, near Stratford. He married this woman by special license, dated Nov. 28, 1582, and their first child, Susanna, was baptized May 26, 1583. Twin children, a boy and girl, named Hamnet and Judith, were baptized Feb. 2, 1585. Shakespeare soon (perhaps in 1585) left Stratford to seek his fortune in London. Tradition says that he had killed some of the deer of Sir Thomas Lucy, of Charlecote, near Stratford, and that the knight's vindictiveness was one of the causes of his leaving his native village. The story, not improbable in itself, finds a certain confirmation in the fact that Sir Thomas is apparently caricatured as Justice Shallow in *The Merry Wives of Windsor*.

Absolutely nothing is known of Shakespeare's first years in London. Tradition says that he began by holding horses at the door of the theater. It is certain that he soon got some humble position inside the theater (another tradition says as a mere "prompter's attendant"), and after a time became an actor, though he seems never to have risen higher than a position of what is known as "general utility." He was one of the original performers in Ben Jonson's *Every Man in his Humour*; he appeared in the same author's *Sejunctus*; and there is a tradition that he played the Ghost in *Hamlet*, and that his brother Edward saw him play the part of an old man, which was probably that of Adam in *As You Like It*. A few years later he began his career as a dramatist by rewriting old plays in conjunction with others, his seniors in years and as playwrights. It was the custom of the various companies of players to have several playwrights in their pay, who, working together, produced new plays and patched up old ones. Marlowe, Greene, and Peele were perhaps among Shakespeare's collaborators. His superiority to all his contemporaries soon asserted itself, and he began to write alone or with little assistance. His first wholly original play was probably *Love's Labour's Lost*; for in *Titus Andronicus*, a revolting tragedy characteristic of a kind of drama then in vogue, there are but slight traces even of his 'prentice hand. He probably also in his earliest dramatic days had some small share in the revision of Part I. of *Henry VI.*, which was almost certainly an old play by another author or authors.

Shakespeare's success provoked the jealousy and excited the enmity of at least one of those whom he eclipsed—Robert Greene, a gifted but dissolute man, who died in wretchedness, and who, in a pamphlet written during his last illness, sneered at Shakespeare as "an upstart crow, beautified with our feathers; . . . and that being an absolute *Johannes factotum*, is in his own conceit the only Shake-scene in a country." "Beautified with our feathers" may mean

that he got credit by acting what others wrote; but some take it to be a charge of plagiarism in the revision of plays written by others. A few months later, Henry Chettle, who was one of the knot of writers to which both Greene and Shakespeare belonged, came to the defense of the latter in a pamphlet in which he says that Shakespeare's demeanor was "no less civil than he was excellent in the quality he professes"; adding that "divers of worship [people of rank and reputation] have reported his uprightness of dealing, which argues his honesty, and his facetious [felicitous] grace in writing which approves his art." Among the friends that Shakespeare won was the Earl of Southampton, a nobleman of taste and culture, who took great interest in literature and the drama. To him the poet dedicated his first published poem, *Venus and Adonis*, which was his first purely literary effort: he calls it "the first heir of his invention." There is a tradition that Southampton gave Shakespeare £1,000, quite equal to £8,000 at present. This may be an exaggeration, though such munificence was not unknown in those days among English noblemen. When Shakespeare published *Lucrece*, his second poem, he dedicated this also to Southampton, saying, "The love I dedicate to your lordship is without end. . . . What I have is yours; what I have to do is yours; being in part all I have devoted yours." This is apparently the acknowledgment of a great service, and it was possibly through the nobleman's generosity that the poet-dramatist became a very considerable sharer in the Blackfriars theater, at which the company with which he was connected was in the habit of performing. Having attained this advantageous position, Shakespeare soon reached the utmost height of success, as to both reputation and profit, possible to one of his profession. The notion long prevalent that he was neglected during his life, and that his plays rose in popularity only a long time after his death, is entirely unfounded. Contemporary evidence shows that he was the most admired of all the dramatists of his day, and that was the productions of the best of his contemporaries—Ben Jonson included—failed to pay the expenses of their representation, his plays filled the house to overflowing. He entered upon a career of dramatic production which is without a parallel in the history of literature, and which soon placed him in independent circumstances. He had money to spend and money to lend; and he used it to place his father in comfort and to acquire landed property and other wealth in his native town. The Herald's College made his father a gentleman by coat-armour, and this may have been done at the instance of the successful playwright, who thereby became a "gentleman" by descent both on his father's and his mother's side. He invested a part of his money in the title of Stratford, and he bought New Place, the best house in the town, and gradually added other lands to the estate. To this house he retired on his withdrawal from the theater about 1611, and there he died Apr. 23, 1616, and was buried on the 25th in the Stratford church. His daughter Judith was married to Thomas Quiney, a vintner, about two months before her father's death. Her sister Susanna became the wife of Dr. John Hall, a Stratford physician, in 1607.

Of Shakespeare's life in London very little is known, almost nothing except the successive production of his plays. Fuller says that he and Ben Jonson used to have many "wit-combats," in which he compares Jonson to a heavy Spanish galleon and Shakespeare to a light English man-of-war. Jonson was his junior, but was one of those who knew him intimately; and jealous, hot-tempered Ben loved him well and honored his memory after his death. He supports Fuller's comparison by saying, with a classical allusion, that Shakespeare was distinguished by great copiousness and facility of thought and language—so great as to be almost oppressive to his hearers. There was a sort of club of which Raleigh, Jonson, Beaumont, Selden, and Donne were members, and which met at the Mermaid Tavern; and the wit-combats probably took place at these meetings. Tradition says that Jonson owed to Shakespeare's influence the performance of his first comedy, *Every Man in his Humour*, which had been offered and rejected. This story agrees with Shakespeare's reported kindness of nature, and with the gruff and cynical scholar-dramatist's love for him.

Shakespeare's *Sonnets*, 154 in number, were published in 1609, and were dedicated to a "Mr. W. H." as their "only begetter," but by the publisher, not by the poet, who seems to have had no agency in the publication of any of his works except *Venus and Adonis* and *Lucrece*. If, as the great majority of editors, critics, and commentators believe (among them Wordsworth, Coleridge, Sir Henry Taylor, Swinburne,

Shakespeare, William Hugh, Malton, Harmer, Steevens, Drake, Halliwell, Wright, Collier, Furness, Trench, and Dowden. The *Sonnets* are autobiographical; most, if not all, of the first 130 were addressed to one person—a man, not a woman—and also most (except the last two) to the “dark lady” with whom “Jove” men, and Shakespeare were both entangled. Among those who believe that the poems are more “exercises of fancy,” with no foundation in the personal experience of the author, are the poets Browning and R. B. Stoddard, with Macaulay, Halliwell-Phillips, Brand White, and Chubbuck—the few last, however, believing that some of the sonnets are personal. The autobiographical theory has received strong confirmation from the researches of Thomas Tyrer (*Shakespeare's Sonnets*, 1900), who has proved quite conclusively that “My W. B.” was William Herbert, afterwards third of Pembroke, and that the “dark lady” was certainly Mary Fitton, maid of honor to Elizabeth, and a mistress of Herbert's, for whom she had a child. There are many difficulties in this theory yet to be cleared up; but at present (1905) it seems more plausible than any other.

Was Shakespeare happy in his married life? After the birth of his children he lived for more than twenty years in London, starting Stratford tradition says, only once a year. While in London, if the *Sonnets* are autobiographical, he was captivated by the “dark lady.” His will has no mention of his wife except in an interlined bequest of the “second-best bed,” apparently inserted during his last sickness. But we know, as he was prosperous in London he bought a house in Stratford, and gradually made it the elegant home which must have been his ideal from the first. Did he look forward to sharing that home with a wife whom he did not love? Alas, he repented of his relations with the “dark lady” (the 129th sonnet clearly shows). As to the will, his wife was simply provided for by her rights of dower, which are seldom referred to in wills of the time; and the bequest of the bed was doubtless a token of affection, not the result of any other cause. On the whole, it may be assumed that this marriage had its foundation in mutual love, and that, after any transient estrangement which may have occurred, it ended as happily as it had begun.

Shakespeare's dramas are unlike those of his predecessors, his contemporaries, and his successors, but their appearance is not in form or in purpose. He assumed the forms of comedy and tragedy, and of history or historical play, which had been established before he began to write, and he conformed in every external respect to the fashion of the time and the needs of the theater. His difference from other dramatists consists in his thought and his language, and in his power of dramatic characterization; in all of which he is unsurpassed by any writer who ever lived. The other writer over united imagination, fancy, humor, knowledge of human nature, worldly wisdom, psychological insight, and creative power, as all these were united in him. The fertility of his mind appears to have been inexhaustible; the profundity of his thought illimitable. He throws upon a minor personage and an unimportant situation poetical thoughts and philosophical reflections which other writers, if they could have originated them, would have carefully reserved for elaboration upon great occasions. His dramatic isolation from his creations appears to have been perfect; once evoked from his mind, they went independently and altogether outside of it, and act and speak altogether according to the laws of their own nature, not of his. He does not hesitate to show us that even truth good and bad may, and often do, act from mixed motives, good and evil. It is in this inflexible justice, characteristic of only the very highest quality of intellectual and moral nature, that one of the chief evidences of his superiority is found.

Most of his plays as were published during his lifetime seem to have been given to the press entirely without his approval. They were written not to be read, but to be performed; and it was to the interest of all concerned in the theater that they should not get into print. But the publishers eagerly sought copies of them for publication, and obtained them surreptitiously; sometimes, it would seem, by copying persons connected with the theater, and sometimes, as the text which they printed shows, by sending shorthand-writers to the performance. Twenty of Shakespeare's plays were thus published during his lifetime. They are known as “the quartos” from the form in which they are printed. Most of them are full of errors, and with one or two exceptions, they are all more or less imperfect; but they are contributions of great value in the formation of the text,

and they have been freely used for that purpose. For the text of the remaining seventeen of the plays we are entirely dependent upon the folio edition of the whole thirty-six (not including *Percy*), published by Isaac Jaggard and Edward Blount in 1616, under the authority—and, in some way, the editorial supervision—of two of Shakespeare's fellow actors, John Hemmings and Henry Condell. This edition, known as the “first folio,” although greatly superior, as to the text, of almost all the plays, to the quarto copies of the twenty plays before mentioned, is yet marred by so many and so great errors, and sometimes even by such important omissions, that it has required the labors of editors and commentators during 150 years to produce the text as now generally accepted.

The order in which the poems and plays were written is much disputed, and it is not likely that it can ever be fully settled; but in recent years certain facts have been pretty well established. If Shakespeare wrote *Titus Andronicus*, it was probably his first play, and produced before 1590; or whatever he did in writing that play and *Henry VI.* for the stage was probably done between 1588 and 1591. *Love's Labour's Lost*, it is generally agreed, was his first original play (1590), followed by the *Comedy of Errors*, the *Two Gentlemen of Verona*, and *A Midsummer Night's Dream* between 1591 and 1594; to which period must also be assigned *2* and *3* *Henry VI.* and *Richard III.* The first draft of *Romeo and Juliet* may have been as early as 1591 (revised 1595 or 1597). Then followed *Richard II.* (1594), *King John* (1594 or 1595), *The Merchant of Venice* (1596 or 1597), *2* and *3* *Henry IV.* (1597-98), and *Henry V.* (1600). As *You Like It*, *Much Ado*, and *Twelfth Night* must have been written in 1599-1600, and *Julius Caesar* by 1601, *The Merry Wives of Windsor* is to be grouped with the other Falstaff plays; and *The Taming of the Shrew* (not wholly Shakespeare's), the exact date of which is not easily fixed, must be put between 1594 and 1598. The first form of *Hamlet* is dated by some critics before 1600, but it may have been as late as 1602. The dates of the rest of the plays are probably as follows: *All's Well*, 1602 (perhaps the revision of a draft ten years earlier); *Measure for Measure*, 1608; *Timon and Coriolanus*, 1604 (very difficult to date); *Othello*, 1604; *Love and Hate*, 1605; *Antony and Cleopatra*, 1607; *Coriolanus*, 1608; *Cymbeline*, 1609; *The Tempest*, 1610; *Winter's Tale*, 1610-11. *Timon of Athens*, (1607-8?), *Pericles* (1608?), and *Henry VIII.* (1612-13?) are Shakespeare's only in part, and their history is perplexing. *Titus Andronicus* was probably written in 1592 or earlier, *Lucrece* in 1593 or 1594, and the *Sonnets* between 1595 and 1599, though some may have been several years later.

There are few traces, even in tradition, of any intercourse between Shakespeare and the eminent men of his time except Ben Jonson, Drayton, and the Earls of Pembroke and Southampton. Shakespeare and Bacon lived at the same time in the same city, then not a large one, passed each other in the street, and yet probably never interchanged one word. The reason was that one was a player and a poet, the other a statesman and a philosopher, and that each was absorbed in his own affairs. The notion that Shakespeare's plays were written by or in conjunction with Bacon—which has found a few ingenious advocates—is unworthy a moment's consideration by any reasonable creature.

There is a stone over Shakespeare's grave on which there is this inscription:

Good friend for Jesus sake forbear
To dig the dust enclosed here:
Blest be y^e man y^e spares this bone,
And curst be he y^e moves my house.

These lines, which may embody a wish expressed by Shakespeare, but which are hardly of his writing, have prevented the removal of the remains of the greatest Englishman to Westminster Abbey. Against the wall of Stratford church there is a monument to Shakespeare, with a laudatory inscription in Latin; but of far greater interest is the bust of the poet which forms part of the monument. It is coarse and rude in execution, but there is no reason for doubting that it gives at least a general idea of his personal appearance. According to this, he was at fifty-three a portly but not at all corpulent man, with a high forehead, a head somewhat bald, a small aquiline nose, and a well-formed mouth and chin. Aubrey, the antiquarian, who lived two generations after him, had heard that he was “a handsome, well-shapt man.” An engraved portrait upon the title-page of the first collected edition of his works, which Ben Jonson,

in some verses almost as hard and expressionless as the engraving itself, assures us was a good likeness, has a general conformity in the features and the form of the head to the bust. The latter was originally colored after life, and had hazel eyes and auburn hair and beard. These traits were afterward obliterated by a coat of white paint. The bust and the engraved portrait in the folio are the only portraits of Shakespeare which are of undoubted authenticity; but one known as the Chandos portrait has tradition of very respectable antiquity in its favor. There is a very slight and vague tradition that Shakespeare "died a papist," but this is very improbable. His works favor no religious form, sect, or dogma. There was also a tradition in Stratford fifty years after his death that he, Drayton, and Ben Jonson had "a merie meeting, and it seems drank too hard, for Shakespeare died of a faveur there contracted." This tradition has probably as little foundation as the other.

Although Shakespeare was acknowledged as the greatest dramatist of his time, his reputation rather diminished than increased during the century after his death. He had no followers or imitators; he established no school. Dramatic taste and dramatic writing steadily declined after the Elizabethan age (about 1575 to 1625), and by the beginning of the eighteenth century Shakespeare was lightly thought of by the literary critics, and much neglected by the actors. There had been among the reading public, however, a steady although not a large demand for his plays. The folio of 1623 was succeeded by another folio in 1632, and a third edition was called for and published in 1664. In the last *Pericles* and six spurious plays which had been published in quarto in Shakespeare's lifetime, with his full name or his initials upon the title-page, were included. A fourth edition, also in folio, appeared in 1685. Upon these four folios, and upon the existing old quarto edition of twenty of the plays, the readers of Shakespeare depended until Rowe's edition appeared in 1709 (see bibliography below). From the time of the appearance of this edition the fame of Shakespeare steadily grew until about the beginning of the nineteenth century he was acknowledged to be the first of poets and of dramatists, the most creative mind, the greatest master of imagination and of language, that the world has known. The number of Shakespeare's commentators has much exceeded that of his editors. His text was left in such a condition by the printers of the old quartos and folios that, although it may be read even in those impressions with pleasure and with a full comprehension of its general meaning, there is to its perfection need of more critical labor than is required by most old manuscripts; and of such there is none to consult, for of Shakespeare's writing not a line has come down to us—not even a word, except his own signature. It is safe to say that more critical ability and learning has been displayed upon this subject than upon any other in the whole range of literature, the poems of Homer perhaps excepted. The works written upon Shakespeare form a library in themselves, and a complete bibliography (unfortunately there is none such in existence) would fill a good-sized volume.

Shakespeare, like so many other men of great eminence, left little trace of his personality behind him. His only son, Hamnet, died at the age of twelve years. His two married daughters left children, but the family, even on the female side, became extinct in the third generation. New Place, his residence upon his retirement from the theater, after passing through several hands was in 1759 razed to the ground by its last owner, the Rev. Francis Gastrell, who was exasperated by a quarrel with the town authorities and by the persecution of prying visitors to the home of the great poet. John Shakespeare's house, which stands in Henley Street, and in which it is probable that William was born, was a comfortable dwelling for that age. After falling into decay, it was bought by an association and restored for preservation as a memorial of the poet. More recently, the grounds of New Place and the cottage at Shottery in which Ann Hathaway is supposed to have lived before her marriage have been bought for the same purpose.

RICHARD GRANT WHITE. Revised by W. J. ROLFE.

BIBLIOGRAPHY.

Editions.—Among complete editions (besides the early folios mentioned above) that are of any critical value, the following may be named: Nicholas Rowe's (6 vols., 1709); A. Pope's (6 vols., 1723-25); Louis Theobald's (7 vols., 1733; 2d ed. 1740); Sir Thomas Hanmer's (9 vols., 1744); Bishop Warburton's (8 vols., 1747); Edward Capell's (10 vols., 1760-68);

Dr. Samuel Johnson's (8 vols., 1765); Isaac Reed's (10 vols., 1785); Edmond Malone's (10 vols., 1790); George Steevens, with Boydell's illustrations (9 vols., 1802; in parts, 1791-1802); Reed's (first ed. with his name, 21 vols., 1803; 2d ed. 1813); Alexander Chalmers's (10 vols., 1805); the *Variorum* of 1807, edited by James Boswell from a corrected copy left by Malone (21 vols.); S. W. Singer's (10 vols., 1826); Charles Knight's Pictorial ed. (8 vols., 1838-43); J. P. Collier's (8 vols., 1842-44; 2d ed. 6 vols., 1858); G. C. Verplanck's (3 vols., 1844-47); H. N. Hudson's (11 vols., 1851-56); J. O. Halliwell's, afterward Halliwell-Phillipps's (16 vols. folio, 1853-65; only 150 copies printed); Singer's 2d ed. (10 vols., 1856); R. Grant White's (12 vols., 1857-66); Alexander Dyce's (6 vols., 1857-2d ed. 9 vols., 1864-67; 3d ed. 9 vols., 1875); Howard Staunton's (3 vols., 1858-60); the Cambridge ed., by W. G. Clark and W. Aldis Wright (9 vols., 1863-66; 2d ed., by W. A. Wright, 1891-93); Charles and Mary Cowden-Clarke's ed. (3 vols., 1863-66); W. J. Rolfe's (40 vols., 1870-83; Friendly ed. 20 vols., 1884); Horace Howard Furness's *New Variorum* (10 vols. issued, 1871-95); Clarke and Wright's G.O.C. ed. (the standard for line numbers, 1874); H. N. Hudson's Harvard ed. (20 vols., 1880-81); R. G. White's Riverside ed. (6 vols., 1883); the Henry Irving ed., by Sir Henry Irving and F. A. Marshall (8 vols., 1888-90); the Banksian ed., by Appleton Morgan (20 vols., including the twenty plays of which early quartos exist, 1888-92); the Temple ed., by Israel Gollancz (1894—not completed in May, 1895). The Leopold ed. (1 vol., 1877), with the German Delius's text, is valuable for the elaborate biographical and critical introduction by F. J. Furnivall.

Editions of single plays and series of plays (mostly for educational use) are too numerous to be catalogued here. The Clarendon Press and Rugby series, and Charles Worth's *Shakespeare's Historical Plays* (3 vols., 1883), are noteworthy among those which have some critical value.

The *Poems and Sonnets* are included in most of the recent standard editions. The first complete edition of both was issued in 1709 (an incomplete edition appeared in 1690). The *Sonnets* were first collected in 1609. The best modern edition is Edward Dowden's larger ed. (1881). Another important one is Thomas Tyler's (1890).

The first complete American edition of the works (with life, glossary, and notes by Dr. Johnson) was published in 8 vols. in 1795-96, at Philadelphia. The first Boston edition (including only the plays) was in 8 vols., 1802-04. Three editions of this appeared, each reset, stereotyping being then unknown. An edition in 17 vols. was published at Philadelphia in 1809, and one in 7 vols. (edited by O. W. B. Parbody, though his name does not appear in it) in Boston in 1836 (reprints of Reed's text had been issued in 1813 and 1814). An edition of the plays in 10 vols. (Reed's text) appeared in New York in 1821, and again in 1824. The first American edition of the *Spurious and Doubtful Plays* was published at New York in 1848.

Life, Birthplace, etc.—S. Neil, *Shakespeare, a Critical Biography* (1861); Halliwell-Phillipps, *Outlines of Life of Shakespeare* (7th ed. 1887); F. G. Fleay, *Life and Works of Shakespeare* (1886); D. W. Wilder, *Life of Shakespeare* (1893); T. S. Baynes, *Shakespeare Studies* (1894); C. M. Ingleby, *Shakespeare, the Man and the Book*, parts i. and ii. (1877-81); C. Knight, *Biography of Shakespeare* (in Pictorial ed., but also published separately); G. R. French, *Shakespeareana Genealogica* (1869; on the Shakespeare and Arden families, persons, and places in Warwickshire mentioned by Shakespeare, and characters in the historical plays); J. R. Wise, *Shakespeare, his Birthplace and its Neighborhood* (1861); Sidney Lee, *Stratford-on-Avon* (n.c. 1890); J. L. Williams, *Homes and Haunts of Shakespeare* (superbly illustrated, 1891-93); W. Winter's *Shakespeare's England* (illustrated ed. 1893); and *Old Shrines and Inns* (1894). J. Walter's *Shakespeare's True Life* (1890) is copiously illustrated, but not always trustworthy.

Dictionaries and other Reference-books.—A. Schmidt, *Shakespeare Lexicon* (2d ed. 1886); Dyce's *Glossary* (vol. ix. of ed. of Shakespeare published separately); R. Nares, *Glossary* (rev. ed. 1859); Charles and Mary Cowden-Clarke, *Shakespeare Key* (1879); J. Bartlett's *Concordance to Shakespeare* (1895; supersedes all earlier works of its class); Mrs. H. H. Furness, *Concordance to the Poems of Shakespeare* (1874; gives every instance of every word); E. Abbott's *Shakespearean Grammar* (1873); W. S. Walker's *Shakespeare's Versification* (1854) and *Critical Examination of Text of Shakespeare* (1860); A. J. Ellis's *Early English Pronunciation* (part iii. published separately); E.

Donawick's *Shakespeare Primer* (1877); small, but invaluable, *in his Introduction to Shakespeare* (1904); *The Shakespeare Library*; four volumes of the plays; rev. ed. 4 vols. 1870; F. W. Stead, *Shakespeare's History* (for sources of Roman plays, 17 (1877); A. Booth's facsimile reprint of *Folio of 1623* (1864); or H. Stanton's photo-lithographic reproduction of the same (1890); and the Gregg's facsimile of the early editions, valuable for the original texts (for twenty of the plays, see also Riverside ed. of Shakespeare); P. Doon, *Introduction to Shakespeare* (n. v. 1810); G. L. Craik, *The English of Shakespeare* (Am. ed. by Rolfe, 1907); H. P. Mason, *Chronological Order of Shakespeare's Plays* (1876); T. F. T. Dyer, *Folk-lore of Shakespeare* (Am. ed. 1904); B. N. Eliazovich, *Parables of Shakespeare* (1872); J. R. Harting, *Ornithology of Shakespeare* (1871); Lord Campbell, *Shakespeare's Legal Acquaintance* (1859); F. P. Harris, *Shakespeare as a Lawyer* (1884); J. C. Bucknill, *Medical Knowledge of Shakespeare* (1880) and *Mad Folk of Shakespeare* (2d ed. 1907); C. Wordsworth, *Shakespeare's Knowledge of the Bible* (3d ed. 1880); W. A. Wright, *Bible Word-book* (2d ed. 1894); contains many illustrations from Shakespeare; J. P. Norris, *Portraits of Shakespeare* (1895); excellent; A. Rolfe, *Handbook of Shakespeare Plays* (1875); older treatment in *List of Songs, etc., by Shakespeare, set to Music*, published by New Shakespeare Society, 1884. The *Papers of the Shakespeare Society* (1844-49) and the *Transactions* and other publications of the New Shakespeare Society (from 1874 onward) contain much valuable textual, critical, and illustrative matter.

Critical Commentaries.—S. T. Coleridge's *Notes on Shakespeare* (in eds. of his works); Mrs. Charlotte Lennox, *Shakespeare Illustrated* (the first critical work on Shakespeare by an American, 2 vols. 1793-94); A. W. Schlegel, *Lectures on Dramatic Art* (1815); Mrs. A. Jameson's *Characteristics of Women* (1838; Am. ed. 1896); N. Drake, *Shakespeare and his Times* (1817); Joseph Hunter, *New Illustrations of Shakespeare* (1845); H. Giles, *Human Life in Shakespeare* (1866); G. Fletcher, *Studies of Shakespeare* (1847); W. Hazlitt, *Characters of Shakespeare's Plays* (1817); G. S. Bigelow, *with the Lectures on Age of Elizabeth*, 1870; T. Hodgson, *Shakespeare: his Mind and Art* (Am. ed. 1891); H. N. Hudson, *Life, Art, and Characters of Shakespeare* (1874); H. G. White, *Shakespeare's Scholar* (1834) and *Studies in Shakespeare* (1890); J. Wiles, *Will, Humor, and Shakespeare* (1870); D. J. Snider, *System of Shakespeare's Grammar* (1877); Lady Martin, *Some of Shakespeare's Poems: Characters* (1864); Mrs. F. A. Kemble, *Notes on Shakespeare's Plays* (1862); R. G. Moulton, *Shakespeare as a Dramatic Artist* (3d ed. 1890); B. E. Warner, *English History in the Plays of Shakespeare* (1894); B. Wendell, *William Shakespeare* (1895); A. C. Swinburne, *Study of Shakespeare* (1880); T. P. Courtenay, *Commentaries on the Masterpieces of Shakespeare* (1840); J. W. Hales, *Essays and Notes on Shakespeare* (1892); B. Ten Brink, *Five Lectures on Shakespeare* (1895); G. G. Gervinus, *Shakespeare Commentaries*, translated by F. E. Bennett (n. v. 1876); H. Ulrici, *Shakespeare's Dramatic Art*, translated by I. D. Schmidt (1876); H. Carson, *Introduction to Study of Shakespeare* (1890).

Articulations.—G. Farmer, *Essay on the Learning of Shakespeare* (2d ed. 1797; several times reprinted); L. M. Carroll, *Beginnings with Shakespeare* (1889; very useful in modernizing spelling-charts); Charles and Mary Lamb, *Tales from Shakespeare* (many eds.; one with notes by W. J. Rolfe, 2 vols., 1900); Mary Comden-Clarke, *Girlhood of Shakespeare's Heroines* (2d ed. 5 vols., 1891); C. M. Ingham et al., *Shakespeare's Centuries of Progress* (reference to Shakespeare between 1391 and 1608; 2d ed. 1879, published by New Shakespeare Society); M. R. Sillsby, *Trifles to Shakespeare* (1899); W. Andrews, *Bygone Warwickshire* (1900); W. Black, *Judith Shakespeare* (1884; a novel, but a careful study of the scene and the times).

For the "Collier controversy" concerning the emendations which J. P. Collier asserted that he had found in a copy of the second (1622) folio, see A. Dyce's *Structure of Collier's New Edition of Shakespeare* (1896); N. F. S. A. Hamilton's *Inquiry into the Grounds of the MS. Corrections in Collier's Shakespeare* (1900); S. W. Singer's *The Text of Shakespeare Verified*, etc. (1853); and C. B. Bradley's *Complete View of the Shakespearean Controversy* (1861).

For the Baconian theory of the authorship of the plays and poems, see W. H. Wymon's *Hibliography of the Bacon-Shakespeare Controversy* (1894), and supplements to the

same in the magazine *Shakespeareana*. The most important work on the Baconian side is N. P. Holman's *Authorship of Shakespeare* (3d ed., 2 vols., 1890; originally answered by J. Spalding's letter to the author, printed in the appendix, pp. 612-618); and on the other side Mrs. C. J. Stowe's *The Bacon-Shakespeare Question Answered* (2d ed., 1899). See also DOUGLASS, JONATHAN.

Shak'opee: city; capital of Scott co., Minn.; on the Minnesota river, and the Chi., Mil. and St. P. and the Chi., St. P., Minn. and Omaha railways; 28 miles W. S. W. of St. Paul (for location, see map of Minnesota, ref. 16-K); it is in an agricultural region, and contains a steam flour-mill, wagon-factory, railway repair-shop, orphan asylum, a national bank with capital of \$50,000, and two weekly newspapers. Pop. (1890) 2,041; (1898) 1,757.

Shale [from Germ. *schale*, *schale*, shell, dish, thin layer; cognate with O. Eng. *scella* > Eng. *shale*, bark pot (scaly oysters)]. The same Teutonic word coming via O. Fr. appears in Eng. as *scall*; a laminated argillaceous rock resulting from the induration of mud or clay stratified in water. A shale containing much organic matter, sand, or calcareous carbonate is characterized as bituminous, arenaceous, or calcareous. The shales are the most abundant of all stratified rocks, and are the most highly composite. From the mixed sediments washed down from the land by streams and deposited in the ocean, the larger grains are usually sorted out and separately deposited, giving rise to sandstones; the schists matter, chiefly calcareous carbonate, is also in the main separately deposited as limestone; and the remainder is deposited as mud, and eventually converted into shale. As these various rocks, being lifted into the land, are degraded by rain and streams, the sandstones and limestones, being relatively hard and constant, come to constitute mountains and hills, while the shales are eroded into valleys. Collectively the shales are of growing importance, being wrought for the manufacture of bricks, especially paving-bricks, and for mixture with other substances in the manufacture of hydraulic cement. G. K. G.

Shaler, NATHANIEL SOUTHGATE, S. D.; geologist; b. near Newport, Ky., Feb. 22, 1841; graduated at Lawrence Scientific School of Harvard University 1862; during the civil war served for two years in the Union army with Kentucky volunteers as an artillery and staff officer; returned to the Lawrence School as assistant and afterward instructor in zoology and geology; professor in Harvard University since 1868, at first of Paleontology, afterward of Zoology; dean of the Lawrence School since 1891; director of the Geological Survey of Kentucky 1878-80; geologist of the U. S. Geological Survey in charge of the Atlantic coast division since 1884; commissioner of the Commonwealth of Massachusetts for various periods on agricultural, topographic surveys, the gipsy-moth, and highways; president of the Geological Society of America 1895. Prof. Shaler is a prolific author and has entered many fields, but his favorite themes are those branches of geology and physical geography which bear most directly on the activities of man. Among his writings are the Kentucky Geological Reports and Memoirs (7 vols., 1876-82); *On the Nature of Intellectual Property and its Importance to the State* (1878); *Aspects of the North* (1880); *The Story of our Continent* (1882); *Nature and Man in North America* (1892); *The Interpretation of Nature* (1900); *Sea and Land* (1904); *The United States of America* (2 vols., 1904); and reports to the U. S. Geological Survey on *Marine Mollusks*, *Fresh-water Swamps*, *Soils*, *Harbors*, and the geology of Cape Ann, Martha's Vineyard, Nantucket, and Mt. Desert. G. K. G.

Shallot [from O. Fr. *schalote*, an altered form of *escallone*, whence Eng. *scallion*]; an onion-like plant (*Allium aceduleum*), native of the Old World, growing in cloves somewhat like the garlic. The cloves are set in the ground early, and become large enough for market two months before seedling onions are ripe. They much resemble onions in taste, and in the U. S. they are sold as such by market-gardeners. Both tops and bulbs are eaten.

Sha'manism [from Pers. and Hind. *shaman*, *shaman*, idolater]; the religion of a large number of primitive North Asiatic tribes, blended in Central Asia with Lamaism (q. v.). It has no idols, save perhaps some fetishes and charms and rude ancestral images. The Shaman is a combination of priest and wizard, who performs incantations and sacrifices, mainly for the two objects of procuring remedies and purifying houses of the defilement of the dead body. Although the

Supreme Being is good, yet so great are the power and desire of the king of the lower world to injure man that the principal worship conducted by the Shamans is intended to placate him. Hence the declaration that Shamanism is devil-worship. See Tylor's *Primitive Culture* (2 vols., 1871).

Sham'mai (shortened from Heb. *Shemáya*): one of the leaders of the Sanhedrin during the reign of Herod. He is always mentioned together with Hillel, from whom he is said to have differed greatly by his harshness of manner and his rigorous interpretation of the Law. The followers of these two teachers, who still existed in Jerome's days, preserved the traditions of their masters, though the freer interpretations of the Bêth Hillel prevailed over the more rigorous of the Bêth Shammai. Shammai is supposed to be identical with the *Saddas* (Josephus, *Ant.*, xiv., 9, 4) who alone dared to oppose Herod when he appeared before the Sanhedrin in 47 B. c., and who was spared by Herod on the taking of Jerusalem (*ib.*, xv., 1, 1). RICHARD GOTTHEIL.

Shamo, Desert of: See Gobi.

Shamokin: borough: Northumberland co., Pa.; on the Lehigh Val., the North, Cent., and the Phila. and Reading railways; 17 miles W. of Ashland, and 19 miles S. E. of Sunbury, the county-seat (for location, see map of Pennsylvania, ref. 4-G). It is in the center of the anthracite coal region; contains several foundries, machine-shops, and other manufacturing, 15 churches, 45 public-school buildings (1890-91), public-school property valued at over \$140,000, water-supply from Shamokin creek, and electric lights; and has a national bank with capital of \$100,000, a State bank with capital of \$50,000, a building and loan association, 3 daily and 4 weekly newspapers, an assessed valuation (1893) of \$1,004,020, and a total debt (1894) of \$59,000. Pop. (1880) 8,184; (1890) 14,403.

Shamrock [from Ir. *seamrog*: Gael. *seamrag*, trefoil, white clover]: the national badge of Ireland, as the thistle is that of Scotland. It is a plant with trifoliate leaves, which was used by St. Patrick to illustrate the doctrine of the Trinity. The plant now generally called by the name is a hop clover (*Trifolium minus*). The wood-sorrel (*Oxalis acetosella*), the common white clover, and the black medick or nonesuch (*Medicago lupulina*) have each been identified with the original shamrock.

Shanghai, or Shanghai, shaang'hi': a hien or district city of the province of Kiangsu, China, and the most important emporium of foreign trade in the empire; on the west or left bank of the Hwang-pu, near its junction with the Wu-sung river, and 12 miles above its embouchure into the estuary of the Yangtse-kiang; lat. 31° 14' 42" N., lon. 121° 28' 55" E. (see map of China, ref. 6-L). In shape it is an irregular oval, surrounded by a wall 3½ miles in circuit, and pierced with seven gates. Its principal native suburb lies between the east gate and the river, and opposite this is the anchorage for junks. Except in the foreign settlement, which lies outside the north gate and stretches N. and N. E. for 2 miles along the bank of the river, the streets, both within and without the walls, are narrow and dirty. The foreign settlement consists of three so-called "concessions," known as the French, the British, and the American concessions respectively. The first mentioned is a narrow strip bounded on the N. by a canal called the Yang-King-pang; thence for three-fifths of a mile to the Wu-sung river (or Soo-chow creek, as it is called by foreigners) stretches the British settlement (the first to be laid out). Beyond this lies Hon-Kew, called the "American" settlement by foreigners, because here the first U. S. consul took up his abode. In 1863 it was incorporated with the British for municipal purposes. The French settlement has its own municipal government. There is no restriction, however, as to the nationality of residents or land-renters in any of these concessions. So efficient has been the municipal management of both that Shanghai has earned the distinction of being the "Model Settlement" of the East. The streets are well made and well kept, and are lined with imposing buildings. Those parallel with the Yang-tse road, which runs along the river bank, and is known as *The Bund*, are named after Chinese provinces, while the cross streets are named after cities. Excellent roads constructed during the military occupation of Shanghai, when threatened by the Taipings, radiate from the settlement to the W. and S., and are much used for driving, while a complicated system of creeks and canals, connecting with the Grand Canal, makes communication with the interior both easy and inexpensive.

The western half of the Settlement is occupied almost entirely by Chinese, for whose benefit a Mixed Court has been provided. In all civil, criminal, and political matters the subjects and citizens of the different treaty powers are, as elsewhere in China, subject to the jurisdiction of their own consuls, except in the cases of Great Britain and Germany, which have provided special courts.

Shanghai was first opened to foreign residence and trade in 1843, in accordance with the treaty concluded at Nanking in the preceding year, though its importance as a commercial center had long been recognized. In 1893, according to the reports of the imperial maritime customs, the gross value of the trade of the port amounted to 177,017,836 taels or custom-house taels (= \$185,868,727 U. S. gold). This included imports of foreign goods amounting to 88,974,245 taels, imports of native produce of the gross value of 55,293,713 taels, and exports of native produce of local origin to the amount of 37,749,878 taels. The chief foreign imports are opium, cotton, and woolen goods, metals, coal, window-glass, indigo, machinery, matches, needles, sandalwood, kerosene oil, paper, sugar, soap, planks, seaweed, silk, skins, stores, and ebony and other woods. The countries from which most of the commodities were received are:

Great Britain.....	26,896,967 taels.
Hongkong.....	20,524,125 "
India.....	16,729,415 "
Japan.....	6,296,517 "
United States.....	5,193,534 "
Continental Europe, excluding Russia.	4,984,866 "

The articles of native produce exported to foreign countries include beans and bean-cake, chinaware, cloth, raw cotton, ground nuts, Chinese drills, hemp, medicines, oil, paper, rice, raw silk, rugs, straw-braid, sugar, tea, tobacco, wax, and wheat. The shipping statistics show that in the same year 2,822 steamers, aggregating 3,147,734 tons, and 343 sailing vessels (117,151 tons) entered port; and that 2,821 steamers (3,154,379 tons) and 331 sailing vessels (110,606 tons) cleared. The population of Shanghai is estimated at 400,000, of whom about 2,000 are foreigners. R. L.

Shan-hai-kwan [literally, mountain-sea-barrier]: a strongly fortified town of China, pleasantly situated on the shore of the Gulf of Peh-chih-li, at the eastern end of the Great Wall. It consists of three towns separated by strong walls and surrounded by one outer wall. The large inner city is the business center; the inclosure on the E. is occupied by official and soldiers, and that on the W. by tradespeople and soldiers. The place is said to be impregnable. It is a station on the Tientsin-Mukden Railway, complete for a few miles beyond Shan-hai-kwan.

Shannon: the largest river of Ireland. It rises in the county of Cavan at 256 feet above sea-level, flows first S. to Limerick, then W., and enters the Atlantic through an estuary 10 miles wide at its mouth. In its course, which is 254 miles in length, it forms several lakes, viz.: Loughs Allen, Boder, Bofin, Forbes, Ree, and Derg. Vessels of 1,000 tons burden can ascend to Limerick, and small steamers to Athlone. The river is canalized between Limerick and Killakee, and some distance below Athlone. The Inny, Brosna, Maigue, Mague, and Deel fall into the Shannon on the left, and the Suck and the Fergus on the right.

Shanny: a marine spiny-rayed fish of the genus *Pholis*, or a related genus, of the family *Pholididae*. The common shanny (*Pholis pholis*), found in shoals on the coasts of England and France, is usually about 5 inches long, and is remarkable for the habit of creeping, by means of its ventral fins, out of the water into the crevices of the rocks, and there remaining until the return of the tide. It has been known to live thirty hours out of salt water, but soon dies in fresh water. The American radiated shanny (*Eumesogrammus subbifurcatus*) is found, though rarely, on the coasts of Massachusetts and New York.

Shans: Burmese name for the most numerous of the races of Indo-China, extending from Assam to Kwangtung, and from Yunnan to the Gulf of Siam, though not occupying all this territory. They form the chief race of the Siamese, and are represented among the Miautze communities farther N. in Chinese territory. They probably migrated from the mountains of Sze-chuen, and appeared on the upper waters of the Irawadi about 2,000 years ago. Their languages are very similar, and they are remarkably homogeneous in appearance, manners, and customs, though much divided geographically and politically.

Shansi, *shan-shan* (an inland province of China) bounded N. by the northern part of the Great Wall, E. by Honan, S. by Honan and the Huang-ho or Yellow river, and W. by the Yellow river. Area, 56,228 sq. miles. The surface is mountainous and may be divided into seven great basins. It has no large rivers except the Huang-ho. The mineral resources of the province are great; coal is found everywhere; iron of superior quality abounds and is worked; copper has been found in over 100 localities; tin is found in 302 localities and in several other places; silver, near Tai-yuen and elsewhere, sulphur is plentiful, and hot springs are numerous. Quantities of salt are produced from the salt-lakes in the southern part of the province. The cities and villages are numerous and the people everywhere civil. The men of Shansi are the bankers and pawnbrokers of the country. Besides the usual cereals, cotton is grown in the south. Pop. about 13,000,000. Capital, Tai-yuen-fu.

Siam States, semi-independent states occupied by people of Shan race, in the northern part of the Indo-Chinese Peninsula, S. of China, between Burma and Tonquin, and N. of Laos. From the seventh or eighth century they have waged war with each other and with neighboring states with varying fortunes. In the thirteenth century they formed a federation of nine states under the name of Muang Man, and reached their highest development. Later the northern states were permanently subjected by China, and the southern by Siam. The most of the remainder were under nominal Burmese protection at the time of its conquest, and passed with Burma under British. These adjoining Tonquin are under nominal French protection, and a disputed central zone by agreement between France and Great Britain, is to be guaranteed independence as a "buffer" state between China, Siam, Burma, and Tonquin. See Hallett, *A Thousand Miles in the Siam States* (1900).

M. W. H.

Shantung, *shan-shang* [literally, east of the mountain which is Mt. Tai] a maritime province of China, which is the form of a mountainous promontory, juts out eastward into the Yellow Sea. It is bounded on the N. by the province of Chihli and the Gulf of Poh-shih-li, E. by the Yellow Sea, S. by Kiangsu, and W. by Honan and Chih-li. Area, 55,194 sq. miles. Pop. about 26,000,000. The surface is diversified, but consists in the main of a very fertile plain along the western, southwestern, and northern borders of the great central mass of mountains, which, with its numerous spurs and secondary ridges and their ramifications, occupies the rest of the province eastward. The general trend of the mountains is from N. E. to S. W., but several important ridges run E. and W. The highest peak is Tai-shan, which is over 4,100 feet. Next in point of grandeur and height come the Lao-shan, occupying a small peninsula on the south coast, lat. 36° 5' to 36° 30' N. and lon. 120° 15' to 120° 45' E., with peaks ranging from 2,500 to 3,500 feet; the Saw-tooth Mountains S. of Chafoo, 2,900 feet; and the Ji-shan Mountains S. W. of Chafoo, 2,065 feet. S. of Wei-hai-wei the highest elevation is 1,600 feet, while still farther to the E., near the city of Yang-ching, the highest is 1,000 feet. Mt. Tai, which, according to Chinese reckoning, is 15 miles high, is one of the five sacred mountains of China, and is much resorted to by pilgrims, for whose benefit paths have been made and steps cut in the rock clear up to the summit. The plain on the W. is traversed by the broad Huang-ho (to which many small but historic streams contribute their waters), and on the N. by the Yellow river, formerly called the Tsien. There are no other rivers of importance, and yet Shantung is well watered.

The coast is deeply indented with good harbors. The best on the north coast are Chafoo and Wei-hai-wei (pp. 45). On the southern side of the promontory there are Shih-tao, in lat. 36° 55' N. and lon. 122° 25' E., and Kin-Kia-Kow, near the important city of Kiao-chow, in lat. 36° 16' N. and lon. 120° 15' E. The waters which surround Shantung are rich in fish of all kinds and fishing is extensively carried on along the coast. The province is very fertile and produces wheat, barley, maize, millet, pulses, tobacco, hemp, and indigo; and numerous of many kinds are extensively produced. Very little rice is grown. Coal and iron abound, and are worked in several places, but extensively at Po-shan-tian, which is the "Black Country" of Shantung. Galena and copper have been found, and gold is obtained in considerable quantities from the sands of the rivers. Precious stones are found especially in the Lao-shan range; sulphur is obtained in several places, and there are many hot sulphur-springs which are resorted to for fever and skin diseases. The best known

are those of Ai-shan, 40 miles S. W. of Chafoo; Wai-shih-tung, 95 miles S. of Tung-chow-too, and Lung-chow-tung, a few miles S. of Wei-hai-wei. Other natural products are asbestos, sulphur, and insect wax. Cotton cloth of various kinds is woven; silk is produced, the best being in the plain lying W. of the mountain area, and silk-weaving is extensively carried on. The finest braided silk is made near Tientsin-fu, the capital, and the province is famous for its porcelains. Straw-plaiting also has attained considerable proportions.

Except in the swampy regions bordering on Kiangsu and Honan, the people are industrious, civil, and well behaved. Shantung is noted as containing the birthplaces of Confucius and Mencius.

R. L.

Shark [of uncertain origin: usually regarded as derived through O. Fr. from Lat. *carcarius*, a shark, from Gr. *καρχαρία*, deriv. of *καρχαριον*, having jagged teeth; but the word does not occur in O. Fr. or M. Eng.]; any fish-like vertebrate of a group (*Squali*) of placiosomous selachians distinguished from the *Rays* (rays and skates) by the gill-openings being at the sides of the body. The body also is elongated and more or less cylindrical, and tapers gradually into the tail. The jaws are homologous with the lower jaw and with the palatal arch of higher vertebrates. The teeth are generally markedly articulated with the jaws, and occur in several rows which are successively shed and renewed from behind forward. The outermost row generally is the only one functional, the rest being bent backward and downward. There are usually five gill-openings, though sometimes, as in the *Heteroschisma*, six or seven. The integument never has scales, but is often developed into enlarged papillae, which, when small and closely set, constitute diamond. The eggs of the oviparous species have a leathery investment as in rays, and in some of the viviparous species, as in certain species of *Galeus* and *Carcharias*, the embryo is attached to the uterus by a placenta.

Sharks are found in all seas, but are most abundant in those of warm regions, while some enter fresh water, and one species is confined to Lake Nicaragua. They are mostly carnivorous and predatory, but some, as the hasking shark and the whale-shark, have very small or weak teeth, and feed on small marine animals or are even herbivorous. Of the species that attack man the most formidable is the great white shark or man-eater, an *Isurus* (*Carcharodon carcharias*), sometimes about 40 feet long. The fossil teeth of the larger extinct *Carcharodon megalodon* are found in great numbers in Tertiary beds of the South Atlantic coast of the U. S., where they are quarried and exported for conversion into artificial manure. Other formidable species are *Galeus* or typical sharks, belonging to *Carcharias*, the largest genus and one abundantly represented in all warm seas, and *Heteroschisma*. The great blue shark (*Carcharias glaucus*) reaches the coast of both Europe and the U. S., and the tiger-shark (*Galeorhinus tigrinus*), common in the Indo-Pacific, also reaches the Atlantic coast of the U. S. The sharp-nosed shark (*Sphodon terra-notae*) is another *Galeus*, common on the southern Atlantic coast of the U. S. The voracious gray shark or sand-shark (*Carcharias taurus*), common on the Northern Atlantic coast of the U. S., is a wide-ranging species, about 6 feet long. The Greenland shark, nurse-shark, or sleeper is a squalid (*Somniosus microcephalus*), about 15 feet long, noted among whalers for its voracity. The hasking shark (*Cetorhinus maximus*), about 40 feet long, inhabits the open sea, and is named from its habit of floating on the surface in calm weather. Its liver yields from a ton to a ton and a half of oil. The whale-shark (*Rhinodon typicus*) exceeds a length of 50 feet. The *Heterodontidae* (p. 45), which are noted as being an archaic type, have broad flattened molar teeth arranged in oblique series, all functional at once and adapted for crushing mollusks and crustaceans. The tiger-shark, a gingivomorphid (*Stegostoma tigrinum*) of the Indian Ocean, attains a length of 15 feet, of which the blade-like tail makes one-half. The spiny shark (*Echinorhinus spinosus*) has its body studded with bony tubercles, each of which bears a thorn-like elevation. The existing saw-sharks, or *Heteroschisma*, are represented by teeth in the Jurassic. *Chlamydoselache angustius* of Japan has an eel-like body 6 feet long. Each of its teeth consists of a slender median cusp separated from the two lateral ones by a small projection. The *Pristiophoridae*, represented in Australian and Japanese seas, have the most produced into a saw as in the saw-fishes. The smaller littoral forms are known as dogfishes

and hounds. One of the commonest of these in the North Atlantic is *Squalus acanthias*, with a stout spine in each dorsal. Its liver is valued for its oil. The small-spotted dogfish (*Scylliorhinus canicula*) and the large-spotted (*S. calulus*) are found on the British coast.

The so-called false sharks are species of another group, HOLOCEPHALI (q. v.). Dr. Gill, in a revision of his *Arrangement of the Families of Fishes*, allocates the families to four orders: *Opistharthri*, including *Chlamydoselachidae* and *Hexanchidae* (*Notidanidae*); *Prosarthri*, the *Heterodontidae* (*Cestraciontidae*); *Tectospondyli*, the *Echinorhinidae*, *Oxynotidae*, *Squalidae*, and *Dalatiidae* (*Scymnidae*); and *Astrospondyli*, the remaining families.

See also ANGEL-FISH, DOGFISHES, FOX SHARK, and HAMMERHEAD. Revised by F. A. LUCAS.

Sharon: borough; Mercer co., Pa.; on the Shenango river, and the Erie, the Lake Shore and Mich. S., and the Penn. railways; 14 miles W. of Mercer, 41 miles S. S. W. of Meadville (for location, see map of Pennsylvania, ref. 8-A). It contains 2 national banks with combined capital of \$250,000, a private bank, 4 public schools, public-school library (founded in 1877), Hall Institute (Baptist, chartered in 1888), and a daily and 4 weekly newspapers. It is principally engaged in mining coal and manufacturing iron and steel, having large rolling-mills, blast-furnaces, foundries and machine-shops, and nail-factories. Pop. (1880) 5,684; (1890) 7,459.

EDITOR OF "TELEGRAPH."

Sharon Springs: village; Schoharie co., N. Y.; on the Del. and Hudson Railroad; 20 miles E. N. E. of Coopers-town, 59 miles W. by N. of Albany (for location, see map of New York, ref. 5-I). It is a popular summer resort in a narrow valley, 1,100 feet above sea-level, surrounded by high hills, and has four noted mineral springs—chalybeate, magnesia, white sulphur, and blue sulphur—which, with a spring of pure water, flow into a small stream below a wooded bluff W. of the village, after a descent of 65 feet over a ledge of perpendicular rocks. Pop., permanent (1880), 627; (1890) 622; summer residents and tourists exceed 10,000.

Sharp, GRANVILLE: abolitionist; b. at Durham, England, Nov. 10, 1734; studied law, and for several years was a clerk in the ordnance office; was the chief patron of the slave Somerset in suing for his freedom, which resulted in the famous decision against the legality of slavery in England (1772); resigned his post in the ordnance office on account of opposition to the American war Apr., 1777; devoted himself thenceforth to philanthropic objects, especially the overthrow of slavery and the slave-trade; was the first chairman of the Association for the Abolition of Negro Slavery in 1787; was the principal promoter of the colony of Sierra Leone; opposed the impressment of seamen; advocated parliamentary reform, and favored the claims of Ireland. D. in London, July 6, 1813. He was the author of sixty-one publications, chiefly pamphlets, in advocacy of the causes to which he devoted his life, philological tracts in favor of Trinitarianism, and millenarian interpretations of biblical prophecies. See his *Memoirs*, by Prince Hoare (1820) and by Charles Stuart (1836).

Sharp, JAMES, D. D.: archbishop; b. in the castle of Banff, Scotland, May 4, 1618; educated at the University of Aberdeen, where he figured among the students who declared against the Solemn League and Covenant 1638; became Professor of Philosophy at St. Leonard's College, St. Andrews 1643; minister of Crail, in Fifeshire, 1648; was the representative of the Presbyterians sent to Cromwell 1656, to Monk and to Charles II. 1660; was appointed king's chaplain for Scotland and Professor of Divinity in St. Mary's College, St. Andrews; consecrated Archbishop of St. Andrews and Primate of Scotland upon an Episcopalian foundation Dec., 1661; was regarded as a tool of Charles in the persecution of the Covenanters, and consequently assassinated by "a band of nine enthusiasts" on Magnus Muir, St. Andrews, May 3, 1679. Revised by S. M. JACKSON.

Sharp, JOHN, D. D.: archbishop; b. at Bradford, Yorkshire, England, Feb. 16, 1644; educated at Christ's College, Cambridge, on leaving which he became chaplain to Sir Heneage Finch, then attorney-general, through whom he obtained the archdeaconry of Berkshire 1672; a prebend at Norwich 1675; the rectorship of St. Bartholomew, London,

1676; of St. Giles-in-the-Fields 1677; and the deanery of Norwich 1681. He became chaplain to Charles II. and James II., by whom he was deprived of his preferments for preaching against his policy 1686. On the accession of William and Mary he became dean of Canterbury 1689, and Archbishop of York 1691. D. at Bath, Feb. 2, 1714. Seven volumes of his *Sermons* were published in 1706.

Sharpe, SAMUEL: Egyptologist; b. in London, Mar. 8, 1799. Though a London banker, he was best known on account of his accomplishments in the study of the Oriental languages, Hebrew, Coptic, and the Egyptian hieroglyphics. He was also a careful writer on historical subjects connected with his linguistic studies. Of his numerous works, the following are the most notable: *The Holy Bible Translated, being a Revision of the Authorized English Version* (1840); *The New Testament, Translated from Griesbach's Text* (1840; 5th ed. 1862); *History of the Hebrew Nation and its Literature* (1869; 4th ed. 1882); *Texts from the Holy Bible Explained by the Help of the Ancient Monuments* (1866; 2d. ed. 1869); *Hebrew Scriptures Translated* (3 vols., 1865); *The Chronology of the Bible* (1868); *Short Hebrew Grammar* (1877); *Inquiry into the Age of the Moabite Stone* (1879); *The Epistle of Barnabas* (1880); *History of Egypt from the Earliest Times till the Conquest by the Arabians A. D. 640* (1846; 6th ed. 2 vols., 1876; this work combines three previous publications in what was their second edition in revised form, viz.: *Early History of Egypt*, 1838; *Egypt under the Ptolemies*, 1838; and *Egypt under the Romans*, 1842); *Alexandrian Chronology* (1857); *Egyptian Mythology and Egyptian Christianity* (1863); *Egyptian Inscriptions from the British Museum* (several series, 1837-56); *Vocabulary of Egyptian Hieroglyphics* (1837); *The Triple Mummy-case of Aroeri-ao* (1858); *Egyptian Hieroglyphics: being an attempt to Explain their Nature, Origin, and Meaning* (1861); *Egyptian Antiquities in the British Museum Described* (1862); *The Decree of Canopus* (1869); *The Rosetta Stone* (1871); and *Hebrew Inscriptions from the Valleys between Egypt and Mt. Sinai* (2 parts, 1875-76). D. in London, July 28, 1881. A biography appeared in 1883, written by P. W. Claydon. CHARLES R. GILLETT.

Sharpsburg: borough; Allegheny co., Pa.; on the Allegheny river, and the Penn. and the Pitts. and West. railways; 5 miles N. E. of Pittsburg (for location, see map of Pennsylvania, ref. 5-B). It is in a coal-mining region, and contains rolling-mills, blast-furnaces, foundries, a State bank with capital of \$50,000, and two weekly newspapers. Pop. (1880) 3,466; (1890) 4,898.

Sharpsburg: a village in Washington co., Maryland; lying between the Antietam and Potomac rivers (see map of Maryland, ref. 2-D). It was the scene of the battle of Antietam Sept. 17, 1862. Pop. (1890) 1,163. See ANTIETAM.

Sharpsville: borough (organized in 1874); Mercer co., Pa.; on the Shenango river, and the Erie, the Penn., and the Sharpsville railways; 3 miles N. E. of Sharon, 11 miles S. S. W. of Greenville (for location, see map of Pennsylvania, ref. 8-A). It is in a coal-mining region, is engaged in the manufacture of pig iron, and contains 7 churches, 2 public-school buildings, a private bank, and a weekly newspaper. Pop. (1880) 1,824; (1890) 2,330; (1895) estimated, 3,000.

Shashanq: See SHISHAK.

Shasta, Mount: See ROCKY MOUNTAINS.

Shas'tra [from Sanskr. *śāstra*, order, command, sacred book, deriv. of *śās*-, order, instruct, govern]: a name applied to the authoritative books of the Hindus upon religion and civil and religious law. The principal works of this class are collectively called *Dharma-śāstra*, or "Law Shashtra."

Shatt-el-Arab: See EUPHRATES.

Shaw, ALBERT, Ph. D.: journalist and author; b. at New London, O., July 23, 1857; graduated in 1879 at Iowa College, Grinnell, Ia.; became a journalist in Iowa; also studied at Johns Hopkins University; in 1883 became connected with the Minneapolis *Daily Tribune* as an editorial writer, but completed his work at Johns Hopkins, and received from that institution in 1884 the degree of Ph. D.; returned to Minneapolis and became chief of the editorial staff of the *Tribune*, which position he held until 1891, with the exception of a year and a half (1888-89) in Europe, which was devoted largely to the study of municipal government. He declined professorships in several colleges, and in 1890 became the founder and editor of the American edition of

The House of Commons, the first number of which appeared in 1860. He has been at Johns Hopkins University and American Shaw University. Among his works are *Co-education in Western City* (Baltimore, 1890) and *Teachings of Study of Co-educational History* (New York, 1894). He edited *National Resources* (Chicago, 1899), and has been a contributor to the *Contemporary Magazine*, the *Contemporary Literature*, and other periodicals, but has become more widely known outside of his editorial work by the articles in *The Century Magazine* upon the government of the principal European cities. An outcome of these is *Municipal Government in Great Britain* (New York, 1902).

C. B. THOMAS.

Shaw, Thomas; naturalist; b. at Horton, Buckinghamshire, England, Dec. 10, 1751; graduated at Oxford 1769; was ordained in the Church of England 1774; studied medicine at Edinburgh and Oxford, taking the degree of M. D. (1781), after which he resided in London as a scientific lecturer; was one of the original members and the first vice-president of the Linnean Society; became librarian and assistant keeper of natural history at the British Museum 1790, and principal keeper 1807. D. in London, July 22, 1813. He was the author of *The Naturalist's Library* (24 vols., 1790-1813); *Botany of New Holland* (1794); *General Zoology, or Systematic Natural History* (11 vols., 1800-10); *Botanical Lectures at the Royal Institution* (2 vols., 1800).

Shaw, Henry WHEELER; humorist; b. at Lanesborough, Mass., Apr. 21, 1819; entered Hamilton College about 1837, but did not remain long; resided for twenty-five years in various parts of the Western States, where he was successful farmer and auctioneer; settled at Poughkeepsie, N. Y., in the latter capacity about 1858; began to write humorous sketches for the newspapers over the signature *Sam Hillings* 1861; became popular as a writer and as a lecturer; published several volumes of humorous sketches, and issued an annual *Illustrator*, which had a wide circulation. His *Complete Works* were published in a single volume 1877. D. at Montross, Cal., Oct. 14, 1885.

Shaw, Lemuel, LL. D.; jurist; b. at Barnstable, Mass., Jan. 9, 1781; graduated at Harvard 1800; became assistant editor of the *Boston Gazette*; studied law, and was admitted to the bar in New Hampshire Sept., 1804; sat in the Legislature 1810-16 and in 1810, and in the State Constitutional Convention 1820; was State Senator 1821-22 and 1828-29; sat on the justice of the Massachusetts Supreme Court from Jan. 31, 1830 (previous to which he had held no judicial office), to Aug., 1860. His reported decisions form a large part of more than fifty volumes, and his judicial reputation in Massachusetts was second only to that of Theophilus Parsons. The city charter of Boston was drafted by him in 1822. He was a member of the American Academy, of the Massachusetts Historical Society, and for twenty-seven years one of the corporation of Harvard College. He published a few orations, addresses, and judicial charges, the most important being his charge to the jury in the celebrated trial of John White Webster, who was convicted of the murder of Dr. George Parkman (1850). D. in Boston, Mar. 30, 1861.

Revised by F. STUBBS'S ALLEN.

Shaw, Thomas; professor of agriculture; b. at Niagara-on-the-Lake, Ontario, Canada, Jan. 8, 1843; educated in public schools; made farming his profession; also taught more than ten years; edited *The Canadian Live Stock and Farm Journal* 1861-85; Professor of Agriculture at Ontario Agricultural College 1888-91; became Professor of Animal Husbandry at Minnesota agricultural experiment station Dec., 1893. He has published *The First Principles of Agriculture* (1899) and *Woods and how to Exploit them* (1901).

Shawano; city, capital of Shawano co., Wis.; on the left river at the head of navigation, and the Chi. and N. W. Railway 36 miles W. N. W. of Green Bay City, 25 miles N. of Oshkosh (for location, see map of Wisconsin, at 1-6). It is in an agricultural and lumbering region, and contains a State bank with capital of \$50,000 and three weekly newspapers. Pop. (1890) 890; (1898) 1,505.

Shawano Indians: See ALGONQUIAN INDIANS.

Shawl; Fr. *shawl*; Germ. *schawl*; Arab. and Hind. *shawl*; Pers. *shawl*; Hind. *shawl*; a kind of loose garment worn on the shoulders or around the waist, manufactured from different nations of different materials, as the Kashmir shawl of goat's hair, the Chinese of silk, the barge of wool, etc., and in different patterns, as the palm pattern of

India, the plaid pattern of Scotland, etc. The most celebrated kind is the Kashmir shawl, famous over the whole world as early as the sixteenth century. Its manufacture was then under the supervision of the Government, and each shawl which issued from the looms received a separate description in the royal registers. The manufacture is still flourishing in Kashmir, though it is imitated extensively in France, Germany, and Great Britain. In Europe shawls are mostly made of wool, of cotton, or of mixed cotton and silk.

Shaw-Lefevre, Le-fer', GEORGE JOHN, M. P.; statesman; b. in 1822; son of Sir John George Shaw-Lefevre, of Mapperly Hall, Nottingham, England; educated at Eton and Cambridge; called to the bar 1856; entered Parliament as a Liberal and retained his seat to 1885; returned as a Gladstonian Liberal in 1886; civil lord of the admiralty May-July, 1890; secretary to the Board of Trade 1906-7; secretary to the admiralty 1871-Feb., 1874, and again Apr.-Nov., 1890; first commissioner of works 1880; succeeded Mr. Fawcett as Postmaster-General Nov., 1884; first commissioner of works again in 1892. He is the author of several statistical works, mainly on the English and Irish land questions.

Shawnee; village; Perry co., O.; on the Balt. and Ohio and the Col., Sandusky and Hoeking railways; 48 miles S. by E. of Newark (for location, see map of Ohio, at 9-41). It is in an agricultural and coal-mining region, has several iron-foundries, sawmills and planing-mills, a private bank and two weekly papers. Pop. (1880) 2,770; (1900) 3,200.

Shawnee or Shawano Indians: See ALGONQUIAN INDIANS.

Shawneetown; city; capital of Gallatin co., Ill.; on the Ohio river, and the Balt. and O. S. W. and the Louis. and Nashv. railways; 192 miles S. E. of Springfield (for location, see map of Illinois, at 11-17). It is in a coal-mining and lead region, is a shipping-point for coal and farm products, has pork-packing and manufacturing interests, and contains a national bank with capital of \$50,000, a private bank, and two weekly newspapers. Pop. (1880) 1,531; (1890) estimated, 2,100.

Barren of "8 cves."

Shays, DANIEL; insurgent; b. at Hopkinton, Mass., in 1747; attained the rank of captain during the war of independence, after which he resided at Pelham (now Prescott); took part in an insurrectionary movement in Western Massachusetts directed against the State government 1786, and, though not at first a leader, became ultimately so prominent that the movement is generally known as "Shays's rebellion," the pretext of which were the high salary paid the Governor, the aristocratic character of the Senate, the exorbitance of lawyers, and the pressure of taxation—grievances which were to be met by the removal of the general court from Boston and the issue of paper-money. In Dec., 1795, he led a considerable force of insurgents to Springfield to capture the arsenal (Jan., 1797), but was repulsed by the militia under Gen. William Shepard (Feb. 4, 1797). His forces were surprised and completely dispersed by Gen. Lincoln, and Shays fled to New Hampshire; was pardoned in June, 1798, by the Massachusetts Legislature, and removed to Sparta, Livingston co., N. Y., where he received a pension for his Revolutionary services, and survived until Sept. 29, 1825. See Minot's *History of the Insurrection* (Boston, 1810) and Holland's *History of Western Massachusetts* (Springfield, 1859).

Shea, JOHN DAWSON GILMERY, LL. D.; historian; b. in New York, July 22, 1824; educated at the grammar school of Columbia College; studied law, and was admitted to the bar, but devoted himself to literature, and rendered great service in illustrating the obscure early annals of French colonization and Jesuit missions. He published *The Discovery and Exploration of the Mississippi Valley* (New York, 1823); *History of the Catholic Missions among the Indian Tribes of the United States* (1854); *The Catholic Authors of America* (1858); *Early Voyages up and down the Mississippi* (Albany, 1862); *Novum Belgicum, an Account of New Netherlands in 1614-44* (New York, 1862); *The Operations of the French Fleet under Comte de Ulloa* (1864); translated, with extensive notes, Charlevoix's *History and General Description of New France* (6 vols. 8vo., 1800-72); edited from the MSS. the *Cronique annales of Memoirs and Relations concerning the French Colonies in North America*, embracing documents on the early history of Canada and Louisiana (24 vols., 1857-68); also *the Maryland* (1869); published *Library of American Linguistics*,

fifteen volumes of grammars and dictionaries of Indian languages (1860-74); edited *The Historical Magazine* (1859-65); and published *The Catholic Church in Colonial Days* (1883); *The Hierarchy of the Catholic Church in the United States* (1886); *Life and Times of Archbishop Carroll* (1888); and three of five projected volumes on *The History of the Catholic Church in the United States*. D. at Elizabeth, N. J., Feb. 22, 1892. Revised by G. J. HAGAR.

Sheaffe, Sir ROGER HALE: soldier; b. in Boston, Mass., July 15, 1763; obtained a commission in the British army, 1778, through Earl Percy, whose headquarters had been at his mother's house in Boston three years before; served in Holland 1799, and in the expedition to the Baltic 1801; served in Canada 1802-11, and again 1812-13; had risen to the rank of major-general in 1811; took command of the British forces at the battle of Queenstown, after the death of Gen. Brock, and succeeded in inflicting a serious defeat upon the American invaders, for which service he was made a baronet Jan. 16, 1818; defended York (now Toronto) against the attack of Apr., 1813; became full general in 1823, and colonel of the Thirty-sixth Regiment in 1829. D. in Edinburgh, July 17, 1851.

Shearman, THOMAS GASKELL: lawyer and writer on economic subjects; b. in Birmingham, England, Nov. 25, 1834. His parents removed to New York when he was nine years of age; he was educated privately; was admitted to the bar in 1859; has practiced law for many years in New York and Brooklyn; was counsel for Henry Ward Beecher in his trials; Republican in politics from 1856-80; since 1880 has devoted most of his time, outside of business, to the propagation of free-trade ideas, always declining public office; joint author of *Law of Practice and Pleadings* (1861-65); *Law of Negligence* (four editions, 1870-88); and author of *Talks on Free Trade* (1881); *Does Protection Protect?* (1883); *Pauper Labor of Europe* (1885); *Distribution of Wealth* (1887); *The Single Tax* (1887); *Henry George's Mistake* (1889); *Who Own the United States?* (1889); *Crooked Taxation* (1890); *Natural Taxation* (1891).

Shearwater: any one of several birds of the genus *Puffinus*, and the family *Procellariidae*. The greater shearwater (*Puffinus major*) is from 18 to 20 inches in length, and the Manx shearwater (*P. anglorum*) about 15. They are often seen hundreds of miles from land. The majority are brown or cinereous above and white below; but the sooty shearwater (*P. fuliginosus*) is an almost uniform sooty brown; the tail is rather long and rounded; the feet large; the tarsus shorter than the middle digit; the nasal tubes are short, flat, and obliquely truncated, instead of being pronounced, as in the true petrels. See *PROCELLARIIDÆ*.

Revised by F. A. LUCAS.

Sheathbill: any bird of the family *Chionididae*. Only two species are known, and both are inhabitants of the southern hemisphere—one, *Chionis alba*, being native to the Falkland islands, etc., and the other, *Chionis* or *Chionarchus minor*, peculiar to Kerguelen's island. Much difference of opinion has prevailed among naturalists respecting the relations of these birds to others in the class, some having regarded them as waders (*Grallæ*), others as swimmers (*Longipennes*), and others still as gallinaceous forms. They are now generally placed with the waders, near the peculiar plover-like *Glareola*, but they also have undoubted affinities with the gulls. In their economy and habits they strongly resemble pigeons and fowl; according to Kidder, who studied the species of Kerguelen's island in life, the "observer is first struck by the strong resemblance which *Chionis* bears to the pigeons in general appearance, gait, and mode of flight. The general shape of the body is of an ordinary columbine character, the head being notably small, as usual in that group, the neck short and full, and the body plump; the tail, moreover, having but twelve rectrices." "The feet, in almost every particular, are thoroughly gallinaceous, even to the character of the marginal fringe of the toes." In color, however, they recall rather the characteristics of the gulls than of either gallinaceous or columbine forms. "On the other hand, the bird's omnivorous diet, habits under confinement, easy domestication, dislike of water, entire inability to swim, and many other points in its habits are strongly gallinaceous characteristics, by so much removing it from the vicinity of either grallatorial or natatorial birds." Nevertheless, the indications furnished by the skeleton outweigh all such superficial correspondences, and conclusively prove that the birds in question are derivatives from gull-like (and therefore primarily natatorial) types, but modified for terres-

trial life. They are omnivorous in diet, feeding upon vegetable substances (seaweeds, etc.), molluscs, and eggs. *Chionis alba* has a total length of 17 inches or more, and *C. minor* about 14 or 15 inches. They are called white paddy by whalers.

Revised by F. A. LUCAS.

Sheathing: a covering for a ship's bottom, made of sheet copper, and first introduced about 1800. It not only serves to protect wooden ships from boring-shrimps, teredos, and other small destructive animals, but to a great extent it prevents the fouling of the bottom by seaweeds and barnacles.

Sheba, or Saba [from Heb. *Shōbā*, or *Shebhā*: cf. *shebhā*, seven]: the name of three persons in the Old Testament: (1) A great-grandson of Ham (Gen. x. 7), who appears to have settled somewhere on or near the shores of the Persian Gulf. (2) The tenth of the thirteen sons of Joktan (Gen. x. 28), who settled in Southern Arabia, and gave his name to the kingdom of the Sabæans, whose queen visited Solomon in Jerusalem (1 Kings x. 1-13). (3) A grandson of Abraham and Keturah (Gen. xxv. 1-3), whose descendants were nomads, in close connection with the descendants of the Hamitic Sheba mentioned above. The same name in a slightly different form occurs in the Old Testament as that (4) of the Benjamite who revolted against David, was defeated by Joab, and beheaded by the people of Abel-Beth-maachah, where he had taken refuge; (5) of a Gadite (Chron. v. 18); and (6) of a town in Simeon.

Revised by S. M. JACKSON.

Sheboygan: city (settled in 1836, chartered as a village in 1846, incorporated as a city in 1853); capital of Sheboygan co., Wis.; on Lake Michigan, at the mouth of the Sheboygan river, and on the Chi. and N. W. Railway; 52 miles N. of Milwaukee, and 137 miles N. of Chicago (for location, see map of Wisconsin, ref. 6-F). It has an excellent harbor and a large lake commerce, particularly in lumber, coal, and tan bark. A line of steamers connects the city with Milwaukee, Chicago, and other points on the lake, and the railway and its branches make the city the trade-center of a large and rich agricultural region. There are two public parks, one of which, Fountain, contains an artesian well, whose waters are strongly impregnated with mineral salts and form an important article of commerce. The city is lighted by gas and electricity, derives its supply of water from the lake, is well sewered, and has an efficient street-railway service. Among the public institutions are 15 churches, high, grammar, intermediate, and primary schools, kindergartens, Roman Catholic and Lutheran parochial schools, Day School for the Deaf, hospital, insane asylum, and Home for the Friendless. In connection with the public schools is a library of 3,000 volumes. There are 2 State banks with combined capital of \$300,000, and 3 daily and 7 weekly newspapers. The assessed valuations in 1892 aggregated \$5,415,980. Sheboygan is particularly noted for the manufacture of chairs and other furniture. There are 5 chair-factories, which employ about 2,000 persons and turn out 7,000 chairs per day. About 40,000 feet of lumber are used daily in the manufacture of furniture. The various manufacturing industries employ about 5,500 persons, who receive in wages about \$225,000 per month. Other important establishments are 2 manufactories of enameled ware, 2 boot and shoe factories, 3 foundries and machine-shops, 2 tanneries, 2 carriage-factories, 2 breweries, and manufactories of toys, office and hotel furniture and fixtures, venetian folding-beds, venetian-blinds, wire-mattresses, and excelsior bottle-wrappers. There are also dry docks, brick-yards, lime-kilns, a ship-yard, and 5 large cheese-warehouses. Pop. (1880) 7,314; (1890) 16,359; (1894) 21,018. J. E. RIORDAN.

Shechem: See *NABLUS*.

Shechl'nah [from Late Heb. *shekhināh*, dwelling, presence, deriv. of *shākhan*, dwell]: a name which first appears in the Jerusalem Targum to designate the Divine Presence wherever it exists in a special manner, but more particularly as manifested in the holy of holies within the ancient sanctuary of Israel.

Shedd, WILLIAM GREENOUGH THAYER, D. D., LL. D.: theologian; son of a clergyman; b. at Acton, Mass., June 26, 1820; graduated at University of Vermont in 1839, and at Andover Theological Seminary in 1843; was pastor of the Congregational church in Brandon, Vt., 1844-45; Professor of English Literature in the University of Vermont 1845-52; Professor of Sacred Rhetoric and Pastoral Theology at Auburn Theological Seminary 1852-53; Professor of Ecclesiastical History and lecturer on pastoral theology in And-

see Theological Seminary 1823-44; pastor of the Irish church (Presbyterian), New York, 1842-53, and Professor of Biblical Literature in Union Theological Seminary, New York, 1853-74, when he was transferred to the chair of systematic Theology in the same institution, which office he held until 1880. D. in New York, Nov. 6, 1894. Besides writing the *Works of Coverdale* (7 vols., 1869) and the *Commentary of Augustine* (1869), he published *Outline of a System of Rhetoric*, from the German of Thorenin (1860); *Lectures upon the Philosophy of History* (1859); *Discourses and Sermons* (1859); *Quaker's Church History* (2 vols., 1857, 1859); *A History of Christian Doctrine* (3 vols., 1863); *Homiletics and Pastoral Theology* (1867); *Sermons to the Natural Man* (1871); *Theological Essays* (1875); *Literary Essays* (1878); *Commentary on St. Paul's Epistle to the Romans* (1879); *Sermons to the Spiritual Man* (1884); *Biblical Preaching* (1886); a treatise on *Dequatic Theology* (2 vols., 1890-94); and *The Proposed Revision of the Westminster Standards* (1890).

Revised by G. P. Foster.

Shediac, town of Westmorland County, New Brunswick, on the Point du Chêne branch of the Intercolonial Railway, 104 miles from St. John, and on the border of an estuary of Northumberland Strait (for location, see map of Quebec, etc., ref. 3-1). It is celebrated for its oysters. Pop. 5,370.

M. W. H.

Shree, Sir Masters Acharya, D. C. L.; painter and author; b. in Dublin, Ireland, Dec. 23, 1779; studied painting at the school of the Royal Dublin Society; was introduced in 1798 by Edmund Burke to Sir Joshua Reynolds, under whose patronage he entered as a pupil in the Royal Academy; became an exhibitor in the following year; was elected an associate of the academy 1799 and a member 1806, and was elected successor to Lawrence as president of that institution in 1820, on which occasion he was knighted. He was especially successful in portrait-painting, and in a long career preserved the likenesses of many illustrious men. He retained the presidency of the academy through life; was an effective orator on public occasions; published *Rhythm as Art*, *Almanac*, a *Tragedy*, and a novel. D. at Brighton, Aug. 19, 1860. See the *Life* by his son (2 vols., London, 1860).

Shrews: see *SHREW* (p. 7).

Sheep [M. *ovis*, *sheep* = O. Eng. *scēp*, *scēap*; O. H. Germ. *schaf*; Mod. Germ. *schaf*; Teuton. *schēp*; cf. Sanskr. *śhāga*, goat (6)] animals constituting the genus *Ovis*, although some writers claim that they form a group of genera. They are hoofed, horned ruminants, and belong to the artiodactyl, or pair-toed, section of the ungulate, or hoofed, mammals. In nearly all the wild breeds horns are present in both sexes, but in many of the domestic breeds they are entirely absent. The tail is usually short, though in some of the domestic breeds it is unusually developed. Sheep are further distinguished by a covering of wool, which varies in length, color, and strength and fineness of fiber, with variations under different climates and other conditions.

Geographically, the wild breeds are or were distributed over some of the islands of the Mediterranean, in Europe, the greater portion of the temperate highlands of Asia, nearly the whole of the Rocky Mountain ranges of a certain altitude in North America, and throughout some of the upland regions of the Andes in South America. More than twenty different species have been described. Of these, *O. montanus* is the bighorn or Rocky Mountain sheep.

The origin of many of the breeds of sheep under domestication can not be traced with certainty. Some suppose that the originals from which these springs are descendants of the ancestors of Chinese or the apes of Asia. They are to be found wherever there is a settled agriculture, but are best adapted to the temperate zones. In North America they are reared only for their meat and wool, but in some countries they are also kept for their milk.

North American Breeds.—The recognized breeds in North America are all of European origin. They are enumerated as follows:

Southwestern breeds: Merino, and subvarieties of the Merino, of which there are several.

Eastern breeds: Southdown, Dorset Horn, Suffolk, Hampshire, Hampshire Down, Oxford Down, Cheviot.

Western breeds: Leicester, Lincoln, Cotswold, Blackhead Highland.

The above classification is based on variations in the character of the wool, which, in going down the list, gradually becomes less coarseness; but there is a slight difference of

opinion as to the order in which some of the breeds should stand, as in a few instances the character of the wool found on different parts of the body varies in some of the breeds, and in other instances it also differs materially in certain families and subfamilies of the same breed.

Care of Sheep.—Adaptation should be carefully considered. The various wild species never frequent swamps, exposed plains, or dense forests from above. In the management of sheep under domestication these preferences should always receive recognition. The smaller the breed the higher and more rugged may the pasture be, and the larger the breed the richer and more level should they be. The pastures in summer, and also the felder in winter, should be characterized by variety and fineness of herbage, and where practicable the sheep should be frequently changed from one pasture to another. Sheep kept for breeding uses should be given the largest liberty practicable both winter and summer, but where these are being fattened they will bear close confinement for a time under outside conditions. Except at the lambing season, they only require to be protected from storms, as they are not much injured by low temperatures. In circumstances of pasture, and with the large or breeds, the flocks should be small, summer and winter, but with the smaller breeds, and ample foraging-grounds, they may run up even into the thousands. Where sheds are necessary in winter, it is imperative that they should be built on ground dry naturally, or made so, and the aim should be to admit plenty of morning and forenoon sunlight. They should be entirely free from draughts, and should be divided by feeding-racks, or otherwise into small compartments. Each compartment requires a close leading into an enclosed yard. These doors should be low and wide to prevent crowding, and should be kept open day and night except in time of storms. It is also important that the yards be kept dry by littering or otherwise.

In winter it is not necessary to cut the felder or to grind the grain for sheep. After going into winter quarters, breeding ewes require only a moderately generous diet until the lambing season. A variety of fodders, a small quantity of roots or corn ensilage, and sometimes a little grain, preferably oats, will be found very suitable. But as soon as the lambs are a few days old their dams require most liberal feeding, until they are put upon pastures excellent and abundant. The food factors which are best adapted to produce an abundant flow of milk should predominate, such as early-cut and well-cured grasses, roots or corn ensilage, and oats and bran. Ensilage in the dams may be prevented by adding such foods as corn or peas, and alfalfa. The lambs also should be given early and continued access to free supplies of grain, fed at first in the ground form, and in a place inaccessible to the dams. Docking should receive attention within a few days of birth, and castration in a few weeks. When pastures are fresh and abundant, sheep or lambs do not usually require any grain until the latter are weaned. This period arrives when they are from four to five months old. As soon as weaned the lambs should get a grain supplement to build up the frame or to fatten it, according to the object sought. Sheep and lambs thrive much better when plentifully supplied with salt and pure water, at all seasons.

For autumn fattening the Dwarf Essex rape is very suitable where it can be profitably grown. Sheep and lambs will fatten quickly when pastured upon it, and without any supplement of grain. Young clover, mixed grasses, and rye are also suitable, but grain is required in addition. In winter fattening the ration may be the same in kind as that already mentioned as being suitable for breeding ewes after the lambing season, but with the difference that more, relatively, of the concentrated foods, such as corn, peas, or alfalfa, should be given. Lambs of the mutton breeds, which average about 160 lb. live weight, will usually gain from 6 to 10 lb. per month in winter, while being fattened on a daily ration of 14 to 2 lb. hay, 4 lb. corn ensilage or 24 lb. roots, and 14 to 14 lb. grain.

In breeding sheep for the block females of mixed blood, though variously bred, will be found suitable. To cross upon these, rams should be chosen successively from the same pure breed, rather than from breeds alien in blood. In choosing them adaptation in size, form, feeding, and mutton qualities, and the needs of the market should be considered. It is pretty generally conceded that stimulating feed to rams and ewes at the mating season tends to increase the number of the lambs, and also to shorten the duration of the lambing period. Early maturity is much

sought for in all the mutton breeds. Medium-sized lambs of quick development, compact build, and good quality stand high in favor in the markets, and they can be raised at a minimum of cost. It is generally considered more profitable to dispose of them before they pass the age of one year.

THOMAS SHAW.

Sheepshead: a well-known fish (*Archosargus probatocephalus*) of the family *Sparidae*, found along the Atlantic coast of the U. S. south of Cape Cod, but most abundant in the warmer waters. The name is given in allusion to a fancied resemblance of the head to that of a sheep, produced by the form and color as well as the cutting teeth of the jaws. The body is deep and robust with the back arched; the dorsal fin has twelve spines and eleven rays, and is preceded by a recumbent spine; the anal fin has three spines and ten rays; the color is gray, with about seven blackish bands; the front teeth are broad and incisor-like, the lateral teeth molars, and in several rows. The sheepshead sometimes exceeds 2 feet in length, although averaging less. It is one of the most esteemed fishes found in American waters, and on account of the delicacy of its flesh has been likened to the English turbot. It is also highly regarded as a game-fish. It feeds chiefly on molluscs and crustaceans, and its molar teeth and stout jaws are eminently adapted for breaking shells. The fresh-water drum (*Haplodinotus grunniens*) is among the fishes loosely called sheepshead in the U. S.

Sheep-tick: a wingless parasitic insect (*Melophagus ovinus*) of the order *Diptera* and family *Hippoboscidae*, often extremely annoying to sheep. There are various arsenical washes which will destroy them; a solution of carbolic acid is also recommended for the purpose.

Sheeraz: See SHIRAZ.

Sheerness: a strongly fortified seaport in Kent, England; on the right bank of the Medway, at its junction with the Thames; 52 miles by rail E. of London (see map of England, ref. 12-L). The harbor is safe and commodious, and, being almost at the mouth of the Thames estuary, is often crowded with vessels. The Government dockyard, with wet and dry docks, storehouses, etc., covers 60 acres. The principal trade is due to the oyster-fisheries. Sheerness is also a favorite summer resort. Pop. (1891) 13,841.

Sheffield: town; in the West Riding of Yorkshire, England; at the junction of the Sheaf and the Don; 41 miles E. of Manchester and 165 miles N. N. W. of London (see map of England, ref. 7-H). It is situated at the foot and on the slopes of a range of hills, and is generally well built, a street-improvement scheme having been carried out after 1875. Noticeable among its public buildings are the parish church of St. Peter, erected in the reign of Henry I.; St. Mary's Roman Catholic church (1850); the Cutlers' Hall, the Albert Hall, the new market-hall (1851), and the new town-hall, crowned with a statue of Vulcan. Among educational institutions are the Firth College (1879), with thirteen professors or lecturers, the Technical School, the Wesley College, and the Free Grammar School. The St. George's Museum, founded by Ruskin in 1890, contains a collection of engravings, minerals, etc., and the Mappin Art Gallery has a fine collection of pictures. There are several public parks and extensive botanical gardens. The cutlery business of Sheffield dates from very early times. The Sheffield whittle of Chaucer was the common knife used by those whose social rank did not permit them to carry a sword. The Cutlers' Company was founded in 1624, but Sheffield was of little importance up to the middle of the eighteenth century. Sheffield Castle, rebuilt in 1270, was the place of imprisonment of Mary Queen of Scots (1572-86). It was taken by the parliamentary army in 1644, and shortly afterward was demolished. Sheffield is the center in England of the manufacture of knives, files, saws, carriage-springs, boilers, stoves, grates, buttons, and all kinds of agricultural, mechanical, medical, and optical instruments. Silver-plating and britannia metal were both invented here, and have given rise to a comprehensive manufacturing industry. Since 1871 rails, railway-springs, tires, steel blocks for naval and military artillery, and armor-plates have been largely manufactured. Sheffield returns five members to Parliament. Pop. (1894), 338,316.

R. A. ROBERTS.

Sheffield: city (founded in 1884); Colbert co., Ala.; on the Tennessee river, and the Birm., Shef. and Tenn. Riv., the Louisv. and Nashv., and the Memphis and Charleston railways; 2 miles W. of Tusculum, the county-seat (for location, see map of Alabama, ref. 1-B). It is in an agri-

cultural region, and contains 8 church organizations, several public schools, 5 blast-furnaces, and 2 weekly papers. Pop. (1890) 2,731; (1894) about 1,200. EDITOR OF "REAPER."

Sheffield, JOHN, Duke of Buckinghamshire and Normanby; statesman and poet; b. in England in 1649; succeeded his father as Earl of Mulgrave 1658; served in the Dutch wars of 1666 and 1672; became privy counselor and lord chamberlain in 1685; favored the revolution of 1688; was made Duke of Normanby in 1694, lord privy seal and Duke of Buckinghamshire in 1703, and built in St. James's Park the residence now known as Buckingham Palace and belonging to the crown. He was said to have been an early lover of Queen Anne; was author of some poems which enjoyed fame during his own generation, and was a friend of Dryden, to whose memory he erected a monument in Westminster Abbey. D. Feb. 24, 1721. Besides minor poems he wrote a metrical *Essay on Satire* and an *Essay on Poetry*. His poetical works were first printed in 1723.

Shehâb-Eddîn: See CHEHAB-EDDIN.

Shehr, or Sahar: town; in South Arabia, on the Gulf of Aden; manufactures coarse cotton cloth, and carries on a brisk general trade, though it has no harbor, but only an open roadstead. Pop. probably 5,000. Four miles E. are remains of another town of the same name, once important, but now a decayed fishing-village.

E. A. G.

Sheik [from Arab. *sheikh*, *shaykh*, elder, venerable, man, chief, deriv. of *shākha*, grow old, be old]; a title among Arabs applied to the head of a tribe. Among Mussulmans in general it is prefixed to the name of a religious dignitary, or one versed in theology, or a reputed saint.

Sheikh-ul-Islam: See MUFTI.

Shell, RICHARD LALOR: patriot and orator; b. at Drumdowney, Tipperary, Ireland, Aug. 17, 1791; was educated at the Jesuit College, Stonyhurst, England, and graduated at Trinity College, Dublin, 1811; studied law at Lincoln's Inn; was called to the bar at Dublin 1814; wrote several successful dramas; contributed *Sketches of the Irish* to Campbell's *New Monthly Magazine*, republished in the U. S. by R. S. Mackenzie (New York, 2 vols., 1854); became an effective popular orator in the agitation for Roman Catholic emancipation; was chosen by the Catholic Association in conjunction with O'Connell, to represent that body at the bar of the House of Lords 1825; was active in promoting the election of O'Connell to Parliament in 1828; was himself chosen member for Milburne Port shortly after the passage of the Relief Act 1829; was returned for the county of Louth 1831, and later for Tipperary and Dungarvan; became noted as a brilliant and effective parliamentary orator, and aided O'Connell for several years in his campaign for the repeal of the Union, until 1838, when he accepted the sinecure post of commissioner of Greenwich Hospital. He subsequently became vice-president of the Board of Trade, member of the privy council 1839, and judge-advocate-general 1841; was master of the mint 1846-50, and was appointed minister to Tuscany 1850. D. in Florence, May 25, 1851. His *Memoirs* were written by W. Torrens McCullagh (2 vols., 1855); a collection of his *Speeches* was published in London, 1845, and his *Speeches, Legal and Political*, in 1855. —His younger brother, Sir JUSTIN SHELL, became major-general and minister to Persia, and aided his wife in the preparation of a valuable work, *Glimpses of Life and Manners in Persia* (1856).

Revised by H. A. BEERS.

Shekel [from Heb. *sheqel*, shekel (liter., a weight), deriv. of *shāqal*, weigh; cf. Gr. *σίκλος*, shekel]; a standard weight among the ancient Israelites, and also a coin of gold, silver, or copper, originally of a shekel's weight. The shekel of the sanctuary (Ex. xxx. 13; Num. iii. 47) was made of silver and was equal to 20 gerahs (Ezek. xlv. 12), or about 54 cents. There were other kinds of shekels. The gold shekel was worth about \$5.69; the copper shekel, a little more than 4 cents.

Revised by S. M. JACKSON.

Shelburne: a seaport; capital of Shelburne County, Nova Scotia; 141 miles S. W. of Halifax (see map of Quebec, etc., ref. 8-B). It has a very fine harbor. Shelburne Lights on Cape Roseway, are in lat. 43° 38' 5" N., lon. 65° 15' 5" W. There is excellent water-power, afforded by the river Roseway. Fishing, commerce, and ship-building are extensively pursued, and the port is one of the best in the province. The place has lost greatly in importance. During the war for American independence it was the center of loyalist influence, and then had about 12,000 inhabitants. Pop. 2,500.

Revised by M. W. HARRINGTON.

Shelburne, William Therry Free-Masons, Earl of, afterwards Marquis of Lansdowne; b. in Dublin, Ireland, May 28, 1747; was educated at Christ Church, Oxford; entered the army in 1767, and served with honor; was elected to Parliament for Chipping Wycombe only in 1781, but before taking his seat succeeded to the earldom, by the death of his father, May 10, 1793; became president of the Board of Trade and navy minister in the Grenville ministry, Apr., 1801, opposed the policy which led to the evacuation of the Stamp Act and other measures oppressive to America; became a personal friend of Benjamin Franklin; was dismissed from office Sept. 8, 1803; separated from Anne and Fox, attaching himself to Pitt; declined entering the Buckingham ministry 1804; became Secretary of State for the Southern Department in Pitt's administration July, 1805; resigned his post Dec. 1806; visited Italy and France; became Secretary of State in the Foreign Department in the Brougham ministry, Mar., 1822; and Premier on the death of Brougham July, 1828; completed the preliminaries of peace with the U. S., resigned Feb. 21, 1830, giving place to the coalition of Pitt and North; was created Marquis of Lansdowne 1834, and passed the remainder of his life in political retirement. D. in London, May 2, 1865. His extensive collection of historical MSS. was sold to the Government, and is in the British Museum. See his *Life*, by his grandson, Lord Edmund Fitz-Maurice (London, 1874-76).

Shelburne Falls, village in Shelburne and Buckland townships, Franklin co., Mass., on the Deerfield river, and the N. Y., N. O., and Hart, Railroad; 19 miles W. of Greenfield, the county-seat, 129 miles W. by R. of Boston (for location, see map of Massachusetts, ref. 2-E). The river here has a picturesque fall of 47 feet, affording excellent power for manufacturing, which is utilized by a silk-mill, a printing, and cutlery and hardware factories. There are 6 churches, the Ames Academy, 2 village schools, a national bank with capital of \$100,000, a savings-bank, and a weekly paper. The town was founded in 1765, and incorporated in 1785. Pop. of Shelburne township (1880) 1,621; (1890) 1,553; (1900) estimated, 1,600; pop. of village not separately reported. Known as "Deerfield Valley Esq."

Shelby, Isaac, first Governor of Kentucky; b. near Magdalen, Md., Dec. 11, 1759; son of Gen. Evan Shelby; received a common-school education; became a surveyor in Western Virginia; served as lieutenant in a company under his father's command at the battle of Point Pleasant 1774; became captain 1776; was commissary of the frontier 1777; judge and member of Virginia House of Delegates 1779; served 1780; rendered distinguished service at King's Mountain Oct. 7, 1780; served under Marion 1781, and under Greene with 600 mounted volunteers 1781-82, in which wars he sat in the North Carolina Legislature, from which he received a vote of thanks and a sword; settled in Lincoln co., Ky. (then Virginia), 1788; was a member of the constitutional convention 1791; Governor of Kentucky 1803-08 and 1812-16; joined Gen. Harrison in Canada with 1200 Kentuckians raised by proclamation; took part in the capture of the Thames, for which Congress voted him a gold medal; declined the post of Secretary of War 1817, and was commissioned with Gen. Jackson in negotiating a treaty with the Chickasaw Indians 1818. D. at Traveler's Rest, Lincoln co., Ky., July 15, 1826. His services are commemorated in the names of counties in nine of the Western and Southern States and in the name of a college at Shelbyville, Ky.—Died son, JAMES B., 1784, acted as major in the war of 1812, became general of militia, and died in Sept., 1848.

Shelbyville, city, capital of Shelby co., Ill.; on the Wabash river, and the Chi. and E. Ill. and the Cleve., Cin. Chi. and St. L. railways; 31 miles W. by R. of Madison, 33 miles E. by R. of Decatur (for location, see map of Illinois, ref. 7-E). It is in an agricultural, lumbering, and manufacturing region and contains a foundry, several large flour-mills, woolen-mill, agricultural-implement works, and other manufactures, a national bank with capital of \$75,000, and a daily, a monthly, and two weekly papers. Pop. (1880) 2,894; (1890) 3,192; (1900) 3,320. Known as "Union."

Shelbyville, city, capital of Shelby co., Ind.; on the Big Blue river, and the Cleve., Cin. Chi., and St. L., and the C. & O., Cin. Chi., and St. L. railways; 34 miles N. N. E. of Columbus, 37 miles S. E. of Indianapolis (for location, see map of Indiana, ref. 7-F). It is in a rich farming region, and has saw, planing, and flour mills, furniture, carriage, and barrel factories, etc., and a large general trade. There are 12 churches, 3 public-school buildings, 9 building

and loan associations, 2 national banks with combined capital of \$900,000, a private bank, and a monthly, 2 daily, and 3 weekly papers. Pop. (1890) 3,745; (1900) 3,421; (1905) estimated, 3,500. Known as "Deerway."

Shelbyville, town, capital of Shelby co., Ky.; on the Louisville and Nashville, and the Southern railways; 20 miles W. of Frankfort, 30 miles E. of Louisville (for location, see map of Kentucky, ref. 4-B). It is in an agricultural, stock-raising, and tobacco-growing region, and contains 2 State banks with combined capital of \$100,000, 2 weekly newspapers, Sumner Hall School (Methodist Episcopal South, opened in 1823), Street Female College (opened in 1839), and Shelbyville Male Academy (1881). Pop. (1880) 3,392; (1900) 3,016.

Shelbyville, town, capital of Bedford co., Tenn.; on the Duck river, and the Nashville, Chat., and St. L. Railway; 40 miles E. S. E. of Columbia, 61 miles S. by E. of Nashville (for location, see map of Tennessee, ref. 7-F). It is an important grain and milk market; contains Shelbyville Female College (non-sectarian, opened in 1850), a national bank with capital of \$100,000, a State bank with capital of \$25,000, and a monthly and three weekly newspapers; and has 5 churches, extensive lead-pencil factory, large lumber-yards, iron-foundries and machine-shops, cotton and woolen mills, and flour, saw, and planing mills. It is a shipping point for telegraph and telephone poles, and pencil-slides. The town and its vicinity were the scene of important military operations in the civil war (June, 1863). Pop. (1890) 1,360; (1900) 1,820; (1905) estimated with suburbs, 3,500.

Sheldon, town, O'Hea co., Ia.; on the Chi. Mt. and St. P., the Chi., St. P., Minn. and Omaha, and the Ill. Cent. railways; 36 miles W. of Spencer, 55 miles N. N. E. of Sioux City (for location, see map of Iowa, ref. 2-D). It is in an agricultural, dairying, and stock-raising region, has important manufactures, and has 2 State banks with combined capital of \$150,000, a national bank with capital of \$50,000, and 2 weekly papers. Pop. (1890) 730; (1900) 1,478.

Sheldon, Rowland AUSTIN A. M., Ph. D.; education: b. at Perry Center, N. Y., Oct. 4, 1823; educated at Hamilton College, Clinton, N. Y.; superintendent of schools, Syracuse, N. Y., Apr., 1851-Apr., 1853; superintendent of schools, Oswego, N. Y., May, 1853-Sept., 1860; principal of Oswego State Normal and Training School since 1869. Author of *Manual of Elementary Instruction* (1862); *Lessons on Objects* (1875); and a number of school text-books. C. H. T.

Sheldon, EDWARD STEVENS, Ph. D.; philologist; b. at Waterville, Me., Nov. 21, 1851; studied one year in Colby University; graduated at Harvard 1872; studied in Berlin, Leipzig, and Paris 1874-77; instructor in modern languages at Harvard 1877-84; Assistant Professor of Romance Philology at Harvard 1884-94; appointed full professor 1894; secretary of the American Dialect Society since its organization, 1890. His work lies chiefly in the field of phonetics and historical phonology, particularly as relates to the French element in English. He has also done much to stimulate the investigation of the living English of America. Author of *A Short German Grammar* (1879); *Some Specimens of a Canadian French Dialect Spoken in Maine, in Quebec, and in the U. S.* (1887); *Etymologies in Webster's International Dictionary* (1890); *Origin of the English Names of the Letters in Harvard Studies and Notes* (i and ii, 1892; 1893); also various articles in the *Modern Language Notes*, the *Transactions of the Modern Language Association of America* and *The Dialect Notes*. D. I. W.

Sheldon, GUINER, D. D.; archbishop; b. at Staunton, Oxfordshire, England, July 10, 1808; graduated at Oxford 1817; became fellow of All Souls' College 1822; obtained the vicarage of Hackney 1833, and the rectories of Ickford and Newington; was appointed warden of All Souls' and chaplain to Charles I. May, 1835; was ejected from the wardenship and imprisoned for loyalty to the royal cause 1847-48; lived in seclusion until the Restoration; became Bishop of London 1860, Archbishop of Canterbury 1869, and chancellor of Oxford University 1867, and built for that institution, at a cost of £16,000, the famous Sheldonian Theatre, opened 1869. D. at Lambeth Palace, Nov. 6, 1877.

Sheldon, HENRY CLAY, D. D.; minister and educator; b. at Martinburg, N. Y., Mar. 12, 1845; educated at Lowell Academy, Yale College (A. B., 1867), Boston University (S. T. B., 1871), and Leipzig University (one year); joined Maine Conference of the Methodist Episcopal Church 1873; was agent of Maine Wesleyan Seminary 1874-76; assistant

professor (1876-82) and Professor (since 1882) of Historical Theology in Boston University. He has published *History of Christian Doctrine* (2 vols., New York, 1886) and *History of the Christian Church* (5 vols., 1894). A. O.

Sheldrake, or **Shieldrake** [*sheldrake* is from Eng. *sheld*, variegated, spotted + *drake*; cf. O. N. *skjöldungr* (< *skjöldr*, a patch): *shieldrake* is identified with the secondary meaning of *skjöldr*, shield, given in allusion to the markings on the breast]: a river-duck of either of the genera *Tadorna* and *Casarca*. The common sheldrake (*Tadorna tadorna* or *cornuta*) is about the size of a goose, and has a red bill with a basal protuberance, head and neck green, with a white collar below, and a brown belt extending across the upper portion of the back. The shoulders and a median abdominal stripe are black, the speculum is green, and the rest of the plumage is white. It is found on sandy seacoasts in the Old World, making nests lined with down

The common sheldrake of Europe.

in abandoned rabbit-burrows. The ruddy sheldrake or Brahminy duck (*Casarca rutila*) is found mostly in South-eastern Europe and in Asia. *Casarca tadornoides* and *C. variegata* inhabit Australia and New Zealand respectively, and are plain-colored. The so-called sheldrakes of North America are mergansers.

Shellac, or **Shell-lac**: See **LAC**.

Sheller, ALEKSANDR MIKHAILOVICH: author; b. in St. Petersburg, Russia, July 30, 1838; educated at the university in that city; interested himself in questions of popular education, and founded a school for the poor which, at first very successful, incurred the suspicions of the Government and came to an end in 1863. In the same year he published his earliest verses, and in 1864 *Gnilyta Bolola* (Dank Marshes), a novel that had numerous successors, among the best of which are *Khleba i Zrelisch* (Bread and Amusements); *Des rublat-Stshepki lettat* (When Wood is cut Splinters fly); and *Chuzhie Grekhi* (The Sins of Others). In 1877 he became editor of the *Zhivopisnoe Obozrenie*; he has also written on questions of religion and sociology, and is especially known for a *History of Communism* in three volumes. A. C. COOLIDGE.

Shelley, MARY WOLLSTONECRAFT (*Godwin*): author; daughter of William Godwin and Mary Wollstonecraft; b. in London, England, Aug. 30, 1797; educated in accordance with the peculiar social theories of her parents; married the poet Shelley Dec. 30, 1816, after having lived with him two years previously to the death of his first wife. She was the author of *Frankenstein, or the Modern Prometheus* (1818), a singular novel, displaying great power, of *Valperga* (1823), *Lodore* (1835), and other less successful romances; contributed to *The Cabinet Cyclopaedia* a series of biographies of eminent literary and scientific men of France, Italy, and Spain, and edited the works of her husband, with biographical prefaces and notes (1839-40). D. in London, Feb. 21, 1851. See the *Life* by Mrs. Julian Marshall (2 vols., 1889). Revised by H. A. BEERS.

Shelley, PERCY BYSSHE: poet; b. at Field Place, near Horsham, Sussex, England, Aug. 4, 1792. His grandfather, Bysshe Shelley (b. at Newark, N. J., 1731), acquired a large fortune, was made a baronet in 1806, and died Jan. 6, 1815.

His father, Timothy, b. Sept., 1753, married, in 1791, Elizabeth, daughter of Charles Pilfold, of Effingham, Surrey. The domestic surroundings of the poet were unfortunate, neither of his parents having given him suitable training or inspired him with affection—a circumstance to which much of the waywardness of his career may be attributed. He received his early education at a school taught by the parish clergyman at Warnham; entered at the age of ten St. Ann's House School, Brentford, where he was noted rather as an insatiable reader than as a successful student; entered Eton College in 1805; was addicted to experiments in chemistry; read much upon ghosts and the "occult sciences"; was careless of his tasks, but translated half of Pliny's *Natural History* for his own satisfaction; wrote an incredible amount of fragmentary verses, mostly "poor stuff," as he afterward perceived; composed, with his cousin Medwin, one or more plays and novels, and with another cousin, Harriet Grove (of whom he was deeply enamored), a romance entitled *Zastrozzi*, which was printed in 1810, and, strange to relate, brought him £40; printed also a volume of poems, "by Victor and Cazire," which he quickly withdrew from circulation, and of which no copy is known to be extant, and another romance, *St. Irvyne*, all within the same year (1810) in which he entered University College, Oxford; published under the pseudonym of *Margaret Nicholson* a volume of burlesque poems; was expelled from his college Mar. 25, 1811, for having printed a pamphlet entitled *The Necessity of Atheism*; went to London with his friend Hogg, who was also expelled in connection with the same affair; was left without support by his offended father, but received occasional supplies from the savings of his sisters, then at school; eloped to Scotland with one of their schoolfellows, Harriet Westbrook, the beautiful daughter of a retired innkeeper, and married her in Edinburgh, Sept., 1811; effected a settlement with his father, by which he received a small annuity; traveled with his wife to York and Keswick, where he met Southey and perhaps De Quincey; proceeded to Dublin, Feb. 12, 1812, where he printed three revolutionary pamphlets, addressed one or more political meetings, and fancied that he had been requested by the police to leave the city; went to the Isle of Man, to North and South Wales, Devonshire, and Carnarvonshire, making but brief residences at any point, after flying visits to Dublin and Killarney, finally settled in London, May, 1812; printed early in 1813 *Queen Mab*, his first poem of real literary merit, a production strongly tinged with anti-religious fanaticism. His first child, Ianthe, was born in June, 1813. Shelley was remarried in London, Mar. 24, 1814, but soon found his married life uncongenial; separated from his wife, settling upon her nearly all his disposable income, and about this time conceived a passion for Mary Godwin (daughter of William Godwin and Mary Wollstonecraft), which was fully returned. As neither of them had any respect for the marriage bond, they saw no difficulty in consulting their own inclinations, and proceeded to Switzerland, traveling as man and wife; returned to England at the close of 1814. In consequence of the death of his grandfather he obtained an annuity of £1,000 and his father's succession to the baronetcy (Jan., 1815); studied surgery during the winter of 1815-16, and daily walked a London hospital; wrote in 1815 his second poem of permanent interest, *Alastor, or the Spirit of Solitude*, published, with other poems, in 1816; proceeded to the Lake of Geneva in the spring of 1816; resided there some months in daily intercourse with Byron; returned to London in the autumn; legalized his connection with Mary Godwin by marriage Dec. 30, 1816, Harriet having shortly before (Nov. 10) drowned herself in the Serpentine; conducted an unsuccessful chancery suit against Mr. Westbrook (Harriet's father) for the custody of his two children, decision being given against him by Lord Eldon on the ground of atheism Aug. 23, 1817; settled at Great Marlow, Buckinghamshire, where he played the part of a country gentleman; made about this time the acquaintance of Keats and the brothers James and Horace Smith, and became very intimate with Leigh Hunt; published in 1818 *The Revolt of Islam* (originally called *Laon and Cythna*), a grandly conceived, sublime, and highly original poem, but with many inequalities and blemishes; suffered much from pulmonary disease, which led him in Mar., 1818, to leave England for the last time; traveled with his early friend Hogg to Italy, residing successively at Milan, Pisa, Leghorn, and the Bagni di Lucca; visited Byron at Venice, remaining there some weeks; completed *Rosalind and Helen* (published 1819), a poem of little value; translated, or rather abridged, the *Symposium* of

Shelley, wrote at Green's villa, near Pisa, *Dioniso and Antioco*, one of his poetical compositions, not published during his life; retranscribed to Rome in November, and to Naples, Jan., 1819; signed the writer at the latter end the spring of 1819 at the Tiber's side; presented to Florence, Oct., 1819; made in each of the Italian capitals an anonymous study of their works of art; wrote, chiefly at Florence, during this year, his two greatest works, the tragedy *Prometheus Unbound* and the tragedy *The Cenci*, both of which, as well as *Robespierre*, the *Pyreus*, a burlesque drama, were published in London by 1820; removed to Pisa, Jan., 1820; wrote in this year his *Witch of Atlas*, not published till 1824; in 1821 *Alceste*, a beautiful monody on the death of Keats, *Kjia*, *Montezuma*, and *Hellas*, a noble drama inspired by the inspiration of Byron, made a long visit to Byron at the Villa Nervi, 1821; was joined by the latter at Pisa during the winter (1821-22); began his poem *The Triumph of Life*, which was never finished; took a summer residence Apr. 1822 in the Villa Magna, at Livorno, a village on the Tuscan coast; went frequently upon boating excursions with his friends, Capt. Trelawney and Ident Williams; and was drowned along with the latter in the Bay of Spezia, Aug. 8, 1822, owing to their boat having capsized in a squall, while returning from a visit to Leigh Hunt at Leghorn. The bodies were cast upon the shore ten days later, and, in compliance with the quarantine laws of Tuscany, the ashes were buried by Trelawney in the Protestant burial-ground at Rome, near the tomb of Keats. Shelley's posthumous poems were edited by his widow in 1824, and *The Mask of Anarchy* by Leigh Hunt in 1832. Mrs. Shelley published a collection of his works in prose and verse in 1839 and 1840, and again in 1845. His daughter-in-law, Lady Shelley, collected the *Shelley Memorials* in 1858. Of recent editions the best have been those edited by William M. Rossetti in 2 vols., in 1870, and by H. Buxton Forman, in 6 vols., 1876-80. The *unlaid* *Life* was that of Medwin, in 1847. Trelawney's *Reminiscences of Shelley and Byron* appeared in 1859, and Hogg's *Biographical Life of Shelley* in the same year. J. A. Reynolds published a *Life* in 1878, and Prof. E. Dowden another in 1898. D. P. McCarthy issued *Shelley's Early Life* in 1879. Dr. Richard Garnett's *Relics of Shelley* dates from 1892.

Revised by EDWARD GIBSON.

Shell-heaps: artificial deposits constituting a leading feature of the aboriginal remains of North America, and occurring more or less plentifully in all habitable countries.

Nature and extent.—These heaps are the kitchen middens of shell-eating peoples, and their contents vary with the nature of the food-supply. Oysters, clams, mussels, and numerous varieties of univalves yield a very large percentage of compact and durable refuse. In some cases the shape and height of the heaps were modified for domestic or defensive purposes, and when the sites became places of sepulture the shells were utilized in building tombs; but they are studied here only as accumulations of refuse reflecting in their mass reliable records of the food-supply, the customs, arts, industries, and movements of the people. Some of these heaps cover areas 10, 20, or even 30 acres in extent. On the shores of some of the Atlantic coast and rivers the deposits are practically continuous for many miles, and reach back from the water for distances varying from a few rods to half a mile or more according to the nature of the ground. It is estimated that in the State of Maryland alone the oyster-banks cover an area of upward of 100,000 acres. The deposits are heaviest where favorable conditions occur near prolific shallows, and it is not uncommon to find them from 10 to 25 feet deep. A depth of 40 feet is occasionally reported, and certain deposits in Florida are said to be 100 feet deep. The shells on decomposition yield a dark rich mud, and where decay is well advanced the beds exposed are exceedingly fertile. In many cases the shells are calcined in kilns and employed as a fertilizer. At Pope's Creek, Md., a single midden has yielded upward of 200,000 cubic feet of oyster-shells for this purpose.

History and age.—In the main the shell-banks of the Atlantic coast are of nearly homogeneous date; they must be regarded as representing a simple and rather brief period of occupation, but examples in Florida, especially the fresh-water deposits, their successive depositions, as well as more advanced decomposition in the lower beds, indicating distinct periods of occupation and considerable lapse of time. The shell found very decided indications of the greater antiquity of the lower beds of the Alaskan middens. In some

cases mounds composed of many forms are found far back from the present salt-water shorelines, and long periods are assumed to have passed since their accumulation, but the rates of silting and of isostatic elevation are not so well determined so to make such data of great value as time-measures. In some localities the forms of life utilized by the ancient inhabitants have changed in character, or have greatly diminished in abundance of size, or have entirely disappeared. These changing conditions are an index of age, but not a definite or valuable one. In the main the species of animals whose remains occur in these artificial deposits are identical with or vary but little from the living or historic species of the regions in which they occur.

Art and people.—The American natives who resorted to the shores of the sea in search of food were not a peculiar people, and did not belong to a particular period of time or stage of culture. Some of the more advanced native peoples occupied the interior of the country and took no part in the marine fisheries, but nearly all grades of culture are represented in the art of these deposits. In some regions the Indians resorted to the fisheries at stated seasons only, and in such cases the relics left do not fully represent the art of the people. The utensils and implements were to a large extent prepared for temporary and local use, and are exceptionally rude; but in passing along the coast from Maine to Mexico the artificial contents of the shell-banks of each section represent somewhat fully the art-remains of the adjacent regions. For example, rude ood-marked pottery is found in the northern middens, stamped wares in southern, painted wares in those of the Gulf States, and highly elaborated and artistic wares in the deposits of the western and southern Gulf shores. The art and people represented by the relics these heaps contain are those of which knowledge has been obtained through other sources.

Archæology.—Atlantic coast: Wyman, *Fresh-water Shell-mounds of Florida*, in *Memoirs of the Peabody Academy of Science*, vol. 1, No. 4 (1875); Britton, *Artificial Shell-deposits of the United States*, in *Smithsonian Institution Report* (1896); Ives, *Artificial Shell-deposits of New Jersey*, in *Sci. Inst. Rept.* (1864). Pacific coast: Schuchman, *Oyster-middens of Oregon*, in *Bulletin Geol. Survey of Territories*, vol. III, No. 1; Hall, *Tribes of the Kalama North-west*, in *Contributions to North American Ethnology*, vol. 1, Interior; White, *Congress International d'Anthropologie* (Boulogne, 1871). W. H. Holmes.

Shells, in artillery: See PROJECTILES.

Shells, in natural history: See MOLLUSCA.

Shelly's Case: a celebrated case at law, decided in 1591, and reported in the first part of Lord Coke's *Reports*. It constitutes one of the landmarks of the English law of property, and established a technical rule of real property law, known as the Rule in Shelly's Case, which may be stated as follows: When a person takes an estate for life, under a deed or will, and in the same instrument there is a limitation by way of remainder to his heirs or to the heirs of his body as a class of persons, the limitation to the heirs merely operates to enlarge the estate of the person to whom the life-estate is given; if the remainder be to the heirs of his body, he takes an estate in fee tail; if to his heirs generally, an estate in fee simple. The rule had no application, however, to the limitation of a remainder to any particular person, who might, nevertheless, be the heir of the life-tenant. Thus a limitation of a life-estate to A, with remainder to his eldest son and the heirs of the latter, was not within the rule. The rule itself has been abrogated by statute in New York and many other States, and in such jurisdictions a limitation of the kind affected by it would now take effect according to the terms of the conveyance. See ESTATE, FEE, PROPERTY, REMAINDER, and consult text-books on real property, especially Leake and Williams, and the *Commentaries* of Blackstone and Kent.

GEORGE W. KIRCHWEY.

Shelter Island: island and town; Suffolk co., N. Y., between the Peconic and Gardiner's Bays, near the eastern extremity of Long Island (for location, see map of New York, ref. 8-9). It is reached by ferry from Greenport on the Long Island Railroad; is about 14 miles long and 4 miles wide; contains several pretty bays and small fresh-water lakes; is a popular summer resort and a Methodist camp-meeting place; and has two large hotels and other facilities for boating and fishing. The island belonged originally to the Manhattans Indians; was acquired by Lord Stirling; and for many years was under the jurisdiction of Connecticut. Pop. (1890) 752; (1900) 921.

Shema'kha (anc. *Kamachia*): town of Russia; in Transcaucasia; on the Pirsaghut, at an elevation of 2,230 feet. It is fortified, and has large and well-stocked bazaars and manufactures of silk and cotton stuffs. Much wine and fruit are produced in the vicinity. Pop. (1892) 22,139.

Semitic Languages: same as SEMITIC LANGUAGES (q. v.).

Shenando'ah: town (founded in 1870); Page co., Ia.; on the Nishnebotne river, and the Burlington Route, the Humeston and Shen., and the Omaha and St. L. railways; 19 miles N. E. of Hamburg, 40 miles S. E. of Council Bluffs (for location, see map of Iowa, ref. 7-D). It is the center of a rich agricultural region, and contains 12 churches, the Western Normal College (opened in 1881), 3 public-school buildings, 2 national banks with combined capital of \$115,000, a private bank, and a semi-weekly and 3 weekly newspapers. The vicinity includes among its industries some of the largest wholesale nurseries in the West. Pop. (1880) 1,387; (1890) 2,440; (1895) 3,100. EDITOR OF "SENTINEL."

Shenandoah: borough; Schuylkill co., Pa.; on the Lehigh Val., the Penn., and the Phil. and Read. railways; 18 miles N. by E. of Pottsville, the county-seat, and 105 miles N. W. of Philadelphia (for location, see map of Pennsylvania, ref. 5-H). It is in the heart of the richest coal district in the anthracite region, the development of which has given it rapid growth. Six of the largest collieries in the coal region are within the borough limits, and eight others, equally productive, are within the radius of a mile. The borough has gas and electric-light plants, an electric railway connecting adjoining towns and villages, 2 national banks with combined capital of \$200,000, 3 building and loan associations, each local and serial, and a daily and 2 weekly newspapers. There are 18 churches, 7 public-school buildings (valued at \$60,000), a public library connected with the schools, 2 parochial schools, a brewery, 2 hat and cap factories, and other industries. Shenandoah was laid out in 1862, and incorporated as a borough in 1866. Pop. (1880) 10,147; (1890) 15,944; (1895) estimated, over 17,000.

M. E. DOYLE, EDITOR OF "SUNDAY MORNING NEWS."

Shenandoah River: a stream which rises in Augusta co., Va., and flows N. E. 170 miles to the Potomac at Harper's Ferry, W. Va. The north fork joins the main stream at Front Royal. The Shenandoah affords great water-power. During the civil war its valley was the scene of many military operations, and was laid waste by Gen. Sheridan in 1864.

Shen'di: town of Nubia, on the Nile, in lat. 16° 38' N.; was a place of some commercial importance before the Mahdist revolt. Almost the entire population of the town and district perished of famine in 1889. C. C. A.

Shenshin, AFANASI AFANASIEVICH: poet, who has written under the name of Fet (that of his mother by a first marriage); b. in the government of Orel, Russia, Nov. 23, 1820; studied in the University of Moscow, and from 1844 to 1856 served in the army, after which he settled in the country. His first volume of verses was published in Moscow in 1840. As a writer Fet belongs to the school of pure art. His short poems, though at times lacking in warmth, are characterized by perfect form and delicate grace. He has also made excellent translations of the whole of Horace and Juvenal, Goethe's *Faust*, Shakspeare's *Julius Caesar* and *Antony and Cleopatra*, etc. A. C. COOLIDGE.

Shensi, shen'see' [literally, western defiles]: a province of China, bounded N. by Mongolia, E. by the Hwang-ho (which separates it from Shansi) and Honan, S. by Hupeh and Szechuen, and W. by Kansuh. Area, 67,400 sq. miles. S. of the Tsing-ling range it is mountainous and well wooded; N. of it the Loess (q. v.) formation prevails, and everything is yellow. The houses are made of yellow earth, vegetation is covered with yellow dust, and even the atmosphere is seldom free from a yellow haze. The chief rivers are the Wei (a long, shallow affluent of the Hwang-ho), which flows E. along the northern base of the Fu-niu and Tsing-ling ranges (some of whose peaks reach an elevation of 11,000 feet), and the HAN-KIANG (q. v.). Iron and coal abound, but are not much worked, except near the upper waters of the Han. Being a loess region, Northern Shensi is unfit for rice cultivation. Wheat, barley, pulse, millet, maize, ground-nuts, poppy, hemp, tobacco, and cotton are extensively grown. Wheat is the staple. Capital, Si-ngan-foo. Pop. about 8,500,000. R. L.

Shenstone, WILLIAM: poet; b. at the Leasowes, near Halesowen, Shropshire, England, in Nov., 1714; studied at Pembroke College, Oxford, and passed his life in retirement on his hereditary estate, writing elegies, ballads, odes, and

pastorals which had considerable popularity. The Spenserian poem entitled *The Schoolmistress* (1742), the *Pastoral Ballad* (1743), and the well-known stanzas *Written in an Inn at Henley*, are the only ones remembered. D. at the Leasowes, Feb. 11, 1763. His *Works* and *Letters* were collected in 3 vols., 1764-69. An edition of his *Poems*, by Gilliland, with a memoir, appeared at Edinburgh in 1854, and his *Essays on Men and Manners* were republished at London in 1868. Shenstone was also one of the best amateur landscape-gardeners of his time. Revised by H. A. BEERS.

She'ol: the transliterated Hebrew word, meaning a hollow place, a cave, used in the Revised Version of the Bible to denote the place of departed spirits. It therefore corresponds with Hades in classical Greek literature. In the Authorized Version it is translated by pit, grave, hell. S. M. J.

Shepard, CHARLES UPHAM, M. D., LL. D.: geologist; b. at Little Compton, R. I., June 29, 1804; graduated at Amherst College 1824; studied botany and mineralogy at Cambridge under Nuttall; taught those branches at Boston; was for two years assistant in the laboratory of Prof. Schumacher at New Haven, and for one year lecturer at the Brewster Scientific Institute at New Haven; employed on a Government commission to investigate the methods of sugar-culture and manufacture in the Southern States 1832-33; lecturer on Natural History at Yale College 1830-47; associate of Dr. James G. Percival in the geological survey of Connecticut 1835; Professor of Chemistry and Natural History at Amherst 1845-52, and in the Medical College at Charleston, S. C., 1854-61; afterward became again Professor of Natural History at Amherst; was author of a *Treatise on Mineralogy* (1832; 3d ed. enlarged, 1855), and of a *Report on the Geology of Connecticut* (1837). D. May 1, 1886.—His son, CHARLES UPHAM SHEPARD, JR., M. D., born at New Haven, Oct. 4, 1842, graduated at Yale College 1863, and in medicine at Göttingen, Germany, 1867; became Professor of Chemistry at the Medical College of Charleston, S. C., in 1867. He wrote many papers on mineralogy, and has been active in the development of the phosphate industries of South Carolina and Florida. Revised by G. K. GILBERT.

Shepard, ELLIOTT FITCH, LL. D.: lawyer; b. at Jamestown, Chautauqua co., N. Y., July 25, 1833; was educated at the University of the City of New York; was admitted to the bar in 1858. During the civil war he raised the 51st New York Volunteer Regiment, which was called in his honor the Shepard Rifles. In 1876 he was prominent among the founders of the New York State Bar Association; and shortly before his death founded the American Sabbath Union. He was owner and editor of the *New York Mail and Express*. D. in New York, Mar. 24, 1893.

Shepard, THOMAS: clergyman; b. at Towcester, Northamptonshire, England, Nov. 5, 1605; graduated at Cambridge, 1627; became a preacher at Earle's-Colne, Essex; was silenced for nonconformity in 1630. He emigrated to Massachusetts, arriving at Boston, Oct. 3, 1635; succeeded Thomas Hooker as pastor of the church at Cambridge, Feb. 1636; was influential in founding Harvard College; published *New England's Lamentation for Old England's Errors* (London, 1645); *The Sound Believer* (1645); *The Clear Sunshine of the Gospel breaking forth upon the Indians in New England* (London, 1648; reprinted New York, 1867); *Theses Sabbaticae* (1649); and other theological works. After Hooker's death he was esteemed the most learned and skillful exponent of Puritan theology in New England. D. at Cambridge, Aug. 25, 1649. He left numerous works in MS., some of which were published in England, especially *Subjection to Christ* (1652), to which was prefixed a *Life* of Shepard by Samuel Mather and William Greenhill; *The Parable of the Ten Virgins Opened and Applied* (London, folio, 1660; new eds. 1839, Aberdeen, 1838 and 1853); and various collections of *Sermons*. He left an *Autobiography*, first printed at Cambridge (1832) for the Shepard Congregational Society. A collected edition of his *Works* appeared at Boston (3 vols., 1853), with a memoir by Rev. Horatio Alger, of Cambridge. A memoir by Cotton Mather may be found in the *Magnalia Christi Americana* (best ed. Boston, 1855, 2 vols.). Revised by S. M. JACKSON.

Shepardson College: See DENISON UNIVERSITY.

Shepherd-dog: any one of the breeds of domestic dogs which are trained to assist in attending the flocks of sheep. Of all strains of shepherd-dogs the Scotch collie is the most celebrated. It is one of the most sagacious and docile of dogs. A good Scotch collie should have a long, narrow

head; small, semicircular eyes, set high on the head; long, straight fore legs, placed well under the body; long and dark, but not woolly, hair. The color is extremely varied, but is more usually black and tan, or black, tan, and white, or yellow and white. P. A. LACAS.

Shepherd Kings: certain rulers of Egypt, known also as *Pharaohs* (q. v.).

Shepherdstown: town, Jefferson co., W. Va.; on the Kanawha river, the Chesapeake and Ohio Canal, and the National Western Railroad; 8 miles W. of Harper's Ferry, 30 miles W. of Washington, D. C. (for location, see map of West Virginia, ref. A. N.). It contains Shepherd College (one of the finest normal schools), large sawmills and flour-mills, bookshops, a savings-bank, and a weekly newspaper. Pop. (1900) 1,633; (1900) 1,613.

D. L. SEYMOUR, publisher of "Herald."

Shepley, Erskine, LL.D.: jurist; b. at Andover, Mass., Dec. 2, 1799; graduated at Dartmouth College 1821, in the same class with Ames, Kendall, Joel Parker, and Daniel Foster; became a lawyer at Andover and subsequently at Portland; sat in the Massachusetts Legislature 1819, and in the same constitutional convention 1820; was U. S. district attorney for Maine 1821-33; U. S. Senator 1833-37; became a justice of the Supreme Court of the State Sept. 23, 1838; served justice 1848-55. He was a man of great constructive ability, and was appointed sole commissioner to prepare the Revised Statutes of Maine (1850-57). D. Jan. 10, 1877. —*Long Successor:* his brother (b. 1787; d. 1857), reported and published *Maine Reports*, the decisions of the Supreme Court of Maine 1830-40. Revised by F. SEYMOUR ALLEN.

Shepley, George Fourier: soldier and lawyer; b. at Andover, Mass., Jan. 1, 1819; graduated at Dartmouth College in 1840, and at Johns Law School, Cambridge, 1829; admitted to the bar of the supreme judicial court, Bangor, Me., 1840; in 1841 removed to Portland; was appointed U. S. attorney for Maine district in 1848, and reappointed in 1853 and 1857; subsequently devoting himself exclusively to a very successful and general practice of his profession, in the course of which he was called upon to argue several cases of great importance in the U. S. Supreme Court, until Sept. 11, 1857, when he was commissioned colonel of the Twelfth Maine Volunteers; commanded a brigade in Gen. Butler's expedition against New Orleans, and on the occupation of that city was appointed military commandant and acting mayor, charged with the administration of civil affairs in the city, and was also assigned to the command of the defense of New Orleans. On July 18, 1862, he was commissioned brigadier-general of volunteers by President Lincoln, and appointed him military governor of Louisiana Jan. 2, 1862. In 1864 he commanded the military district of Arkansas and North Carolina; served with the Army of the James 1864-65; entered Richmond with the Twenty-fifth Army corps Apr. 3, 1865, and was appointed military governor of that city. Resuming his profession at the close of the war he declined the appointment of judge of the Supreme Court of Maine, but in 1869 accepted that of U. S. circuit judge for the first judicial circuit. His decisions are reported in *Shepley's Circuit Court Reports*. D. at Portland, July 20, 1879. Revised by JAMES MANCZ.

Sherbrooke: *chef-lieu* of Sherbrooke County, Quebec, Canada, and by courtesy called The Capital of the Eastern Townships (see map of Quebec, ref. 6-U). It is a flourishing town situated on both sides of the river Magog at its confluence with the St. Francis, one of the large tributaries of the St. Lawrence. It is a station on the Grand Trunk railway, which has its terminus in Portland, Me., being 94 miles from Montreal. The Canadian Pacific Railway also runs through it on the line between Montreal and New Brunswick. The Quebec Central Railway has its head office here, and with the Boston and Maine Railroad connects Quebec with the railway systems of the U. S. Sherbrooke has a small water power, and on both sides of the Magog are several large and important factories, the largest being the *Boisbrun* and *Wright* mills. The town possesses several fine buildings, including the post-office, the Eastern Townships Hotel, and several churches. The Magog and the St. Francis are spanned by bridges. There are three weekly newspapers, one of which is printed in the French language. Pop. (1901) 7,227; (1891) 10,110, mostly French-Canadian. J. M. HARRIS.

Sherbrooke: a seaport of Guxborough County, Nova Scotia, at the head of navigation of the beautiful St. Mary's

river, 12 miles from its mouth (see map of Quebec, etc., ref. 2-U). Shipbuilding, the lumber-trade, gold-mining, and quartermilling are carried on. Pop. 1890, mostly Scotch.

Sherbrooke, Vancouver: see Lower, Roman.

Shere Ali, sheet-*al* 160: Amir of Afghanistan; b. in 1823; succeeded his father in 1863, and seemed at first to be open to British influence, introducing numerous reforms after British models, but was subsequently compelled by a revolt of the conservative party, headed by his own son, Yakub Khan, to change his policy completely and submit to the Russian influence. As he declined to receive a British embassy, though a Russian embassy lived in Kabul in great state, the British invaded the country in the last months of 1878. Shere Ali fled across the frontier, and died suddenly at Mazarisheh, a place under Russian authority, Feb. 21, 1879.

Sheridan: See *Gerrymen*.

Sheridan, Frances (Chamberlain): novelist and dramatist; b. in Ireland in 1794; wrote at the age of fifteen a romance, *Regina and Adelaide*, which was dramatized by her daughter long afterward, and successfully acted at Dublin; made the acquaintance of Sheridan, the theatrical manager, during the controversy in which he was involved, by the publication of a pamphlet in his favor; married him about 1743; wrote two popular novels, *Sidney Baskin* (3 vols., 1761) and *Nemoralis* (1769), and two comedies, *The Discovery* (1763) and *The Duke* (1764), and left an unpublished play, *The Triple Hulk*. D. at Bath, France, Sept., 1766. Revised by HAYDEN MYRRORS.

Sheridan, Philip Henry, LL.D.: soldier; b. at Albany, N. Y., Mar. 6, 1831; graduated from the U. S. Military Academy, and assigned to the First Infantry as lieutenent second lieutenant July 1, 1853. After a brief term in barracks he was ordered to Texas; transferred to the Pacific coast in 1855, serving in Washington and Oregon Territories until the fall of 1861, at which date he was captain in the Thirtieth Infantry. In December he was assigned to the army of Southwest Missouri as chief quartermaster. After the battle of Pea Ridge (Mar., 1862) he was relieved, and in the Corinth campaign accompanied Gen. Halleck as quartermaster until May 25. On this date he was appointed colonel of the Second Michigan Cavalry; three days later was off on a raid to Booneville, and May 30 in pursuit of the Confederates retreating from Corinth. On July 1, in command of a cavalry brigade, he defeated a superior cavalry force at Booneville, and was commissioned brigadier-general of volunteers from that date. Transferred to the Army of the Ohio, he commanded a division at the battle of Perryville (Oct. 8), where "he held the key of our position, and used the point to its utmost advantage." At the battle of Murfreesboro (Dec. 31) Sheridan's division held the left of the right wing. An attack on his front had been met and the enemy driven back, when by the giving way of the two divisions on his right his flank became exposed to the advancing foe. Hastily forming a new line under cover of a charge, he made a brave resistance for an hour, when he was again compelled to take up a new line, this time connecting with Negley of the center. The two divisions repulsed three desperate assaults by four divisions of the enemy, when, Sheridan's ammunition giving out, he ordered a bayonet charge and withdrew his line from the field; but by his obstinate resistance priceless time had been gained for Rosecrans to make his new dispositions. Sheridan's commission as major-general of volunteers followed, dating from this battle. With the exception of skirmishes with Forest and Van Dora, little of interest occurred until late in June, 1863, when Rosecrans advanced against Bragg, who fell back into Georgia. The battle of Chickamauga took place Sept. 19-20, where Sheridan fought with great gallantry, rescuing his division from a perilous position. Grant superseded Rosecrans in October, and on Nov. 24-25 was fought the battle of Chattanooga, where, on the 25th, Sheridan, by his fearless assault at the head of his division upon the center of the enemy's line on Missionary Ridge, gained additional renown. The march to Knoxville, where Burnside was besieged, next followed. Upon Grant's promotion to lieutenant-general (Mar., 1864) he applied for the transfer of Sheridan to the East, and appointed him chief of cavalry of the Army of the Potomac. In the campaign of 1864 the cavalry covered the front and flanks of the infantry through the battles of the Wilderness until May 8, when the greater part of it was withdrawn, and next morning Sheridan started on a raid against the enemy's lines of communication with

Richmond. On the 25th he rejoined the army, having destroyed the dépôts, trains, and track at Beaver Dam and Ashland stations, liberated 400 Union men, and defeated the enemy's cavalry at Yellow Tavern, where their cavalry leader, J. E. B. Stuart, was mortally wounded. The outer line of works around Richmond was taken, but the second line was too strong to be carried. Resuming the advance, the battle of Hawes's Shop was fought May 28; Cold Harbor was occupied on the 31st, and held until the arrival of the infantry. On June 7 Sheridan, with two divisions, started around the left of Lee's army and destroyed the Virginia Central Railroad in the rear. The Richmond and Fredericksburg railroad was struck at Chesterfield, and the Virginia Central was again cut at Trevilian's, where he routed Wade Hampton (June 11); next day he tore up the railway nearly to Louisa Court-house, when, on the advance toward Gordonsville, an indecisive engagement took place; not hearing from Hunter, who was to meet him here, he withdrew, rejoining the army June 19. On Aug. 7 the Middle Department and departments of West Virginia, Washington, and Susquehanna were constituted "the Middle military division," and Sheridan assigned to command of the same. Numerous severe cavalry skirmishes occurred during August and early in September, but no general engagement, although the two armies lay in such position—the Confederates under Gen. Early on the west bank of Opequan Creek, covering Winchester, and Sheridan in front of Berryville—that either could bring on a battle at will. The imperative necessity of having the unobstructed use of the Baltimore and Ohio Railroad and the Chesapeake and Ohio Canal led Grant to take the initiative, although Sheridan's defeat would have exposed Maryland and Pennsylvania to invasion; but before giving orders to attack he visited Sheridan (Sept. 16), the latter expressing such confidence of success that Grant gave him but two words of instruction: "Go in!" Three days later, at the crossing of the Opequan, he attacked Early, whom he routed after a vigorous battle, and captured 3,000 prisoners and 5 guns. Early rallied his army at the strong position of Fisher's Hill, where, on the 22d, he was again defeated, with heavy loss, and pursued to the mountains. Sheridan devastated the valley on his return, rendering it untenable for an enemy's army. He was then (Sept. 20) appointed a brigadier-general in the regular army. On Oct. 19 Early, after surprising the Union army in the morning, was disastrously defeated, owing to the arrival of Sheridan from Winchester. (See CEDAR CREEK.) The thanks of Congress were bestowed upon Sheridan and his army, and Nov. 8 he was appointed major-general in the regular army. On Feb. 27, 1865, starting out with 10,000 cavalry, he destroyed the Virginia Central Railroad, the James River Canal, and immense quantities of supplies, and defeated Early again at Waynesboro, rejoining Grant before Petersburg Mar. 27. Sheridan had now a force of about 9,000, and in subsequent operations was under the immediate orders of Gen. Grant. He commanded at the battle of FIVE FORKS (q. v.) with his customary vigor. The loss of this battle compelled Lee to evacuate Petersburg. Sheridan pursued the flying army to Sailor's Creek, where he captured 16 guns and 400 wagons. When the Sixth Corps came up a combined attack resulted in the capture of upward of 6,000 prisoners. On Apr. 8 four supply-trains were captured at Appomattox Station, and at Appomattox Court-house the advance of Lee's army was resisted until dark. On the morning of the 9th the enemy endeavored to break through his dismounted command, but abandoned the attempt when Sheridan, moving aside, disclosed the infantry behind. Mounting his men, Sheridan was about to charge when the white flag betokening surrender was displayed in his front. In June, 1865, he was placed in command of the military division of the Southwest, of that of the Gulf in July, of the department of the Gulf, Aug., 1866, and of the fifth military district (Louisiana and Texas) Mar., 1867. In Sept., 1867, he was transferred to the department of the Missouri, continuing in command until Mar. 4, 1869, when he was promoted to be lieutenant-general, and assigned to command of the division of the Missouri, headquarters at Chicago, assuming command Mar. 16. In 1870 he visited Europe and witnessed the Franco-German war. During the political disturbances in Louisiana in 1875, Gen. Sheridan was sent to New Orleans, returning to Chicago on quiet being restored. He assumed command of the army Nov. 1, 1883; was appointed general June 1, 1888. Author of *Personal Memoirs of P. H. Sheridan* (1888). D. at Nonquitt, Mass., Aug. 5, 1888.

Revised by JAMES MERCUR.

Sheridan, RICHARD BRINSLEY BUTLER: dramatist; son of Thomas Sheridan, actor and author, and Frances Chamberlaine, author; b. in Dublin, Ireland, Sept., 1751; educated in Dublin and at Harrow School; published a rhymed translation of Aristænetus, Aug., 1771; married Miss Linley, a beautiful oratorio singer, of Bath, in 1773; brought out his first comedy, *The Rivals*, at Covent Garden, Jan., 1775; followed it in November with an opera, *The Duenna*, for which his father-in-law composed the music, and which was acted seventy-five nights the first season; became part-purchaser of Garrick's half of Drury Lane theater in June, 1776; produced *A Trip to Scarborough* Feb., 1777, altered from Vanbrugh's *Relapse*; and in May followed it with *The School for Scandal*, the most successful comedy of manners in the English language; became owner of one-half of Drury Lane 1778; wrote *Monody on Death of Garrick* 1779; brought out the farce of *The Critic, or a Tragedy Rehearsed*, Oct., 1779. Elected a member of The Club, he became a friend of the leading wits and statesmen of the time; was elected to Parliament from Stafford 1780; was Secretary of the Treasury 1782; cultivated oratory with great success; crowned his fame as a public speaker by two great speeches against Warren Hastings, one in bringing charges in Parliament, Feb., 1787, and one on the trial at Westminster Hall, in June of same year; held his own in debate even against Pitt; revised Thomson's adaptation from Kotzebue, *The Stranger*; rebuilt Drury Lane 1784; produced in 1799 his patriotic play, *Pizarro*, also an adaptation from Kotzebue; became treasurer of the navy and a privy counselor in 1806; was ruined by the burning of Drury Lane 1809; made his last speech in Parliament 1812. Having fallen into habits of dissipation and carelessness in money matters, his last years were harassed by the importunities of creditors, pursuing him even to his death-bed. D. July 7, 1816, and was buried in Westminster Abbey. His *Life* was written by Thomas Moore (1825), who also edited his plays, admitting one piece, *The Camp*, which he did not write. His *Speeches* have been collected in five volumes (1816). *The Rivals* and *The School for Scandal* were published in 1884, with biography, introductions, and notes, by the present writer. BRANDER MATTHEWS.

Sheridan, THOMAS: actor and author; b. in 1721 at Quilca, near Dublin, Ireland (the residence of Dean Swift); educated at Trinity College, Dublin; became an actor 1743; played tragedy at Covent Garden theater 1744 and at Drury Lane 1745; was by some considered a rival of Garrick; was manager of the Dublin theater 1746-55; was ruined by a wanton riot; withdrew temporarily from the stage; became a successful teacher of elocution at London, Oxford, and Cambridge, and in Scotland and Ireland; returned to the stage 1760; was pensioned by George III.; was acting manager of Drury Lane 1776-79, after his son obtained control of that theater; published several works on elocution; edited the works of Swift (1784); wrote his *Life*, and was author of a *General Dictionary of the English Language* (1780) of considerable phonetic value. D. at Margate, England, Aug. 14, 1788. Revised by BRANDER MATTHEWS.

Sherif, she-reef [Arab. *sherif*, noble]: a title; applied by Mussulmans to descendants of Fatima, the daughter of the prophet Mohammed. The Sherif of Mecca is the guardian of the KAABA (q. v.), and chief dignitary of the city. E. A. G.

Sheriff [M. Eng. *shereve* < O. Eng. *scir-gerefa*: *scir*, shire + *gerefa*, reeve, officer]: a county officer with administrative and generally also judicial functions.

In England, Ireland, and Wales the sheriff is the chief officer of the crown, in every county or shire, who does all the sovereign's business in the county, the custody of the county being committed to him alone by letters patent of the crown. The office of sheriff is one of the most ancient and honorable known to the English law. The custody of the county is said to have formerly been committed to the earl or (Lat.) *comes*, and anciently the sheriff, whose Latin title is *vicecomes*, was his deputy. The earls in time became unable to transact the business of the county, and the burden was laid on the sheriff, who is now entirely independent of the earl.

Sheriffs were formerly chosen by the inhabitants of the several counties, but now by statute they are annually appointed by the crown (on nomination by the judges and the great officers of the crown) on Nov. 12, and the person appointed must have sufficient land within his county or bailiwick to answer the crown or the people. The discharge of the office is compulsory, and within one month after a

sheriff's appointment suggested he must nominate a fit person for his undersheriff. Until 1899 the citizens of London had the right to elect the sheriffs for Middlesex and London, but now the custom appoints the sheriffs for the county of Middlesex and the (recently created) county of London, and the city sheriffs for the city of London only.

The sheriff was formerly a judicial officer before whom might be held the trial of disputed facts in certain cases; but now he is relieved of this burden, except that he is charged with the assessment of damages (by the aid of a jury) and of compensation in certain cases, and that he is bound to hold a county court whenever the holding of such court is required for the purpose of election or any other lawful purpose only. He is charged also with certain other duties, as a returning officer, etc., in regard to parliamentary elections.

As the keeper of the king's peace he is the first man in the county, and superior in rank to any soldierman therein during his term of office. He may apprehend and commit any one who breaks the peace, or attempts to break the peace; and may bind any one in a recognizance to keep the peace. He is bound to pursue all traitors, murderers, and other offenders, and commit them to jail. He is also to defend the county against any of the king's enemies, and for this purpose, as well as for the purpose of keeping the peace, in apprehending offenders, he may command all the people of the county to attend him. See *Poore's COMPANION*.

The sheriff, as an officer of court, is also bound to execute process issuing from the high court of justice, and to attend on the judges when they come into the county at the assizes. In civil cases he may serve all processes by which persons are begun, unless he is a party (when service is to be made by the coroner); he must, upon a proper order, arrest and take security from the defendant (where the defendant is liable to arrest); he executes mesne process by serving attachments, etc.; and in any action or cause he must, when the case comes to trial, summon and return the jury; and when the case is determined he must see the judgment or sentence of the court carried into execution. In some matters he is liable, like other ministerial officers, to some action for the negligent or improper discharge of his duties. To protect himself against liability for mistake he must, in cases of doubt, require from the proper party a bond of indemnity.

In executing criminal process the sheriff may break open the outer door of any dwelling-house or other building, but in executing civil process he can not force an entrance into a dwelling-house, although when once admitted he may break open inner doors; and he may break the outer doors of buildings which are not dwellings. It is also the sheriff's business as the officer to preserve the rights of the crown within his county, as, as it is often called in his writs, his bailiwick. He must seize neglected lands, levy fines and forfeitures, and seize waifs, wrecks, estrays, etc.

Although the sheriff's authority extends in general over the whole county, there are many liberties exempt from his jurisdiction, in which, by ancient crown grants, the execution of legal process, etc., is bestowed upon other persons. These liberties, though still recognized, are now partly subjected to the surveillance and control of the sheriff.

The sheriff, for the better execution of the duties imposed upon him, has under him many inferior officers—an undersheriff, a deputy, and bailiffs; and these under-officers may sue, levy, and sue farm their offices on forfeiture of £500; and the sheriff himself is forbidden to "let to farm" his county or any part of it. The undersheriff, deputies, and bailiffs of the sheriff are in all respects his agents, and may perform in his name only acts which are purely administrative in their nature, and not any which are judicial. Their acts are his acts; he is responsible for all their defaults done under color of office, even when willful and intentional offenses or violations of law. To protect himself he can sue from them bonds with sureties for their good behavior.

The sheriff is the chief local judge of the county. His jurisdiction in civil matters extends to all personal actions on contract, bond, or obligation, to the greatest extent; by actions for rent; to possessory actions; and generally to all civil matters not especially committed to other courts. His criminal jurisdiction in general extends to the trial of all crimes which do not involve a punishment of death or banishment from Scotland; and he may fine, imprison, banish from the county, and generally even inflict corporal punishment without a jury.

In the several States of the U. S. the sheriff is the chief ad-

ministrative officer of each county, and his general duties and powers are essentially the same as in England in matters pertaining to the execution and enforcement of the law, whether civil or criminal. He is as often the administrative organ of all the superior courts sitting within his county, charged with the duty of carrying into effect their judgments and orders. He is wholly a State official, and has never been incorporated into the executive branch of the U. S. Government. He is generally elected by popular vote for a fixed term (usually three years); but in a few States the ancient practice of appointment by the Governor is still retained. Of his common-law judicial functions the only one retained is the assessment of damages, by the aid of a jury, in certain classes of cases in which defendants have made default.

For a full treatment of the subject, see the statutes of the jurisdiction in question and Stephen's *Commentaries on the Laws of England*; Churchill and Brown's *Law of the Office and Duties of Sheriffs* (London, 1879); Erskine's *Principles of the Law of Scotland*; Tyller's *History of Scotland*; Bell's *History of the Law of Scotland*; Whimore's *Institutions for Sheriffs, Coroners, and Constables* (Chicago, 1894); and Crocker's *Duties of Sheriffs, Coroners, and Constables* (3d ed. New York, 1896). F. BRIDGES ALLEN.

Sherlock, THOMAS, D. D.: bishop and author; son of Dean William Sherlock; b. in London, England, in 1676; educated at Eton; graduated at Cambridge 1697; was master of the Temple forty-nine years (1704-53); was made a prebendary of London 1713, vice-chancellor of Cambridge 1714, dean of Chichester Nov. 1715, prebendary of Norwich 1719, Bishop of Bangor Feb. 4, 1728, of Salisbury 1734, and of London 1748, having declined in 1747 the Archbishopric of Canterbury. He took an active part in the Bangorian controversy in opposition to Dr. Hoadly (1730), wrote several controversial works on Christian theology, of which the most celebrated were *The Use and Intent of Prophecy* (1725) and *Trial of the Witnesses of the Resurrection of Jesus* (1729), and published four volumes of his *Dissertations at the Temple Church* (1754-58), which gained him a high reputation as a pulpit orator. D. in London, July 18, 1761. His Works were edited by T. S. Hughes, D. D. (London, 5 vols., 1800). Revised by S. M. JACKSON.

Sherlock, WILLIAM, D. D.: clergyman and author; b. in Southwark, London, England, 1641; educated at Eton; graduated at Cambridge 1660; took orders in the Church of England; became rector of St. George's, Botolph Lane, London, 1669, prebendary of St. Paul's 1681, master of the Temple 1684, and dean of St. Paul's 1691, in which year he at first refused to take the oaths of allegiance to William and Mary, but subsequently took them; published a pamphlet in justification of his course, *The Case of Allegiance Due to Sovereign Powers Stated* (London, 1691), which caused a great sensation and elicited many replies. D. at Hampton, June 19, 1707. Author of over sixty publications, chiefly theological and controversial, of which the *Validation of the Doctrines of the Trinity* (1690), directed against Dr. South, and the *Practical Discourse concerning Death* (1689; n. ed. 1853) made a great impression at the time, but are now little read. Other works are *The Judgment* (1692) and on *The Divine Providence* (1694; edited by T. O. Summers, Nashville, Tenn., 1853; 3d ed. 1875).

Sherman: city; capital of Grayson co., Tex.; on the Ross, and Tex. Cent., the Mo., Kan., and Tex., the St. L. & W., and the Tex. and Pac. railways; 13 miles S. of the Red river, and 87 miles N. of Dallas (for location, see map of Texas, ref. 2-1). It is in a wheat, corn, cotton, and fruit region, and within 50 miles of the great Ardmore coal-fields, and has large manufacturing and shipping interests. It contains one of the largest cottonseed-oil mills in the South, a cotton-gin (cost about \$250,000, and said to be the largest in the world), several flour, saw, and planing mills, foundries and machine-shops, marble-works, cigar, furniture, carriage, broom, and mattress factories, and brick-yards. There are 7 churches, Austin College for boys (Presbyterian), St. Joseph's Academy (Roman Catholic), Sherman Institute, the North Texas Female College, a commercial college, improved water-works, electric street lights and railway, a national bank with capital of \$600,000, a State bank with capital of \$300,000, and 2 daily and 2 weekly newspapers. The city has an altitude of about 1,000 feet above sea-level. Pop. (1880) 6,063; (1890) 7,325.

Sherman, FRANK DEMPSTER: poet; b. at Peekskill, N. Y., May 6, 1860. He was educated at Columbia College and

Harvard University; became a fellow of Columbia in 1887, and afterward instructor in the Columbia School of Architecture. He has published *Madrigals and Catches* (1887); *Lyrics for a Lute* (1890); and, with John K. Bangs, *New Waggings of Old Tales* (1888).

Sherman, JOHN: clergyman; grandson of Roger Sherman; b. at New Haven, Conn., in 1772; graduated at Yale College 1792; was pastor of the First Congregational church at Mansfield, Conn., from Nov., 1797, to Oct., 1805, when he left that post on account of having adopted Unitarian principles; was for a short time pastor of a Unitarian church at Trenton Falls, N. Y., where he established and conducted an academy. D. at that place Aug. 2, 1828. He was the author of *One God in One Person Only* (1805), the first elaborate defense of Unitarianism that appeared in New England; and *Philosophy of Language Illustrated* (1826).

Revised by G. P. FISHER.

Sherman, JOHN: statesman; b. at Lancaster, O., May 10, 1823; brother of Gen. W. T. Sherman; was admitted to the bar 1844; was a delegate to the Whig conventions of 1844 and 1848; sat in Congress 1855-61; was Republican candidate for the Speakership 1859, but was defeated after a prolonged contest; became chairman of the House committee of ways and means; was re-elected to Congress 1860, but before taking his seat was chosen U. S. Senator; re-elected 1866 and 1872; was long the chairman of the Senate committees on finance and on agriculture; took a prominent part in debates upon finance and the conduct of the war, was one of the authors of the reconstruction measures adopted 1866-67, and was appointed Secretary of Treasury Mar. 7, 1877. He was elected U. S. Senator from Ohio Jan. 18, 1881; elected president *pro tem.* of U. S. Senate Dec. 7, 1885; re-elected U. S. Senator Jan. 13, 1886, continuing president *pro tem.* of the Senate, but he resigned the latter office Feb., 1887. In 1888 he was a prominent candidate for the presidential nomination, which was finally awarded to Harrison. He was re-elected to the Senate in 1893.

Sherman, ROGER, M. A.: signer of the Declaration of Independence; b. at Newton, Mass., Apr. 19, 1721; was in childhood apprenticed to a shoemaker, and followed that occupation until 1743, when he settled at New Milford, Conn., and joined an elder brother in keeping a small store; studied privately law, politics, and mathematics; was chosen county surveyor 1745; made for several years the astronomical calculations for an almanac issued in New York; studied law; was admitted to the bar 1754; sat for several years in the colonial assembly; removed to New Haven in 1761; was assistant governor nineteen years (1766-85); judge of common pleas and of the superior court twenty-three years; treasurer of Yale College 1766-76; sat in Congress from 1774 until his death; was one of the five members of the committee to draft the Declaration of Independence 1776; served on many important committees on the board of war and ordinance and on the treasury board; assisted in codifying the laws of Connecticut 1783; was one of the framers of the original Articles of Confederation 1777, and an active member of the Federal constitutional convention 1787; U. S. Senator 1791-93; and mayor of New Haven from 1784 till his death in that city July 23, 1793.

Sherman, THOMAS WEST: soldier; b. at Newport, R. I., Mar. 26, 1813; graduated at the U. S. Military Academy July, 1836, when he was assigned to the artillery as second lieutenant and sent to Florida, where he served against the Indians until 1842; was subsequently employed in recruiting and in garrison until 1846; was promoted captain in May, 1846. In the war with Mexico he commanded his battery at Buena Vista, and was breveted major; again in garrison and on frontier duty 1848-61, in April of which latter year he attained a majority in his corps, and was assigned to guard the Philadelphia and Baltimore Railroad and to restore communications with Washington. On May 14 he was promoted to be lieutenant-colonel, and three days later appointed brigadier-general of volunteers. In the Port Royal expedition (Oct., 1861) he commanded the land-forces, which he had organized, continuing in command in South Carolina until the end of Mar., 1862, when he was assigned to the Army of the Tennessee as division commander, participating in the Corinth campaign (April to June). Transferred to the department of the Gulf, he commanded a division in the vicinity of New Orleans until May, 1863, when he joined the expedition to Port Hudson, and in the investment of the place commanded the second division Nineteenth Corps, forming the left wing of the besieging army.

In the assault of May 27 he lost a leg while leading the assaulting column. Colonel of artillery June 1, 1863. Returning to duty in Feb., 1864, he held various commands in Louisiana until 1866, when he was mustered out of the volunteer service. He was breveted brigadier-general and major-general for gallantry, and Dec. 31, 1870, was retired from active service with the full rank of major-general. D. at Newport, R. I., Mar. 16, 1879. Revised by JAMES MERCER.

Sherman, WILLIAM TECUMSEH, LL. D.: soldier; b. at Lancaster, O., Feb. 8, 1820; son of Judge Charles R. Sherman. From 1829, when his father died, he was reared in the family of the Hon. Thomas Ewing; in July, 1836, he was appointed a cadet at the U. S. Military Academy, and in July, 1840, he graduated and was appointed a second lieutenant in the Third Artillery; first lieutenant Nov., 1841. He served in Florida until 1842; was in garrison at Fort Mifflin, S. C.; in 1846 he was ordered to California, serving as acting assistant adjutant-general of the department of California until Feb., 1849, when he was transferred to San Francisco on similar duty on the staff of Gen. Persifort F. Smith, commanding the division of the Pacific. Ordered to New York in Jan., 1850, as bearer of dispatches, he was married on May 1 to Ellen, daughter of Thomas Ewing, then Secretary of the Interior. In September of that year he was transferred to the commissary department, with the rank of captain, and stationed at St. Louis and New Orleans until Mar., 1853, when, after a six months' leave of absence, he resigned from the army Sept. 6, 1853, to engage in the banking business in San Francisco; removed to New York in 1857, in which year the affairs of his firm were closed. In 1858 he removed to Leavenworth, Kan., where he practiced law until July, 1859, when he was elected superintendent of the proposed military academy in Louisiana. The institution was opened Jan. 1, 1860, as the Louisiana State Seminary of Learning and Military Academy, and Sherman remained at its head until Jan. 18, 1861, when he addressed a letter to the Governor asking to be relieved "the moment the State determined to secede." His request was soon after granted, and in the latter part of February he left for St. Louis, where for a short period he held the presidency of a street-railway. On May 14, 1861, he was appointed colonel of the Thirteenth Regular Infantry, and soon after his arrival in Washington was placed in command of a brigade in Tyler's division, which he led at the battle of Bull Run, July 21. On Aug. 3 his commission of brigadier-general of volunteers was issued, to date from May 17, and Aug. 24 he was ordered to duty in the department of the Cumberland under Gen. Anderson, succeeding to the command of that department Oct. 8, 1861, but was relieved in November and sent to Missouri. After a brief service on inspection duty he was (Dec. 23) placed in command of the camp of instruction and post of Benton Barracks, whence in Feb., 1862, he was transferred to Paducah, Ky., to aid in the operations then in progress on the Tennessee river. Here he organized the division which he subsequently commanded at the battle of Shiloh (Apr. 6-7), where his conduct did much to check disorder and overcome the shock of the unexpected onset. Gen. Halleck reported that Sherman's firmness at the 6th saved the day. Grant officially announced that he was indebted to Gen. Sherman for the success of the battle. The advance upon and siege of Corinth next followed, resulting in the evacuation of that place May 29. In the meanwhile (May 1) he had been promoted to be major-general of volunteers. In July, having been assigned to command the district of Memphis, he occupied that place until the 21st, where he remained until called upon in December by Gen. Grant to take command of the expedition for the capture of Vicksburg. As this movement was intended to be a surprise, the preparations were hastily executed. Embarking his troops Dec. 21, a landing was effected on the 26th at Johnston's Landing, some 12 miles up the Yazoo. On the 29th the attempt to carry the position by assault was bravely made, but without success, and, owing to the surrender of Holly Springs, which overthrew Gen. Grant's plan of co-operation, re-enforcements were arriving to the aid. Sherman returned to Milliken's Bend, where Gen. McPherson took command Jan. 4, 1863. Sherman was assigned to the Fifteenth Corps, which took a leading part in the assault and capture of Arkansas Post (Fort Hindman) on the 11th.

In the Vicksburg campaign which succeeded, Sherman bore a prominent part with his command—in the expedition to Steele's Bayou to the Yazoo (March); the feint upon Haines-

May 29–May 31), movement to Grand Gulf (May 1–3), capture of Jackson (May 14), the occupation of Walnut Hills and subsequent assaults upon the fortifications at Vicksburg (May 18 and 22), in each attempt the capture of the position planned on the enemy's works; and in the siege of the city ended in the surrender of the city July 4, 1864. Sherman with a detached command was at once ordered to follow Johnston, who with a relieving force had been trying to force the Black, but retreated hastily on the news of the approach, being eventually driven behind the intrenchments of Jackson. On the night of the 18th Johnston succeeded in escaping. After destroying the railways in all directions Sherman fell back to the W. of the Big Black, along which he lay when summoned (Sept. 27) to the relief of Johnson's beleaguered army at Chattanooga. Meanwhile he had been appointed lieutenant general in the regular army, his term from July 4. On Sept. 27 the last of his command was evacuated at Vicksburg, reaching Memphis Oct. 4, where he marched onward, repairing the railway as he moved, and the 20th, when orders reached him at Tennessee from Gen. Grant, who had superseded Rosecrans, to resume all work and leave on to Chattanooga. On Nov. 1 Sherman arrived at that place, and, after viewing the position, marched back to his command, which he found in a position on the 23d, and at 3 p. m. the next day he ordered the north end of Missionary Ridge, which seemed to strongly fortified during the night. At sunrise on the 25th, by orders Sherman attacked Bragg's right as it seemed to be weak in the Confederate order, on which then Bragg was thrown at 3 p. m., and by midnight Bragg's army was in full retreat. Sherman and Hooker pursued at daylight the retreating army, the former turning back on the 28th to take command of the force for the relief of Burnside at Knoxville and reported to be unable to hold beyond that day. He moved rapidly, making the last 84 miles in two days, and Laumet was compelled to leave the city and retreat to Virginia, whereupon Sherman returned to Chattanooga and ordered his command into winter quarters. Since Oct. 27 Sherman had commanded the department of the Tennessee, though retaining command of troops in the field.

The following year (1864), on Feb. 2, Sherman moved out from Vicksburg with two divisions, and, making his way to Meridian, the great railway center of the Southwest, he cut the source of supplies for the Confederate army in the region, destroyed the railways in every direction, burnt gunpowder, etc.; but, owing to the failure of the winter division of health to perform its part, the expedition was obliged to return (Feb. 29). Gen. Grant having been promoted to be lieutenant general, he named Sherman as lieutenant general in command of the military division of the Tennessee, composed of the departments of the Ohio, the Cumberland, the Tennessee and the Arkansas. Assuming command about the middle of Mar., 1864, Sherman at once turned upon the task of organizing his army and ordering his communications preparatory to the spring campaign, which was to be directed against Atlanta, Ga., and to the Southwestern with the opening of the Richmond campaign by Grant. Accordingly, on May 6, Sherman set out with his army from the winter quarters about Chattanooga. To oppose him was the army of Johnston, lying about Dalton and numbering not far from 45,000. Sherman's force numbered 38,707 men of all arms, with 254 guns. Johnston was compelled, by Sherman's flank movement, to abandon Dalton May 13, and fall back upon Resaca, where he was evacuated after a severe battle (May 15), and retreated to Allatoona Pass. Without attempting to take any strong position in front, Sherman, on the 23d, by a flank to the right, marched on Dallas, Johnston took a strong position about New Hope Church, where severe fighting occurred May 25–26. On June 1 Allatoona was taken by Sherman and made a secondary base of supplies, as the 4th Johnston retreated to the strong position of Peachtree, Pine, and Look Mountain. From June 10 to 27 a most constant fighting occurred, when, after two unsuccessful assaults on Kennesaw (June 27), Sherman began the decisive flank movement by the right. That night the position was abandoned by Johnston, and by July 10 the army had fallen back across the Chattahoochee and taken up a new covering Atlanta. Here he was superseded in command July 13 by Hood. On this day Sherman commenced crossing of the Chattahoochee, and on the 19th and 20th the battle of Peachtree Creek was fought, resulting in the evacuation of the enemy to the intrenchments of Atlanta.

On the 22d Hood, by a night march, had gained the left of Sherman's line, which he attacked frontally, a severe battle ensuing, the enemy finally retreating to their defenses. A movement to flank Hood out of Atlanta by cutting the railways, in his rear was in progress when (July 28) Hood made a vigorous attack, but was repulsed with great loss. On Aug. 12 Sherman was made a major general in the regular army. Sending Kilpatrick out to destroy the railways in the rear, he swung around to the S. W., and by Aug. 26 his entire army, excepting the Twentieth Corps, was behind Atlanta, busily engaged in destroying the only railways by which that city was supplied. During the night of Sept. 1 Hood evacuated Atlanta, after destroying everything that could be used, and on the 2d Sherman with the Twentieth Corps entered the city. Sherman's losses from Chattanooga amounted to 21,337; the Confederate loss was about 25,000. Hood had been reinforced from time to time, and had yet an effective force of 40,000. Sherman received in June Blair's Seventeenth Corps, with 14,000. Hood then drew off to about Lawrence's, fighting with Hardee, while Sherman gave his army a much-needed rest. On Sept. 28 Hood resumed operations by crossing the Chattahoochee and operating against Sherman's communications, spending before Atlanta Oct. 3, and by a garrison of 1,944 men. The reported strength of the Confederates were of no avail, and were finally abandoned, but not until 707 of the little band had fallen, while the loss of the enemy was not less. Hood then moved S. W., Sherman following as far as Milledgeville, Ala., when, becoming convinced that Hood's only design was to draw him out of Georgia, he abandoned further pursuit, and despatching the Fourth and Twenty-third Corps to reinforce Thomas at Nashville, and leaving the latter to defend Tennessee against Hood, he took back all the surplus property and supplies to Chattanooga, broke up the railway, destroyed Atlanta, and, cutting the telegraph behind him Nov. 15, started on the 15th upon his famous "march to the sea." The history of this march is well known. On Dec. 10 Sherman was before Savannah, Fort McAllister was carried on the 13th, and on the night of the 20th Savannah was evacuated while Sherman was on his way to Hilton Head to arrange for making this very step impossible. Returning to Savannah, he entered the city on the 23d. His loss from Atlanta was 800, including 100 killed, 428 wounded, and 278 missing. By resolution of Jan. 10, 1865, the thanks of the people and of the Congress of the U. S. were tendered to Gen. Sherman and his command. After resting at Savannah and settling his army he moved northward Feb. 1. Columbia was occupied on the 13th; Cheraw, Mar. 3; Fayetteville, Mar. 11; the battle of Averysboro was fought Mar. 16; that of Bushyville, Mar. 19–20; Goldsboro was occupied Mar. 23; Raleigh, Apr. 13; and Apr. 18, at Durham Station, Sherman accepted the surrender of Johnston's army on a basis of agreement which was rejected by the Government, but on the 26th received the surrender on the terms accorded to Lee by Grant. Resuming his march, Washington was reached May 24, 1865, where, after the grand review, his army was dissolved. On June 27, 1865, he was appointed to command the military division of the Mississippi; was promoted to be lieutenant general July 25, 1866, and Aug. 11 assigned to command the military division of the Missouri. On the accession of Gen. Grant to the presidency he became general (Mar. 4, 1869). In 1871–72 he made an extended tour in Europe and the East. In Oct., 1874, the headquarters of the army were removed from Washington to St. Louis, but in Apr., 1878, were re-established at Washington. He published in 1875 *Memoirs of General W. T. Sherman, by himself* (revised edition, 1886). Retired Feb. 8, 1884. D. in New York, Feb. 14, 1891.

Sherry-wine: See WINE and WINE-MAKING.

Sherwood. MART MARTHA (*Belle*; author) b. at Stamford, Wiltshire, England, May 6, 1775; married Capt. Sherwood of the army 1801, with whom she resided in India 1804–18, and settled on her return at Wickwar, Gloucestershire, where they lived many years. Her husband died in 1849; she died at Twickenham, Sept. 22, 1861. She was the author of 20 vols. of widely circulated works, chiefly written with a moral object, and many of them for juvenile readers. The best-known are *Little Henry and his Brother, Henry Milner, Erwin, Rosabel, and The Lady of the Manor*. A *Memoir*, including an autobiography, was published by her daughter, Mrs. Sophia Kelly (London, 1854), and a collected edition of her works in 16 vols. appeared in New York about 1852.

Revised by H. A. BEANS.

Sherwood Forest: a hilly region in the west of Nottinghamshire, England, between Nottingham and Worksop, about 25 miles in length by 8 in breadth. It was once a royal hunting-forest, and known to legend as the scene of Robin Hood's exploits. It is divided into farms, and it includes the town of Mansfield, several villages, and many parks and gentlemen's country-seats. The soil is gravelly and usually unproductive.

Shetland (or Zetland) Islands: a group of about 100 islands, of which 23 are inhabited, in the Atlantic Ocean between lat. 59° 50' and 60° 52' N., and belonging to Scotland. Area, 551 sq. miles. Pop. (1891) 28,711. The largest island is Mainland, with the town of Lerwick; among the others are Yell, Unst, Barra, and Foula. They are all treeless, high, and rocky, presenting steep, abrupt, and bold coasts, with fine natural harbors, and a rugged, wild surface in the interior. In the valleys some oats, barley, and potatoes are cultivated. The climate is mild and damp. Many cattle and sheep are reared, but the principal occupation of the inhabitants is fishing, especially for cod and herrings, giving employment to 7,500 men and 300 boats. Eggs form an important article of export. See Hibbert, *A Description of the Shetland Islands* (new ed. 1892).

Shevchen'ko, TARAS GRIGOROVICH: the greatest of Little Russian writers; b. Feb. 25, 1814. He was the son of the serf of a German landed proprietor in the government of Kiev, and from his childhood was exposed to brutal treatment, but picked up the rudiments of an education, early showing a talent for song and also for painting, which caused him to be apprenticed to a house-decorator in order to learn that business. In 1832, with his master, he moved to St. Petersburg, where he attracted the interest of the poet Zhukovskii and others, who bought his freedom. At first all went well with him, but in 1847, owing to some of his writings and to his participation with KOSTOMAROV (*q. v.*) in a society of which the Government disapproved, he was banished as a common soldier to the Asiatic frontier of the empire. In this vicinity he passed the next ten years, part of the time in prison and forbidden to write or paint. After the accession of Alexander II., the intercession of powerful friends procured his pardon, but although he began to compose again his health was broken and he died in St. Petersburg, Feb. 26, 1861. Shevchenko's *Kobzar*, a volume of lyrics in the Little Russian dialect, appeared in 1840 (new ed. 1860), and achieved great popularity. The deep poetic sympathy for the life of the people in these pieces made their author the idol of his countrymen, while the hopeless sadness and pessimism of his tone were the natural result of his own experiences. In 1841 he brought out *Haidamaki*, a Cossack epic, also the only Russian one with claims to greatness, and this was followed by *Hamalia, Maiak*, and other pieces. See article in the *Revue des Deux Mondes* (1874), and *The Peasant Poets of Russia*, by W. K. Morfill, in *The Westminster Review* (July, 1880). A. C. COOLIDGE.

Shibboleth [from Heb. *shibboleth*, ear of corn, stream, deriv. of **shābhal*, increase, flow]: a test or password by which one's rank in society is indicated. It is recorded in Judges xii. that after Jephthah's victory over the Ephraimites the men of Gilead detected their fugitive enemies by requiring them to pronounce the word *shibboleth*, which the Ephraimites called *sibboleth*, and thus betrayed their origin; whereupon they were put to death.

Shield [O. Eng. *scield*: O. H. Germ. *scilt* (> Mod. Germ. *schild*): Icel. *skjöldr*: Goth. *skildus*]: a buckler, a broad defensive weapon carried upon the arm to protect the body from blows and missiles. Most savage nations employ shields of some form, and all the nations of antiquity used them, as in mediæval Europe, down to the general introduction of gunpowder in warfare. The shield is of great importance in heraldry. For practical use, shields were of leather, wood, basketwork, etc. See HERALDRY.

Shieldrake: See SHELDRAKE.

Shields: the name of two towns of England, about 8 miles from Newcastle, opposite to each other on the Tyne, near its entrance into the North Sea—North Shields on the northern bank, in the county of Northumberland; South Shields on the southern, in the county of Durham (see map of England, ref. 4-1). North Shields has two docks—the Northumberland, of 55 acres, opened 1857, and the Albert Edward, of 24 acres, opened 1884. There are large exports of coal and coke and imports of timber, grain and esparto-grass. North Shields forms part of the borough of TYNE-

MOUTH (*q. v.*). The total tonnage entered and cleared at both ports, exclusive of that coastwise, was, in 1893, 3,540,860. South Shields is an old town, but is well built in its modern part. It has a town-hall, public library and museum, marine school, etc., and a park of 45 acres. The south pier, a breakwater nearly a mile in length, was begun in 1854, and is not yet completed (1895). The Tyne docks of the North Eastern Railway, covering 50 acres, are chiefly used for shipping coal and coke. The harbor is lined with ship and boat yards, and alkali, glass, and iron works. On an eminence overlooking the harbor are the remains of a Roman station where coins, portions of an altar, etc., have been dug up. South Shields sends one member to Parliament. Pop. (1891) 78,431. R. A. ROBERTS.

Shields, CHARLES WOODRUFF, D. D., LL. D.: educator; b. at New Albany, Ind., Apr. 4, 1825; graduated at Princeton College (1844) and Theological Seminary (1847); was pastor of Presbyterian churches at Hempstead, Long Island, 1849-50, Philadelphia, 1850-65; and since 1865 has been Professor of the Harmony of Science and Revealed Religion in Princeton College. He has published *The Presbyterian Book of Common Prayer according to the Revision of the Westminster Divines* (New York, 1864; 4th ed. 1886), *Liturgia Expurgata* (Philadelphia, 1864; 3d ed. New York, 1884); *Philosophia Ultima, or Science of the Sciences* (vol. i., New York, 1877; 3d ed. 1889; vol. ii. 1889); *Order of the Sciences* (1884); *Religion and Science in their Relations to Philosophy*; *Essays on Church Unity* (1891); *The Historical Episcopate* (1894); and *The Question of Unity* (1894). C. K. HOYT.

Shi-Hwang-Ti: See CHI-HWANG-TI.

Shi'ites [Arab. *shiah*, sect]: the most numerous of Muslim heretical sects. Their main characteristics are rejection of the Sunna (see SUNNITES) and extravagant devotion to Ali, the son-in-law of the prophet Mohammed and the fourth caliph. The most advanced maintain that the revelation of the Koran was intended by God for Ali, but given to Mohammed through an error of the archangel Gabriel. The majority, however, are content with denouncing the first three caliphs, Abubekir, Omar, and Othman, as usurpers, and asserting that Ali was the rightful successor of Mohammed. The memory of the tragic death of Ali by murder, and of his two sons, Hassan and Houssein, by poison and murder, inflames the Shi'ites to this day beyond conception and is annually commemorated with bloody rites. The bitterness of hatred between the Sunnites and Shi'ites has never been equaled even in the most envenomed wars of Christendom. To kill one Shi'ite is declared by the Sunnites more acceptable in the sight of God than the slaughter of seventy Christians. In the treaties imposed by the Ottomans on Persia the first clause has commonly stipulated that the Persians, who are Shi'ites, should not hereafter curse the memories of the first three caliphs. The Shi'ites are found mainly in Persia, India, and among the Tartars. They number probably not more than 18,000,000, and are divided into many minor and hostile sects. E. A. GROSVENOR.

Shikarpur: town; in the Presidency of Bombay, British India; in a low, level, regularly inundated, but fertile and not unhealthful plain; in lat. 27° 57' N., lon. 68° 45' E.; 15 miles W. of the Indus, with which it communicates by a canal (see map of N. India, ref. 5-A). It is an entrepôt for transit trade between the Bolan Pass and Karachi. Pop. (1891) 42,004.

Shiko'ku: the third in importance of the islands forming the empire of Japan; between lon. 132° and 135° E. and lat. 32½° and 34½° N.; area, 6,855 sq. miles. The mean temperature is about 59° F. The island comprises the provinces of Tosa, Awa, Sanuki, and Iyo. The surface is hilly, and there is no mountain over 4,600 feet high. The chief towns are Kochi, Matsuyama, Takamatsu, and Tokushima. Pop. (1891) 2,827,397. J. M. P.

Shill'aber, BENJAMIN PENHALLOW: humorist; b. in Portsmouth, N. H., July 12, 1814; entered a printing-office at Dover 1830; was a compositor at Demerara, Guiana, 1835-37, and in the office of *The Boston Post* 1840-47; was editorially connected with the latter paper 1847-50, acquiring celebrity by his "sayings of Mrs. Partington"; was printer and editor of *The Pathfinder* 1850-52; proprietor and editor with Charles G. Halpine ("Miles O'Reilly") of *The Centinel* 1850-52; returned to the *Post* 1853-56, and was one of the editors of *The Saturday Evening Gazette* 1856-66; retired to his home at Chelsea, Mass., and devoted himself to

which are regarded as of great value. He was elected president of the American Institute of Mining Engineers in 1880, and president of the American Society of Civil Engineers in 1890. D. at Homewood, Pa., May 5, 1892.

Shinshu, or True Doctrine (known also as *Ikko-* or *Monjo-shu*): a powerful sect of Japanese Buddhists, having their headquarters at Kioto, in the great *Nishi* (West) *Hongwanji* temple. Its founder was a man of good family, Shinran Shonin (1173-1262 A. D.), who studied as a lad at Hiyeizan. (See Kioto.) The Shinshu sect finds salvation in the "extinction of passion," a doctrine at once the cause and effect of salvation, which salvation is called Nirvana. The doctrine of "help from another" is also taught, and Amita, or "the boundless" Buddha, is relied upon for the completion of merits and a rebirth into paradise. In this sect there is less difference than in any other between laymen and priests, the latter being allowed to marry and to eat flesh and fish.

J. M. DIXON.

Shinto (liter., Way of the Gods): the ancient cult of the Japanese, which has scarcely a title to be classed among religions, having no moral system and no eschatology. It has passed through three phases: the early stage, when it was part and parcel of the national life, and was as much political as religious; the second stage, when it had to struggle with the powerful and profound system of Buddhism, which almost swallowed it entire; and the modern stage, when a brilliant band of literary men sought to rescue it from the obscure condition into which it had fallen. These strove to identify it with a reformed patriotism and a restored imperialism, and their views finally triumphed in the restoration of 1868. The first period may be considered to have lasted until about A. D. 550, and its history is told in the *Kojiki* and the *Nihongi*, written a century and a half later—books which may be called the Japanese scriptures, in so far as they are concerned with the creation of the race and its early history from a religious standpoint.

Probably about the year 400 A. D. the ancestral worship out of which Shinto developed was so far organized that the home was no longer deemed sufficient, and a separate temple was erected. Over it was placed as custodian, or chief priestess, a daughter of the Mikado. When Buddhism arrived from the West in the sixth century it seems to have adopted wholesale the Shinto pantheon, and all that remained distinctive of the old ritual was the *gohei*. From this era is to be dated the term *Shinto*, way of the gods, in contrast with *Butsudo*, or way of Buddha, both Chinese terms. The *gohei* (liter., august cloth or present) was originally a piece of hempen cloth hung on the sacred *sakaki* (*Cleyera Japonica*) in honor of the gods. The material was changed successively to cotton, silk, and finally to paper. In modern temples all that is visible to the eye of the worshiper is a mirror and a bundle of these zigzag paper-cuttings attached to a rod. The paper is usually white, but on occasion a succession of *gohei* may be seen—yellow, red, black, white, blue—in honor of the gods of wood, fire, earth, water, and metal respectively. The wand plays a considerable part in the divination with which Shinto became associated during the thousand and odd years of its eclipse. The god was supposed to come in answer to the worshiper's call and to possess the wand, and through it the *gohei*, the whole rite resembling closely the Shamanism of Northern Asia. The priests of Shinto seem to have made clever use of the phenomena of water boiling on mountain heights at a low temperature, and of the heat-absorbing qualities of salt, in their ordeals of water and fire. See *Esoteric Shinto*, by Percival Lowell, in vols. xxi.-xxii. of the *Transactions of the Asiatic Society of Japan*.

The Tokugawa shogunate strongly favored Buddhism, with its gorgeous ritual and magnificent temples; but a reaction toward the simplicity of early Japanese life and customs set in among native scholars, Mabuchi (1697-1769), Motoori (1730-1801), Hirata (1776-1843) being the most prominent. This movement is known as the revival of pure Shinto, and was directly hostile to the dual rule under the shogunate. Satsuma, always less Buddhist than the rest of Japan, led the restoration movement in 1868, and the result was altogether favorable to Shinto, which became the only state religion. Buddhist temples were stripped, "purified," and handed over to Shinto keeping. The revived religion, however, proved entirely too feeble to supplant Buddhism and quickly lost ground. "Pure Shinto," indeed, was largely the fad of scholars, for Buddhism had appropriated and assimilated almost everything that was dear to the people in their old religion.

The Shinto temple proper (*yashiro* or *jinja*) differs from the Buddhist *tera* (monastery or temple) in being that is, destitute of furniture, smaller, and usually double. The inner shrine (*honsha*) at the back contains, carefully inclosed in a succession of boxes, the sword (if a male deity), or mirror (if a female), which is jealously guarded as the sacred treasure of the place. With this mirror the mirror exposed to view in the outer shrine or oratory (*haiden*) has nothing whatever to do, being a loan from Buddhism. Worshippers ascend the steps in front, strike the temple-gong with a mallet provided for the purpose, smite or rub their hands together, and then depart after throwing some coins on the floor. The entrance to the temple is a torii, or sacred arch. Shinto morality is practically a Rousseau-like following of natural impulses, and proclaims neither heaven nor hell; its priesthood is not a caste, nor wholly devoted to a religious life; it is largely a form of hero-worship, and intensely national; and its chief deity is Amaterasu, goddess of the sun, from whom the Mikado traces his descent.

Other deities are Susano, a kind of Mars, presiding over the moon; and his daughter Uga-no-mitama, popularly worshipped as Inari, the goddess of rice. Most of the deities appear to be deified human beings. See article on Inari for Japanese mythology, the *Introduction to the Kojiki*, and *Transactions of the Asiatic Society of Japan* (vol. x.), and various articles in these *Transactions* by Ernest Satomura. J. M. DIXON.

Ship-building: naval architecture, or the art of designing and constructing vessels for navigation, and more particularly the larger vessels, or those which carry naval forces, whether intended for war or for commercial purposes. It is impossible to state with any degree of accuracy the origin of the art, or the portion of the globe in which ship-building originated. Among razor-knives found in Denmark, belonging to the "bronze age" in Europe, are several with representations of the hulls of galleys which compare favorably with those of ancient Rome. The Phœnicians were the greatest commercial people of ancient history, and, instructed by the Egyptians, seem to have been the first to make material progress in the construction of vessels. Among the paintings in the tomb of Rameses the Great is a representation of a naval combat between the Egyptians and a people supposed to be Phœnicians, whose ships are propelled by sails. A biblical reference to the power of Tyre, capital of Phœnicia, describes its vessels and their construction: "The planking being made of the fir-trees of Senir (Hermon), the masts of cedars of Lebanon, the oars of the oaks of Bashan, the rowing-benches of ivory, and the sails of fine linen of Egypt. Reference is also made to mariners, pilots, captains, and men of war, showing the progress made in the art of ship-building and navigation. A peculiar feature in the construction of the ships of the Egyptians was the planking, which was about 3 feet square, and was laid overlapping, like shingles upon a roof, being fastened to the ribs or frames by wooden tree-nails. According to Herodotus the Nile vessels were fitted with rudders at the stern, thus antedating the application of that invention to sailing vessels by several centuries. The vessels of the Phœnicians served as models to the Greeks, whose ships of the height of their civilization, show a marked resemblance to those of the dwellers in Tyre.

Ship-building in Europe.—The nations of the north of Europe developed a class of vessels which, from specimens found buried in mounds in Scandinavia and Denmark, show a remarkable knowledge of the forms of least resistance, together with the strength of materials and their proper distribution, and suggest that the influence of the Phœnician ship-builders had in some way penetrated to the north of Europe.

Cæsar, in his history of the campaign against the Veneti in the year 54 B. C., states that their ships were built of tire of oak, and designed to endure the force and violence of the tempests; the rowers' benches were fastened by iron spikes; instead of cables, they secured their anchors with chains of iron. A Roman ship of the time of Trajan, sunk in Lake Ricciola, was raised after more than 1,300 years. The planking was of pine and cypress, covered on the outer side with sheets of lead fastened with copper nails.

The Greeks and Romans had a peculiar method of girding their vessels with long hempen cables, which, passing through holes at the stern-post, continued all around the vessel fore and aft immediately under the wales; as the hulls were undergirded transversely in the same manner

the buoyancy of the water acting in an opposite direction through a point which is the center of gravity of the volume of displacement, called the center of buoyancy. When the vessel is at rest in an upright position the two points lie in the same vertical plane. The position of the center of buoyancy is calculated about two axes—one taken at the load-line and the other at the mid-length of the vessel. In order that the vessel may float at a given draught at the bow and stern, the center of gravity of the vessel in a fore-and-aft direction must lie in the same vertical line with the center of buoyancy of the immersed body. When these points are thus located the vessel is said to be in trim and proves the correctness of the designer's calculations, for in order to ascertain with accuracy the position of the center of gravity of the vessel the weight of each particle that goes to make up the entire vessel must not only be calculated, but also its moment about some point in the length taken as an axis. In a similar manner, the vertical center of gravity must be determined in order to ascertain its distance, called the metacentric height, below the metacenter of the vessel. The metacenter is a point above the vertical center of buoyancy at a distance equal to the moment of inertia of the load-water plane divided by the volume of water displaced. The metacentric height is a measure of the initial stability of the vessel, but not of the range of stability. (See *HYDROSTATICS, Stability of Floating Bodies*.) For good easy behavior the metacentric height should not exceed 3 feet, and for safety not be less than 18 inches, provided that the vessel has a reasonable amount of free-board or height out of water. There are many other calculations that can be made in regard to the stability of the vessel in various conditions of load or when some of the compartments are filled with water.

The plans necessary to give a clear idea of the design are given below, but these must be supplemented by detail plans of the principal parts of the vessel: 1. Plan of lines, or half-breadth and body plan. 2. Midship section. 3. Profile in-board. 4. Deck plans. 5. Cross-sections. 6. Sail plan.

The plan of lines shows the form of the vessel, and is in reality the "traces" of planes taken at right angles to each other throughout the ship. From these the shape of the vessel is laid down full size upon the mould-loft floor. The midship section is taken at the mid-length of the vessel and shows the character of the framing, the disposition and thickness of the plating of sides and bottom, decks, bulkheads, stringers, etc., in fact, all the parts upon which the strength of the vessel depends. If the vessel is not built according to the rules of one of the insurance companies, plans and calculations showing the strength of the structure must accompany the application, and this involves considerable mathematical investigation, for the ship must be taken as a girder, and the maximum stresses the material is subject to calculated for the top and bottom flanges of the girder. The inboard profile gives the location of the principal weights in a fore-and-aft direction, the spacing of the frames, the location of bulkheads, the distances between the decks, the position of cargo hatches, and the portions devoted to cargo, coal, passengers, crew, etc. The deck plans and cross-sections show the general arrangement of the deck framing and plating, and the arrangement of the cabins and passenger accommodations. The sail plan gives the general outside appearance of the vessel, with the amount of sail carried, the height of masts, etc. The many questions of handling cargo quickly and effectively, of steering-gear for controlling the vessel, providing sufficient sail-power to prevent the vessel falling off in the trough of the sea when the machinery is disabled, the working and stowing of lifeboats, give the designer occasion for the careful application of scientific and experimental data. The work involved in the preparation of the design for a war-vessel is of a much more complex nature. The features of speed, armament, protection, accommodation, and endurance are so thoroughly interwoven and depend so much one upon the other that the emphasizing of any one feature must be at the expense of some of the others. Thus the most thorough and scientific investigation must be made of the vessel in all its features to enable the maximum of efficiency to be attained in the ship as a whole.

Laying Down.—The form of the vessel or the lines having been determined in the draughting-room, the frames or ribs are next drawn full size upon the floor of a building known as the mould-loft, in order that moulds or scurve-boards may be made, to which each frame is shaped or bent. To facilitate the work in the loft, the ship is divided into two parts called the fore and after bodies, being divided by

an imaginary line amidships, or a point near which the curvature of the lines is reversed. On the bodies are laid off the edges of the plating, the line of the stringers and keelsons, the undersides of the decks, the outline of the floors, etc. For the wooden vessels the moulds represent the shape and taper of the frame timbers. Pieces of timber are then selected and worked exactly to the moulds, their edges beveled to conform to the curvature of the vessel taken from the mould-loft floor, and the joints or butts carefully doweled together. For metal vessels the moulds are made to show the shape of the outer edge of the frame and the line of the floors; the object in thus moulding, shaping, and bending the frames is to have them their true shape, so that when put together they shall form the outlines of a vessel, agreeing with the plan of the naval architect, and giving, when the planking or plating is fastened to them, the complete outline of the hull. While this part of the work is going on, the shipwrights are preparing the foundation and laying the keel-blocks upon which the vessel is to be built.

Ordering Material.—For convenience in ordering the material of an iron or steel vessel an exact model of it is made in wood on a scale $\frac{1}{4}$ th or $\frac{1}{8}$ th of full size; on this model are marked off the stations or the frames, the deck-lines, the edges of the plating and stringers, and the plates laid off in their proper lengths so as to have a proper shift of the butts or joints. The dimensions of the frames and plates are then measured from the model, and after verification as to width in the loft are sent to the mills. An allowance is made for machining the plates, or such of them as form the outer strakes, for the inner strakes are often placed on the ship without planing the edges, the ends only being machined in order to have close joints for calking metal to metal.

Keel-blocks.—As the entire weight of the vessel must come upon the keel-blocks, it is essential that they shall have a very firm foundation, such as piling or concrete; they generally slope lengthwise toward the water, and are placed about 4 feet apart from center to center. Each block is built up of several pieces of timber, the bottom pieces often of sufficient length to serve as a foundation upon which to build up the supports of the launching ways; the upper pieces are in some yards so put together as to permit of being removed from under the keel without splitting, while in others the removal of the blocks is effected by splitting out the cap pieces. The blocks are generally given an inclination to the foot of from five-eighths of an inch in heavy vessels to three-quarters of an inch in light ones, to facilitate launching.

Keel.—The first operation, be the ship of wood or metal, is to place the keel upon the blocks; if the vessel is of metal the keel may be constructed after one of several methods. The bar-keel consists of a plain bar in suitable lengths with scarfed butts, the plating of the garboard strakes being flanged or turned down against the bars, and riveted through and through. Another variety is the side bar-keel, which is built up of three parts, the middle piece extending above the keel proper to a depth equal at least to the floors, and the garboard strakes being riveted through in a manner similar to that employed with the ordinary bar-keel; this is one of the strongest of keels, and also one of the most costly. Another variety, and one that, in these days of cellular or double-bottom construction, finds general acceptance, is the flat keel; this consists merely of flat plates bent to shape. If the keel laid is a bar-keel of either type, the garboard strakes are at once put in place to afford a landing for the frames. The stem and stern post are set up, and, if the vessel is of wood, the deadwood and other pieces in the center line are bolted in place.

Stem and Stern Post.—The stem of a metal vessel is usually a simple forging rabbeted to receive the ends of the plating—that is, a recess is cut in it on each side so that the plates may end in it and form a fair and flush surface. The stern-post, if of a single-screw vessel, is quite an elaborate forging, although of late years castings of steel have been substituted for forgings with great success. The post is made up of two parts in one, first the post proper on which the plating ends, and through which the screw-shaft passes, forming incidentally a part of the stern bearing, and second the rudder-post or the support of the rudder; the two connected form a continuous frame about the propeller. In twin-screw vessels the stern frame is scarcely less elaborate, for provision is usually made for heeling thereon the shaft brackets or struts which support the screws. The frame must also receive the ends of the hull-plates and support the rudder.

Frames Forward.—In wooden ships the frames are raised up, and usually fastened to the keel, and are set at right angles to the keel, except that at the ends they are placed across on the outside planking. These end timbers are called "ends," and are adjusted at their heels to mortises cut in the deadwood. In iron vessels of the plating class the frames and floors are often riveted up entire upon the keel, and each raised to their place upon the keel or garboard plates, but first the frames and floors must be bent to shape, and this is done as follows: The frames are usually in three or four parts in one length, either of single box, single sole, channel, or Z bars. The long bars are placed in a furnace especially arranged for this purpose, and heated until they can be readily bent to the shape of the mould, which has been worked off upon the landing slide; the ends are of cast iron, from 3 to 4 inches thick, perforated with square holes already set, and arranged so as to form a smooth floor of sufficient size to accommodate the largest frames, and give room to the workman. In the square holes, iron stops are placed, agreeing in contour with the shape of the mould; the bars after being heated are forced back against the stops and at the same time bent to conform to the levels taken from the moulded-off floor. After cooling, holes are punched by the rivets used in connecting the frames with the floors, side plating, beams, etc.

The upper ends of the frames are held by crosspieces of plank, called spalls. Each frame is adjusted so as to be exactly perpendicular to the keel, and is held in place at the top by strips of timber called rib-bands, which have been prepared from measurements taken from the loft, and the proper positions of the frames marked thereon. The rib-bands and frames are shored up to keep them in position until the inner strakes of plating are on.

Main Keelson.—The main keelson is then placed upon the beams directly over the keel, if of wood, it is fastened through floors and keel, but if of metal it is riveted to the beams, they in turn being riveted to the outside plating. This keelson serves to keep the floors from tripping and enforce the stress-resisting element of the vessel.

Double-bottom Plating.—A much better disposition of the material, on the same weight, is known as the cellular construction, or double-bottom system; on this system are constructed nearly all of the large and magnificent vessels engaged in the transatlantic trade, and nearly all war-vessels. The frames in the double bottom, or the space between the inner and outer skins, are made up of short frames and braced plates somewhat like the latticework of bridge girders, between the keelsons or longitudinal, so that the reaction of the longitudinal and transverse framing must be carried on together; outside of and above the double bottom the raising of the frames is substantially the same as described above.

Setting on Planking or Nailing.—Before the planking is put on the vessel the sheer lines at side and the normal lines or spilloings of the bottoms are marked on the outside surface of the frames; the spilloings are found by fastening a board, square, and straight-edged battens to the frames in such a manner as to cross the midship frame at right angles; the battens will then assume a line at all points normal or square to the frames of the ship. These lines are laid off at intervals of from six to eight inches or wider of planking. The boards are worked either in parallel strakes or in combination of two strakes with the alternate edges straight. This is sometimes called the "anchor-stroke method," the object being to have the narrowest portion of one strake always opposite the widest portion of the other. The battens of the plank are shifted so as to have at least three strakes between centers in the same frame space. The strakes next the keel, called the garboard strakes, and those at the heads of the beams are made thicker than the balance of the plank, in order to have the greater amount of material at the parts of the vessel where the greatest strains are experienced. Before the planks are placed in position the frames are often bound together inside and strapped diagonally by iron bands 2½ to 3 inches wider than the frames are bound longitudinally by the planking and ceiling and diagonally by the beams. In metal vessels the plates forming the outside skin are worked to lengths from 12 to 20 feet, and in widths varying from 24 to 30 inches. Templates are constructed from the loft, giving the exact size of the plates with the position of the rivet holes marked thereon; the plates are then planed to the required sizes and the rivet-holes punched and countersunk, and are then ready to be put in place. The bulkhead strakes are placed in position first and bolted up. Tem-

plates of the rivet-holes in the edges are taken off for the outer strakes in order that the holes in the inside and outside strakes may exactly coincide for riveting. The necessary holes for the stringers and keelsons are also punched at the same time. As the finished surface of the vessel beneath the water must be smooth and free from all projections, the rivets that pass through the plates are bent down to a conical head to fit counterbores in the outer surfaces of the plates.

Deck Beams.—The beams not only serve to carry the deck and its load, but are also struts and ties which prevent in a certain measure the ship's sides from collapsing; it is very necessary therefore that they shall have great connection with the frames and the outer skin. In wooden vessels the beams are made in one length, if possible, but are sometimes built up, that is composed of several pieces of timber securely worked and bolted together. The beams rest at their outer ends upon clamps, which are thick plates of plank running fore and aft on the inner side of the frames, and are securely fastened by means of vertical knees to the framing and planking. They are also braced in a longitudinal direction by smaller knees placed horizontally. The whole structure—beams, knees, clamps, frames, and planking—is thoroughly bolted and clamped together.

In order to give the beams strength to resist deck loads, and at the same time throw the water in the sides, where the waterways are loaded, they are slightly arched; the arch is called spring or round.

The beams of metal vessels are usually formed of iron or steel rolled to shapes known as T or angle bars. They vary in weight and in depth from 4 to 15 inches. The lengths are taken from the plans and ordered in one piece for each beam, with the proper round or spring. The beam so ordered is slightly longer than the distance from side to side of the ship, to allow for turning down the lower half at the ends to form knees through which they are fastened to the frames. The method of forming the knees is to split the beam for a slight distance at each end, midway of its depth, and turn down the lower half upon a former; a piece of metal is then welded in to connect the upper and lower parts. After the beams are in position the spalls can be removed from the frames, leaving the space between decks free for the workman. In framing the decks the beams are arranged to allow of the boilers and machinery being lowered to their beds without disarrangement of the deck-plating; provision is also made for the cargo-hatches, mast-partners, and other openings.

Inner Skin or Ceiling.—In wooden vessels the ceiling and the thick strakes and keelsons form a complete lining to the vessel, worked on the inner side of the frames. In metal vessels the inner skin is more often called the inner bottom, and is worked only when the vessel is constructed on the cellular system. It is usually placed from 8 to 24 feet from the outer skin, to allow ready access for thorough inspection, cleaning, and painting. It is worked on the upper side of the bracket frames very much in the same manner as the outside plating is put on. For structural purposes the inner bottom enters largely as a factor of strength. Many freight-vessels, oil-steamers, and colliers are provided with inner bottoms, the space between the inner and outer bottoms being used as tanks for water ballast.

Bulkheads.—At certain positions throughout the ship are located water-tight partitions or bulkheads; those in the middle portion of the vessel are necessarily determined by the arrangement of the boilers and machinery, but every effort is, or should be, made to allow at least any two of the compartments bounded by the bulkheads to be filled with water without endangering the stability of the vessel. The foremost bulkhead of all is called the collision bulkhead, and is located half the maximum breadth of the vessel from the bow. This bulkhead is especially stiffened and braced to withstand the pressure of the water against it in case of injury to the ship forward of it. In metal vessels bulkheads have two functions to perform: one to serve as a structural tie uniting the sides of the vessel, the other, by far the more important, to confine the inflow of water in case of damage to the compartment injured. The pressure per square inch due to a head of water of 25 feet is about 11 lb. Very efficient stiffening must be provided to enable the plating to withstand such pressure. The best method of construction is to have the plating worked horizontally, with heavy vertical stiffeners bracketed at the heads and heels. The stiffeners may be of rolled shapes or built up of plates and angles, as the depth and width of the bulkhead may

require. In addition to the vertical stiffening, horizontal webs are sometimes worked on the opposite side of the bulkhead, with their ends securely bracketed to the ship's side.

Decks.—The upper deck, to which is carried the full scantling of the vessel, plays a very important part in the structural strength. The arrangement of the material subject to longitudinal stress may be compared to a beam of which the upper deck is the top and the keel the bottom flange, the outside plating forming the web of the beam; therefore in vessels of large size this deck is plated completely over in order to secure for the top flange of the girder the proper sectional area. On the ends of the beams are worked stringers of heavier plating than the balance of the deck-plating, making good connection with the sheer strake by means of heavy angle bars; the space between the stringers is filled in with plating as required. In wooden vessels the strength at the deck is made up through the waterways, thick strakes, and clamps, which are strong pieces of timber or plank running longitudinally.

The remaining decks of an iron vessel are worked in a manner similar to the upper deck. Where the frames pierce the plating staple-angles are sometimes worked about the frames to make them water-tight. Deck beams should be supported by stanchions; so far as possible these should be in the midship line, but for convenience of staterooms and deck arrangements they are sometimes worked two to a beam, and placed beside the joiner-work bulkheads.

Fastenings.—The fastenings of a wooden vessel are composed of copper and iron bolts, iron spikes, and treenails of wood. The plank is fastened generally by spikes or treenails, except at the butts, which are bolted. For additional security the frames, outside and inside planking, are often fastened together by through-bolts, driven from the outside and riveted on washers against the inside of ceiling. The deck plank is usually fastened by spikes. The fastenings of a metal vessel consist almost entirely of rivets, which are hammered into place while hot.

Calking.—When the planking is fastened the seams or slight spaces between the edges of the plank are filled with oakum, and this is driven in with great care until it is as hard as the plank. To hold the oakum the planks are laid with a slight bevel outward, about $\frac{1}{16}$ th of an inch for each inch of thickness of plank; otherwise the oakum would be easily forced through the seam. An improved method is to cut a recess in the edges of the plank about midway of the depth, so that the oakum will spread into the recess and render it impossible to be driven through. After the calking the seams are paid with hot pitch or marine glue. In metal vessels all water-tight work must be calked metal to metal, that is, a slight layer of metal must be driven over against the adjacent metal until the joint is absolutely tight. This work was formerly done entirely by hand; now a calking-tool operated by compressed air or electricity is used, the blows being given with great rapidity.

Launching.—The vessel has been built resting upon the keel-blocks and shores; while here the shafting and propellers have been put in place, the rudder hung, the bottom painted, and all work below the water-line on the outside surface finished. Now the vessel is to be transferred from the fixed keel-blocks to a movable platform which shall allow the vessel to move easily and without damage into the water. This is done by building on each side of the vessel, about one-fourth of the breadth of beam from the keel, a platform or foundation to which the weight of the vessel shall be transferred. In laying the keel-blocks the bottom pieces were made of sufficient length to allow of their forming the foundation for this platform. On these are built up the groundways, which are shored to prevent spreading and are capped with strong pieces of timber, 3½ to 4 feet wide, with smooth upper surfaces; on these are laid the bilgeways, which are also large smooth pieces of timber, free to slide with the vessel; on the bilgeways are constructed the cradles, which are fitted to the ship's bottom; between the cradles and the bilgeways are fitted rows of long wedges of such thickness that when driven up the vessel will be lifted from the keel-blocks, and the weight brought to bear on the groundways. The upper surface of the groundways and the bottom surface of the bilgeways are coated with tallow, and the bilgeways secured to the groundways by pieces of plank at the bow so that they can not move until they are sawn asunder. Then the wedges are set up until the keel-blocks can be removed and all clear for launching; when all is clear, the planks at the bow

are sawn off, and the vessel, resting only on the greaser surfaces, begins slowly to slide down the inclined plane. She soon gains headway, and in a few seconds is in the water. After launching, the fitting of the joiner work and cabins, the putting together of the machinery, stepping and securing the masts and rigging of the ship, are proceeded with until the vessel is complete in all respects.

PHILIP HICHBORN.

Ship-canals: canals intended for the passage of ships proper; hence, therefore, canals to connect sea with sea, and thus by a short cut to obviate a long ocean navigation. Such canals are usually laid across an isthmus or peninsula. The Suez Canal is an apt instance; so also are the projected canals across the Central American isthmus and the isthmus of Florida. The CALEDONIAN CANAL (q. v.) of Scotland is an instance of a class of minor ship-canals. In another sense ship-canals are those proposed to connect routes of natural navigation (rivers or lakes), by allowing a passage of the vessels, whatever they may be, used in such navigation. To this class belong many of the works described in the cyclopædia under separate heads—e. g. the ILLINOIS AND MICHIGAN CANAL (q. v.); see also the article CANALS.

The importance of a navigable connection between the Atlantic and Pacific Oceans through the isthmus which connects North and South America calls for a condensed view of the chief plans proposed at different dates, and of the natural obstacles baffling them all up to the present. From the era of the Spanish conquest of America the search for the secret of the supposed natural strait was carried on along the whole coast-line of the two continents; and when this ceased, the possibility of the construction of an artificial route began to be discussed. Governments, companies, and individuals have devoted much time and money to the search for a practical route for a ship-canal. Tehuantepec, Honduras, Nicaragua, Chiriqui, the Isthmus of Panama (or Darien), and the Atrato river, have all figured in connection with this question, and a full statement of the various surveys and projects made prior to 1866 will be found in the report of the superintendent of the U. S. Naval Observatory (Admiral C. H. Davis), made in compliance with a resolution of the U. S. Senate (*Ex. Doc.* 624th). See also *Engineering* (London), in a series of articles entitled *The Nicaragua Canal* (Feb. 24, 1893, *et seq.*).

The results of the surveys since 1875 of the American isthmus for ship-canals and their substitute, the ship-railway, will be found under *Nicaragua Canal* and *Panama Canal*, below, and in the article SHIP-RAILWAYS. Since 1875 important results at both Nicaragua and Panama have proceeded from efforts to construct the canals. The remaining projects have ended either in surveys and estimates, or in lapsed concessions from the governments on whose territory the canals were to have been constructed.

Panama Canal.—Across the Isthmus of Panama occurs, next to Nicaragua, the greatest depression yet found on the isthmus, the summit-level of the railway being 287 feet above sea-level. The route from Porto Bello or Chagres to Old or New Panama has been the established line of communication since 1658, nearly coeval with the first settlement in America. A survey was made in 1843 by the French engineer, M. Garella (*ingénieur-en-chef des mines*), of which the report was printed in the *Journal of the Franklin Institute*, and in the French *Journal des Ponts et Chaussées* (1844). George M. Totten, chief engineer of the Panama Railroad, subsequently made an estimate for a canal with locks, to cost from \$60,000,000 to \$115,000,000, according to the summit-level adopted. The survey was renewed by the U. S. Government, by Commander E. P. Lull, U. S. navy, resulting in the location of a practicable line for an interoceanic ship-canal, 26 feet deep, from the Bay of Aspinwall on the Caribbean Sea to Panama on the Pacific.

In 1879 Count Ferdinand de Lesseps made an appeal to the several nations to send delegates to a proposed congress to meet in Paris, to decide upon the route and the plan for an interoceanic canal between the Atlantic and Pacific Oceans through the American isthmus. On May 15 of that year the congress met in Paris. Twenty-four countries were represented. Count de Lesseps was elected president. The congress decided that a canal with a constant level was desirable, and that this canal should be by way of Limón Bay to Panama.

Immediately after the adjournment of the congress the Universal Interoceanic Canal Company was organized under

the French law for building the canal under a commission previously granted to Louis X. B. Wyse by the Government of Venezuela, and sold by him to Count de Lesseps.

The total length of the canal as projected is 46 miles; the lowest carrying float in the Colaba is 440 feet. The route is a goodly follow-up of the Panama Railroad. The dimensions of the canal are as follows: The breadth at the bottom is 22 to 24 meters (72 to 78 feet); the breadth at the surface of the water, 25 to 60 meters (82 to 195 feet); depth, 8 to 9 meters (26 to 294 feet). The curves on the canal are to have a minimum radius of 2,000 meters (6,560 feet). The greatest obstacle to be overcome on the Atlantic side, was in construction, maintenance, and operation, is the Chagres river. It was the original intention to dam back the river and carry the floods to the sea by an artificial channel along the slopes of the mountains, but the great cost and doubtful practicability of the plan led to its abandonment.

The canal, if built according to the original design, would require a tide-lock at Panama, where the ordinary range of tide is 19 feet. During storm-tides the range is much greater. The materials in general to be excavated are, on the mountain and valley of the Chagres river, a very fine alluvium in which is but little mineral soil; elsewhere, solid rock, clay mixed with magnesian, with tufa (or compressed volcanic ash) in the Cerro Chagres. From Colaba to Panama the route is through pyroclastic rock, sandstone, tuff, and conglomerate. The total amount of materials to be excavated in the canal proper, according to the original design, is 140,000,000 yards, and, with the last cut for the Chagres river, not including those required for the Chagres dam at Gamboa, is 150,000,000 cubic yards, or a total of 150,000,000 cubic yards.

The original estimate made by the Panama Canal Congress was \$600,000,000 francs = \$120,000,000. At the close of the year 1888 the amount expended, not all on the actual work, however, was 1,000,000,000 francs, equal to \$200,000,000. It was necessary to raise much more money, as there was at that time not more than one-third of the whole work completed. It was found impracticable to raise this money except by a lottery loan, but this scheme failed, and work ceased on the isthmus in 1893. A commission sent out by the French Government reported that it would cost \$242,000,000 to complete the canal. The canal was thrown into the hands of a receiver, M. Montheilant being appointed by the Government as liquidator. In 1896 he estimated that it would require to complete the canal at sea level three milliards of francs, or about \$600,000,000.

Nicaragua Canal.—The Nicaragua route follows the most direct marked depression of the American isthmus, and has the natural advantage of the great lake of the same name as a waterway. It would perhaps be more directly in the water's highway than the Panama route. A route for a proposed canal was in 1850 surveyed by Orville Childs, C. E. This report will be found in the *Journal of the Franklin Institute*, June, 1870. A Government survey was also made by Lieutenant Edward P. Lull, U. S. navy.

In 1870 a commission was appointed by President Grant to examine the reports of the various isthmian surveys. After an examination of all the routes they reported and estimated the cost of construction, including the harbor improvements, at at least \$100,000,000. Other estimates were made by Maj. Walter McFarland, U. S. A., \$140,000,000, and of A. G. McLeod, C. E., U. S. N., \$40,919,839. A congressional committee which investigated the subject and the estimate of Mr. McLeod placed the total cost at \$162,981,124.

Commissions have been given to various companies by the Nicaraguan Government. The first given to a U. S. company was that called "The Vanderbilt concession of 1840." This was abandoned in 1850 on account of the non-fulfillment of the company of the conditions of the concession, but in 1870, by another administration, the concession was renewed, to be abandoned only upon the decision of arbitrators who have yet not been appointed. The concession of 1849 and the complications that existed, particularly on account of Britain's formal Britain to the territory at the northern terminus of the canal, led to a treaty (still in force) between the governments of the U. S. and Great Britain, called the Clayton-Bulwer Treaty of April 19, 1850, which in Article I. says: "The governments of the U. S. and Great Britain have declared that neither the one nor the other will obtain or maintain for itself any exclusive control over the said canal." On Jan. 19, 1899, a bill was introduced in the U. S. Congress to incorporate the Maritime Canal Company of

Nicaragua under a commission granted by that Government. This bill became a law on Feb. 20, 1899. In the meantime the Nicaragua Canal Construction Company was incorporated under the laws of the State of Colorado. This latter company contracted with the canal company to complete the surveys and construct the canal. In June, 1899, the preliminary work on the construction was begun. Before Oct. 1, 1899, over \$2,000,000 had been expended, as certified by the Nicaraguan Government commissioners, the concession requiring this expenditure within three years after the acceptance of the work.

The route which was finally located and on which work has been begun is from Greytown, on the Atlantic to Brito, on the Pacific, 169½ miles apart. In detail, the line of the canal extends from Greytown in a southeasterly direction 67 miles through the low grounds of the heavily wooded plains and swamps. The cross-section of the canal here is to be 190 feet wide at bottom, 288 feet at surface, and 29 feet deep. Lock No. 1 will have a lift of 31 feet; dimensions of lock, 650 feet by 80 feet. Lock No. 2, 14 miles from No. 1; lift, 30 feet. Lock No. 3, about 2 miles from No. 2; lift, 40 feet. About 3 miles from No. 3 is the "Eastern divide" cut, 20 miles long; summit depth of cut, 238 feet; average depth entire length of cut, 141 feet; material mostly rock; dimensions of the cut, 80 feet at bottom, 80 feet at surface, with 2 to 1 slopes above water; depth of water, 30 feet. The route from the divide cut is through the basin of the San Francisco river. It is a tributary of the San Juan and flows across the axis of the isthmus. It and all other openings are dammed up to make an impounded reservoir, or lake, extending from the divide cut 12½ miles to the main San Juan at Ochoa, where the river is to be dammed by an immense work of loose rock, to be raised from the divide cut. This dam is to be 70 feet high, 1,900 feet long, and it will raise the water above it to a level of 104 feet above the sea, and this will raise the level of Lake Nicaragua from 103 feet, its present level, to 110 feet above the sea.

The San Carlos river now discharges into the San Juan above the dam site, and the lower reach of this river must be dammed also. From 6 to 8 miles of embankments are required, some of them 60 feet high, to impound and hold the waters.

Several waste weirs, or sluices, to relieve the basin of excessive flood waters, are provided for in the plans. These dams and embankments will make slack-water navigation from lock No. 3 to the lake.

Considerable dredging is required in the river channel, especially near the lake, for about 30 miles. It is then necessary to dredge 20 miles out into the lake, as the shore has a very flat slope. On the opposite side of the lake submarine rock dredging is required for 9 miles. The depth from shore to shore of the lake is to be 39 feet. From the Ochoa dam to the west shore of the lake the distance is 121.04 miles, the lake being 564 miles wide. From the lake to the Pacific the distance is 17.04 miles.

There are three locks, Nos. 4, 5, and 6, located near each other. Their lifts are each 42½ feet, No. 6 having a variable lift on account of the fluctuations of the tides of the Pacific.

The harbor of Greytown before 1855 was a good and capacious port. Drifting sands have closed up its connection with the sea and only a shallow lagoon exists, with its entrance practically closed to navigation. The work of restoration has been attempted by building a jetty out from the shore about 1,000 feet and dredging a channel under its protection, which (1895) has about 12 feet depth. The work thus far executed is some dredging on the axis of the canal by the great Panama dredges, which were purchased and taken to Nicaragua, and the construction of several miles of the ordinary railway, to be used as an auxiliary to the canal work; also some clearing in advance of the work and a telegraph line for some distance.

At Brito, on the Pacific, is an open roadstead which must be inclosed by heavy stone dikes, or breakwaters. The cost of the entire work, estimated in May, 1889, by the commission of civil engineers employed for the purpose by the construction company, is \$87,799,570. On account of financial difficulties the work was suspended in 1894.

Florida Ship-canal.—The U. S. Congress has made a number of appropriations for surveys for a Florida ship-canal. Four routes have been surveyed under the direction of the Secretary of War; these surveys were made in 1824, 1855, 1856, and 1878-79. A survey was made by the city of Mobile in 1872, but with the exception of dimensions on the subject nothing has been done for some time to pre-

note the undertaking. For a full history and complete statement of facts see the *Florida, Atlantic, and Gulf Ship-canal Company*, published in New York (1881); also report of Gen. Quincy A. Gillmore, in the annual report of the chief of engineers U. S. army (1880).

Cape Cod Ship-canal.—To shorten the distance and avoid the dangers of navigating around Cape Cod a proposition for a ship-canal between Barnstable Bay on the north and Buzzard's Bay on the south has been brought forward. Probably the best route follows a natural depression between Sandwich on the north coast and Monument, at Buzzard's Bay, on the south, a distance of about 8 miles. At an earlier geological period this depression was a sea-channel separating Cape Cod from the mainland, and it is so low even now that within the nineteenth century the storm-tides have met each other.

Many examinations, surveys, and reports were made from 1776 to 1878, when Clemens Herschel, C. E., made an exhaustive report on the subject, and estimated the cost of a canal and jetties with a depth of 18 feet at mean low water, and a width of 111 feet, at \$2,000,000 in cash.

Although the State Legislature has granted many charters to different companies, yet very little actual work has been done on the construction of the canal. There are (1895) several bills for charters before the present session of the Legislature.

Suez Canal.—According to Diodorus Siculus (B. C. 60) there was a canal from the Gulf of Pelusium (not far from the present terminus of the canal) to the Red Sea. It was begun by Necos, continued by Darius, and finished by Ptolemy II. The canal was said to be wide enough for two galleys to pass abreast.

For the modern canal nothing was done except to make careful surveys until 1849, when the project of a ship-canal was finally taken up, to be carried through by Count Ferdinand de Lesseps. After the route had been carefully surveyed and favorably reported on, the Viceroy of Egypt granted the first concession to M. de Lesseps in Nov., 1854. At Constantinople, where de Lesseps had an interview with the prime minister, the project was favorably received; but through the interest of the representative of Great Britain, Lord Stratford de Redcliffe, the sanction was not given. In order to place the subject prominently before commercial nations de Lesseps wrote to the principal foreign ministers, asking that they would name engineers of high rank, and would secure their uniting in a commission to examine the routes for a ship-canal. The commission met and appointed a sub-commission to prosecute the study of the proposed route on the ground, which they did, and presented to Said Pasha a preliminary report dated Alexandria, Jan. 2, 1856. The commission rejected the plan for an indirect canal from Alexandria as "inadmissible from a technical and an economical point of view," and reported in favor of a direct route, making an estimate of 200,000,000 francs as the cost of the work. A second concession was given on Jan. 15, 1856, the terms of which were designed to satisfy the opposition which had already begun in Great Britain, and to guarantee fair returns to the stockholders who might invest. The viceroy made an official declaration for himself and his successors, subject to the ratification of the sultan, that the canal and all its ports should be open at all times as a neutral highway to every merchant ship passing from one sea to another, without any exclusive distinction or preference to persons or nationalities. The statutes which were to govern the company fixed its capital stock at 200,000,000 francs.

The Egyptian Government engaged to furnish a contingent of the fellaheen, and the work was at once begun. The location of the northern terminus of the canal was changed from Pelusium to Port Said. The first work on the canal was at this terminus, and was begun on Aug. 25, 1859, by de Lesseps in the presence of about 150 persons. For a description and illustration of the artificial harbor at Port Said, see HARBORS.

From Port Said the distance across the isthmus in a direct line is about 70 miles. The length of the canal is 100 miles, of which over 60 per cent. is through shallow lakes. The material excavated was usually sand, but in places it was necessary to blast through strata, 2 or 3 feet in thickness, of solid rock. The total excavation was 80,000,000 cubic yards.

On account of the complications with Great Britain and its opposition to the construction of a canal, obstructions were placed in the way of the work from time to time which greatly delayed its completion and increased its cost. The

most important result was the withdrawing of the fellaheen from the work by peremptory orders from the British Government to the viceroy. Although the work was delayed by this, it served to bring into use a much more extensive plant of machinery, specially constructed to perform work hitherto done by men. The appliances thus used were various and very efficient. With them the contractors excavated 50,000,000 cubic meters, with the assistance of less than 4,000 men and in the space of less than five years. The work was all performed in daylight.

The canal was formally opened by vessels from nearly all the maritime nations of Europe on Nov. 17, 1869. The canal at that time was in a very imperfect state, not being fully completed in width and depth, but the company has since finished the work and maintained the depth needed. The canal has a sufficient depth and width to permit the safe passage of ships drawing 25 feet of water. The following table shows the increase in the number of ships, tonnage, and receipts:

YEAR.	Number of vessels.	Net tonnage.	Receipts from tolls and passengers.
1870.....	486	435,911	* \$569,152
1875.....	1,494	1,887,578	5,296,137
1880.....	2,026	3,057,421	7,501,627
1885.....	3,624	6,335,753	12,423,254
1890.....	3,389	6,890,094	12,482,542
1891.....	4,207	8,698,777	16,789,113
1892.....	3,559	7,149,175	14,899,175
1893.....	3,841	7,710,000	14,133,722
1894.....	3,852	8,089,108	14,770,081

* Computed at 5 francs to the dollar.

In the concession it was laid down that the maximum charge was to be 10 francs per ton "of capacity." The business of the canal became so great that it was necessary to widen and deepen it. This work is (1895) nearly completed. The new dimensions are 31-2 feet depth; bottom width, 108-2 feet; surface width, 420 feet; area of prism, 8,240 sq. feet. There are sidings—called *gares*—excavated for the passage of vessels at several points; the radius of the curves is 2,000 feet. The cost of the canal as originally completed was \$95,000,000.

The Corinth Canal.—This canal extends from the Bay of Corinth to the Gulf of Athens. It was across this isthmus that the Athenians, 300 years before Christ, hauled their triremes, which are thought to have been of about 150 tons burden. The canal saves 185 miles (342 km.) from Adriatic ports and 95 miles (178 km.) from Mediterranean ports. The average tolls are 18 cents per ton and 20 cents per passenger. The length of the canal is 3-9 miles (6,290 meters), part of which is excavated in alluvial soil and part in calcareous and granitic soft rock. There is no lock or tunnel, it being a sea-level canal. There are generally quiet harbors at each end, but jetties are (1895) being constructed for further protection. The width of the canal is 22 meters (72 feet) at bottom, and 24-20 meters to 28 meters (79½ to 92 feet) at the low-water level. The depth of the canal below low-water level is 8 meters (26½ feet). The heaviest cutting is about 79 meters (259 feet); the average cutting is 45 meters (147½ feet). The amount of material excavated was 11,500,000 cubic meters (14,453,400 cubic yards). The total cost was nearly \$5,000,000. The work was begun in 1884, but suspended at various times by financial embarrassments. It was completed so as to permit its inauguration by the King of Greece on Aug. 6, 1893, but it was not opened to navigation until Nov. 9, 1893. Owing to the slips of the canal sides, developed in the original excavation, it was found necessary to construct retaining walls for rather more than half of its length. The total amount of masonry in these walls and used in protecting the slopes of the cuttings was 165,000 cubic meters (216,000 cubic yards).

Cronstadt and St. Petersburg Canal.—This is a work of great strategical and commercial importance to Russia. The plans were matured in 1874, and work was begun in 1877. The canal and sailing course in the Bay of Cronstadt are about 16 miles long together, the canal proper being 6 and the bay channel 10 miles, and extend from Cronstadt, on the Gulf of Finland, to St. Petersburg. The available depth prior to its construction was 9 feet in the river. The canal, opened in 1890, is navigable for vessels drawing 20½ feet; its greatest width is 350 feet and its least width 220 feet; the total cost was \$9,000,000. For a descriptive and historical sketch, see London *Times*, Oct. 17, 1884.

The *Brussels Canal* in Belgium is (1895) approaching realization. This has been contemplated and argued for over 400 years. The distance by water from Brussels to Antwerp is about 32 miles, of which 17½ are on the Willemshaven Canal, now 10½ feet deep; 4½ miles on the canalized river Rupel, and 8 miles on the Scheldt. Vessels of 100 to 400 tons can now sail to Brussels, but the narrowness of the canal and locks excludes larger vessels. It is intended to deepen the canal to 24½ feet. The cost is estimated at \$5,000,000.

Manchester Ship-canal.—The city of Manchester, England, is situated on the Irwell, about 30 miles from the Liverpool bay. The canal avoids cost and delay in transshipment at Liverpool. In 1852 a plan was proposed by E. Leader Williams as engineer, and James Abernethy as consulting engineer. The terminus in the estuary of the Mersey was to be a point opposite Garston. The canal in the estuary was to consist of five training-walls. Several modifications were made in the route and plans of the canal during the various discussions that took place in Parliament. The final total estimate on the plan before that body in the spring of 1864 was £6,994,168 15s. 6d. The plan was opposed in Parliament by the Mersey docks and harbor board on the ground that it would reduce the depth on the Liverpool side at the mouth of the estuary, and as this case was sustained by James B. Esdaile, the engineers of the ship-canal changed the route so as to reach the estuary at Eastham, about 9 miles from Liverpool, on the south bank of the estuary. The necessary parliamentary approval was then obtained.

The locks for admitting vessels at Eastham (three in number) are, respectively 600 feet long by 80 feet wide, 550 feet long by 50 feet wide, and 550 feet long by 30 feet wide. The four other sets of locks between there and Manchester are of similar dimensions. The total length of the canal is 65½ miles. The total rise from the ordinary water-level of the canal at Eastham to the docks at Manchester is 80 ft. 6 in. Dividing this between the four sets of locks gives an average rise of about 15 ft. 1½ in. All the lock-gates are worked by hydraulic power. Sluices are provided on Flacey's patent. The railways and highways crossing the route of the canal have been raised by expensive constructions, so as to give a clear height of 75 feet for the vessels traversing the canal. An ordinary canal was carried across for a swinging aqueduct composed of a long iron caisson resting on a pivot pier.

The canal is excavated throughout its whole length to a minimum width of 120 feet at the bottom, and it averages 125 feet wide at water-level. The upper portion, from Flacey to Manchester, is 170 feet wide at the bottom and 220 feet at water-level. At the various locks the canal is widened considerably, and vessels can be turned there if necessary. The width adopted permits large steamers to pass each other at any part of the canal. The minimum depth of the canal is 26 feet. The sills for all the locks are placed 28 feet below water-level to allow future deepening of the canal by dredging. Extensive docks have been constructed at Manchester, and at Warrington there is one of 22 acres. The time required for navigating the whole length of the canal is from five to eight hours.

The masonry, both brick and stone, used in the locks, locks, piers, and retaining walls is of the best quality, both in materials and workmanship. The total amount in cubic yards of brickwork is 173,000, and 220,000 cubic yards of masonry. The lower portion of the dock and lock walls is made of concrete, the culverts being lined with masonry of brickwork. At the water-level granite or limestone fender stones, slightly projecting from the face of the wall, are inserted to protect the concrete facing. The deepest cutting is near Ramsey, where, for a short distance, it is 60 feet. The cutting with the largest prism is at Latchford, where, for a distance of 1½ miles, the depth averages 55 feet. The slope of the excavations varied with the nature of the soil from 4 to 1 to 2 to 1. In the lock excavations the sides are nearly vertical. The total amount of excavation in the canal and docks was about 46,000,000 cubic yards, 10,000,000 cubic yards of which was in softest rock. All this waste material from the canal was used in filling up the beds of the river Mersey which are cut off by the canal, and in raising the sea locks so as to make them available for shipping, building, and other purposes. The canal was opened for operation Manchester on Jan. 1, 1894. The total cost was about \$75,000,000. The excess over the estimated cost (\$46,000,000) was largely due to extraordinary cost of right of way. The engineer of the work was Sir E. Leader Williams.

The *North and East Sea Ship-canal* between the Baltic Sea and the North Sea, in Germany, opened June 19, 1895, was constructed mainly for military and naval purposes, although largely used for general mercantile traffic. The work was begun by the German Government in 1857. The canal is 61½ miles long, the terminal in the Baltic Sea being at Holtenau, at the harbor of Kiel. The route lies mainly through marshes, shallow lakes, and the valleys of two small rivers, the summit of the watershed being about 79 feet above sea-level. The normal water-level is that of the Baltic Sea, but there are protective locks at each end. The canal has a depth of 29½ feet below mean water. The width at bottom is 72 ft. 2 in. and the minimum width on the surface is 100 ft. 8 in. Six passing-places of ample length and width are provided. The total amount of earth removed was about 107,000,000 cubic yards, and the total cost of the canal was about \$50,000,000. K. L. CURRIER.

Ship-fever: See *TYPHUS FEVER*.

Shipley, Omer: clergyman and author; b. at Southampton, England, July 1, 1832; educated at Cambridge; was for twenty-three years a clergyman of the Church of England; was received into the Roman Catholic Church Oct. 26, 1878; edited many ascetic and devotional works; translated from Catholic authorities three volumes of religious poetry (*Lyra Eucharistica, Meditations, and Mystical*) and a number of volumes of essays by different authors (*The Church and the World, Tracts for the Day, Ecclesiastical Reform, Studies in Modern Problems, Curious Horrors*).

Revised by J. J. KEANE.

Ship-money: a tax formerly laid in England on the cities, ports, towns, and boroughs of the kingdom in order to provide and furnish ships for a navy. It was first imposed about 1097 to resist the invasion of the Danes. Ship-money was among the wrongs complained of in England in 1641, and was one of the causes which led to the death of Charles I. on Jan. 30, 1649. He was very much in need of money, and Parliament, which alone could vote him a subsidy, he would not give, and perhaps he dared not. He then undertook to levy a tax on his own authority, the so-called ship-money. Such a tax had been levied previously without any special vote of Parliament, but only in the seaports and coast-districts, and only in time of war; it was simply another form of the old duty resting on the port of the country of furnishing ships for the navy. In 1696 the king arbitrarily extended this tax to the inland counties and to times of peace. John Haverley (q. v.) was taxed twenty shillings, but refused to pay, and asked for a decision by the courts. The courts decided against Haverley, holding that the ship-money was not a tax, but in 1640 and 1641 the Long Parliament declared this exaction illegal, and the bill stating this principle received the assent of the king in Aug., 1641.

Shipp, ALBERT MORGAN: educator; b. in Stokes co., N. C., Jan. 15, 1819; graduated at the University of North Carolina 1840; became a Methodist preacher 1841, president of Greensboro Female College 1848, Professor of History and English Literature in the University of North Carolina 1849, president of Wofford College, South Carolina, 1859, and Professor of Evangelical Theology in Vanderbilt University, Nashville, Tenn., 1875. He was the author of *History of Methodism in South Carolina* (Nashville, 1887). D. at Cleveland Springs, N. C., June 27, 1887. ALBERT OSBORN.

Shippen, EDWARD, LL. D.: jurist; b. in Philadelphia, Pa., Feb. 16, 1729; studied law in Philadelphia and at the Temple, London, where he was admitted a barrister 1750; became prothonotary of the Supreme Court of Pennsylvania and judge of admiralty 1753; held various judicial positions, and was chief justice of Pennsylvania 1799-1806. D. in Philadelphia, Apr. 16, 1806.—His daughter MARGARET was second wife of Benedict Arnold. P. S. A.

Shippensburg: borough laid out by Edward Shippen in 1734; incorporated in 1819; Cumberland co., Pa.; on the national pike road, and the Cumberland Valley, the Phila. and Read., and the W. Md. railways; 11½ miles S. N. E. of Chambersburg, 41 miles W. of Harrisburg (for location, see map of Pennsylvania, ref. 6-P). It is in an agricultural region; has large deposits of iron ore in its vicinity; and contains water-works, gas and electric-light plants, manufacturing streets, paved sidewalks, the Cumberland Valley State Normal School, a national bank with capital of \$75,000, 2 weekly newspapers, and manufactories of clothing, furniture, hosiery, engines, flour, carriages, and flywheels. Shippensburg was the seat of the first courts of the county.

the headquarters of Gen. Braddock's army, and the site of several colonial forts built to protect the settlers from Indians. Pop. (1880) 2,213; (1890) 2,188.

JOHN C. WAGNER, EDITOR OF "NEWS."

Shippigan': post-village in Gloucester co., New Brunswick; on the Gulf of St. Lawrence, near the northeast angle of the province: 254 miles N. of St. John (see map of Quebec, etc., ref. 3-1). It has a magnificent harbor, which serves as a port of refuge, and important herring, cod, and mackerel fisheries. It occupies an important point in the scheme to shorten the transatlantic passage. It is the proposed terminus of the Continental Railway, and from this port ferry-steamers are to cross to St. George's Bay, Newfoundland. Just beyond Shippigan is the wide flat island of Miscon, said to be the best district for plover in the Dominion. Pop. 2,500, nearly all French-Canadians. M. W. H.

Shipping-articles: See SEAMAN.

Shipping, Law of: the body of rules governing the ownership and employment of vessels, as well as the relations and conduct of persons engaged in their navigation. It is a branch of MERCANTILE LAW (*q. v.*).

What is a Ship?—The term has a very broad signification in this branch of the law, unless narrowed by a statute. Whether a particular water-craft is subject to the rules of shipping depends not on its size, form, capacity, or means of propulsion, but upon the use for which it was designed and to which it is put. Hence a floating elevator, a steam-dredge, and a floating bath-house have been treated as ships, because intended and employed for navigation and transportation. A bath-house built on several boats, with a view to its transportation whenever and wherever desired, is to be deemed the permanent cargo of the boats. *Public Bath No. 13, 61 Federal Reporter, 692.*

Ownership of Vessels.—This may be acquired by capture (see *The General Usages of War* under INTERNATIONAL LAW), by operation of law, as in the case of the bankruptcy or the death of the former owner, or by contract between the former and the present owners. A contract to purchase a vessel from a ship-builder and to pay the price in installments as the work progresses does not pass the title to the purchaser until the vessel is in a deliverable state and the purchaser is notified thereof, unless the parties stipulate that it shall pass sooner. Such has been the rule always in the U. S. (*Clarkson vs. Stevens, 106 U. S. 505*), and was finally established in Great Britain by the House of Lords in *Seath vs. Moore, 11 Appeal Cases 350* (A. D. 1886).

The present sale of a chattel passes title to the purchaser at common law, although the contract is oral, and the chattel is not delivered nor the price paid, except in cases within the statute of frauds. (See FRAUDS, STATUTE OF.) This rule is believed to apply to ships in the U. S. British courts, however, declare that "a ship is not like an ordinary chattel: it does not pass by delivering, nor does the possession of it prove the title to it," and that as well by the law merchant as by the Merchant Shipping Act (17 and 18 Vict., c. 104, §§ 55-65) a bill of sale is necessary to the transfer of title from the seller to the purchaser of a ship.

Because of the costliness of ships and of the risks and repairs incident to them, it has been customary from an early period for several persons to unite in their ownership. Generally the title of such persons is that of part-owners and not of partners—a form of title much older than that of partnership (see PART-OWNERSHIP), although by agreement they may constitute themselves partners. If part-owners of a vessel can not agree as to its employment, English mercantile law permits the majority in value to "employ it upon any probable design," upon their giving a stipulation to the dissenting owners, in a sum equal to the shares of the latter, either to restore the ship or to pay the value of such shares. Such dissenting owners then bear no part of the expense and reap none of the profits of the adventure. This rule is based on the idea that ships "are built to plow the sea, and not to lie by the walls"—that their employment is a matter of public concern. If the part-owners are equally divided, the court will decide between them. In the U. S. it has gone to the extent of ending such conflicts by forcing a sale of the vessel, but in Great Britain it never exercised such power until authorized by statute. (24 Vict. c. 10, § 8).

Liability of Owners.—English maritime law determined the liability of ship-owners for the conduct of persons in charge of the vessel on their behalf by the common-law rules of agency. (See AGENT.) In case of loss occasioned by their agents, their responsibility was coextensive with the

loss. Such was not the rule of the general maritime law of Europe. By that rule innocent owners were chargeable for the acts of the master and crew to the extent of their interest in the ship only, and if the ship was lost their liability was at an end. The reason given by Grotius for this rule is that men would be deterred from owning and operating ships if they were subject to the fear of an indefinite liability for the acts of the master. This fear induced Parliament to limit the liability of ship-owners (see preamble to 7 Geo. II., c. 15), although British legislation has not adopted fully the doctrine which prevails on the Continent; it leaves innocent owners responsible, in many cases, to the value of ship and freight immediately before the injury, although the ship be destroyed or injured by the same act, or afterward on the same voyage. (See 17 and 18 Vict., c. 104, § 503, and 25 and 26 Vict., c. 63, §§ 54-56.) The U. S. Government has abolished the English rule which it inherited, and has adopted the continental rule, graduating the liability by the value of the ship after the injury as she comes back into port, and the freight actually earned; and enables the owners to avoid all responsibility for acts done without their privity or knowledge, by giving up the ship and freight, if still in existence, in whatever condition the ship may be; and without such surrender subjects them only to a responsibility equivalent to the value of the ship and freight as rescued from the disaster. U. S. Rev. Statutes, §§ 4282, 4283; *The Scotland, 105 U. S. 24.*

Master's Duties and Powers.—The master is responsible for the proper navigation of the ship, and is entitled to the obedience of all the officers and crew. He is bound to exercise due care and skill in keeping the vessel in a seaworthy condition, and in properly guarding all interests committed to him by the owners of the ship or of the cargo. Accordingly, he has authority to make contracts relative to the usual employment of the ship and to its repairs and necessities. He may even sell it when the prosecution of the voyage becomes impossible and immediate necessity to sell exists. His power to pledge the ship and crew is described in the articles on BOTTOMRY and RESPONDENTIA (*qq. v.*). When the vessel is in her home port, or subject to the supervision of the SHIP'S HUSBAND (*q. v.*), the master's implied authority is greatly limited.

Nationality and Registration.—The registration of British ships begins with the Navigation Act of 1660 (13 Car. II., c. 18, § 10), whose professed object was "the increase of shipping and encouragement of the navigation of this nation, wherein, under the good providence and protection of God, the wealth, safety, and strength of this kingdom is so much concerned"; but whose real objects, according to Blackstone, were dealing a blow to the sugar islands and "clipping the wings of those our opulent and enterprising neighbors." (1 *Commentaries* 418.) Under this act ships might be registered as a rule by English owners, whether built in England or elsewhere; but a statute of the next year required them to be of English building. (13 and 14 Car. II., c. 11, § 6.) This remained the policy of Great Britain until 1850. The subject is now governed by 17 and 18 Vict., c. 104, which provides that any ship may be registered which is owned by natural-born subjects, or by persons legally naturalized or denized, or by corporations established under the laws of, and having the principal place of business within, the British dominions. Unless registered, a ship is not to be recognized as a British ship, so as to be entitled to any of the advantages or to the protection enjoyed by such a ship, or to use the national flag or to assume the national character.

The registry laws of the U. S. are based upon an early act of Congress (ch. i. of 1792) which copied very closely the English statute then in force. (26 Geo. III., c. 60.) Only vessels built within the U. S. and belonging wholly to citizens thereof, and vessels which may be captured in war by citizens of the U. S. and lawfully condemned as prize, or which may be adjudged to be forfeited for a breach of the laws of the U. S., being wholly owned by citizens, or vessels wrecked in the U. S. and purchased and repaired by a citizen, in case the repairs cost three-fourths of the value of the vessel when repaired, can be registered (U. S. Rev. Stat., §§ 4132 and 4136), with the exception of a limited class provided for by ch. 63 of the laws of 1892 and other special statutes. The place of registration is the vessel's home port. In order to register a vessel, the owner must take and subscribe the oath required by statute, must give a bond that the certificate of registry shall be used solely for this vessel, must produce a certificate of construction from the carpenter

the ship built it, and must have it surveyed. If the ship or not is not altered in its hull, or if it is altered in form or structure, a new registry is required. If the vessel is not to be engaged in foreign commerce, but in the coasting trade or fishing, instead of being registered it must be recorded, if of 20 tons and upward, or if of less than 20 tons it must be licensed. (U. S. Nav. Stat., §§ 4311-4391.) Under this legislation U. S. ships have a virtual monopoly of the coasting trade.

Inspection of Steam-vessels.—The owners of registered or licensed steam-vessels invading the public waters of the U. S. are required to have them inspected from time to time, and to obtain a certificate that they are suitable for the service in which they are employed. U. S. Nav. Stat., §§ 4391-4397.

None of the rules relating to this branch of the law are set forth in other articles and need not be repeated here. See *LOCOMOTIVE, APPROPRIATE, BILL, or TANKER, CARRIAGE, COACH, CHALLOUPEAU, DESTROYER, FREIGHT, JETTERON, LARK, (Moosehead Lake), MARINE, LORAIN, PILGRIM, ROAD, LAW, or VESSEL, 744, 745, 746, 747, and 748, and 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000.*

The literature on this subject is very extensive. Among the most important treatises are *Alford, Law of Merchant Ships*; *Byron, Law of Shipping*; *Macle and Pollock, Law of Merchant Shipping*; *Parsons, Law of Shipping*; *Bever, History of the Law of Shipping and Navigation*; *Wheeler, Vessels and Voyages*.

FRANCIS M. BURDORF.

Shipping-master; See DECKMAN.

Ship-railways.—Railways for the transportation of ships overland between sequential basins of navigable water. The connection between the water and land-transportation is effected by lowering the side of the railway tracks into the water to such a depth that the ship floats on and off a carriage or cradle. This is done by means of hydraulic lifting-jacks, inclined planes, or any of the other methods in common use for raising ships out of the water for repairs.

Method of operating a Ship-railway.—The cradle having a track, a line of supports along the center to steady and sustain the load, with other supports for the fulgura arranged on each side, is lowered on the rails into the water. The road is then brought into position and the cradle is raised in a bearing along the load, and the fulgura supports are adjusted to places where the cradle and road are lifted on of the water to the level of the tracks on shore. The action power is then applied, and the ship is taken across the railway line to the other harbor and lowered into the water by the means employed in raising it.

Early Methods of Overland Transportation.—Transportation by means of portage is the most ancient form of artificial navigation. The first ship-railway recorded is one that was used through centuries, the *Dolomieu Canal*, which existed at the time of Athenianus, 400 A. D., and which is said to have been in operation 300 years. It connected *St. Louis* to *Port Jackson*, and its remains are still to be seen here. It is thus described in the *Journal of Commodore Bouchard*: "A track on the Corinthian isthmus where ships were hauled out of the Ionian into the Aegean Sea." The ships hauled are said to have been about 150 feet long and 18 feet wide, with a draught of 84 feet. It is very probable that before the *Dolomieu* was built the practice of transporting ships overland was long in use, for the ability to handle such ships as these, merchantmen must have had a long and slow development, with the limited knowledge and power at the service of the engineers of those days. It is said that this method of ship transport was employed by the Greek admiral *Nicias* *Geryllus* in the year 851 to attack the *Argonauts* who were then devastating the coasts of the *Chalcidians*.

In 1485 the *Venetians* transported under the direction of *Nicolas Machiavelli*, a civil engineer of Venice, a fleet of thirty-five vessels overland from the river *Adige* to *Lake Garda*, a distance of 90 miles; the motive power on the plains being used and on the mountainous windlasses worked by men. The longest ship of the fleet averaged 148 feet in length, 40 feet wide, with a displacement of 300 tons, and were armed with the ponderous bombardment artillery of the period, and were with large crews of crews, bows, arrows, lances, and all the usual necessities of war in vogue.

The object of the expedition was to relieve the city of *Verona*, at the time besieged by the *Milaneses*. This was accomplished to a measure, but the *Milaneses* captured and burned the fleet. Early in the spring of 1489 a larger and

more powerful fleet was in like manner transported to *Lake Garda*, and accomplished the relief of *Verona*. Thirteen years later, at the siege of *Constantinople* in 1509, the mouth of the *Bosphorus* being closed to their ships by heavy chains the *Turks* moved a large fleet from *Two Bosphorus* into the *Golden Horn* behind the chains in a single night, over a newly constructed trackway 3 miles long, thereby almost doubling the length of line which the besiegers had to defend, and largely contributing to the city's fall and the consequent end of the *Turk* empire. In 1718 *Moscow* being covered a shallow, two galleys, and four large boats 2 leagues over mountains and valleys from *St. Petersburg*, Russia.

Application of Railways to Navigation.—The first application of railways to navigation occurred in providing substitutes for locks on canals and in one notable instance for the canal itself. The *Hule Canal* in *Cornwall*, England, between *Hule* and *Lantern*, has been in use since 1829. At *Hule* the canal draws the usual boats, which are furnished with small iron wheels, ascend to the uplands by an inclined plane 900 feet long provided with two lines of rails terminating at each end in the canal. There are seven of these inclined planes on the *Hule Canal*.

The *Morris and Essex Canal* in *New Jersey* is operated with inclined planes connecting different levels.

Before the *Peru* railway was built a portage railway 90 miles long was in operation across the *Andes* between *Johnstown* and *Holladayburg*, upon which canal-boats were carried in sections from one canal to another.

In 1860 *Sir James Brunel* and *E. G. Webb* proposed to the *Emperor Napoleon III.* a ship-railway across the Isthmus of *Suez* in lieu of the ship-canal. *Marshal Vaillant*, Minister of War, referred the matter to *M. de Lesseps*, who rejected the idea. It was proposed to make the railway level throughout, have ten rails in its track, and to use there for the first time the hydraulic lift invented by *Edwin Clark*, and since so successful at the *Victoria Docks* and elsewhere. The speed was to be 30 miles per hour; that on the ship-canal, for steam-vessels, is 5 miles per hour, a difference in favor of the ship-railway which, as soon as its practicability is demonstrated elsewhere by everyday use, may cause it to supersede its one-time successful rival. *Moore, Brunel* and *Webb* also in 1872 prepared plans for a ship-railway which the republic of *Honduras* proposed to build across its territory from *Puerto Caballo* to the *Bay of Amoy*. It was to carry vessels of 1,200 tons, and doubtless would have been successful had the republic found the money to carry out the work. Another plan of great interest for a ship-railway was that of *Sir John Fowler* for passing the catamarans of the *Nile*.

The Chignecto Railway.—In 1875 *H. G. C. Ketchum*, C. E., of *Fredericton*, *New Brunswick*, proposed a ship-railway as a substitute for the *Bellefleur Canal* across the Isthmus of *Chignecto*, to connect the navigation of the *Gulf of St. Lawrence* and that of the *Bay of Fundy*. From the report in 1783 of *Col. Robert Morse*, chief of the *Royal Engineers*, recommending the construction of the *Bellefleur Canal* as an important necessity of commerce, the question of when and how it should be built was never allowed to drop. In 1863 the first actual survey for a canal was made by the government of *New Brunswick*, and from that time until *Mr. Ketchum's* survey in 1881 of the ship-railway line there was no possible canal route that had not been gone over and reported on, as great was the interest of Government and individuals in the question. The ability and perseverance of *Mr. Ketchum*, and the superiority of a ship-railway for the purpose intended, finally carried the day. The proposal to form a company to build a ship-railway was accepted by the Dominion Government, and an annual subsidy of \$170,000 was granted for twenty years. The company was not to call on the Government for any portion of the subsidy except what might be necessary to make up the net earnings of 7 per cent. on the authorized capital of \$5,000,000, and it agreed to pay over to the Government half of the surplus profit beyond the 7 per cent. until the whole of the subsidy which might have been paid to the company should be repaid.

In 1889, under *Sir John Fowler*, *Sir Benjamin Baker*, and *H. G. C. Ketchum*, as engineers, the construction of the *Chignecto ship-railway* was begun. It is 17 miles long, and on a straight line from end to end, running through a country moderately rolling, with only one watercourse in view, and generally favorable to the rectilinear location and 75 per cent. maximum grade adopted.

Fig. 1 shows a vessel as it will look on the lifting-deck

ready for transportation. The vessel, resting on blocks along its keel and bilges, is supported on platform-cars 38 feet wide, carried on 240 wheels, arranged in four lines to run on two tracks of standard gauge, 18 feet apart between

of the gate proper is 17 feet lower, or 13 feet below high water spring tide, and retains a minimum depth of 32 feet in the basin. The lifting-dock at the inner end of the basin is 270 feet long. Vessels will be able to enter or leave during the

high stages of the tide, while the excellent anchorage off shore, and the large storage capacity of the basin, insure a continuity of traffic uninterrupted by the fluctuations of the bay. This pioneer ship-railway is (1895) more than three-fourths finished. Awaiting the completion of this great work are many others that are projected, and whose construction will doubtless quickly follow.

The Hurontario Railway.—This is to connect Georgian Bay with Lake Ontario at Toronto. It is to be 66 miles long, probably in one straight line; the maximum grades going south (the direction of heaviest traffic), 8 feet per mile; going north, 22 feet per mile; its track will consist of six rails, and the estimated cost is \$15,500,000. The available water-power along its line is over 100,000 horse-power, from which electricity for doing all the work of operating the railway will be generated. The saving in distance over the route around by way of Detroit is

about 300 miles, while the country through which it is to run favors facility and permanence of construction.

Columbia River Railway.—A boat-railway along the Dalles of the Columbia river, U. S., between Three Mile Rapids and Celila, is under way, Congress in Aug., 1894, having appropriated \$100,000 for the preliminary work. The novel feature of this work is the proposed use of one-degree curves on the railway. The track would be similar to the Chignecto ship-railway, and the general features are also alike with some variation in details to suit the flat-boat traffic for which it is designed.

The Tehuantepec Railway.—This was first proposed by Capt. James B. Eads in 1879, and with characteristic energy, in a few years, in the face of almost universal opposition, he pushed through all the stages of preliminary surveys, detailed plans, congressional inquiries, procurement of concessions from Mexico, and some actual construction at a cost of more than half a million dollars. A table of the distances the railway would save is unnecessary, for it is plain that lengths and breadths of continents are involved. With the opening of the Suez canal, one of the two great barriers to interoceanic navigation was removed. The completion of the Tehuantepec ship-railway would remove the other.

Tehuantepec was selected as the proper location because of its greater proximity to the U. S., its superior advantages

centers. The gridiron on which the ship and cradle move up and down in the lifting-dock is like the deck of a bridge with floor-beams arranged in pairs, slightly separated to admit the hydraulic presses between them, and are connected in the usual way by track-stringers under the rails. The hydraulic presses are 25 inches in diameter and twenty in number, and are designed to lift a vessel carrying 1,000 tons of cargo, together with the cradle and gridiron, a total weight in all of 2,500 tons. They are placed 21 feet apart longitudinally and 64 feet transversely, and have a maximum stroke of 40 feet. The cross-heads on the inner cylinders or rams are attached to the floor-beams with eye-bars.

When a vessel is to be lifted the gridiron, with a cradle on its tracks, is lowered, and the vessel is hauled into position with hydraulic capstans. Water is then forced into the presses until the keel-blocks are brought to a bearing; next the bilge-blocks are drawn into place and the pumps are again started, raising the gridiron in less than ten minutes to a position where its tracks are slightly above those of the railway. A connected system of heavy iron chocks, supported by the masonry, is then moved under the ends of the girders by hydraulic power, the gridiron is lowered to a bearing on them, and its tracks are connected with those of the railway. Two locomotives will haul the ship across the isthmus in less than two hours, and the lifting-dock at the other end by a reverse operation quickly replaces it in the water.

The track is composed of rails weighing 110 lb. per yard, laid on very heavy ties, some of which extend under all four rails. It is stone-ballasted, on the most solid cuttings and embankments, and is characterized by smoothness and rigidity.

A novel feature is the way in which the difficulties arising from the immense tides of the Bay of Fundy are overcome. A basin 500 feet long and 300 feet wide is constructed at the south end. The entrance-gates and seawalls are of heavy masonry, the top being at the common level of the top of the lifting-dock and railway. The top

in distance and time to the main more healthful climate, the easy gra

FIG. 1.

FIG. 2.

By the railway, and the expenditure of the labor (when improved in each mile). The summit between the two oceans is 700 feet above low tide; the heaviest grade on the line is 25 feet per mile, but between the summit and the Pacific plain; on the remainder of this railway the grades where they occur are from 20 to 40 feet per mile. The total weight of ships carried will not exceed 7,000 tons; there will be six rails of very large sections, built in the most substantial manner, forming the railway, which is to be 134 miles long; all of which, with the lifting devices, hoists, machinery, stations, docks, and all requirements, will cost less than \$50,000,000.

Fig. 3 shows the proposed lifting dock and cradle ready to receive a vessel as deep as submerged. The lifting dock is built of steel pontoon, 450 feet in length, 75 feet in breadth, and 15 feet in depth. The pontoon is sunk very quickly by admitting water through sluice-gates in its sides, and can be raised again by powerful pumps in about fifteen minutes. The cradle is in the first with hydraulic appliances to properly distribute the weight of the vessel over the keel and the supports.

It is quite plain that a loaded ship's cradle presents exceptional difficulties as regards curves on the ship-railway.

If a part-owner holds the position he is known generally as managing owner. (See *U. S. Rev. Stat.*, § 1144, 39 and 40 Viet., c. 50, § 304.) The ship's husband goes to the outfit for the voyage; procures provisions and stores; provides proper master and seamen; looks after her legal registration and documents, as well as her due clearance from the custom-house; engages and settles for freight, adjusts averages, salvage, etc., enters into charterparties, and keeps true and proper accounts of all contracts, payments, and receipts in the course of his employment. The master is sometimes called the ship's husband, but all that is meant in some cases is that when the ship is beyond the jurisdiction of owners and of husband, the master possesses many of the latter's powers. As the ship's husband is the agent of the owners in their capacity of joint adventurers in his employment, and not in their capacity of part-owners of the vessel, the scope of his authority is limited accordingly. He can do what is necessary to enable the ship to prosecute her voyage and earn freight, but he has no implied authority to bind the owners by a contract for altering the size of the ship, or for her insurance. Mercantile usage, however, seems to be extending the scope of this peculiar agent.

copper. With the increased use of iron in the shape of chains, pistons, stanchions, guns, large anchors, coils, funnels, wire rigging, and its special use in ships of war, and when the ship itself could be regarded as a large magnet under the earth's inductive force, the subject of deviation of the compass assumed a vast practical and critical importance.

The disturbance of the compass is principally due to permanent magnetism of the ship's iron, and is always increased by the transient induced magnetism of masses of iron. In wood-hull ships there is little permanent magnetism, the generally small observed deviation being due to transient induced magnetism. In iron-hull ships the very large deviation is dependent on permanent magnetism, and remains indicative of the direction in which the ship is built, its magnetism as a whole, having then been fixed by the process of hammering and riveting.

The inductive effect of the earth's magnetism is greatest along the line of the magnetic dip. By means of a small com-

pass C. A. Schott was enabled to trace out with chalk on the iron gun-turret (sides 11 inches thick) of an ironclad vessel its magnetic equator, and found its plane inclined to the horizon at an angle of nearly 90° dip; after revolving the turret 180°, the line of no polarity again was traced out, when the plane, passing through the intermediate horizontal position, gradually approached its former place after a lapse of about twelve hours; it probably takes weeks before the fixed position is reached, depending on the action of the iron. Inside such turrets the magnetic intensity is very much weakened, but 12 per cent. was found to be left in the above case. The reader is referred to Sir George B. Airy's *Treatise on Magnetism* (London, 1870) and to the *Admiralty's Manual for the Deviations of the Compass*, by Capt. F. J. Evans, R. N., and Archibald Smith (London). This manual is the standard work on the subject of the deviation of the compass.

The earth's magnetic force has been represented by three component forces, to the ship's head, to the starboard side, and to the keel respectively; similarly, the components of the combined total magnetic force of earth and ship are in these directions; their respective differences or components of disturbance can be expressed by linear equations possessing each a constant and three coefficients, which are to be determined by experiment for each ship and position of compass, and must be numerically worked out by application of the method of least squares.

The general character of the deviation in wood-built sailing ships, with compass as usual on the quarter-deck and over the middle fore-and-aft line of the ship, is found as follows: No deviation when heading (magnetically) N. or S.; greatest deviation when heading (magnetically) E. or W.; deviation easterly when head in eastern semicircle, and westerly when head in western semicircle. In steam-vessels, with the compass aft, these directions of no and maximum deviation will often be found displaced by several degrees, yet preserving their general symmetrical character. In the southern (magnetic) hemisphere the deviations are reversed, though for steam-vessels they may be only partially changed. In iron-built ships an individual character has to be recognized. The points of no deviation are shifted from the N. and S. points, and lie nearly in the direction (by compass) of the ship's head and keel while building; they may not be opposite to each other, nor be removed exactly at right angles from the point of maximum deviation. In general, the deviation is easterly when the part of the ship which was S. in building is E. of the compass; westerly when W. The deviation described above is technically known as the semicircular deviation, and may be expressed by $B \sin \zeta + C \cos \zeta$. In the general deviation formula $\delta = A + B \sin \zeta + C \cos \zeta + D \sin 2\zeta + E \cos 2\zeta$, the angle ζ being the azimuth or the compass-bearing of the ship's head reckoned from the disturbed magnetic meridian positive to the eastward; it is a constant, generally small, + if easterly deviation is in excess. + B is approximately the deviation at E., and + C at N.; in the last terms of the harmonic function involving 2ζ , and which are technically known as the quadrantal deviation, + D is the mean deviation approximately at N. E. and S. W.; the coefficient E is generally small or zero; the deviation δ is reckoned + when the N. end of the needle is drawn to the E.; and the above empirical expression applies, provided the deviation on any course does not much exceed 20°, or about two points, in which latter case the formula becomes more complicated. The correct magnetic course will be $\zeta = \zeta + \delta$. The semicircular deviation rarely exceeds 10° in wood-built vessels, but in iron-built ones may reach double and treble this amount. The quadrantal deviation seldom exceeds 1° or 2° in wood-built ships, but in iron-built ones may reach three or four times this amount. The semicircular deviation is principally due to the effect of permanent or sub-permanent magnetism. The quadrantal deviation, which undergoes no change with a change in the ship's place, is mainly due to the effect of induced magnetism.

The heeling error in wood-built ships is not appreciable, but in iron-built ones it may be serious; generally, the error vanishes with the ship's head at or near E. or W., and attains a maximum value with headings at or near N. or S. The sign of the error changes with a change from the northern (magnetic) to the southern hemisphere. In the northern (magnetic) hemisphere, with the compass above the upper deck, the majority of iron ships have the N. end of their compass-needle drawn to windward, and in the southern hemisphere to the leeward. The heeling error is

due to the joint disturbing effect of the vertical components of permanent and of induced magnetism.

The values of the coefficients A, B, C, D, E , are found directly from observations, the deviation of the compass being observed with the ship heading in a number of equidistant points around the horizon, usually either 32, 16, or 8. If the deviation is observed on four cardinal compass-points, D remains indeterminate; if on four quadrantal compass-points, E remains indeterminate. These observations are made by swinging the ship (or allowing it to swing by the tide), and noting for the several headings the bearing of a distant object, or by reciprocal bearings if the locality is confined, or when at sea by azimuths of the sun, the local time and latitude being known. The deviations being determined for a number of points, they may be plotted on what is known as Napier's diagram, and graphically interpolated by drawing a curve with a free hand through the several fixed positions. The deviations for any compass course will then become known. They may also be tabulated. If we deduce numerically the coefficients A, B, C, D, E , we can compute directly the values of δ for plotting or tabulation. In either case we know the correct magnetic course corresponding to the disturbed or compass course, as well as the reverse of the compass course belonging to any correct magnetic course.

It has been remarked that inside iron turrets the magnetic intensity is greatly diminished; the same is the case with nearly all iron ships, the directive force of the needle being diminished. The relative horizontal force is found by means of the number of oscillations in a given time of a small needle, and the proportion of the disturbed to the undisturbed horizontal force, usually called λ , is determined from oscillations in four equidistant azimuths. It is usually less than 1, and is closely connected with the coefficient D , as may be surmised from the fact that λ is due to the effect of the horizontal induction of soft iron. D and λ are nearly constant. A knowledge of the value of λ is of importance; by its assistance the values of B and C may be found without swinging the ship from observations of δ and λ on one course; similarly, observing on two courses, we may determine B, C, D and λ . The value of λ is further needed in the computation of the heeling error, which is expressed— $(D + \frac{\mu}{\lambda} - 1) \tan \theta \cdot i \cdot \cos \zeta$ for

a heel of the vessel of + i degrees to the starboard. Here μ is the ratio of the disturbed vertical force at the compass to the earth's vertical force; it is found by means of oscillations of the dipping-needle in the plane of the magnetic prime vertical; μ changes with a change in the geographical position; θ is the magnetic dip. It is therefore not actually necessary to heel the ship in order to determine the heeling deviation. It should be added to the general deviation table.

The mechanical correction of the deviation of the compass is properly resorted to in case no suitable position for the standard compass can be found where the deviations are comparatively small; in ships built head S. (northern hemisphere), and intended for navigation in northern magnetic dips, the compass should be placed as far forward as practicable. It may also be elevated 3 or 4 yards above deck. The semicircular deviation may be corrected mechanically, either by means of two magnets or by one magnet; the quadrantal deviation may be corrected by a mass of soft iron placed near the level of the compass; the same may be effected by the mutual action of two compasses placed side by side; the heeling deviation may be corrected by the application of a vertical magnet. In mechanically corrected compasses there is always some danger that, with change of geographical position, loss of magnetism of magnets, and change in the sub-permanent magnetism of the hull, deviation may reappear, though the disturbing force may have been completely neutralized in one place and at one time. It is therefore never to be trusted, and, as a rule, deviation tables should be formed whether mechanical corrections have been applied or not.

An excellent collection of important memoirs, entitled *A Series of Papers from the Transactions of Foreign Societies by Poisson, G. B. Airy, A. Smith, F. J. Evans, W. W. Rindell*, with other papers and documents, has been published by the British Admiralty.

C. A. SCHOTT.

Revised by FRANK H. BIGELOW.

Ships of War: vessels built and armed for offensive or defensive purposes. Modern war-ships include the fol-

floating types; armored vessels for the line of battle and for coast service; armored monitors, rams, protected cruisers, armored cruisers and auxiliary cruisers, gunboats, gunboats, torpedo-boats, torpedo-boats, and various vessels for harbor service. It is the endeavor to give in this section a brief historical sketch of modern naval construction in Great Britain, France, and the U. S., which, until the war activity of the Italian authorities, have alone originated types of war-vessels; this is followed by descriptions of the more important typical warships of the various classes, which may serve to render more intelligible the tabular statement of the ironclad navies of the world.

Transition to the Application of Armor.—Since about the middle of the nineteenth century a revolution has been wrought about in naval construction, and new systems have been adopted through the influence of the following agents: (1) The application of steam, chiefly the screw-propeller; (2) the increasing and the increased power of artillery; (3) the use of armor; (4) the submarine torpedo. Up to the time that the advantages of the screw were established to the satisfaction of admiralty boards, steam-vessels were regarded almost as auxiliaries, owing to the vulnerability of hulls and machinery, the limited scope of the battery, the momentary consumption of their engines, and the difficulty in making paddle-wheel steamers good sailing vessels. The U. S. steamer Princeton (1842-43) was the first screw steamer. She was designed by Johnson, and her construction and success were mainly due to the efforts of Capt. Henry R. Stockton, U. S. navy. Great naval powers are reluctant to begin changes that involve costly reconstruction; thus, with the conservatism regarding any new system, was the reason of the otherwise unaccountable reluctance of the British to take up the project of a screw navy. When the French built the line-of-battle screw-ship *Napoleon* (1850), the British took alarm and began reconstruction with vigor; and the renovation of their navy by the application of the screw was well advanced in 1859, when the French launched the ironclad wooden frigate *la Gloire*. Then began the decline of unarmored hulls.

The principal incentive to the application of armor was the discovery anticipated from shell-fire. It was not until 1854 that naval batteries consisted entirely of shell-guns, the magazines being filled with loaded shells entirely fossil. Admiral Dahlgren carried the application of this missile to great perfection in the U. S. frigates of 1854. The *Merrimack*, one of them, visited Europe in 1859, starting naval admiration by the enormous shell-power of her battery. The swift destruction of the Turkish fleet at Sinope by the shells of the Russian ships during the war in the Crimea (1854) had much to do with hurrying forward the application of armor; the destruction of the Congress and the Connecticut during the civil war in the U. S., and the *Monitor* and the *Merrimack* engagement, gave it fresh stimulus.

Early Forms of Armored Ships.—The first definite proposal for building an ironclad was made in 1841 by Robert U. Stevens, of Hoboken, N. J.; armor, it is stated, was suggested by his father, John Stevens, in 1812. An act passed Apr. 12, 1842, authorized the Secretary of the Navy to enter into a contract with Stevens for the construction of a "war-steamer for harbor defense, and iron-plated, to be built principally of iron." The contract was made Feb. 10, 1844, and altered Nov. 14, 1844, increasing the dimensions as follows: Length, 75 ft.; beam, 40 ft.; depth, 33 ft. 6 in.; protection, 64 inches of iron; horse-power intended, 9,624. Work was begun in 1844, and when the vessel was about half completed, the Government refused further appropriations.

It was the initiative taken by the Emperor Napoleon III. which wrought about a complete revolution in modern naval construction of war, as the first ironclad used in battle was the French battleship *Désolation*, Lave, and Tonnerre, begun for service in the Crimea in Sept., 1854, two months after the loss of the *Niagara* battery was laid at Hoboken. They were all of the same dimensions—namely: Length, 75 ft. 6 in.; beam, 40 ft. 1 in.; draught, 8 ft. 8 in.; hulls, of wood; armor, 400 inches thick; armament, 16 guns of French 7-in., corresponding to 68-pounder, carried 2 ft. 8 in. above water-line. They were about 1,000-ton displacement, with speed about 4 knots an hour. They formed part of the fleet, carrying 1,500 guns, which destroyed Fort Komora, an inferior barbed-iron work. The ironclads engaged at about 1,000 yards, at which range they were proof against 40-pound shot with 10-pound charges. The British adopted the design and built five, but they were never in action.

In view of these successful results, the French determined to build ships which should combine with their protective armor satisfactory sailing qualities, and in Mar., 1855, the first ironclad frigate, *la Gloire*, was begun at Toulon. The construction of two other wooden armored frigates—the *Invincible* and the *Narmandie*, of the same type as the *Gloire*—and the *Couronne*, an iron vessel, was ordered. The latter ship differed from the others not only in the materials employed, but in the strength of the hull, which afforded protection against the projectiles then in use. The *Couronne* was especially constructed with a view of establishing comparison between wooden vessels and those of iron. The four frigates were completely armored above the water-line with 5-inch plates resting on a 18-inch wood backing. The armament consisted of thirty-six 5-in. guns mounted on a single battery, extending the whole length of the ship 6 ft. 8 in. above the water-line.

Great Britain at last decided to follow in building armored ships. The *Warrior* was ordered in June, 1859, a few months before the completion of the *Gloire*. The *Warrior* and her counterpart, the *Black Prince*, were one-half greater displacement than the *Gloire*, and 102 feet greater length; they were built entirely of iron and armored with 44-inch iron plates over a length of 215 feet out of a total length of 290 feet. Their speed was 14 knots, compared with 12½ for the *Gloire*. The wise choice of the material of construction leaves them serviceable vessels to-day, while the French ships were some years since stricken from the list. The *Defence* and the *Resistance*, of 6,150 tons displacement, with similar disposition of armor, were begun at the same time. In 1861, following upon the four ships just mentioned, Great Britain undertook the construction of not less than eleven ironclads, representing four different types—the *Achilles*, 5,820 tons displacement, armored along the whole length with 44-inch plates; then the *Minotaur*, the *Northumberland*, and the *Agincourt*, of 10,700 tons displacement, similar to the *Achilles*, except that the armor was 5½ inches thick amidships, tapering to 3 inches at the extremities. The vessels of the fourth type, the *Hector* and the *Valiant*, have proved more serviceable than the others, being smaller, more maneuverable, and much more economical; they were armored throughout the whole length with 44-inch plates, the protection being only above the water-line at the bow and stern. The *Magenta* and the *Solferino*, laid down two years after the *Gloire*, formed part of the first group of French ironclads. The second group consisted of ten vessels of the *Provence* or *Flandre* class. The displacement was slightly augmented, but the protection was increased to 6 inches of armor.

Up to 1855 the vessels built for the U. S. navy were the best possible specimens of their class; among the early steamers, the *Powhatan* and the *Susquehanna*, at the time they were launched, in 1850, were the most efficient naval vessels afloat. The screw frigates, built in 1855, were regarded all the world over as the model men-of-war of the period. Of these, the largest was the *Niagara*. The other five—the *Roanoke*, the *Colorado*, the *Merrimack*, the *Minnesota*, and the *Wabash*—were vessels of about 5,000 tons, and carried a powerful battery of shell-guns. The twelve screw-vessels were of two classes, built in 1853, the first, of about 3,000 tons, including the *Overette*, *Lanaster*, *Hartford*, *Richmond*, *Brooklyn*, and *Pennsylv*; the second class, small sloops. These were all admirable vessels, but they were no advance upon the type of the *Wabash* class. At the beginning of the civil war, of the ninety ships on the naval register fifty were sailing vessels, and only twenty-four of the forty others were serviceable steamers. The construction of iron or armored vessels had not been begun, and sail-power had been only partly replaced by steam-power. At the outbreak of the war a special naval board was appointed to determine upon types of ironclads to be built for immediate service. The three ships ordered on the recommendation of the board were the broadside vessels *Galena* and *New Ironsides*, and the *Monitor*. The first vessel was armored with bars, of 2½ inches total thickness, put on in a very complicated manner, which proved so deficient that the vessel failed in the first test under fire, in the James river, in an action from which the *Monitor* came out unhurt. The *New Ironsides* was a converted ironclad wooden frigate with unarmored ends, except that the water-line belt was complete all around. Her armor consisted of 44-inch solid plates backed by 21 inches of oak, the whole inclined throughout the casemate at an angle of 30° from the vertical. Her battery consisted of fourteen 11-inch

smooth-bores and two 8-inch Parrott rifles. Though her speed was only about 6 knots at the best, this vessel performed most valuable and effective service throughout the war, both before fortifications and on the blockade. In a period of about six months she was struck some 193 times, but never forced to go into a home port or to depend upon outside assistance for repairs. The *Monitor* (*g. r.*) was built of iron under the superintendence of, and from an original design by, Ericsson. The opportune appearance of the *Monitor* in Hampton Roads in Mar., 1862, and her successful combat with the *Merrimac*, gave a fictitious value to this vessel as an example of naval architecture. Nevertheless, these vessels performed invaluable services and furnished the type of modern coast-service ironclads and a system of armament which has been followed in the most powerful ironclads of recent construction. At the termination of the war it was determined to build four seagoing double-turreted monitors without overhanging armor-shell at either the end or the sides. These were the *Miantonomoh*, the *Monadnock*, the *Terror*, and the *Amphitrite*. Their hulls were of wood, and were armored with laminated plates an inch thick, with a total thickness of 6 inches at the sides and 12 inches on the turrets. The *Miantonomoh* made a voyage to England, where she attracted much attention, and was no doubt the progenitor of the *Devastation*; the *Monadnock* was sent around Cape Horn to San Francisco. In 1874 these vessels were broken up and rebuilt into the double-turreted monitors of the same names.

Improvements in the Construction of Ironclads.—During the period of the civil war in the U. S. construction of ironclads proceeded rapidly in Europe, but until a later period it was more influenced by the developments in artillery than by the results of the war. The introduction, in 1864, of the 7½ and 15½ ton guns into the French armaments made the *Flandre* class ineffective before they were completed. In 1865 the *Océan* was begun, and later the *Marengo*, the *Suffren*, and the *Friedland*, after the same type, only the latter being completely of iron. They were protected at the water-line by 8-inch armor. The armament consisted of four 23-ton guns mounted in a central battery protected by 6½-inch armor, and four 15½-ton guns in barbette turrets at each of the four corners, projecting beyond the sides of the ship, and armored with 6½-inch plates. The *Friedland* differs from the other ships in having only two barbettes, each armed with a 23-ton gun. In 1868–69 a fourth group of ships was begun, the *Richelieu*, the *Colbert*, and the *Trident*, plated with 9-inch armor and very similar to the preceding group, the excess of 1,200 tons displacement being devoted mainly to armor and armament. The hulls of these ships were constructed of wood, except the extremities forward and abaft of the central battery, which were of iron. Such was the construction of the French ironclad navy up to the time of the Franco-German war.

E. J. Reed, appointed in 1862 to the office of chief constructor of the British navy, undertook the building of the *Bellerophon*, in which the cellular system of construction was first fully introduced, realizing a considerable saving in weight with great increase in the strength of the structure, and obtaining a system of water-tight subdivision which is the only protection against rams and torpedoes. Designs for the best mode of defense combined with the most powerful means of attack sprang up with the rivalry between guns and armor. For masted ships Capt. Coles advocated the turret system and Mr. Reed the broadside system, each striving to give the utmost protection armor could afford to the battery and other vital parts, while enabling the largest guns to be worked safely under these defenses. The broadside system armored the battery and the water-line, while the sides and the upper portions of the ships remained much as in the older frigates. The turret aimed at lower sides, as offering less target to the enemy, while affording an all-round protected fire. In 1862 the *Enterprise*, the *Favorite*, and the *Research* were adapted to Mr. Reed's principle—the belt and the battery—upon which, also, with the addition of indented ports at the corners of the battery, to give wider range of fire, were built the *Pallas*, the *Penelope*, the *Bellerophon*, and the *Hercules*. In the *Sultan* an upper-deck battery with four guns was added. On the *Sultan* pattern the *Audacious* and several other vessels were built. As the guns increased in size the batteries decreased and the guns became fewer, but the belt remained.

The *Monarch*, ordered in 1865, was designed as a seagoing rigged turret-ship having 7-inch armor, a free-board of 14 feet, and an armament of four 25-ton guns in two turrets

plated with 8-inch and 10-inch armor. Then came the *Captain*, a ship designed by Capt. Coles and Messrs. Laird in rivalry of the *Monarch*. She was intended to combine a low free-board with the qualities of a seagoing frigate, and the result of her first cruise seemed to indicate the value of the combination; but an investigation of the calamity of her capsizing in the Bay of Biscay, on the night of Sept. 6, 1870, with 500 men, only eighteen of whom were saved, showed that, in comparison with the other qualities, the small stability due to lack of free-board was a fatal error in her design. This disaster led to more complete and exact investigations of the stability of ships than had ever before been customary. A seagoing mastless turret-ship, or improved and enlarged monitor, was then devised, and three such ships were built—the *Devastation*, the *Thunderer*, and the *Fury*.

The *Devastation* is a mastless, twin-screw, sea-going turret-ship, 285 feet long, 62 ft. 3 in. beam; mean draught, 26 ft. 8 in.; displacement, 9,300 tons. Her sides, which rise 4 ft. 6 in. above the water-line right aft, are protected along the whole length by armor 12 inches thick; right forward this belt drops to 6 inches above the water-line, and is covered by an armored deck, 8 inches thick, arranged so as to give great support to the bow in ramming. Armor of the same thickness covers the deck aft. On the middle of the upper deck there is a raised breastwork about 150 feet in length, protected by 10-inch and 12-inch armor, covered by a deck 2 inches thick and 11 feet above the water, forming a glacis for two turrets, each containing a pair of 35-ton guns, protected by armor 12 and 14 inches

FIG. 1.—*Devastation*.

thick. All the necessary hatches, openings, smoke-pipes, etc., are led up by iron trunks to a light flying-deck which extends between the two turrets, slightly overlapping each. The sides of the vessel above the armor-belt are continued, forming an unarmored superstructure extending 9 ft. 3 in. above the water-line forward, and to the height of the breastwork throughout its length and slightly abaft it, the open deck aft having 4½ feet free-board. The trial at load-draught showed a speed of 13·84 knots, the engines developing 6,650 indicated horse-power. She carries 1,350 tons of coal, which enables her to steam 4,700 knots at 10 knots an hour.

In 1894 the *Devastation* was refitted throughout, supplied with new machinery and armament, and extensive internal rearrangement. The tables at the end of this article give the present outfit.

In the construction of the third ship, the *Dreadnought*—first named *Fury*—a new design was followed, making the breastwork of the same width as the ship itself—in other words, raising the armored side of the ship to a level with the upper deck of the breastwork. The *Dreadnought* was 35 feet longer and of over 1,500 tons greater displacement than the *Devastation*, and the armored belt was carried for the whole length of the ship at the same height above the water-line, increased to 14 inches thickness amidships. In 1885 this vessel, whose design was then sixteen years old, was commissioned as the flagship of the British Channel Squadron.

In 1872–73 the Italian first-class battle-ships *Duilio* and *Dandolo* were begun. They were the first vessels of the central-citadel type with revolving turrets *en échelon*. For their general design the naval authorities accepted the view of the British committee on designs, trusting for both buoyancy and stability to their unarmored raft. The principal dimensions are as follows: Length between perpendiculars, 340 ft. 11 in.; beam, 64 ft. 9 in.; mean draught, 26 ft. 7 in.; displacement at deep load-line, 11,200 tons.

There is a central citadel or compartment, 197 feet in length and 28 feet in breadth, which descends to 5 ft. 11 in. below the water-line, protecting the machinery and boilers, the magazines and shell-rooms and a portion of the

FIG. 2.—Duilio and Duodecim.

machinery for working the turrets and guns. Forward and aft of this citadel, the decks, which are 4 ft. 8 in. under water, are defended by horizontal armor. Over this citadel is built a second central armored compartment, including the bases of the turrets and the remaining portion of the mechanism employed in working and working the guns; namely, above this second compartment the two turrets, placed at diagonally opposite corners of the citadel, the effect of which arrangement is to render possible the discharge of three guns simultaneously in a direction parallel with the keel. Each turret is armed with two 100-ton Armstrong muzzle-loading guns. The armor of the central portion of the vessel is 21.67 inches thick, and that of the turrets is 17.72 inches. The decks are protected by horizontal armor of steel and iron, the latter being under the former. The Duilio has twin screws, driven by a pair of Pamb's trunk-engines. On the trial, in 1860, with all weights on board, at a mean draught of 20 ft. 9 in., the vessel showed on the measured mile, with 7,710 indicated horsepower, a speed of 15 knots per hour.

The *Indefatigable*.—Upon the construction of these ships, Mr. Barclay, director of naval construction in Great Britain, brought forward the design of the *Indefatigable*, of similar type, until 1886 the largest vessel in the British navy. The *Indefatigable*, begun in 1874 and launched in 1876, is a

FIG. 3.—Indefatigable.

twin-screw double-turret ship with a central armored citadel. Her length is 330 feet and she has the extraordinary breadth of 78 feet. The displacement at the mean load-draught of 25 ft. 3 in. is 11,880 tons. The general design is similar to that of the Duilio. The protected portion of the ship is confined to the citadel or battery, within whose walls are inclosed the engines and the boilers, the turrets, the hydraulic loading-gear, the magazines, and, in fact, all the vital parts of the vessel. It measures 110 feet in length, 78 feet in breadth, and is armored to the depth of 6 ft. 9 in. below the water-line and 9 ft. 7 in. above it. The sides of the citadel consist of two thicknesses of 12-inch armor, each backed by iron girders and oak backing. Inside of this are two thicknesses of skin-plate, in which the horizontal girders are secured, the ends of the armor-backing and plating being supported by and bolted to transverse frames 2 feet apart, composed of plates and angle-irons. It will thus be seen that the total thickness of armor at the water-line is not less than 24 inches. The armor-belt, however, is not of uniform strength throughout, but varies in accordance with the importance of the protection required and the exposure to attack. Consequently, while the armor at the water-level is 24 inches, in two thicknesses of 12 inches each, above the water-line it is 20 inches, in two thicknesses of 12 inches and 8 inches,

and below the water-line it is reduced to 10 inches, in two thicknesses of 12 inches and 8 inches. Outside the citadel a 4-inch armor-belt, 9 ft. 6 in. below the water-line at the sides, extends to the extremities of the vessel, disposed at the bow and to meet the spar of the main. Over this shot-proof deck, at a level a little above the water-line, comes the middle deck; and the entire space between the two decks is divided into compartments arranged partly to carry coal and partly stores packed in water-tight tanks, forming further subdivisions of the space. At the sides of the ship the compartments, about 4 feet wide, are filled with cork, inside which, again, are compartments 2 feet wide, filled with layers of canvas and oakum. The cork and canvas compartments are carried above the main deck, 4 feet and 3 feet respectively, and 30 feet forward of the citadel and 37 feet aft of it. Thus if a shot hit the unarmored ends of the vessel at right angles to the water-line, it would travel through, first, 4 feet of cork, then 2 feet of canvas and oakum, then such coal and stores as were encountered, and would finally pass through oakum and cork to the sea on the opposite side from which it entered. The cork is, of course, intended as a life-belt to the ship, to give her additional buoyancy and stability when the unarmored ends are riddled and filled with water. The turrets are set on *decks*, or diagonally in opposite corners of the citadel, so that all the guns can be fired together, either forward or aft, without either turret obstructing the fire of the other. They are protected by armor-plates 18 inches thick. The internal diameter of the turrets is 38 feet; in each are two 24-ton muzzle-loading rifled guns mounted on Armstrong's hydraulic system. The guns themselves are 26 ft. 8 in. in length, the bore is 24 feet long and 16 inches in diameter. The weight of each projectile is 1,500 lb., and the powder-charge weighs 450 lb. The guns are loaded by depressing the muzzle beneath the level of the armor-deck covering the citadel, where a hydraulic hoist lifts the charge to the muzzle, whence it is put home by a hydraulic rammer. The *Indefatigable* is propelled by twin screws—an arrangement adopted in all ironclads and most recent unarmored vessels. Each screw is driven by an independent three-cylinder inverted compound engine. On trial, when in commission and complete in every respect, the engines developed an indicated power of 8,010, giving a speed of 12.81 knots per hour. The ship carries 1,200 tons of coal, enabling her to steam 4,000 knots at 10 knots per hour. Two years after the construction of this vessel was begun, Mr. Reed stated in Parliament and in the public prints that his investigations showed that in action the cork and stores might be shot away and the unprotected ends riddled and waterlogged, and that in such an event, though the citadel were still intact, the ship would capsize. The reply was that the supposed case was too remote a possibility to be considered, and that without any unprotected ends the ship would still float, and under the most unfavorable circumstances would have a margin of stability. A technical committee, appointed to investigate the matter, after most elaborate calculations of great value to naval architecture, completely sustained the views of the admiralty.

The *Italia* and the *Lepanto*.—In these great vessels of the Italian navy, launched in 1880 and 1883, of 15,000 tons displacement, side-armor is not used as a means of preserving stability when the ship is pierced at the water-line. Their buoyancy is preserved in such an emergency by the cellular subdivisions of the space just above an arched armored deck extending the whole length of the ship beneath the water-line. Armor is used only at the openings to the engine and boiler rooms, and to protect the heavy guns mounted on *barbette* and the communications leading to them from the magazines. The *Lepanto* was tried at sea in 1885 at a displacement of 14,800 tons, and made a maximum speed of 18.38 knots over a course of 80 miles, with the engines developing 16,150 I. H. P. The trial is notable from the facts that the power and speed surpassed those of any ironclad afloat, and also because a large number of locomotive-boilers were used with complete success in connection with boilers of the usual type.

In 1883-84 Italy began the construction of the *Andrea Doria*, *Ruggiero di Lauria*, and the *Francesco Morosini*, first-class battle-ships of some 11,000 tons displacement; these ships were completed in 1892, and are similar in design to the Duilio. They were followed in 1893-96 by the *Re Umberto* and *Sicilia*, sister ships, similar to the *Lepanto*; and the *Sardegna*, a still more formidable ship of the same class, was begun in 1897.

The "Admiral Class" of British Vessels.—Following the *Inflexible*, the British built the *Ajax* and the *Agamemnon*, reduced copies of the first vessel, and then the *Colossus* and the *Edinburgh* of the same type, with 18 inches side-armor and armed with 43-ton breech-loading guns. A great gain was made in the speed of the latter two vessels over their predecessors, partly by a better form and partly by improved propelling machinery, by which much greater power has been obtained from the same weight of material. The "Ad-

FIG. 4.—Collingwood.

miral" class, of which the *Collingwood* was the first, begun in 1880, followed by the *Rodney*, the *Howe*, the *Anson*, the *Camperdown*, and the *Benbow*, in 1883-84, while following the same system of construction, have their battery mounted *en barbette*. This modifies the distribution of the armor by dispensing with the upper part of the citadel—necessary with turrets to protect their training, loading-gear, etc.—and allows the maximum thickness of the armor to be concentrated on the water-line where required to protect the machinery and the boilers. A part of the weight thus saved, and that due to the less weight of barbettes over turrets, is devoted to ordnance; for the *Howe*, the *Camperdown*, and the *Anson* carry four 66-ton guns each, the *Rodney* four 68-ton guns, and the *Benbow* has two 111-ton guns. In addition to the heavy guns they all carry six 6-inch guns in a machine-gun proof battery on the upper deck, between the barbettes.

British Turreted Ships.—The steady progress of France and Italy in the building of armored vessels of the first class had in 1884-85 aroused the attention of the British to the probability that if their rate of construction were to continue the French fleet would soon be superior to theirs, and eminent authorities contended that upon certain methods of comparison the French fleet was then the more powerful. The relative merits of the central-citadel type of British battle-ship and the completely armor-belted battle-ships of the type of the *Amiral Duperré* received careful attention, and though most serious allegations were made by Sir E. J. Reed, popularly considered an authority, against the safety of the citadel-ships when their ends were riddled by shot, the balance of favor seems to remain with the British type. As the result of this discussion Great Britain laid down in 1885 two turreted battle-ships, the *Victoria* (afterward sunk by collision with the *Camperdown*) and *Sans Pareil*, of 10,470 tons displacement each, the armament consisting of two 110-ton 13½-inch guns in a single turret forward, protected by 18-inch compound armor, and twelve 6-inch guns in broadside on the upper deck, protected by a 3-inch steel side and steel traverses. The citadel is 170 feet long and the armor 18 inches thick at the sides. Also were then begun the *Nile* and *Trafalgar*, two double-turreted battle-ships of type similar to the *Inflexible*, of 11,940 tons displacement. Their armor-belt is of unusual length and 20 inches thick. The two turrets, each mounting two 66-ton guns, are situated, like the *Dreadnought's*, on the middle line, but, unlike this ship, the *Nile* and *Trafalgar* have a broadside battery of eight 5-inch guns between the turrets. These vessels attained on trial in 1890 a speed of 17 knots.

These vessels were regarded when designed as the maximum displacement and power to be hereafter required, and indeed it was predicted by some authorities who favored the building of protected cruisers that these vessels might be the last ironclad battleships. They were hardly launched when the British authorities formulated in 1889 the most

extensive programme ever adopted by them. Under the title of the Navy Defense Act \$105,000,000 was appropriated for building and completing by Apr., 1894, 70 vessels to carry 566 guns, having an aggregate of 336,000 tons displacement and of 594,000 horse-power. These vessels comprise 10 armored battle-ships, 8 of the first and 2 of the second class; 40 protected cruisers, 9 of the first and 31 of the second class; and 18 torpedo-vessels. The distinguishing features of the programme were the rapidity with which the vessels were to be built, the great increase of engine-power and speed, and the increase in size and power of the armored vessels. Nine out of ten of these are barbette-vessels, in contrast to the recent turret-ships, and are of greater free-board and superior sea-keeping qualities to the earlier vessels. The *Royal Sovereign*, the first of these battle-ships, was completed in Apr., 1892. The rapidity of construction surpasses all previous records in the building of great war-ships, as the *Royal Sovereign* was laid down in Sept., 1889. This vessel is the largest battle-ship hitherto constructed for the British navy, and has six counterparts, named the *Renown*, *Repulse*, *Ramillies*, *Resolution*, *Revenge*, and *Royal Oak*. The eighth vessel of this class is a turret-ship, the *Hood*. The armament of the *Royal Sovereign* comprises four 13½-inch 67-ton guns, mounted in barbette in pairs, and firing a projectile weighing 1,250 lb. with a powder-charge of 630 lb.; ten 6-inch 100-pounder quick-firing guns, double-banked, the four on the main deck being mounted in casemates protected by 6-inch armor, while the six on the upper deck are mounted in sponsons; sixteen 6-pounder and twelve 3-pounder quick-firers, 8 small machine-guns, and two 9-pounder field-guns. The auxiliary armament is distributed all over the ship and extends from bow to stern. The ship is also fitted with seven torpedo-tubes, of which two are submerged. The following table gives the principal dimensions of the *Royal Sovereign* and her predecessor in design, the *Trafalgar*, and includes the results of actual trials for speed and power as obtained in smooth-water trials:

DIMENSIONS, ETC.	Royal Sovereign.	Trafalgar.
Length.....	380 ft.	345 ft.
Breadth.....	75 ft.	73 ft.
Draught, mean.....	27 ft. 6 in.	27 ft. 6 in.
Displacement, tons.....	14,150	12,240
Free-board { forward.....	19 ft. 6 in.	11 ft. 3 in.
aft.....	18 ft.	11 ft. 3 in.
I. H.-P. { natural draught.....	9,700	8,440
forced draught.....	13,300	12,940
Speed { natural, knots.....	16.77	16.22
forced, knots.....	18.0	17.28
Coal carried at the designed load-draught, tons.....	900	900
Coal endurance at 10 knots.....	5,000	5,000
Total weight of armament, tons.....	1,410	1,065
Weight of auxiliary armament, tons.....	500	135
Height of heavy guns above water-line.....	23 ft.	15 ft.
Length of belt.....	250 ft.	230 ft.
Greatest thickness { side armor.....	18 in.	20 in.
protective deck.....	3 in.	3 in.
Total weight of armor and backing, including protective deck, tons.....	4,350	4,400

Growth of the French Navy.—The modern navy of France dates from the close of the Franco-German war, when a programme was elaborated, according to which the armored fleet was to consist of 16 first-class ironclads, 12 second class, and 20 coast-service vessels of two classes. It was then definitely decided to use only iron or steel in future construction, a conclusion which was arrived at very tardily considering the progress upon the opposite side of the Channel.

The *Redoutable*, 8,800 tons, the first vessel built in accordance with the new programme, was begun in 1872 upon designs of M. de Bussy, and was then classed as a first-class ironclad. The *Dévastation* and *Poudroyant* (since named *Courbet*), ships of nearly 10,000 tons displacement, were begun in 1876 upon the same general plans as the *Redoutable*, masted, high free-board, central battery.

The *Amiral Duperré*, begun in 1876, has proved the type upon which the later French ships have been designed without substantial variation, excepting only that the later vessels have been fitted with military masts instead of the full ship-rig of spars and sails. The designers, believing that mastless low free-board turret-ships would not make good seagoing battle-ships, and in order to reduce the armored area and increase its thickness, discarded the central battery of the preceding first rates, which was also no longer suitable to the heavy guns required, and mounted on the *Amiral Duperré* four 13½-inch 48-ton guns, each in an armored bar-

British battleship Royal Sovereign.

United States Protected Cruiser Columbia.

bottom of the upper deck, 21½ feet above the water. There are located by each gun in an unprotected gun-deck-battery. The armor consists of a complete water-line belt 8 feet long and 21½ inches maximum thickness. The top

FIG. 2.—Amiral Duperré.

batteries have 15½-inch armor-plates and armored ammunition-tanks leading to the armor-belt, 2½ inches thick at the level of the top of the belt. The Amiral Duperré has in a marked degree the distinguishing peculiarity of all the French vessels, a great "tumble-home," or decrease in breadth from the water-line up. This serves the double purpose of decreasing the weight of upper works and giving better command to the battery. The Formidable and Amiral Dautouche, sister ships, begun in 1872 and 1873 respectively, were practically upon the same design as the Amiral Duperré, the modifications consisting in mounting three French 75-ton guns in batteries on the middle line of the upper deck and having two auxiliary masts, and consequently no sail-power. These two vessels were long years in building, and were completed and successfully tried in 1882, the Formidable making under command a speed of 16½ knots with 9,000 I. H. P. In 1887 two more battle-ships of 10,000 tons, from the same design by M. Moue, the Massena, Hoche, Neptune, and Napoleon, were begun. Each was to carry four 19½-inch guns in batteries placed one forward and one aft on the middle line and one on each side in spigons, obtaining a fore-and-aft fire. Subsequent changes were made by which the Hoche under the forward and after guns in turrets with a comparatively low free board at the extremities, similar to the British

system 34-inch, as in the earlier designs, the armor being confined to the complete water-line belt and the barbette.

After these vessels some years elapsed before new designs for first-class battle-ships for the French navy were decided upon, and of these the Brennus, begun in 1880, was the first to show the marked influence of the great development during that time of quick-firing guns and high-explosive shells. The Brennus is nearly 11,000 tons displacement. The armor consists of a complete water-line belt 13½ inches thick, covered by an armor-deck of 4 inches of steel. Above this the side is protected by a belt of thin armor, 4½ inches thickness, 5 feet in height forward and 4 feet aft. Two 18½-inch guns are mounted in a post-shouldered turret forward with 17½-inch armor, and one in a similar turret aft, each protected by 10½-inch armor. The secondary armament consists of ten 44-inch quick-firing guns, six mounted in a central belt of 4-inch armor which rises from the armor-belt to the upper deck, and four mounted in independent revolving turrets of 4-inch armor located upon the top of the central fore. The speed is 17½ knots.

In 1891 the Jauréguiberry, Carnot, and Charles Martel, of 10,000 tons displacement, were begun. The heavy guns are mounted in turrets, one 12-inch gun forward and one aft, and one 10½-inch gun on each side in turrets at a lower level. On the central superstructure above all these turrets are eight 54-inch guns, mounted in turrets of 4-inch armor, those of the Jauréguiberry in pairs and the others singly. The armor-belt at the water-line is 18 inches thick amidships and 11 inches at the ends, surrounded by an armor-deck 2½ inches thick, and a cushioning stranding around the whole side, covered with 4-inch armor.

It will be seen that in these later ships the barbette has been abandoned for the turret, individual protected stations are provided for the smaller guns, and the side in the vicinity of the water-line is protected for the whole length by thin armor and minute water-tight subdivision.

The Massena and a sister-ship, of very similar design to the preceding vessels were begun in 1892. These are to have triple screws and a speed of 15 knots.

Of armored vessels for coast-defense of more modern type than the Tonnerre class the French have four ships from the same design, the Indomptable, Terrible, Calman, and Requin, begun in 1877 and completed in 1884-87. Four ships of about the same class were begun in 1891, namely,

FIG. 3.

Albatross class. This, with the great height of the central superstructure carrying the masts, gives the vessel the appearance of a floating castle. The Hoche and Massena were completed in 1885 and the remaining two in 1892. These vessels carried the unprotected gun-deck-battery of small guns,

the Tréhouart, Douvres, Valmy, and Jemmapes. The first two of these vessels will be undergoing second-class ironclads.

First-class Battle-ships of the U. S. Navy.—These are represented by the Massachusetts, Oregon, and Indiana, begun in 1891 and designated for coast-line defense. The prin-

cial dimensions are: Length, 348 feet; beam, 69½ feet; mean draught, 24 feet; free-board, 11½ feet; displacement, 10,300 tons. There is a belt of 18-inch armor extending over slightly more than half the length, rising 3 feet above the water-line, and extending 4½ feet below it. The under-water protective decks at the ends of the belt are 3 inches thick, and the armor-deck over the belt 2½ inches thick. Above the 18-inch belt and for the same length the side is covered with 5-inch armor to the upper deck.

The armament consists of four 13-inch guns mounted, two in a turret, one forward on the central line of the ship and one aft, each turret protected by 17-inch armor. At a higher level than these turrets are four others of 8½-inch armor, each containing two 8-inch guns. The battery is thus so arranged that four 8-inch guns fire straight ahead and four right astern, in addition to the 13-inch guns. There are also four 6-inch guns protected by 5-inch armor, two on each broadside on the main deck at the same level as the 13-inch guns. There are twenty-eight rapid-firing and machine guns and six torpedo-tubes. The battery of these vessels far exceeds that of any vessel in the world of their size, and equals that of any ship. The engines are of 9,000 I. H. P., and a maximum speed of 16½ knots is expected, with a sustained sea-speed of 15 knots. The normal coal-supply is 1,400 tons, and the bunker capacity 1,800 tons.

The seagoing battle-ship *Iowa* was authorized in 1892 and begun in 1893. This vessel will exceed her predecessors in size by about 1,000 tons and in speed by a knot, but will be of about the same general design, although greatly improved by considerable increase of free-board forward and better security against interference of the lines of fire of the guns of the battery.

In 1895 Congress authorized two additional battle-ships and six composite gunboats of 1,000 tons displacement.

The *Texas* and *Maine*, begun in 1889, should be, according to the latest classification adopted in the British navy, rated as third-class battle-ships. The *Maine* has been officially called an armored cruiser in the U. S.

CRUISERS.

There no longer exists in the classification of war-vessels a definite size or class which may actually be distinguished as armored or unarmored, as was the case so recently as 1880. Then began the extensive introduction of armored decks in all classes of cruisers, and since then the rapid improvement in rapid-firing and machine guns, and also the improvement in machinery with greater possibilities of speed, have tended to a rapid increase in the size of cruisers, and an increased amount of armored protection by the use of thin armor-plating on the sides in addition to protective decks, armored protection for individual guns, and cofferdams of water-excluding material. The use of sails in the larger cruisers has practically disappeared, and the greater dependence upon fuel has also tended to increase the size of these ships in order to increase the supply of coal carried, and thus increase the endurance at sea under steam.

The following tabulated particulars relate to eight of the most important cruisers in the world:

DIMENSIONS, ETC.	United States.			Spain,	Russia,	Great Britain.		
	New York.	Brooklyn.	Minneapolis.	Infanta Maria Teresa.	Rurik.	Edgar.	Blenheim.	Powerful.
Length.....	380 ft. 6½ in.	400 ft. 6 in.	412 ft.	340 ft.	396 ft. 6 in.	380 ft.	375 ft.	500 ft.
Breadth.....	64 ft. 10 in.	64 ft. 8½ in.	58 ft. 2½ in.	65 ft. 2 in.	67 ft.	60 ft.	65 ft.	71 ft.
Draught.....	23 ft. 3½ in.	24 ft.	22 ft. 6½ in.	21 ft. 6 in.	26 ft.	23 ft. 9 in.	25 ft. 9 in.	27 ft.
Displacement.....	8,300 tons.	9,271 tons.	7,375 tons.	6,890 tons.	10,923 tons.	7,390 tons.	9,100 tons.	14,200 tons.
Coal capacity, maximum.....	1,290 tons.	1,753 tons.	1,670 tons.	1,100 tons.	2,000 tons.	850 tons.	1,500 tons.	3,000 tons.
Armor, thickness of belt.....	4 in.	8 in.	12 in.	10 in.
Armor, thickness of battery.....	5½ to 10 in.	5½ to 8 in.	10 in.	2 in.
